The opportunity of establishing these national monuments was certainly at the close of the war, and Flaxman was well qualified to have designed them. His was a happy period for the foundation of a great work, and for the commencement of a school which ought to carry English sculpture to its desired place. The originality and vigour of his mind, which rose in proportion to the demands on them, only required scope and stimulus. Such a field would have fired with a noble enthusiasm, and have elevated his soul to the noblest heights. The immediate commerce with foreign countries by the most distinguished men of our own, had created a taste for sculpture which began to be better understood. Banks had shown that English genius was not uncultivable; Flaxman had proved himself equal to his contemporaries on the Continent — equal in hand and eye, and superior in power and sentiment. Canova then, and Thorwaldsen since, could alone compete with Flaxman; for, with some splendid exceptions, mediocrity is the mark of our time rather than of our country: a fact the more remarkable, as this may be considered the peculiar period of science, not only in research but in diffusion. Now the progress of the fine arts must depend on the previous cultivation of the sciences, without which they cannot exist in perfection. Mr. Simpson, in his lectures on orthophrenic education, said, the other day, that the poets were the true moral philosophers. No doubt of it, — and the great artist is the truly scientific man. Great intellect arrives at once, and, by its intuitive power, at the same conclusions which laborious science gradually works out. The utilitarian would banish the fine arts while he cultivates practical science, unconscious that the one is the soul of the other. The man of profound science is a true critic in art; but he and the artist arrive at their end by paths so opposite, and express themselves in forms so different, that they are hardly intelligible to each other; yet the results of their several processes are nearly the same; and ancient art is a union of understanding and sentiment; the former mathematically demonstrates, the latter appealing to a *sixth* sense, which appears to be denied to some, and to be given lavishly to others, but which is really the result of the rare combination of well-poised qualities of the mind in man, as its exciting cause in sculpture is the felicitous union of parts in the most exquisite proportions — a subtle harmony, felt, but not to be described.

The cultivation of the sciences has always preceded the successful practice of the fine arts, and we may therefore reasonably conclude that the scientific taste of our day will lead to a period of the great in art. On the know-

ledge of geometry, numbers, optics, perspective, and anatomy, as subservient to and inspired with genius, depends the excellence of sculpture.

Now not only were these sciences better understood in Flaxman's time than formerly, but the appliances and means to make a sculptor had grown rife in England. To the Townley and Hamilton collections, in the British Museum, were added the metopes of the Parthenon and the frieze of the Phigalian Temple of Apollo. Casts of the finest groups and statues of antiquity grew common in our academies and in the galleries of the great. We, in common with all Europe, reaped the greatest advantages from the inestimable treasures of ancient art discovered at Herculaneum and Pompeii. Some of the best works of Canova were in England, and remain here, particularlyhis group of the Three Graces, in possession of the Duke of Bedford, and his beautiful recumbent statue of a Nymph in the royal collection. Every work of Flaxman's was an addition to the wealth of the country, in pure taste, and often with forcible execution. Francis Chantrey began to develope the graces of his style, which, though more remarkable for delicacy of design and grace of execution than for power, originality, or any of the loftier qualities of art, was yet so true in its imitation of nature, and, as in his famous group in Lichfield Cathedral, so tender in its feeling, as to make him an honour to the British school. Greatness and power are not his attributes; and a false patronage and the pursuit of wealth have too often humbled his efforts to those of mere portraiture; yet, since art must ever look to vanity for a large share of the support it is to meet, we should rather rejoice at the fancy and poetry he contrives to throw into his portrait-statues than condemn him as a mere bust-maker. He has chosen his walk, however, perhaps directed by his capacity, and has thereby shut himself out from the higher and more glorious province of his art. Flaxman was the first lecturer on sculpture appointed by the Royal Academy; and it was about the same time that the then regent (George IV.) presented that institution with the invaluable series of casts which the academy first fitted up in its dark closet of a council-room, at Somerset House, and has now stuck against the wall of its entrance hall, at the National Gallery. The statues, in both instances, being so arranged as to impress the spectator with the greatness of their size, rather than the innate greatness which made the originals the glory of Rome and the shame of Paris. Flaxman says, "their presence has converted the council chamber into a Homeric olympus, where none approach without the mingled sentiments of delight and awe." This is exactly the effect that the pope's present to the regent ought to have produced; and we cannot but regret that they were not given to the National Gallery, under an injunction that a fitting place should be provided for them. The public see little of these noble casts, (which in Rome were made to supply the vacant pedestals when French force ravished the originals from the imperial city,) except during the exhibition of the Royal Academy's pictures, when the Laocoon stands over the check-taker, the Venus and Minerva act as waiting-maids, and the Apollo Belvidere as groom of the chambers to the one-shilling customers, who are much too impatient for new pictures to waste their time in looking at old statues, even if they were so placed as to be seen to advantage. To the student, however, these casts are among the many valuable means this country possesses of advancing his studies.

The collections of the Queen, of the Duke of Sutherland, of the late Lord Egremont, of Earl Spencer, of Lord F. Egerton, of the Duke of Wellington, of Sir R. Peel, and many other noblemen and gentlemen, contain treasures of art in sculpture as well as in painting; and the lectures

of Fuseli and Flaxman — perfect contrasts in style and manner—will enable the student to appreciate them. The libraries of the Museum and the Academy possess copies of all the expensive and valuable works that the last century has given to the illustration of sculpture; and the *vivâ voce* lectures of Sir Richard Westmacott must not be overlooked. With these means sculptural genius cannot perish for want of food in this country.

But if among these means all were wanting but the Elgin Marbles—that collection of all that is beautiful, all that is intelligible, all that is educating in ancient art — the scholar would need no other teacher. In these wonderful works all her principles may be traced, all her powers are amply developed, all her charms displayed. There is not a swell nor fall of the marble, not a curve nor flexure of the outline, that does not combine the most poetical yet accurate study of nature with the most correct observance of scientific rule. When we contemplate these true glories of ancient art, observe their amazing force of expression, their perfect freedom and grace, their endless variety, their sentiment, their truth, we are lost in admiration. The store of words would be vainly exhausted in describing even this effect, much more in detailing their individual excellences. Volumes have been written in vain. They must be seen, and studied, and sought with affectionate regard, and wooed by repeated suit, before they reveal the secrets of their perfectness. The contemplation of any species of perfection is exalting to the imagination and stimulates to virtue; but, in the perfection of art, poetry and science lie in each other's arms; and the delightful, the elevating, and the useful, are happily combined. We would have the student of sculpture keep his hand and eye for them: let him avoid books, and lectures, and inferior means, and imbibe first and for ever the sense of perfect beauty and unexcelled skill in those immortal marbles. Let these be his scriptures in art, the objects of the devout religion of his eye. If he thirst after deserved fame, let him drink deep of this fountain, and live for ever.

With all these advantages, what is the state of sculpture now, and where are we to look for the result of so much and such excellent instruction? Our squares and public places are not without their monuments of kings, and warriors, and statesmen. But do the modern instances excel the old? Mr. Wyatt's literal George III., on his ideal horse, in Cockspur Street, and the plaster figure of George IV., over the station-house, at King's Cross, are the last metropolitan erections in honour of royalty. The Dukes of Kent and York are remembered as generals; and the latter is, by way of triumph, perched in bronze at the top of a tall, severe, and naked column of granite, as if to suffer punishment rather than receive honour. The portrait-statues of Pitt and Canning, in Hanover Square and Palace Yard, on their pyramidal pedestals, are harsh, heavy, and terminal; and to Nelson and Wellington no monument is *yet* erected, except the Achilles in the park, which includes the latter among the brave men to whom their country-women dedicate that unmeaning and inappropriate colossus. These certainly are no proofs of the advance of art. Our monumental sculptures are better, and our busts are best. But this is not the legitimate effect of the Elgin Marbles. The imaginative and the ideal are wanting, and no one devotes himself to art in the abstract. The Duke of Northumberland, Earl Grey, and other noblemen and gentlemen, have lately ordered works of a higher class; but the instances are few where sculpture is loved for its own sake. Private patronage is chiefly turned to busts and monuments, and the country does nothing. Even Mr. Barry's design for the new houses of parliament is denuded of its enrichments and all its intended sculptures. But there are means to reconcile vanity and art, and to confer a favour at

once on history and sculpture in that design. Let the tracery of the interior of both houses spring from heads in relievo, and let these heads be portraits of the members of each house at the time of erection. Some 800 recollections of our day would thus be handed down to posterity. Busts of the distinguished men who already belong to history might be thus given at the expense of the country; and every peer or M. P., who wished to be immortalised without establishing a claim on the country, might add his own mite, with his own bust, to the adornment of the chambers of legislation, and to the illustration of his period. If neither our squares, nor churches, nor palaces, nor mansions, show the progress of sculpture, shall we find it in the exhibition of the Royal Academy? There are 113 subjects, which, if any man were asked to accept as a whole, he would probably refuse to find room for. Sir Francis Chantrey is an academician and trustee, yet he sends nothing from his overloaded studio to support the exhibition, and show to stranger visiters that in the mechanical part of his art the country possesses one unrivalled sculptor. Sir R. Westmacott, an academician, an auditor, and professor, can afford nothing to the exhibition but the pedestal to his statue of Lord William Bentinck, on which is represented, in basso-relievo, an interrupted suttee, and the recumbent statue of a sleeping child in marble — the Lady Susan Murray — a little thing in all respects. Do these men love the art they live by? or, now that it has raised them to fortune, do they scorn to do any thing towards the instruction and encouragement of those who have yet to run their course, — any thing for the enlightenment of the public mind, and the training of the public eye, and the improvement of the public taste, to the ultimate advancement of the art itself? How different was the conduct of Canova! Honoured with a title, and endowed with little more than a competence, he devoted all his superfluity of means, and all his treasured skill, in his last days, to the noblest purposes. He dedicated a church to God, in gratitude for those talents which had been given him, and determined to adorn it with all the powers for the possession of which he felt grateful. Such a work would have been in every sense his monument; — a homage to religion, an ornament to his country, and an ever-living testimony of his own genius, while it preserved to posterity his purity and humility, and held out a lamp to the path of the student. Every body knows that it was grief at the failure of his project, vexation at the delay of the work, and trouble at the discovery that his means would not reach the end proposed, that brought to a rapid close the life of the warm-hearted old Marquis of Ischia. Courteous and courageous, pious and patriotic, Canova, it is but just that thy genius and talent should embalm for all futurity thy upright walk and warmth of heart.

The other academicians who are sculptors, Bailey and Gibson, have sent, the former *two* and the latter *three* works to this year's exhibition. Bailey's statue of Thomas Telfourd, the engineer, is a noble work. The figure massive and composed, the head finely moulded, the features like, and with the happiest expression; the drapery easy, and procured without effort from the loose coat; the form well understood and distinctly expressed, and then slightly but naturally draped in the ordinary costume. His second work is a group (between the statue and the bust in size) of the son and daughter of Sir F. Shuckburgh, which is well imagined and executed with neatness. This has the "prettiness" of manner which is too characteristic of the artist, while his Telfourd is broad and forcible, and exhibits a power of which his previous works convey a faint idea. In the flutter of his ornament, in the statue of Earl Grey, &c. he had nearly frittered away his reputation. In the present instance, he is still but the portrait sculptor. The bust and the

monument are but the objects of a low ambition; but it is otherwise with Gibson, whose first production is Love cherishing the Soul while preparing to torment it,—perfectly classic and imaginative. The Psyche is a butterfly, the Love a boy, not *Cupido* but *Amor*, or both combined in *Eros*,—personified youth, and freshness, and love. The figure is, on the antique model, perfect, and with a grace and truth in all the forms which promise well for modern sculpture. His Venus and Cupid, a basso-relievo, in marble, is fine but less ideal—a mere mother and son of any period, with well expressed forms and faces. The Venus Verticordia is a clever study of the antique, and serves with the others to show that Gibson is certainly in the right path. He has feeling, taste, and skill; his wants are power and originality. He will follow with success, but is not able to lead. He does honour to the existing school, but will never found a new one. Grace and classic feeling are hardly less conspicuous in Wolff's Girl with a Goat and Tambourine: the unformed limbs of youth are, however, too truly given; the ideal of a habit of exercise would have allowed even to the girlish form a better model. There is something so sweet, however, in this group, and so chaste and classic in the conception, that slight faults cannot betray us into censure. We must not omit to notice the boldly relieved head in Carew's Good Samaritan, a bas-relief of great spirit. After these we might mention several admirable busts, and although not in an exalted walk of art, yet as clever specimens in their style, the Dorothea of J. Bell, a very pleasing cast; the Statue of Henry VII. in Caen Stone, by C. Smith, one of a series for Mamhead Park—a design honourable to the patron as to the artist; and several instances of more than moderate ability and some promise: but originality and genius are absolutely wanting in the exhibition. Where is Lough? The sculptor of Milton's Satan has more in him of the spirit of Flaxman then any one of his contemporaries, but he has no subject in this exhibition. Why? Is it that the academy are careless of those who do not court them, or is the sculptor more concerned for himself than his art, and resents, with an ignoble anger, the misplacing of his last year's group? In petty differences, concerning matters of no moment, how much of the soul and spirit is wasted that should, by individual energy and the cordial co-operation of all, be powerfully applied to the advance of the art itself! Public indifference, and the false taste of the modern Mæcenæ, are less dangerous to art than the captious jealousy and excessive self-esteem of the artists themselves. Lough's Captive, modelled at Rome, is a figure of matronly beauty, simple without severity, full without voluptuousness, delicate without feebleness, graceful without affectation. The attitude is one of deep and absorbing grief, not excited by personal suffering, but the anguish of mind for the misery of others occasioned by that suffering. The face is eloquent with this expression: the well understood form of the figure, the flowing outline, and the feeling, the flesh-like living feeling, of all the parts, are proofs of freedom and power in execution which, added to the genius of the conception, place Lough almost alone among the original and poetical of our sculptors; yet, except by his immediate patrons, and the few who will take the trouble to look for unobtrusive merit, Lough is not duly appreciated. It appears, then, that, setting aside busts, and portraits, and mere statuary, the real works in this exhibition worthy of the name of sculpture are few indeed, and the hands so employed still fewer. But does the exhibition of the Royal Academy afford a fair test of the state of sculpture? The architect, the professor, the editor of Vitruvius, the erudite and classic Wilkie, when his National Gallery was completed, is said to have exclaimed, "Bless me! I forgot sculpture," and immediately to have stuck behind the building that conceited little after-

thought, the semicircular saloon. Forgot sculpture! Had the professor forgotten architecture, too, the public would have gained the loss of that piece of honeycomb, the National Gallery. Indeed it is not surprising that the artist is undesirous of decorating this "hole in the wall" with his productions. The exhibition of the first and second years at the new Academy averaged 130 subjects, while the present year (the third) the number is 113, and the paucity of merit is more marked than that of number. The academy should have two large saloons of sculpture — one in which the antique casts, &c. should be seen to advantage, and the other for the exhibition of modern works. What is a statue without space and light? and who should know how much sculpture depends on both if the Royal Academicians do not?

The government have bought pictures for the public, and the public are grateful: we have never heard a complaint against the expense of the Museum, or the National Gallery, or any other means of improvement which the public are called on to pay for and enjoy. But the government raises no statue. A vast number of individuals, however, have united to raise, by subscription, statues to Nelson and Wellington. The history of these transactions has thrown some light on the state of sculpture in England, the power to appreciate it, and the will to encourage it. The city statue was subscribed for and entrusted to Sir Francis Chantrey — with great propriety, as it appears to us. Not that we so estimate Sir Francis as to conceive him capable of producing a truly great work; but because his position and his fame, native and European, demand of his countrymen a fair opportunity for the exercise of his talent in almost the highest line of his profession. The share taken by government in this work was the supplying of some old cannon for the bronze of which the statue will be cast. It is to be completed in four years, and the artist will not probably be restricted to a thousand pounds or so in the ultimate expense. The site of this intended statue is the corner of Cornhill, opposite Cheapside, and near the Mansion House: its character is equestrian, and the size heroic. Neither the style nor the site entirely satisfies our views of the subject; but we will not digress into objections: we shall content ourselves with rejoicing that English valour and sagacity are to be commemorated by English talent, and the city to be adorned with a work of art at the expense of the citizens.

No sooner was the statue decidedly entrusted to Sir F. Chantrey than the friends of Mr. Wyatt got up another subscription for the erection of a Wellington testimonial at the west end of the town. That the real object of this undertaking was the employment of the sculptor has been made clear in the course of the proceedings; and, if such a purpose had been avowed instead of disclaimed, who could have blamed the patrons of art? But patriotism, and taste, and all the virtues were assumed as the motive, and a large sum of money was subscribed, a committee formed, who met, discussed, arranged, and at length settled that the statue should be mounted first on a horse, and then horse and all on the archway opposite to Apsley House, and leading into the Green Park, and that Mr. Wyatt should be employed to execute it. Now, as on all such occasions, a great number of noblemen and gentlemen who had consented to be of the committee had carefully abstained from taking any share in its labours, or encountering any part of its responsibilities; and these honourable men, who ought to have guarded the public against what looked not unlike a job, although we are far from accusing the committee of any such intention, and what would certainly have given us, as the Wellington at the west end, something not un-

like the King of Cockspur Street, now came forward, and accused the committee of partiality, and of hurry, and of holding meetings without notice, and of various high crimes and misdemeanors, which were all resolvable into their own neglect of a duty which they ought either to have declined or discharged. Whether we are to have a Wyatt Wellington, or whether the malecontents of the committee will have spirit enough to reverse its decrees, remains to be seen; but we believe, however painful, and perhaps unfair, to the selected artist, the monument will be transferred to other hands, but not, we hope, into those of Sir F. Chantrey. If one George III. is enough for Mr. Wyatt, let one Wellington satisfy Sir Francis: there are able men behind.

Warned, however, by this alleged intrigue, and shocked, at least, by the reproaches hurled at the Wellington committee, the gentlemen selected by the subscribers to the Nelson memorial resolved on a public competition, which took place last March. The gallery of Mr. Rainy, in Regent Street, was accepted by the committee for the exhibition of models and drawings, and many artists and amateurs competed for the prize. Architects and sculptors were alike encouraged to try their talent; and the exhibition was expected to afford a fair view of the amount of ability in these arts as they existed in this country. And it was fair to suppose so. Than Nelson never was a hero so heartily beloved, never was a country more proud of a son, never were actions more capable of artistic illustration, nor a character more inspiring of lofty sentiment and high feeling than his. He was himself a genius with whom genius was likely to sympathise, in the astonishing boldness of conception, and in the rapidity and dash of execution. He scorned all pettiness of detail, all trifling quibbles of the schools; he was content to trust to the dictates of his own original mind, and won his battles, not according to rule, but by the force of genius; and it might be expected that the artist who would commemorate his actions would catch a spark of his fire; and, scorning the pedantry of precedent, unfettered by rule, and excited to greatness by the contemplation of greatness, would have produced something at once surprising and appropriate, something new yet recognised, daring but allowed, grand yet intelligible, bold, significant, expressive, and commanding admiration rather than soliciting approval. Was any thing of this kind exhibited? Nothing approaching to it. But in its place every variety of eccentric device, every extravagance of bewildered imagination on the one side, and on the other every form of the cold and tame. Among the multitude of designs, few indeed were fitted to be the monument of any thing but the dulness of him who had conceived it. We will not waste words on the rocks from which flowed fountains, and on which sat tritons in the most amiable confusion, with the most inexplicable purpose; nor with the confectionary or pastry models of mock Egyptian and ungenial Greek temples; nor with the monstrous light-houses, nor the more absurd fountains, which decorated the rooms. The committee divided the designs into the column, the obelisk, and the pile, in which architecture and sculpture were combined, and selected from each class a specimen for the first, second, and third prize,—but not one for execution. The column was of the Corinthian order, surmounted by a statue: it was the design of Mr. Railton, and, although no way remarkable, was correct and pleasing as a column — a column *apropos* to what? certainly not to Nelson. The obelisk was the design of Mr. Bailey, and, had the competition proceeded, would have probably carried away the majority of suffrages. It was an Egyptian obelisk of granite, surrounded at the base with allegorical figures in bronze, — among them a lion, a Britannia, a Nelson, and a number of sea-gods and goddesses "swimming," as somebody

said, "round the world for sport," but meant, according to the artist, to signify that Nelson's victories were as extensive as the element on which they were gained, which, if they did express, their significance was as simply complex as Lord Burleigh's nod. The architectural composition was the design of Messrs. Fowler and Sevier, and was finished with remarkable beauty for a model, but was distinctly wanting in all the characteristic features of a monument to naval glory. Mr. Rennie, Mr. Coffee, Mr. R. Westmacott, and some others, appear to have approached more nearly the simple and severe standard which might be expected to guide this work: they all agree in a sculptured pedestal, columnar or pyramidal, surmounted by a statue. The pervading thought in these designs was certainly the true one; and he who succeeds best in embodying it will probably be the selected artist. But to accomplish this design great power and judgment are required; and perhaps the public would be unwilling to receive the grave and true for the frivolous and showy. But to return to the history. The committee had announced this selection, and the day was fixed for their final determination. In the meanwhile the press had spoken, the committee had consulted all who were likely to know any thing of the matter, and they resolved to re-open the competition, a resolution which does them the greatest credit, and which, we believe, the public owes to the Duke of Wellington and Sir Ridley (now Lord) Colborne. Sir Hussey Vivyan had taken under his patronage Lieut. Siborn, and had resolved to move the committee to decide on a temple which should contain the model of Waterloo, now exhibiting at the Egyptian Hall, and a model of the battle of Trafalgar on a similar scale. From what we have seen and heard of the models in preparation, we have no doubt that the approaching competition will do more honour to English art; but we have no very high hopes of seeing such a tribute to Nelson as will at once satisfy the critic and the public — the true test of fitness in the design and of ability in the artist; but when we look abroad at the monuments of the Continent, ancient and modern, we do not see the design which we should desire to see naturalised for the Nelson monument. Here is a difficulty not carefully considered by the critics. The monument should be one to the glory of England's navy; it should record by intelligible figures the localities of those victories, and the means by which they were gained, and the ideal of the men who won them; and Nelson should be the climax, — the point to which all should tend, — the grand feature, the aim, object, the soul of the composition.

We have endeavoured to show that at one period English sculpture had attained an eminence from which all but the summit of perfection was in sight. We have attempted to explain the causes that interrupted its progress. If we are right, the greatest evil of the interruption is over, and the stream of art again flows easily on. The advantages we possess in the splendid relics of ancient art, to direct its progress, cannot be calculated. As yet they have not produced their natural effect; but the advance of art is slow, and more especially is this true of sculpture. The country must acquire a taste for the beautiful, and a knowledge of its own treasures, before the artist can be stimulated to the necessary exertion. Money is no due reward, nor ordinary fame a sufficient stimulant to greatness. To be praised by those who know is the artist's aim; and, until a whole people are educated to an understanding of art, the applause of that people will fail in its effect. We have all to do, but we have the means of accomplishing all; and we hope the Nelson monument will mark the commencement of a new era in English art — the era of the great and the original; and the final period of the tame, the feeble, and the imitative, which, from the time of William Austin to that of John Flaxman, have been the characteristics of sculpture in England.

THE EXPEDIENCY OF A RURAL POLICE.

First Report of the Commissioners appointed to inquire as to the best Means of establishing an efficient Constabulary Force in the Counties of England and Wales. London: C. Knight & Co. 1839. 8vo. pp. 416.

> "An vigilare metu exanimem, noctesque diesque
> Formidare malos fures, incendia, servos,
> Ne te compilent fugientes; hoc juvat?" HOR.

No little sensation has been created throughout the country, from the very extensive circulation of an Abstract of the First Report of the Commissioners appointed to inquire into the best means of establishing an efficient constabulary force in the counties of England and Wales. As the subject has been much canvassed at quarter-sessions, and other public meetings of the magistrates throughout the country, we feel induced to draw their attention still further to a subject calculated to prove so immediately important to them individually and collectively, and to excite in no ordinary degree the attention of the whole community.

Previously to entering upon the minutiæ of the leading propositions in their Report, we would offer a few observations on the general expediency of the object to which that Report is directed, inasmuch as some are inclined to doubt the necessity of any further security for their property and persons, having hitherto escaped from those depredations and outrages which the present project is intended to remedy.

In order to prove the utility of this intended change in the method of advancing the peace of the country, it must be shown that the advantages to be reaped from its adoption will exceed the expenses attending the outlay for its proper maintenance. This has already been demonstrated in a most satisfactory manner by the admirable working of the metropolitan police force, both as to the security of person and protection of property at a most economical rate. It may be retorted that the metropolitan police force can be no criterion whereby to ascertain the advantages of a similar institution in the country, the latter having none of the wretchedness and vicious characters wherewith the metropolis so greatly abounds; but any one at all acquainted with the character of the rural population, even in those districts where manufactories do not greatly abound, will feel at once the futility of any such objection; and were it really the case, that our agricultural population in its present state required no protection, still, when the larger towns are furnished with a trained force on the same footing as that of the metropolis, the various descriptions of town-delinquents will be driven out into the country, and thus a police force will be rendered quite as necessary for the latter as it is for the former.

That which has been partially achieved, in particular portions of the country, with success, may surely be extended, with equal success, to the whole. The system has already been tried in several small towns, and found to be productive of the greatest benefits; so much so, that there can be little doubt but that those towns would much rather double the salaries of the police officers than be deprived of their services. On the line of the Great North of England Railway there are several whose inhabitants consider that they owe the peace and safety which they enjoy solely to the appointment of an active police officer in each. Moreover, it has been found that vagrants almost invariably avoid these towns in their routes. The principle upon which the commissioners ground their system — that of

centralisation — will render these officers of much greater service to the country, from their being each members of one great and uniform whole. Notices of crimes and misdemeanors, with full descriptions of the persons of the supposed depredators, can thus be readily transmitted throughout the kingdom, so as almost to preclude the possibility of an escape. These scanty observations show that here there is no expatiating on the field of imagination, that this is no new-fangled scheme wrought out from the region of conjecture, but one founded on that sure and infallible basis — well-established experience, followed up with the most cautious and mature deliberation.

It has been suggested that the project under consideration will infringe on the liberty of the subject, and be a curtailment of that political liberty and freedom which the people of England have so long enjoyed. Assuredly it would be but indiscreet, and very far from good policy on the part of any government in this our day, were it to put forth a measure which might reasonably be thought to encroach upon the sacredness of "freedom's glorious cause" in any shape. We think, however, no such presentiments need be entertained with regard to the one at present under consideration.

Our liberty is ever liable to be assailed by two great counteracting powers — those of government and individuals, and which have ever been a mutual check upon each other; the encroachments of the one having a direct tendency to restrain, in some degree, the power of the other. In broaching, therefore, any plan of reformation calculated to affect the polity of this country, it should be made manifest that the benefits to be gained on the one hand will supersede any objection which might suggest itself from the diminution of power or loss of liberty on the other. This general position can be fully established with reference to the present project; for, as far as the personal freedom of the subject is concerned, there is no question but that it will be materially protected and rendered much more secure than it has been hitherto: in comparison with which the imagined accumulation of power dwindles down to a mere shadow. Nay, would not despotism itself be preferable to an all-prevailing sense of insecurity?

But, at the same time, it cannot be expected that cultivated minds, and those who extend their views beyond their own personal and immediate protection, will rest satisfied until every semblance of an approach towards tyranny, every encroachment upon their rights and liberties, however minute, shall have vanished from the scheme. To clear away, to the satisfaction of every reader, the few doubts which might thus arise on the subject, would necessarily occupy a larger space in these pages than our present object would warrant; we shall, therefore, only observe, that he should put into the counter-scale the security which our personal freedom must derive from the project when carried into effect, and he will find it greatly to preponderate: further, that the power imagined to accrue to those in whom the appointment of a constabulary force shall reside would be found to be of little avail, were any insurrection to arise from the excitement of the public mind or otherwise; as each officer of the establishment would be no more led to forsake his own private opinion, interest, or bias, on account of his office, than any workman in a cotton factory would, under similar circumstances, succumb to the will of his employer. History furnishes many instances to bear out this assertion; but, even under the supposition that it is a false one, the power conferred, when the sketch of the Report has been gone through, will be shown to be of but comparatively little import.

The principle of centralisation — the leading feature in the system — has in some instances been rendered odious to the feelings of this country, from

the necessity of its connecting with government a subordinate body of men who would be likely to become domineering and arbitrary, and from its tendency to sow seeds germinating on the establishment of a despotic rule. In others, and those by far the most numerous, it has been hailed with almost universal approbation, and has conferred upon some of the institutions of this country benefits which need only to be slightly glanced at to be highly appreciated by every one. That which appears to approach nearest in its internal formation to the proposed force is the excise-office. What confusion, disorder, and irregularity would have existed had the body of men forming this establishment been hitherto acting under no general rules, and had they been apportioned throughout the country at random, and without regard to the different grades of officers which at present exist! One portion of the body would be acting under a more salutary scale of regulations than another, without any means of conveying the improved method to its adjacent district; whilst, having no immediate superiors to watch over and direct their movements, the greatest overbearance would be practised through pique, and the utmost latitude be given to delinquents through partiality or favour. These are only a very few of the consequences which would ensue from the absence of this principle, and which would be equally applicable to some other of our comprehensive systems of management, as, for instance, the present administration of the poor-laws, that admirable piece of machinery — the post-office, our courts of justice, the stamp-office, custom-house, &c. It is not within the province of this paper to indulge in any lengthened emcomium on the grand outlines of these really admirable institutions, and we will therefore conclude this portion of the argument by recommending those who take any interest in the measure of a rural police to give them their most serious attention.

The question as to whether the present constables are sufficient for the conservation of the peace may be easily disposed of. Generally speaking, they are wholly inadequate and unfit for that purpose; and, ignorant and inert, neither know nor seek to know in what their actual duty consists. Indeed, this can hardly be a matter of surprise, when we consider that, in many instances, the office is only temporary, and that there is no inducement, by way of emolument or otherwise, to excite their activity. They are often induced by local connections and prejudices to excuse offenders, or to exercise oppression towards those of their neighbours who are the objects of their enmity, but more especially towards the poorer classes, who have frequently no means of redress. Some refuse to render any assistance unless remunerated for their services, whilst others, through timidity or fear, allege a multiplicity of excuses in the shape of illness, important business, and the like. Then the appointment is frequently conferred upon those who are incapable of great activity, from being far advanced in years; and it is well known that not only are they in many instances extremely difficult of access, but that in some townships an appointment never takes place. The office, again, is avoided as much as possible by farmers, and the more industrious class of labourers; consequently it falls the more frequently on the idle and dissipated.

Blackstone thus speaks of them: — "They are armed with very large powers of arresting and imprisoning, of breaking open houses, and the like, of the extent of which powers, considering what manner of men are for the most part put into those offices, it is, perhaps, very well that they are generally kept in ignorance." The powers are certainly great, but not too great for the very nature of the office, unless when placed in hands where it is likely to be perverted; but

"Where ignorance is bliss
'T is folly to be wise"

ought not be applicable to any public officer who has certain and definite duties to perform.

The maleadministration of parochial justice has long been considered a crying evil against the good government of this country; and, should this measure meet with the sanction of the legislature, it will only be one step towards the formation of what has ever been a great and manifold desideratum, viz., a well-organised local or parochial government. The principle of governing by small communities, as tending towards the formation of a healthy sound government, though out of place here, is well worthy of the serious consideration of the legislature, and would be productive of the most incalculable advantages to this country.

We will now proceed to give the chief recommendation from the first report of the commissioners, and comment shortly upon the several clauses in their order.

It is proposed

"I. That, as a primary remedy for the evils set forth, a paid constabulary force should be trained, appointed, and organised in the principles of management recognised by the legislature in the appointment of the new metropolitan police force."

With regard to this regulation — the superiority of the management of the metropolitan force being generally admitted — few objections can reasonably be made, beyond the fact, that the exchange of intercourse which subsists between the superintendent, district-superintendent, inspectors, and serjeants of the metropolitan police, cannot be made so immediately available to that for the country. The distance which must necessarily separate them from each other will prevent that ready communication between the different grades of the officers of the establishment which tends so much to the well-ordering of the corps, and to the maintenance of that unanimity so indispensable to their efficient formation. This, however, appears to be rather a concomitant evil than an objection.

"II. That for this purpose on application in writing, under the hands and seals of a majority of the justices assembled at any quarter sessions of the peace for the county, setting forth the insecurity of person and property, and the want of paid constables, the commissioners of police shall, with the approbation of the secretary of state for the home department, direct the location of such constables and such officers as may, upon examination by the said commissioners, be deemed adequate for the due protection of life or property within the county."

Here there is no power vested in the magistracy. They are merely to inquire into the inefficiency of the present conservators of the peace and report thereon; the commissioners undertaking to prescribe the number and condition of the officers to be appointed. It has been recommended that the appointment of the officers should be with the guardians of the poor-law unions, as opposed to the commissioners and the magistracy. This would seem at the outset a very plausible and apparently popular plan, as tending to give greater and more general satisfaction; but it will ultimately be found, what indeed is generally admitted, that the lower orders are by far more jealous of those persons who are equal with, or only a remove above themselves, than they are of their more elevated superiors. The guardians, we are persuaded, have already a *quantum sufficit* of business upon their hands, independent of this perfectly extraneous duty; indeed it appears to be totally incompatible with their office, and certainly inconsistent with their other duties. They would frequently be led to confer the appointment upon men whose capacities for the office would be lost sight of in the

wish to gratify some personal feelings, or to provide a means of subsistence for those who have no other possibility of gaining a livelihood. Would it not be objectionable, also, on account of the probability of their appointing such men merely as were resident within the limits of the union, in the stead of — what is certainly a desideratum — perfect strangers to the office? Of course this last would apply with almost equal force to the appointment being with the magistrates, as limiting it to those persons within their district jurisdiction.

It appears, therefore, to be the safest and best method that the appointment and ordering of the intended force should be entirely under the control of the commissioners, magistrates, and superintendents of the police; they being also far more conversant with criminal matters than the guardians of a poor-law union.

"III. The force should be paid one fourth from the consolidated fund, and three fourths from the county rates, as a part of the general expenses of the whole country."

This clause has probably been more canvassed than any one in the list, inasmuch as it is that which comes nearest to the pocket. The suggestion which stands opposed to it is that the three fourths of the expense should be raised by a rate made in the particular districts where the services of the force are deemed requisite; and not that each district should be compelled to contribute indiscriminately, and towards the protection of other property than that within its own limits. That would be considered a harsh and unjustifiable enactment which should compel a peaceable and thinly populated district to contribute towards the protection of a manufacturing and more thickly populated portion of the county, where crime is continually committed, and where wretchedness and vice abound. Many of the associations which have been formed for promoting the apprehension and prosecution of felons average two or three prosecutions each during the quarter; whilst others, equally alive to the offences cognisable within their district, scarcely average that number in as many years. Nor is there so much disparity between the populations of each in point of numbers as to account for this variation in the amount of crime committed. What reason, then, can be assigned why the latter should partially defray the expenses of the former? Certainly, as the proportion for each district would vary in accordance with the force required, the preference appears to be in favour of a rateable district contribution to that of a whole county, where the rate would be equalised throughout.

"IV. That the constables so appointed shall report their proceedings to the justices of the peace of the quarter and petty sessions where they are stationed."

Here again has the objection most ridiculously been urged — the placing too much power with the magistracy; and it has been the cause of no little umbrage to many who are jealous of the power already in the possession of that body; but those who are aware of the benefits derived to the country from their gratuitous exertions, and of their proper application of the power they possess, will not consider the present clause as one calculated to augment that power one iota. Nay, will it not rather be an addition to their already arduous duties? Were any other body of men of equal authority appointed to superintend the proceedings and receive the reports of the force, in lieu of the magistrates, the requisite salaries for such appointments would suggest a much greater objection than that which arises from the fear of granting too much power by the present arrangement.

By a recent act* of the legislature, the magistrates, in cases of emergency — the very period when the fear arises of the power vested in them being perverted — are empowered to swear in all persons who are willing to act as special constables, in order to quell any violent proceedings which they have reason to think to be in contemplation. How, then, can the present measure in any way accelerate their power, when they have thus at command an unlimited number of assistants? Did the legislature grant them this power without sufficient deliberation? Did the country ever apprehend any danger from it? No: the magistrates have ever possessed the confidence of the country in all matters of a criminal nature, and there is scarcely an instance on record to show that it has been misplaced.

The practicability of the police officers laying their reports before the magistrates at petty sessions has already been sufficiently put to the test, in those districts where a police officer has been appointed; and it has been found to answer every expectation.

"V. That the superintendents should be subject to dismissal upon the representation of the justices of the peace in quarter sessions; and that the serjeants and constables shall be subject to dismissal upon the representation of the justices of the peace in petty sessions."

It may be a matter of surprise to some why the appointment of the intended force should rest with the commissioners of police, whilst their dismissal, as we see by the present clause, is within the power of the magistrates. The intention would appear to be to provide officers who can be exchanged from district to district at discretion, and who are perfect strangers to the people on the one hand, and, as they will be continually acting under the directions of the magistrates, to render them in some measure amenable to that body for their conduct on the other.

Again, as to the power conferred on the magistracy. The office of high constable has been held hitherto at the will of the magistrates assembled at quarter sessions, and yet we believe there is not a single instance on record to show that any of them have been dismissed, unless upon grounds perfectly justifiable. The office is one of great antiquity; and history does not furnish us with an instance of their being made the tools of any party, further than from what their own private interest or opinions suggested.

The superintendents of police will be upon the same footing, though standing in rather an altered relation to the magistrates, in consequence of their appointments not having been derived from that body. The power to be vested in the justices at petty sessions over the serjeants and constables will, for the same reason, be less than what they at present exercise over the petty constables; and as the former will, in all probability, in many instances, entirely supersede the necessity for the latter, this clause will eventually, instead of increasing, diminish their power in a much greater ratio than any other clause in the report is calculated to increase it.

"VI. That the justices of the peace shall frame rules and regulations for the service of process and attendance at petty or quarter sessions of such force, which rules shall be submitted to the secretary of state, and if approved of by him shall be binding."

This is a most salutary provision, and likely to prevent much irregularity, as there are many local resources and advantages of which the commissioners

* 5 & 6 Will. 4. c. 43. enacts, "that in *all cases* where it should be made to appear to any two or more justices of the peace, &c., upon the oath of any credible witness, that any tumult, riot, or felony, *might be reasonably apprehended*, and such justices should be of opinion that the ordinary officers are not sufficient, they are authorised to nominate and appoint *so many as they should think fit and necessary* for the preservation of the public peace." It then extends the power for the appointment of special constables, given by 1 & 2 Will. 4. c. 41., viz. "that *all persons willing to act* as special constables shall be capable of being appointed and acting."

of police could not be aware, and which would, without this arrangement, have been entirely lost sight of.

"VII. That the commissioners shall frame rules and regulations for the general management of the police, which rules shall, on the approbation of the secretary of state, be binding."

Somewhat of the same local information, so readily to be obtained by the method recommended in the last clause, would, with all due deference to the commissioners, be to a certain extent advantageous for the present one; as the magistrates, from their accurate knowledge of the country, and their many years of experience, would be enabled to furnish numerous suggestions and advantages applicable to the present state of the different portions of a county where they for the most part reside. To be sure, it must be admitted, that the superintendents, when appointed, will readily acquire a competent knowledge of the different localities in the districts over which their jurisdiction may extend; but why not at once obtain that really practical information which may be had so readily?

"The trained force which we propose is of little more than one constable to 2000 inhabitants."

About the proper medium, were a uniform number requisite throughout the country, and each district requiring a similar state of protection; but, as this is far from being the case, would it not be very desirable that information should be obtained of the relative position of the inhabitants in each district, many of whom in the agricultural counties are so widely disseminated, that in some cases it might be doubtful whether an officer to 1000 would be deemed adequate? And these districts, be it remembered, are amongst those where the attendance of the police is extremely requisite, being infested by those travelling depredators who are by far the most obnoxious to the farmer. For here they can resort in perfect quietness, and free from molestation, at the same time extending their ravages to the adjacent and more thickly populated districts, without danger of detection.

Here we have the limits of the power to arise from the appointment of the officers — 1 to 2000, or, as suggested in a few remote instances, 1 to 1000. This really insignificant proposition, when coupled with the improbability of its being swayed during the time of any civil commotion by the will of the few, affords very strong grounds in favour of the before-mentioned supposition, that the liberty of the subject will be but little disturbed by the intended organised force.

Some difference of opinion has been expressed, as to whether it would be requisite to extend the force over those portions of the country which are purely of an agricultural nature, it being thought an injustice to entail a considerable burden, in the way of expense, on the small farmers, who will have no proportionate return. This has already been almost entirely dissipated at the outset of these remarks; but, in order somewhat further to elucidate this trivial objection, we would offer a slight sketch of the most reprehensible characters and objects common to an agricultural population, and which may prove worthy of the attention of a superintendent to be appointed for the more northern agricultural counties of England.

The most prominent are those marauding hordes who, being furnished with horses and carts, have opportunities of plundering with impunity, and facilities of escape denied to the mere strolling beggar. Journeying from market to market with covered carts, they plunder whenever an opportunity occurs; and, having a ready concealment at hand, set detection at

defiance.* Some, by affecting an outward pretension to merchandise, lull suspicion to rest; whilst others, of a bolder front, disdain to have recourse to any such artifice, and openly travel through the country with no apparent object in view.

Travelling colliers, as they are termed, are also a continual prey upon the farmer, and in the very worst manner, turning a whole drove of asses and mules during the night into the best pasture they can meet with. Well may the farmer complain of the failure of his crops!

There exists another set of pilferers, the extent of whose schemes and devices for plunder is confined to a most praiseworthy and valuable class in an agricultural district — the unwary and open-hearted farmer of limited means. At the neighbouring market or fair, these swindlers, having a prepossessing exterior, impose upon the honest simplicity of the farmer by assuming an air of kindness and generosity, and which seldom fails of ensnaring those whom they have singled out for their prey.

Those autumnal visitors who reap a portion of the fruits of the harvest under the mask of a display of horsemanship — a distant grade from Astley's — are highly to be reprobated, inveigling, as they do, the lower orders into a trumpery lottery, the highest prize of which invariably goes to the party with whom the itinerants lodge, as a set-off against bed and board. Thus do they elicit from the poor reaper the hard earned wages which his industry may have procured him, and at the only period when he has an opportunity of adding to his little store, in order to provide against the inclemency of the winter season. Surely some method might be devised by the legislature whereby to arm the magistrates and police with sufficient power to suppress such pests of society as these.

Lastly, in the small country towns and villages, there are abandoned characters who obtain a livelihood by harbouring during the night all the characters above described, as well as every wandering beggar. We have known from twenty to thirty turn out in a morning from one of these wretched hovels. Here is a root which ought to be struck at, which the law does not reach, but which might gradually be removed by the adoption of the system we have been considering.

We might run on with numerous other classes of delinquents, some moving about over the whole kingdom, having London as a sort of centre or head quarters; others stationary in particular neighbourhoods; but the list would carry us beyond all reasonable limits. The above enumeration is confined to such as are not generally known, and which do not appear to have been brought under the notice of the commissioners. Turning to the report, we find various descriptions of vagrants described in detail, and upon the most authentic testimony.

The most prominent body of delinquents in the rural districts, are vagrants, who appear, say the commissioners, to consist of two classes: first, the habitual depredators, house-breakers, horse-stealers, and common thieves; secondly, the vagrants, properly so called, who seek alms as mendicants. The report gives extracts from the confessions of four depredators of the migratory class, and one mendicant, setting forth in detail their previous career of depredations, and the descriptions of their associates. As we have not room for a large portion of the evidence, we think it may be most interesting to the reader to give one of these stories entire. If it is not worked

* One of this description was convicted of sheep-stealing, at the last sessions for the north riding of the county of York, and transported for the term of fifteen years. He travelled with an open cart, but had a loose cover concealed under the seat to screen the animals he stole. This system he had carried on to a great extent throughout the last winter.

up so graphically, it is at least as instructive and characteristic as the history of Jonathan Wild or Oliver Twist. It consists of short condensed notes of the confessions of a young thief, confined in Cold Bath Fields prison.

"A twelvemonth ago he and P—— were together in Cold Bath Fields, where they planned a thieving journey to Kidderminster.

"They built a dog-cart, stole two dogs from Smithfield, bought hardware, brooms, &c. at a shop near Farringdon-street, to the amount of 17*s*. While they were purchasing the articles, two companions stole for them a dozen and half of hand-brooms from the door; they valued them at 5*s*., making, as four were concerned, 1*s*. 3*d*. each; — P—— and H—— paid them 2*s*. 6*d*. They also took with them twenty sixpences and ten shillings bad money, which they concealed in a large false bottom of the cart. Thus equipped, H—— with 5*s*., P—— with 15*s*. 6*d*., they started off about twelve at noon, in the winter or end of autumn. At Wandsworth they sold a mat for 1*s*. 4*d*. and a broom for 11*d*. They went on to Wimbledon and called at a public-house, where they had a pint of beer, for which they gave a bad sixpence. The landlady served them, and then went into the inner bar and continued serving. The boy H—— reached round and took four silver salt-spoons, which were on a shelf; he would have taken the salt-cellars, but was afraid they might soon be missed. They decamped, bought some bread and cheese, and hastened out of the town in about ten minutes after the robbery. At Kingston they went to a travellers' house and sold the spoons to their landlord, who gave them board and lodging for the night and next day, with 5*s*. for the bargain.

"They proceeded on their journey, and at about half-past ten a coach passed them on the road; a small trunk was fastened on behind the seat. P—— ran after the coach, climbed up, and cut it down. It contained a quantity of papers, and nothing else. They tore the papers into shreds, and, having destroyed the box, they hid the pieces. This box was subsequently advertised, and a reward of 50*l*. offered for the recovery.

"At the next town (the boy did not recollect the names of the places), about eleven or twelve miles from Kingston, they went to a public-house; it was market-day. H—— made cloth caps, and in the course of the evening he sold a dozen and a half, at 1*s*. 6*d*. each, to the countrymen in the tap-room. They stole a great coat which belonged to one of their customers, and hid it in the false bottom of their cart. There was a hue and cry for it; some suspected the boys, but the landlady said she could be answerable that the poor lads were innocent. Having proceeded next day on their route, they sold it to a passing countryman for 3*s*. H—— considers it to have been worth 7*s*.

"For three weeks they lived entirely on the produce of what they sold, and ultimately arrived at Kidderminster.

"They put up for a short time at a travellers' house. Houses of this kind are in every town, price 3*d*. or 4*d*. a-night; they have a common kitchen, where the trampers cook and live. (P—— confirmed this, and stated that the better sort pay 6*d*., and have the attendance of a girl to cook.)

"At every lodging-house on the road H—— met plenty of trampers, and he did not see one face that he had not seen at St. Giles's. They also recognised him, and compared notes. Some were hawkers, some were going half-naked, some were ballad-singers, some were going about with false letters, others as broken-down tradesmen, some as old soldiers, and some as shipwrecked sailors; and every night they told each other of good houses. They all lived well, never ate any broken victuals, but had meat breakfasts, good dinners, hot suppers, and frequently ended by going to bed very drunk. Not one spent less than 3*s*. a-day, many a great deal more. They sometimes make 5*s*. and average 3*s*. 6*d*. per day; some often get a sovereign where humane people reside. (All this is confirmed by P——.)

"P—— having been employed at a carpet-manufactory before he came to London, went to visit his old friends, and was soon able to introduce H——. Every day these boys stole balls of twine and string from this place. They daily went there to take whatever they could lay their hands upon, and have brought out two and three dozen balls of a day in their great-coat pockets, finding a ready market for their plunder in the rag-shops. The first lot they sold was worth about 1*l*., and they got 10*s*. 6*d*. for it. They did not dispose of any stock-in-trade while in the town, but lived by plundering the manufactory and picking pockets in the streets. Some of the property they pawned, some they sold to trampers at the lodging-houses.

"P—— and H—— were very punctual in attendance at the churches, where they always robbed. They took three watches — one was pawned for 15*s*., the other two for 1*l*. a-piece. P—— is very clever at 'easing a yokel of his watch.'

"They went to a fair about fifteen miles from Kidderminster, leaving their dogs and cart at a public-house about two miles from the scene. P——, who can play at 'prick in the garter,' soon got a mob, and soon found 'betters.' He allowed them to win nearly all the money he had, and then won it back with double interest. In the mean time H——, who never appeared to know P——, was very busy rifling the farmers' pockets of their money-bags. (He minutely described the bags as being to him a matter of great singularity.) He

took eight bags in a short time, but the richest of the eight contained only 15*s.*; he also took seven handkerchiefs. One of the party having lost a bet, applied to his pocket, but missed his purse; a row ensued, every one felt his pockets; the robbed and the swindled gave vent to their anger, and, having secured P——, took him to a pond and ducked him. H—— decamped when the storm was brewing, as he had all the bags and property about him. This occurred at about four in the afternoon, and at about nine P——, having concealed himself after his ducking, joined H—— at the public-house, and off they set in their vehicle.

"They left the neighbourhood and shaped their course for London. On their journey back they entered a gentleman's house, about half-past eight in the evening. It stood upon a hill, and was to let. They opened the kitchen-window, and rummaged all over the house for about an hour, taking away a great-coat, some glass decanters, and a hearth-rug. On arriving at the next town, which was about ten miles off (and they travelled in the night after this robbery), they told the landlord they had something to sell. His wife went out and returned shortly after with a man, who bought the lot for 1*l.* 5*s.* 6*d.*; but H—— remarked, 'The fellow swindled us, for the decanters were worth all the money, but we were glad to get rid of them at any price.' At some distance from this town they came near a large village, and saw several persons coming towards them, when P—— put down the table for the 'garter story.' H—— began betting, and the people, when they came up, stopped to see the fun. Shortly they began to play, and H—— began to thieve; at length they became exasperated at their losses to P——; H—— had retreated, and, having packed away the property in the dog-cart, was moving off, when the storm broke out, and P—— again got into a scrape. He was severely thumped and beaten; H—— was accused of being an accomplice, and they were both locked up in the cage till next day, when the magistrates acquitted them, remarking that P——, if guilty, had received punishment enough, and as for H——, there was no charge against him. It remained a mystery amongst them what had become of the stolen property, for neither boy had been out of their sight, and yet nothing was found either on them or in the cart. They never suspected the false bottom.

"About thirty miles they stopped a night at a public-house, and became friendly with some soldiers who were billeted at the house, being on a march with their regiment. While the soldiers were telling their adventures, the boys stole 2*l.* from them. The next morning the alarm was given, and P—— was again the scape-goat. H—— fled, and hid the purses here and there about the stable-grounds as quickly as possible; some he threw down the privy, and they were found by one of the soldiers. The landlady in this instance took part with the boys; and, as no other person had been in the company, the soldiers, though there was no proof, had no alternative but to suspect the boys, or one of their own comrades: however, the boys got clear off.

"At a short distance (that is, about twenty miles) from London, they stopped at a gentleman's house to hawk some things, and, while the servant went upstairs with some hearth-brooms, P—— slipped into the parlour and brought out a watch and a silver egg-stand. The servant bought about 5*s.* worth of things on her return, and they made the best of their way from the premises. In five days after they were in London, having added to their plunder from the gentleman's house a pair of silver salt-cellars, which they stole from a public-house where they slept. This plunder they brought to London. The silver was sold for 3*s.* 6*d.* the ounce; the watch for 15*l.*"— *Report*, p. 43. et seq. 8th edit.

The following classification of these predatory vagrants taken from the confession of an experienced vagrant, may be found not only very curious and amusing, but extremely useful. The man alluded to described the various classes as follows:—

"1st. Men who go about the country almost naked, begging clothes or food. They get about 3*s.* a-day. They have good clothes at their lodging-house, and travel in them from town to town, if there are not many houses in the way. Before they enter the town, they take them off, as well as their shoes and stockings, put on their Guernsey jackets, send the bundle and the woman forward to the lodging-house, and commence begging at the first house they come to. Knows a man who was recently clad from head to foot in new clothes at a shop in Billericay, by the son of the rector in a neighbouring village, all of which clothes, including hat, shoes, and stockings, he sold about half an hour afterwards, by auction, in the tap-room of a low public-house, to his companions, and they all got drunk together with the proceeds. These fellows always sell a gift of clothes.

"2d. Men who are ring-droppers. Travelling tinkers make sham gold rings out of old brass buttons. H—— D—— is a noted fellowat this work; his wife and mother go with him and drop the rings. They live in St. Giles's, and travel for a month or two. They sometimes make 20*s.* or 25*s.* a-day.

"3d. Fellows who go round to different houses, stating their master's stock of rags has been burnt, or that a sudden supply is wanted, and that they are sent forward to collect them. The rags are called for, and one fellow marches off with the bundle, leaving one or

more talking with the housewife, who is gravely cavilling about the price, and as gravely informed that the master is coming round, and they leave some private mark on the door-post, which they say is the sign to indicate to him the quantity and quality taken, and the amount to pay; so they walk off, and 'never tip her any thing.' The rags are carried to the keeper of a rag-shop, who gives quires of paper in exchange, which they carry round to small villages, and sell to small shopkeepers, or at farm-houses. All rag-shops 'stand fence for anything,' and buy any stolen property, or metal, from iron hoops to gold rings.

"4th. A set of fellows who go about in decent apparel, leaving small printed handbills at cottages and farm-houses, wherein are set forth the wonderful cures of all sorts of ailments effected by medicine which they sell. The following day these bills are called for, and the credulous people buy small phials of this nostrum, at various prices, from ten shillings to sixpence, according to the tact of the beggar and the folly of the party. The mixture is only a decoction of any herb or rubbish that may be at hand. He (B——) was told by one of this class that he had just sold a bottle of 'stuff' to a poor woman who lived in a cottage on Warley Common, Essex, and who had been long ailing. She gave ten shillings for it, and it was only salt and water, some tea, and coloured green with nettle tops. These fellows obtain more money than any other class of impostors, sometimes as much as 2*l.* a-week, and they seldom go to London.

"5th. Men who travel about the country in shabby-genteel attire, stating that they had been well off formerly, but are reduced by recent misfortune. Some are burnt-out farmers or shopkeepers; some first-class workmen out of work, owing to the bankruptcy of their employers; some captains, who have just lost their ships upon the coast. This story is always used after a heavy gale of wind. Some carry begging-letters, which are written for them, price 1*s.* This is very profitable, if well managed. The 'Lady Bountifuls' are great supporters of these fellows.

"6th. Fortune-tellers. Many women, when tramping with the men, dress themselves like gipsies, and contrive to get a tolerable daily booty, at least 3*s.* or 4*s.* a-day.

"7th. Trampers who have nothing to sell, but manage to live merely by begging.

"8th. Thieves—'prigs'—generally go in couples; walk into a country shop, where there is an old woman and a candle; buy something, drop a sixpence; get the old lady to bring the candle round to look for it, while the other fellow is filling his pockets with whatever he can lay his hands upon.

"9th. Match-sellers. 10th. Ballad-singers.

"11th. Fellows who boil up fat and a little soap over night, run it out in a cloth, and next morning cut it up like cakes of Windsor soap. It's all bad, but they drive a good trade.

"12th. Fellows who go from house to house stating that they live in some neighbouring town, and ask for "umbrellas to mend." An active fellow in this line will make a clean sweep of all the umbrellas in a village before dinner. These umbrellas are produced in the London market on wet days and dusky evenings.

"13th. A Jew seldom thieves, but is worse than a thief; he encourages others to thieve. In every town there is a Jew, either resident or tramping; sure to be a Jew within forty-eight hours in the town, somehow or other. If a robbery is effected, the property is hid till a Jew is found, and a bargain is then made."* — *Report*, p. 61. et seq. 8th edit.

* Notwithstanding the attention that has been devoted during the last thirty or forty years in this country to that important branch of legislation, the suppression of offences against property, it does not appear that we are at this moment much in advance of our ancestors. Sir John Fielding published a very curious work about the middle of the last century, in reference to the penal laws of the metropolis, in which he described very circumstantially the various kinds of thefts and cheats to which the unwary public were then exposed, and by which, it would seem, that vagrancy and delinquency in that day presented pretty nearly the same characteristics they exhibit now. The work to which we allude was partly compiled from the manuscripts of Sir John Fielding's brother, the celebrated Henry Fielding, who had investigated the whole subject with that acuteness which in another form he brought to bear so successfully upon the habits and manners of society. One section of the volume, entitled "Cautions to Shopkeepers and Tradesmen in general," contains an account of the different classes of petty rogues that then infested the metropolis and other places; and one or two extracts from it will show that the whole system has undergone scarcely any perceptible modification. We fancy we can trace the hand of Henry Fielding in the following sketch of the ring-droppers: —

"The next class are those who find a paper full of gold rings, which they take care to pick up in the sight of a proper object, whose opinion they ask. This set appear very mean, which gives them an opportunity of saying they had rather found a good piece of bread and cheese, for that he had not broke his fast for a whole day; then wishes the gentleman would give him something for them, that he might buy himself a pair of shoes, a coat, &c. The cull immediately bites, and thinking to make a cheap purchase of an ignorant fellow, gives him 20*s.* for four or five brass rings washed over. Or, what is more frequent, and yet more successful, is the picking up of a shilling or a half-crown before the face of a countryman, whose opinion of it is immediately asked, whether it be silver or not, and he is invited to share the finder's good luck in a glass of wine or a pot of

The following passage will give an idea of the character of the depredators who are resident in and infest particular neighbourhoods. The answers from the city of Lincoln state, that

"'It would be difficult to give their numbers with any thing like accuracy. They are principally poachers, who make no disguise of their vocation, but proceed on their excurs ons, with their snap dogs at their heels, in the afternoon, before dark, and bring home their game in the light of the morning.'

"It is stated that in the borough of Ludlow there are many such characters: —

"'Perhaps forty in number, idle and drunk, who each keep a dog: no visible means of obtaining a livelihood.'

"It is also stated that in the borough of Chesterfield —

"'There are many — the number cannot be stated: their habits are to prowl about the borough and immediate adjacent villages, under pretext of begging or seeking work, but whose real objects are to look at the premises where they call, to see what booty can be gained by plunder at night.'

"In answer to the inquiry as to the cause of the impunity of such characters, the authorities of the borough of Devizes answer —

"'To no other cause than that they follow these practices in the adjacent country, and in places beyond the observation of the constables on their parade duty.'

"A communication from the borough of Maidstone sets forth that there are —

"'Many bad characters living in the town, who support themselves by committing depredations in the neighbouring villages. An effective rural police would put an end to such a practice, and the characters in question would then be soon reduced to the necessity of either leaving the town or maintaining themselves by work.'" — *Report*, p. 25. 8th edit.

There is no redress against these grievances to be had at the hands of the constables. Sometimes, as in the case of a man who committed murder at midnight *, the constable refuses to get up from his bed, though repeatedly and urgently called upon. Sometimes, in case of beer-shop disturbances, or general riot, this functionary says, "Nay, I mun gang out at way for I 'm constable." † Sometimes, on being told that the body of a dead man has been found, he answers, "Yes, I saw him dead *there* three hours ago, but I have had trouble enough in finding one dead man: — I'll be —— if I ever find another." ‡

The following case also affords a striking exemplification of the total inefficiency of the present constabulary force: —

"Some time ago, at between three and four in the morning, a farmer on the Mendip Heights went into a field to attend his sheep, and after being a short time there, he perceived two men going into the field, and putting a halter on a horse's head, mounting it, and riding out on the high road. He immediately mounted his horse, and followed the men to a public-house, where he saw them stop. He rode as fast as he could to the public-house; the men were then in the act of drinking beer. He told the man at the public-

ale. The harmless countryman, pleased at such an invitation in a strange place, is carried to an alehouse, where the sharper's friends are waiting for him, and where betting or playing at cards is soon proposed, and the countryman most surely tricked out of all his money, watch, and every thing valuable he has about him."

He next describes a set of sharpers who hang about the inns, and intercept the porters who are sent with boxes and parcels, by first learning the address to which they are sent, and then meeting them on the steps of the house as if they were waiting for the goods. In order to give a greater appearance of truth to the business, the sharper, says Fielding, "abuses the porter for his delay, damns him, and tells him he was just coming for it, that he had a great mind to give him nothing; the porter asks pardon, the gambler pays him, and takes possession of the goods, with which he decamps the instant the porter's back is turned." We have also, in this curious work, a very full account of the class who contrive to take fine houses by stratagem, and even to get possession of estates, and run in debt with tradespeople, by assuming false names, and making a great display; a class which, in the present day, has lost nothing of its lustre. Others assume the calling of coal merchants, and in that character apply to some tradesmen to buy goods, telling him that he is out of cash, and that if he chooses, he will pay him in coals, with which he is overstocked; the tradesman approving, the sharper goes down to some wharf, and orders a chaldron or two of coals to be delivered at the tradesman's house for his use. This description of cheat Fielding designates as the gambler who attacks the understanding. But we have not room to illustrate these ancient rogueries any farther.

* § 46. † Ibid. ‡ § 129.

house, who was a constable, that there were two suspicious people in his house, who had taken a horse out of 'Farmer So-and-so's field, and that he ought to detain them.' The man said, 'I cannot do it, I have something else to attend to; I have my brewing to attend to to-day; somebody else must do it.' The farmer remonstrated. He said he could not do any thing in it. The men left the house, and the farmer followed them to another public-house farther on. The excuse that the man made there was, that he had his cattle going to the fair, and that he could not give up his time; that he was not sufficiently encouraged, or something of that sort. The farmer, determined not to lose sight of the men, mounted his horse again, and followed them, when they were detained at length by a police officer and another man." — *Eighth Report*, p. 197.

In providing a remedy for these great and pressing evils, it appears to us that the great difficulty is to obtain the advantages of a trained and organised constabulary, that shall be available at whatever point it is most wanted at any particular time on any extraordinary emergency, and shall be in constant readiness to act at all points, at all times, on ordinary occasions, and at the same time not to lose the advantages, whatever they are, of the superintendence of the local authorities. The former is now rendered absolutely necessary by the facilities which civilisation, with its concomitants, has given to the thieves, of moving silently and rapidly from one part of the kingdom to another, however distant. The latter is absolutely necessary too; for the English people are jealous, and justly so, of any interference with their management of their own affairs. We say justly so; for from their ancient habits of managing their own affairs, that is their local affairs, have arisen many of the benefits they enjoy as a nation. The commissioners appear to us to have met the difficulty with great skill in the following recommendation. "On account of the acknowledged necessity," they say, "of obtaining men from a trained force, unconnected with the districts, and of changing them from time to time, as well as of reducing the numbers within any district, we propose that the appointment should be with the commissioners of police, and that the magistrates should be invested with the control of the appointment, by the dismissal of the constables, or the removal of the chief officers appointed." * The commissioners do not recommend the immediate, absolute, and general adoption of their proposed plan. They propose that the adoption of their plan should be gradual and voluntary. Gradual it must necessarily be in order to be efficient; for, as they remark, in the organisation of a rural or provincial constabulary force, time would be required for the arrangement of the force in the several divisions, for the selection of stations, and for the adaptation of attendances on the magistrates at the petty or quarter sessions, for providing the performance of such miscellaneous services as those we have described, and for other arrangements which involve much consideration of details. Voluntary it may be, and yet soon become very general, if not universal, throughout the country. They state, in the course of their report, that applications have been made from nearly every parish on the exterior of the boundary of the metropolitan police to be included within it. They think there is no reason to doubt the general and voluntary extension of this desire in favour of a force expressly organised to meet the wants and conveniences of the rural or provincial districts, aided by the contribution of a portion of the expense.

The following is a recapitulation of some of the chief conclusions set forth in the report: —

"I. Having, with a view to judge of the extent of any requisite remedy by means of a paid constabulary force, made a general investigation as well as to the state of crime as to the present state of the unpaid constabulary, we find in respect to the state of crime —

* § 280.

" 1. That the public information as to the number of crimes committed, inferred from the extent of crimes judicially pursued and punished, is widely erroneous. (§ 1, 2, 3, 4.)

" 2. That there is an average of upwards of 100,000 commitments annually to the gaols of the able-bodied population of England and Wales for criminal offences. (§ 12.)

" 3. That there are from 11,000 to 20,000 persons constantly in the criminal gaols, of which number a large proportion are persons known as living wholly by habitual depredation; and from inquiries made in a large number of the individual cases of prisoners confined for thefts in these gaols, we find that on the average such prisoners in the rural districts, where there is no trained constabulary, have been at large living by depredation during average periods upwards of five years; and that the criminal prisoners in the gaols in the towns, where there is a paid and trained force, have not been able to pursue their depredations more than half that time. But that nevertheless, in either districts, prisoners are liberated with the prospect and the temptation of a career of unknown but long duration for the future, before permanent removal by process of law or by natural causes. (§ 10, 11.)

" 4. That with relation to the particular crimes committed by such habitual depredators, no information is possessed by the unpaid constables. (§ 1, 2, 3, 4, 5, 6.)

" 5. That it results from a special investigation of the habits of the classes of habitual depredators; that a large proportion of them are migratory; that they migrate from town to town, and from the towns where they harbour, and where there are distinct houses maintained for their accommodation (§ 35, 36, 37, 38, 39), they issue forth and commit depredations upon the surrounding rural districts, the metropolis being the chief centre from which they migrate; and that they harbour in provincial towns in proportion to their magnitude, and in proportion to the facilities for plunder, or to the absence of protection in the surrounding districts. (19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 20, 31, 32, 33, 34.)

" 6. That, judging from particular cases in which we have made inquiries, a large proportion, if not always the majority, of prisoners in the county gaols, for offences committed within the rural districts, are persons who have migrated from the towns to the rural districts. (§ 24.)

" 7. That from the impunity enjoyed by the classes of depredators, migrant or resident, property is rendered insecure; in some places so much so on the part of the labouring classes as greatly to impair the value of property to them, and their motives to industry and frugality. (§ 31. 43.)

" 8. That in the rural districts agricultural produce is subjected to extensive depredation, which often interferes with the most advantageous course of production. (§ 41, 42, 43. 146, 147, 148. 207.)

" 9. That a large proportion of the highways are left without any protection whatsoever from any constabulary or other civil force. (§ 51.)

" 10. That on the highways of a large part of the country commercial travellers and strangers who travel singly, otherwise than by public conveyances, and carry money about them, abstain from travelling after dark, from fear of robbery and violence; and that farmers return from market in company, from the like fear, after dark. (§ 51. 207.)

" 11. That the products of commercial industry *in transitu* on the highways being almost entirely without protection from any civil force, are subject to extensive and systematic depredation. (§ 52, 53. 55, 56.)

" 12. That in the absence of due protection, property carried by sea in ships which are wrecked on those parts of the coast where shipwrecks occasionally or frequently occur, is subject to extensive habitual depredation, and life is endangered or lost under circumstances of barbarity disgraceful to a civilised nation. (§ 58, 59, 60, 61.)

" III. 1. That the free investment of capital and employment of labourers, and the progress of manufacturing industry are impeded and endangered, and combinations carried on by violent and unlawful means; that murder has been resorted to; and that threats of murder, and arson, and personal violence are resorted to by such combiners as means to effect their objects. (§ 66, 67. 71. 75, 76, 77, 78. 80, 81, 82, 83, 84. 86.)

" 2. That for the prevention of the disturbances peculiar to such districts, as well as for the prevention of the more ordinary breaches of the peace, amidst the new and increasing population, no other efficient force than a military force is provided. (§ 86. 88, 89, 90. 97. 130, 131.)

" 3. That such force is inadequate for the purpose of the prevention of disorders; and that from the reluctance which is felt in having recourse to it for the purpose of repression, it is rarely used until considerable evil has been occasioned.

" 6. That in consequence of the extensive dereliction of the constitutional principles of penal administration, self-protection is extensively resorted to by private individuals separately, as well as by individuals associating together for mutual protection. (§ 117, 118. 122, 123.)

" 7. That there are upwards of 500 private or voluntary associations for self-protection in different parts of the country, by the payment of rewards for the apprehension of felons and the expenses of their prosecution, independently of a large number of associations for self-protection by subscription for the maintenance of private watchmen, and of other

private associations for the removal of various evils, such as the suppression of vagrancy and mendicancy, which it is the business of the government to prevent or repress." (§ 118.) — *Eighth Report*, p. 343. et seq.

In conclusion, therefore, the commissioners propose: —

"I. That as a primary remedy for the evils set forth, a paid constabulary force should be trained, appointed, and organised on the principles of management recognised by the legislature in the appointment of the new Metropolitan Police force.

"II. That for this purpose on application in writing, under the hands and seals of a majority of the justices assembled at any quarter sessions of the peace for the county, setting forth the insecurity of person and property, and the want of paid constables, the commissioners of police shall, with the approbation of the secretary of state for the home department, direct the location of such constables and such officers as may, upon examination by the said commissioners, be deemed adequate for the due protection of life or property within the county.

"III. The force shall be paid one fourth from the Consolidated Fund and three fourths from the county rates, as a part of the general expenses of the whole county.

"IV. That the constables so appointed shall report their proceedings to the justices of the peace of the quarter and petty sessions where they are stationed.

"V. That the superintendents shall be subject to dismissal upon the representation of the justices of the peace in quarter sessions, and that the serjeants and constables shall be subject to dismissal upon the representation of the justices of the peace in petty sessions.

"VI. That the justices of the peace shall frame rules and regulations for the service of process and attendance at petty or quarter sessions of such force, which rules shall be submitted to the secretary of state, and, if approved by him, shall be binding.

"VII. That the commissioners shall frame rules and regulations for the general management of the police, which rules shall, on the approbation of the secretary of state, be binding.

"§ 298. The principles embodied in our recommendations being based on extensive experience, we feel confident that, however they may for a time be impeded by adverse interests, those interests and the prejudices engendered by them will yield before the light of future experience, which will lead to the ultimate adoption of measures on the principles of those we propose. If one uniform and trained force be efficiently directed to the prevention or repression of crime, we cannot doubt of success.

"§ 299. We can find no solid grounds for the supposition often entertained, that a large amount of crime is a necessary evil incident to the present condition of society, and that the most ignorant and base of the community may defeat the exertions of a well-appointed agency instituted for the repression of their crimes.

"§ 300. The appointment of a proper force for the prevention or repression of crimes has sometimes been viewed with apprehension, on the supposition that such a force might be used to impair the political liberty of the subject.

"If we were to admit that a diminution, instead of an increase of the political liberty of the subject, were the probable consequence of the establishment of an efficient constabulary force, we should nevertheless be prepared to show that the evils we have found in existence in some districts, and the abject subjection of the population to fears which may be termed a state of slavery, which the objectors would endure from a groundless fear of the loss of liberty, form a condition much worse in all respects than any condition that could be imposed by any government that could exist in the present state of society in this country. We do not believe that in this country any government could possibly exist, which subjected the people to domiciliary attacks, and to have their houses broken open and plundered, and their lives endangered at night, or which caused a large proportion of the population to abstain from travelling singly after dark, for fear of being put in danger of their lives, and stripped of their property by armed men, — which allowed its agents to pillage or maltreat the unfortunate people wrecked on the coasts, or which generally inflicted such evils as are now inflicted by upwards of 40,000 thieves, robbers, or marauding hordes of various descriptions, against whom the honest in almost every part of the country have been driven to associate for self-defence. Neither do we see any motives which could induce any government in these times to impose political restraints so oppressive or so mischievous on any industrious community as we find imposed by illegal means on the manufacturing population of the city of Norwich and other parts of the kingdom; nor do we believe that by any form of the abuse of the powers of a government, it could use any such agency as secret committees have employed in the manufacturing districts to coerce the honest and industrious, but peaceable, to purposes injurious to them, by actual murder or the fear of life or maiming, or the threats of such fire and pillage as were displayed in the burning of the city of Bristol. — *Eighth Report*, p. 350. et seq.

RECENT POETRY.

The Deluge: a Drama, in Twelve Scenes. By JOHN EDMUND READE, Author of "Italy," &c. London: Saunders & Otley, 1839.

Fra Cipolla, and other Poems. By Sir JOHN HANMER, Bart. London: Moxon, 1839.

Prothanasia: and other Poems. By THOMAS WADE. London: Miller, 1839.

Songs and Poems: in Three Parts. By THOMAS TOD STODDART, Esq., Author of the "Death Wake," &c. Edinburgh: Blackwood & Sons, 1839.

"I NEED not tell you," said Mr. Milnes, in a speech at the Anniversary Dinner of the Literary Fund last month, upon the occasion of his health being proposed in connection with the Poets of England — "I need not tell you what Poetry is; you all know what it is as well as I could tell you. It is the grandest and the simplest of all forms of literature. Poetry is the highest tree in the forest, and the smallest flower." Parliament and politics have not yet spoiled Mr. Milnes; and, although we do not much relish this comparison of poetry with a tall tree and a small flower, because it brings with it odd associations of certain arborical and floral curiosities that occasionally glare upon us in places where neither trees nor flowers have any business to be found, still there is a pith of profound truth in the passage, which, making due allowances for the *tournure* of an after-dinner speech, cannot be too strongly commended to the private thoughts of the great multitude, who have a vague notion that poetry is a mystery.

Truly has Mr. Milnes said, that they know as much about it as he could tell them. He could do no more, at best, than interpret emotions that are common to all mankind. He might find language for the thoughts and feelings; but the thoughts and feelings were there, whether he put them into words, or let them lie in darkness like the uncrystallized carbon. The mountains, and the forests, and the waters, and all sights and sounds of created things, are full of poetry, from the remote stars sleeping in the pavilions of the clouds to the flowers in the depths of the invisible caverns of the sea; and all men understand this glorious poetry of nature in the degree of their individual sensibility, and according to the intensity of the circumstances by which that sensibility is influenced. To suppose that there is something in poetry which requires a philosophical or critical exposition, which is beyond or above the comprehension of the millions, something which cannot be felt until it is explained, is to mistake false enthusiasm for true — the pretence and finesse of Imitation for Art itself. Of a verity Poetry is as intelligible as light: if it be not intelligible, the defect is in the faculties of the poet, and not in the discernment of his audience.

Need we guard ourselves against being suspected of confounding Poetry and Metre — the Spirit and the Forms of Poetry? We believe the distinction is thoroughly understood by every body, if not in its strict elementary definitions, at least in its essential differences, and this is all that is wanted to keep poetry alive in the world as long as the world lasts. The various modes of poetry are adapted — as modes — to various classes of educated intelligence; and the epic, the lyric, the dramatic, and the pastoral, have each their fitting public. But whatever is good in them all — whatever has a relish of nature and of love in it — those little gleams of universal truth that grow up into household words and familiar types of every-day sensations, of practical experiences, and of the caprices that flit across the ima-

gination between dreams and realities — those incidental fractions of verse, which are by far the most profound parts of poetry, because they are the closest to our sympathies — these are understood by masses of men to whom the mechanism of measures is a sealed enigma. There is no truth more entirely true than this, that the final test of poetry is the recognition, by general suffrage, of its fidelity to the nature it reflects. The best poetry is the most popular — although popularity is sometimes, for different reasons, slow of progress, and sometimes transitory and capricious.

When people say they have "no taste for poetry," they really mean that they do not enjoy all kinds of verse they happen to meet; or that being sated and sickened by verbal processions and imagerial draperies, they do not care to go in search of poetry through similar tracks. Now it would help to increase the believers in the religion of poetry, if it could be shown to these self-doubters that they are all the time as much in love with it as their neighbours who make such an exhibition of their zeal, and such a fuss about the ceremonials of their faith. The people who do not read books of poetry, and who sincerely dislike such books (because they have never found any thing in those they have read to *touch* them), are nevertheless moved by a thousand influences that are essentially poetical, but of the existence or operations of which they have lived all their lives utterly unconscious! Are not these non-conductors of metrical lightnings sometimes fond of gardens, or of angling, or of racing, or of children, or of boating, or of long walks in the country, or of drawing, or of music, or of some one or some dozen other delights that fill up their spiritual being with exquisite sensations and escapes of happiness from the crush and turmoil of prosaic existence? Every one of these vents, out of which the spirit flutters into enjoyment, are entrances to the regions of poetry. The solitary angler who labours up a mountain stream, fishing, as a true angler ought to do, against the current, with the trees around him, and the clouds sailing overhead, and the low winds whispering in the reeds, and the multitudinous music of the birds and the waters occupying his ears with delicious murmurs, has that faculty of rapture in him which is the congenial recipient of poetry. The pleasure he feels is a pleasure he would be incapable of feeling had he no relish for poetry: the poetry enters his soul, subdues his turbulent passions, and spreads its religious calm over his whole nature. He is silent in the tangled solitude — he has no mind to break the stillness voiced with floating harmonies; and that tacit surrender of his spirit to the impressions of the scene is the effect of that very agency which he finds no communion with in books. Life is full of poetry — throughout all its affections, its distant points of similitude and agreement, its picturesque aspects, its mental associations, and that inner world of unspoken hopes, frustrated aspirations, unrequited tenderness, blighted or unrewarded love, griefs, regrets, projects, fancies, which are perpetually in action beneath the surface, welling up like springs in the centre of the earth, hidden but restless, supplying a principle of life which at once stimulates and wastes its energies. Who has not felt some of these struggles and fictions of the heart and the imagination? Who has not been conscious of the exaggerations of passion, the delusions, disappointments, and chaos of volition without power, of whole dramas of sentiment begun and ended like a reverie in the chambers of the brain? Depend upon it, every man living is capable of poetry; and, which is something more to the purpose, no man can help himself. He cannot, if he would, extricate himself from its enchantments. The spell is in the air, and he breathes it from morning till night.

But poetry as an Art is not this poetry of which we have been speaking,

but a mighty agent to give it an intelligible shape,—to reduce it to harmonious outlines, and inform it with a universal language. This is the poetry of books, and whenever it is not as clear as the pellucid diamond it is naught. Now, for the ultimate end in view, it is perfectly immaterial whether this is done in prose or verse; but as the world has agreed that it is best done in verse, for the sake of the play of fancy which that form peculiarly admits of (a sort of game of romps of the imagination through bars and wickets), so it is ordinarily understood that poetry comes out upon us in this mode and fashion of versification. Verse once adopted, there is no end of its fantastic varieties — the modifications being, as all the world knows, innumerable throughout past ages; and, as all the world may reasonably conjecture, infinite in ages to come. Yet notwithstanding this inexhaustible capacity in the production of forms, it is in poetry as in architecture, music, and painting, — a few striking kinds or classes have become gradually supreme over the confusion of a multitude; and the assent of mankind seems to have recognized these, as containing within themselves all the Shapes of Verse that are essential to the expression of beauty, of power, thought, character, and the rest of the human and intellectual aims that are embraced by the Art throughout all its wide and diversified regions and influences.

The present period of time is said not to be poetical, and, no doubt, with truth in one sense. Steam and cast iron, and, above all, an active progress in the practical business of life, which at intervals shuts out the day dreams of the soul, have intercepted the frequent enjoyment, and still more the frequent production, of the higher kinds of poetry. But if we have less of the higher kinds, we have more of the central level of verse, between excellence and mediocrity (for there is nothing below mediocrity) — a sort of middle current, that runs on freshly and fluently; while the upper stream seems to flow languidly, like a wave hushed in the still meridian. This sort of mid-living poetry is not much esteemed, because it falls short of those great examples which are within every body's reach; and because men, when their judgments become educated in such lofty schools, often affect, in the very pride of their knowledge, to despise more than it deserves that which is confessedly inferior to the models with which they believe they possess a sort of exclusive acquaintance. But this is mere bigotry of the mind, and want of sympathy. It is not because the poems that come within the description to which we have referred are not equal to the elevation of the subjects they attempt that they do not contain a deep and healthy germ of feeling, out of which high aspirations and noble tendencies flower like sweet blossoms gushing into the air from a rich and warm soil; it is not that the poet does not feel and long for that far-off and unrevealed glory which he vainly struggles after, but that he wants the power to give force and vitality to his emotions. But we are, nevertheless, required to note the amount of incapable enthusiasm, if we must so call it, that is thus for ever labouring in vain — the zeal that eats in upon itself — the passion that is nourished by its own heart — the energy blind in the depths of its action, and bringing out no visible signs of its strength, but a thousand tokens of a lost strenuousness working against despair! These men are poets in their internal nature, in the mystery of their lives and toils, who, wanting the art to develope their desires, still struggle on in hope and demonstration. We would call old Christopher North to bear testimony to this, but that we are afraid he would break down in his evidence.

We have been carried away into this rhapsody by the volumes with the titles of which we opened. There are in them all traces of ardent tempe-

raments and fine spirits, and snatches of melody as exquisite as if they floated down to us from those invisible strings that vibrate in the gardens of the Paradise of the Houris. And there are also signal deficiencies — flat intervals to traverse before we arrive at the regions of music and perfume; the feeling of Design is not perfect in any of them, and the execution is incommensurate in grandeur with the scope of ambition they develope. But it is in the consideration of these defects that our sense of the liberal allowance to be awarded to the imperfect yearnings of the Poet softens the measure of criticism, and adapts it more genially and cordially to the true deserts that lie infolded even in these general blemishes. It is the easiest process imaginable to exhibit the beauties of poetry; and it is the rarest thing to find its failures attributed to their real source. The stunted capacity that gropes through the fillagree work of a structure, failing to recognize the harmony of particular parts, each composed of a multitude of small and elaborate features, or, which is still more important, the Oneness of the Whole, is exactly the sort of capacity that is cut out by nature to find fault. Oh! what sensibility there is in the critics who are perpetually showing us lame feet and broken stanzas; who luxuriate, with an air of enjoyment, over imperfect images and obscure phrases; and who, blind to the magnificent sweep of the procession, fasten their ferret eyes on some feather that has fallen awry, some dishevelled tress, or some accidental speck in the embroidery of a jerkin! These, also, are the critics who, to make compensation for the lack of warmth and deep feeling, pick out bits that have nothing remarkable in them, and extol them to the skies with a sort of spurious rapture; for, without the happy discernment that lights at once upon the beautiful and the true, they only acknowledge the necessity of saying something, now and then, in a grateful and flattering tone, calculating — we are afraid with too much reason — upon the acquiescence of the crowd, who are ignorant of the *art* of poetry, in the decisions of the oracle who is presumed to know all about it. But if this very crowd, instead of taking every thing for granted that is thus oracularly delivered, were to look in upon their own emotions, they would discover abundant justification for venturing to doubt the judgment that would thus fascinate and surprise them into admiration where it is not always regulated by just and accurate perceptions.

We do not propose to analyse or to criticise the poems which have beguiled us into this wandering maze of suggestions, but rather to show their quality, and initiate the reader into the pleasures they spread out before him. Mr. Reade, whose poem of the "Deluge" we place first, because it is the most ambitious in its plan and scope, is the author of other pieces; one of which, "Italy," we noticed some months ago in this publication. Of the "Italy" we spoke in terms of strong commendation; it was a fervid and glorious burst of imagination, filled with noble sentiments, and statuesque images. The "Deluge" belongs to a different class. In form it is dramatic, and its subject is derived from that dubious book of Enoch, which has engaged so much of the controversy of the learned, and which, amongst other strange things, reveals to us the affinities subsisting between the spiritual and the animal natures. The problem — whatever may become of it in the schools — is at all events a tempting basis for poetry, and has already been employed with success by two of our most distinguished modern poets. Mr. Reade's design possesses the great advantage of being exceedingly simple and distinct, and of embracing in the most intelligible forms the whole range of the subject. The action is limited to two days; the scene is on and immediately around Mount Hermon; and the chief personages

are the two angels, Israphil and Oraziel, the spirit lovers of two sisters, Ozoara and Astarte. The characters of the sisters are skilfully contrasted, Ozoara being self-willed, and possessed of indomitable mental energy; and Astarte, a struggling, gentle-hearted being, whose mighty devotion for Oraziel is troubled and agitated all through by an earthly and more natural passion for Irad. The events — or rather the progressive emotions and pangs — that arise out of these relations of the several actors, conduct us gradually to the awful catastrophe of the rising waters. The lovers assemble on the crest of the mount as the flood roars and lashes upwards; Irad in vain warns the beautiful and trembling Astarte — her heart is in her streaming eyes that implore her winged lover; the ark at last passes away, and hope is over; Ozoara, firm and resolved to the end, flings herself headlong into the abyss as Israphil is borne into the clouds; and Astarte, anticipating the fiat, dies before the bright presence, to whom she had surrendered up her soul, has vanished from her sight. The catastrophe is in strict keeping with the individuality of the characters, and the fate of the delicate Astarte is beautifully and judiciously opposed to that of her stern sister.

Turning back to the pages of the drama, let us open a few of the passages through which the main arteries of the design may be said to run. The early struggles of Astarte, before her heart was yet quite assured of its feelings, before she had yet quite abandoned her love for Irad, and while there was yet enough of mere human purity left to keep her in suspense between the spiritual influence and the earth-passion, are indicated with some power in the following portion of a dialogue with Irad.

> " *Irad.* Astarte!
> That name was a familiar sound; and now
> The very word that once was music sounds
> So strange that it doth startle! — look on me.
> Astarte! we were reared together; we
> Were pledged to each upon the gates of life:
> We grew together; I, the stronger plant,
> And thou, the hidden violet: how I loved thee!
> Turning away from Enoch's haughtier maids,
> To dwell on thy retiring beauty. Thou —
> Yes — thou didst love me then: oh! blessed be
> The memory of those hours, when we sat
> And heard the bird of evening's song, and watched
> The sunset hueing the rich clouds, and felt
> The beauty and the feeling of the hour
> Draw us together to the inner world
> Of our own bosoms, as the outward failed!
> Those tresses then lay on thy neck; those eyes
> Looked into mine — our very breath was mingled,
> Drawn from one heart, inspired from one vast soul.
> " *Astarte.*—Think not I have forgot those hours, which were
> The sunniest of my life: those days of peace,
> And hope, and innocence, when my young heart
> Sought nothing further than its earthly joys;
> When no vague hopes, no restless wishes were
> Awakened, leaving in my breast a void
> Unfilled, and wasting it with vain desires:
> I was then worthier thee, for I was like thee.
> " *Irad.* — Then what hath changed, and made thee as thou art?
> The same indeed in outward form; and oh!
> More beautiful than——
> " *Astarte.* Irad! not to love
> Such as thou art, would prove my bosom dead
> To memory and gratitude. My heart
> Is all unchanged, unbroken are those ties——
> " *Irad.* — Then wherefore wilt thou not unite our loves,
> Making my earthly life a paradise,

From which I cannot be expelled? Thou knowest
Thy sire will barter with my kinsmen——
" *Astarte.* Nay,
Give me but time, and I will tell thee all.
I am as yet no mate for thee; my heart
Is wayward and unsettled as the tree
Tossing to every wind: vague thoughts and hopes
Are shook from it like leaves, but soon to pass
Away, and be forgotten."

In the delineation of such a character as Astarte the great difficulty consists in exhibiting the weakness that is natural to her condition, and yet to preserve it from falling below our sympathies. Mr. Read has hardly kept her out of this predicament. She sinks without showing enough of womanhood to raise her to our level. She gives herself up with a timidity and shyness that depress the tone of her moral nature. We are made to think lightly rather than tenderly of her, and to suspect that had the contest of her affections been between a choice of kinsmen, accident might have as easily subdued and decided her (if decision enters at all into the case) as the supremacy of power at either side. And all this, which tells so much to the disadvantage of Astarte, is rendered still more palpable by the firmness and fire-eyed resolution of Ozoara. Mark how this opposition is brought out towards the closing scene, where the sisters with the angels stand on Mount Hermon prepared to die. The following outbreak of natural regrets is from the lips of Astarte, whose nature quails before the coming ruin.

" Farewell,
O thou dear earth, that I have loved so well!
Farewell the dim and leafy places, where
These eyes first opened to the azure air,
And drank in all the glories of the day,
Stamped in my heart, that cannot pass away! —
The love, the life, the beauty which there dwells;
The stars that seemed like God's own oracles,
Making me feel, while gazing on each shrine,
Although they spoke not, that their homes were mine!
Farewell the twilight imaging that heaven
I never now shall see: and my own flowers,
Mingling their sweet breath with my own;
Gladdening the earth with their bright eyes, which I
Have loved as living things, and felt,
Watching them in my solitary hours,
They were my heart's companions given —
That human sympathies within them dwelt;
For in the sunshine I have seen them glad,
As if my joy they had!
And droop their heads beneath the sky, o'ercast
With a fine sorrow! — They, too, die like me,
But not alone:
When their bright hour is past,
They leave behind them for their memory
Some odorous breathings, and a few light leaves,
Frail playthings of the wind — the wind that grieves,
Or seems to grieve, about them!
I shall pass,
And die unknown: — lost — buried in the mass
Of a departed world. I shall not rest
On the sweet pillow of some human breast;
I shall not hear the soothing sympathies
Of human love! the silent-speaking eyes,
Whose feeling found no vent in words, but made
Their silence, more than eloquence, pervade
The answering spirit, until even to die
Became but slumber's last tranquillity;

A blessing — on my loved one's breast reclined,
Feeling I felt my love, my life behind!
Oh, that I thus had died, and never known
Love's desolating passion! but had flown
Lightly from earth as gossamer doth rise,
Serenely wafted to the twilight skies:
Or slumbered like the violet unseen,
Known only by its breath that it had been!
While human eyes and human hearts had found
My grave, and sanctified the holy ground
With tears drawn from the memories of love —
With prayers that had been borne to me above;
And made a haunt of that familiar spot,
Where I, in death, should not have been forgot!"

We have quoted the whole of this, because it is highly wrought and full of human pathos. But the daring language of Oroaza outstrips and bears it down by an irresistible mental ascendency.

"And where are they, the elect who shall be saved;
Who tremble at the fate that we have braved;
Who in their caves and caverns shrink from death,
The wretched remnant of the seed of Seth?
They of inferior race, and mind, and powers;
Strong only in their selfishness o'er ours,
And bartering love of gain: strife we resigned;
Our triumph the supremacy of mind!
Shall they be rescued, and we perish?—Yes —
These are the things that live — 't is ever thus —
Wanting alike the courage and the will
To dare or do aught great in good or ill.
How carefully are they concealed from view,
Ere the great wrecks of life and death ensue!
To watch from some safe nook, with placid eye,
The desolation of a world roll by!
We must tread in our fathers' path, and bear
And meet our fate, and die — but not despair;
While they eke out their dregs of human life.
So let them — soon will end their petty strife,
With wants, and agonies of which 't is made.
We shall not have to blush that we betrayed
Our selfish fears, abandoning our kin,
The great and good, to meet the death of Sin;
Shaming our nature and our origin!"

These extracts have grown so largely upon us that we must leave them to make their due impression upon the reader, contenting ourselves with one passage more — the description of the Deluge.

"Behold the hills are heaving like the waves
In their great agony, and from their caves
And shattered brows are hurling torrents forth,
That, like eternity, in their fierce path
Sweep all before them; or cast down below
The toppling rocks with each convulsive throe;
Now flashing forth volcanic streams — now gone,
As if extinguished; ever and anon
The winds awake the lightnings in their wrath,
From their deep womb of clouds, which hurtle forth
Their arrowy vengeance; every vale and height —
Each mountain — depth — and crag — and yawning cave
Blazes one moment in intensest light;
Swallowed, the next, in darkness as a grave!
Through earth's rent sides the waters of the deep
O'er the low plains deliriously sweep,
In waves like rolling mountains; while the woods
And towers of men are borne before the floods;

Or, crushed in one enormous mass, delay
Their course a moment — until heaved away.
Then, swept like chaff before the whirlwind, all
Sink in the waters' universal pall."

The "Prothanasia" of Mr. Wade is founded upon the story of Bettine's love — for what else was it? — for Goethe; or rather upon passages in her letters shadowing forth an episode of intense interest, but not wholly free from that dangerous mysticism of the passions which eats like rust into the spiritual creations of German poetry. Gunderode, the friend of Bettine, is here delineated with great power — but darkly. Her mind broods over dreams that lead her to a terrible consummation of her gloomy philosophy; and the curtain falls upon the body of the suicide lying beside the waters of the Rhine. All this is related, not clearly, but with deep and thrilling pathos, darkened throughout by the fearfully indistinct revelation of the terrible thoughts and phantasies that haunt the solitude of the stately and self-deceiving Gunderode. We prefer such sunlight as the following picture of Bettine to the esoteric grandeur of the mental conflict.

"Of Gunderode Bettine was the friend;
The earnest-soul'd and vivid-hearted friend:
Dark-eyed, dark-hair'd, mirth-faced, and fairy-framed,
With a clear voice, that, on the pleasured ear,
Rippled a stream-like music; and a step
That kissed the ground as lightly as swift wing
Of swallow doth the meadow's placid lake,
Or insect-severed leaf its quiet grass.

"Bettine's youth was yet i' the early bud
When first she knew the lady Gunderode,
Who then for two years had in Frankfort been
A convent's inmate, a lone canoness:
A timid creature, that was wont to tremble
But to "say grace aloud;" and scarcely dared
Greet her prayer-mates with "Benedicite!"
Upon the ground her little chamber was;
With casement folding-doored, that open'd out
Upon a quiet garden, full of flowers
And balmy shrubs and grass-embedded trees —
A miniature of nature's loveliest scenes!
A silver poplar near the window grew,
And to its pale boughs would Bettine climb,
And from on high read heavenly poesy,
Toned ever to the hour and to the scene,
Unto the garden's tranced inhabitant,
Who sat, or stood, or paced the grass below;
One white hand hidden in her bright brown hair,
And brow down bent, or glancing fearfully,
As the wind wanton'd where Bettine sat,
Up through the quivering poplar leaves."

The beautiful impetuosity of Bettine — a light and aërial creature — upon hearing her friend discourse of death, is exquisitely described in the following lines: —

"Silent long,
And looking gently in each other's eyes,
Stood the death-parted friends: till sobbed aloud,
And fell upon the neck of Gunderode,
Her passionate woman-love; implored and wept,
And pressed her lips, and kissed her throbbing breast
Beneath the orbed grace where she had learn'd
To let the life out from the pained heart:

And pale, convulsed — even as two gleaming lilies
That quail i' the wind together spectrally
Far in the faint light of the dying moon —
Thus sway'd they, folded in each other's arms.

"Beside the casement — throng'd as unripe thoughts
I' the brain of poets, ere they colour'd be,
And pregnant made, and teeming mightily,
By light and heat o' the passions; crowded thickly
As feelings new in the heart of maidenhood,
Ere love comes open-eyed and tells it all —
Grew bunches of young grapes, beneath the verdure
Of an old vine. These tore Bettine off,
And dashed them on the floor, and trampled them
Under her little feet, and cried aloud,
'Thus dost thou, Gunderode, tread on my heart,
And the fruit crush that swells to ripeness there!'
The canoness bowed down her graceful head,
And glanced aside, and paler and more pale
Grew momently; when, suddenly, a thought —
As a bright creature from the lowest deep
Of some transparent pool springs rapidly
And flashes a swift splendour into air —
Seem'd to leap wing'd from her profoundest soul
Up to her cheeks, — there beaming gloriously
Awhile, then vanishing as it upsprang,
And leaving paleness paler for its coming.
And then she rose, and coldest of cold kisses
Upon Bettine's brow most icily
Imprinted; and a painful silence grew
Between them, till they parted: one in tears,
And one in calmness too self-wrought for tears."

Thus breaking off in tears, Bettine retires; but impressions on so elastic a spirit are like tracks in dew. The morning sees her again as volatile as if tears had never gushed from her sparkling eyes. This is touching, and true — the very spring hopefulness of youth.

"The air which by a dancer's winged heel,
Or flitting pinion of aroused bird,
Is sunder'd, closeth not again more quickly,
With softer motion, or less visible wound,
Than did the sorrow-cloven atmosphere
Of young Bettine's clear felicity;
And the next day she sought the priory
With heart as fresh with joy as morn with dews,
And to the chamber of the canoness
Went singing cheerily."

Evening on the Rhine, bringing this melancholy tale to a conclusion, winds up the whole with an appropriate Thought of Grief.

"Sweet evening brooded on the tranquil Rhine:
The flowers all slept; and in the placid sky
Were shining tremulous its earliest stars;
And in kind Nature's eye no tear was seen,
Nor sigh of sorrow heard in her calm voice;
Tho' dark and cold upon the river's bank,
Under a low-droop'd willow, lay the image
Of angels, as they haunt the human soul;
With wounded bosom and blood-stained limbs,
Strew'd hair, and pallid eyes, and livid cheeks —
A pity, and a withering for the heart!

"A boat came floating up the quiet Rhine;
And earnestly talk'd they who sat therein —
Save one, a silent and a weeping girl:
The boatman moor'd his bark beside the willow;

She leapt upon the bank; and on the corse
Fell, like another death.
Ah! this our life
Is a moth's twilight-flight, discerned dim
In the mysterious air a little while,
And then beheld no more; a dreamy cloud
Of light and gloom, which melts into the wind
Even as we gaze.
Weep not for Gunderode!"

"Fra Cipolla," by Sir John Hanmer, is adapted from the "Decameron," and makes a piece of as roguish poetry as can be desired. In the words of the argument, it discovers to us "how Friar Onion showed the coals on which St. Lawrence was broiled, instead of the feather of the angel Gabriel, as he promised, to the people of Certaldo." This, it will be admitted, was a downright monkish cheat; but Friar Onion was a rare fellow, and when he set about cheating, he did it *con amore*. He was the merriest of souls, and, like Goldsmith's chest of drawers, fulfilled in his time two different purposes: —

"The people loved him for his very name,
For most that herb about Certaldo grows,
And rears its savoury head in watered rows;
A household name, and redolent of cheer;
Nor he belied it with a mien severe,
Nor took his gettings churlishly for right;
If priest by day, he gossip was by night;
And all the women loved the tales he told,
And children laughed his antics to behold,
And graver things he had at seasons for the old."

The gist of the joke is, that our most excellent friar preached to the people from a little box, which he assured them contained the feather of the angel Gabriel, and in which the true feather was deposited; but when he went away, an ungodly fellow, who was not touched even by superstition, opened the box, stole the feather, and placed a coal in its stead. But brother Cipolla was not to be thus discomfited; and upon discovering the coal, he declared to the people that it was a relic of the fire which bore the great St. Lawrence into bliss; and he uttered this with such a priestly air, that the fellow who had himself deposited it there, and knew the birth, parentage, and travels of the said coal, was struck in the conscience, half believed the miracle, and kissed the coal with as much fervour as the rest of the wondering crowd.

This story of "Fra Cipolla" forms, however, but a fraction of the volume of poems which Sir John Hanmer has given us, and which, with some rather remarkable irregularities, develope considerable power of fancy, and great freedom of versification. "The Strategy of Death" is, perhaps, of its class, the best of all these pieces; but there are some amongst a cluster of briefer compositions that equally attest the educated mind and artistical power of the author. It is impossible by an extract or two to exhibit the miscellaneous character of a volume of this description; and we must be content with the following picture — tinted glowingly — of Salerno.

"Come out upon the terrace, there is yet
An hour of light, although the sun has set,
Or his pale disk has hidden in the clouds;
And we can, looking down, behold — no crowds
On the once populous quays, but here and there
Some scattered groups, or fishers who repair
By the sea-side their boats, or sail, or oar;
And some there are that slowly to the shore
Pull a long net, whose meshes rise and fall,
Still swaying with the waves; upon the wall

There is a marble figure, which should be
One of the Sirens: pale and silently
She looks over the dim bay once her own.
But we can reinstate her on the throne,
And make sweet music from her lips proceed,
Taking imagination for the deed;
Or call Ulysses, or who else hath seen
On this same spot the enduring stars serene;
Or talk of Paestum, and the Silaro,
And the old boat that doth like Charon's go,
Wafting us to a new and silent land,
Where those three thunder-stricken temples stand,
Or tell the tragic tale that Dryden feigned,
'When Norman Tancred in Salerno reigned.'"

Mr. Stoddart's songs and poems are, like Sir John Hanmer's, of very unequal merit; they are, however, all fresh and genuine, written under immediate influences, and highly descriptive. The angling songs have leaping fish in them, and gurgling rivulets, and flies, and broken boughs, and bring us into the green shadows where trout are most readily taken. Mr. Stoddart is evidently an angler; and that, perhaps, has made him a poet. He writes like one who feels his theme, and who cannot help giving it a shape of verse. Even the lyrical irregularities which it is the peculiar province of music to harmonize, impress us with such sensations as are produced by those gusty breezes that every now and then burst over the streams and ruffle and disconcert both fish and fisher. We know not where a better collection of out-of-door lyrics is to be found than Mr. Stoddard has supplied; and we will make room for a short one, which, although not the most favourable specimen, is sufficiently meritorious to justify the author in taking rank amongst our living bards:

A PICTURE.

We listen by the waters blue to voices that we love;
Sweet flowers are twinkling at our side, and willow leaves above;
Before us feeds the fearless trout, emerging from the calm,
And bleats behind the fleecy ewe upon its wandering lamb.

Delicious musings fill the heart, and images of bliss;
Oh! that all pictures of the past were innocent as this —
That life were like a summer trance beneath a willow wide,
Or the ramble of an angler lone along the river side.

Poetry is not dead amongst us while such poets as these remain to vindicate the muse. The specimens with which we have enriched our pages testify that the art is cultivated still with success, and that it only wants a little more sunshine of quietude to bring it to full perfection.

But there is one beyond all these, greater than them all — the author of that singular production called "State Trials." We read it once, and have not seen it since; but it has left behind visions of beauty and strength, of chivalry and logic, of passion and stately grace; whole panoramas of living pageants, pictures of fresh fields and crumbling castles, of antique halls and dim cloisters, of fortified ramparts streaming with banners, and sequestered chapels with long trains of nuns and monks winding noiselessly like shadows through their aisles — visions that cannot be dissolved by time, but that become strengthened in their hues and forms the longer they dwell in the memory. This work, strange to say, has, with, we believe, only two exceptions, been almost wholly unnoticed by the critical periodicals. It seems as if it startled the reviewers, who, not knowing what to make of it at first, sullenly let it pass in silence, lest they might commit themselves one way or the other. We will endeavour to repair this neglect as soon as we can, — perhaps next month; but in the mean while, we say to the lovers of poetry, read Mr. Moyle's "State Trials."

THE BATTLE WITH THE DRAGON.

FROM SCHILLER.

WHAT's all the rout? What means this crowd,
Hallooing through the streets so loud?
Is Rhodes on fire? And see yon knight,
High on his horse, amidst the throng;
And after him — heavens what a sight! —
That monster, which they drag along:
It seems a dragon by its size,
Its crocodile jaws and its basilisk eyes.

Now on the beast, in wild amaze,
And now upon the knight, they gaze;
And hark! a thousand voices bawl,
"This is the lindworm — come and view it —
That ate up our herds and our herdsmen all;
And this is the valiant youth that slew it!
Many have gone on the monster's track,
But never before did one come back."

And now the glad procession files
On to St. John's dim-cloister'd aisles,
Where, with their prince, in grave debate,
The brethren of the order wait;
When, stepping forth before the rest,
The hero thus his chief address'd: —
"Lo! there he lies, slain by my hand,
The dragon that laid waste the land!
Our roads are free; o'er plains and rocks
The shepherds now may drive their flocks;
And, joyful, in his long-left fane,
The pilgrim's voice be heard again."

He paus'd. "And hast thou then to learn,"
Exclaim'd the prince with visage stern,
"How priz'd soe'er the warrior's art,
The Christian has a nobler part?
Thou 'st shown thy courage in the fight,
And courage well becomes a knight;
But what 's the first of duties, say,
For those who arm in Christ's array?"
"Obedience, sire!" the youth replies,
Griev'd honour kindling in his eyes —
"Obedience, of all tests on earth
The best that proves a Christian's worth."

"And this, this first of duties, thou,"
Resumes the chief, "hast set at nought;
Thou'st spurn'd our law, forgot thy vow,
And the forbidden battle fought!"
"Hear, ere you judge" — with stedfast soul
Pursues the youth — "first hear the whole.

'Gainst law I sought not to offend,
But to fulfil law's noblest end:
Not with rash arm the sword I drew,
Not without thought and caution due,
And means that best might overthrow
The force and fury of the foe.

"Five heroes, victims of their zeal,
Had perish'd for the public weal,
When forth the unwelcome mandate flew
That none the combat should renew.
Yet still, by edict unreprest,
Still burn'd the fever of my breast;
E'en in the visions of the night,
I gasp'd, I languish'd for the fight;
But when the blood-ey'd morn arose
With tidings of fresh deaths and woes,
A wilder anguish seiz'd my soul,—
My rage no longer knew control;
And straight I swore my chance to try,
And triumph in the cause, or die.

"What decks the youth? — what crowns the man?
'Twas thus my self-reflections ran:
What were the deeds achiev'd of old
By those of whom our bards have told,
Whom Heathen blindness, in its love,
Hath rais'd to rank of gods above?
Earth's deadliest monsters they defied,
Quell'd the fierce lion in his pride,
The minotaur's foul strength subdued,
Crush'd the dire hydra's venom'd brood,
And perill'd limb and life to save
Poor mortals from a cruel grave.

"Is it the Saracen alone
That's worthy of a Christian arm?
Is there, save from the Moslem throne,
No danger, no alarm?
A true-born knight should strive to free
His land from every misery,—
Should shrink before no living foe:
Still judgment must direct the blow,
Wisdom its aid to courage lend,
And stratagem with strength contend.
Thus meditating, day by day,
I took my solitary way,
Explor'd each mountain-rock and glen,
In search to find the monster's den,
Till chance at length my efforts crown'd,
And, joyful, I exclaim'd — 'Tis found!

"'Twas known how, with my chief's consent,
On voyage to my home I went.
There scarcely had I touch'd the strand,
When, aided by an artist's hand,
An image of the beast I plann'd;

In size, in form and feature, rife,
It look'd a dragon to the life.
On his short legs, in towery strength
High-pil'd, repos'd his body's length;
His brawny back, his deep-ribb'd waist,
A shirt of triple mail embrac'd;

" Far stretch'd his neck, and vast and dire
Yawn'd, like hell's gates, his jaws of fire;
Fierce, from his throat of darkness, sprung
The forked terrors of his tongue;
His teeth, thick-set in grim array,
Grinn'd gauntly, gnashing for their prey;
His keen small eyes flash'd lightnings round;
His tail, in serpent volumes roll'd,
Now wav'd aloft, now swept the ground,
As man and horse it would enfold.

" Such was the beast I did essay,
Then dress'd it all in ghastly grey.
Half crocodile it seem'd, half snake,
Foul offspring of the Stygian lake.
This done, two noble dogs I found,
For courage as for strength renown'd,
Train'd to the battle and the chase,
And terrors of the urus race;
These I let loose upon the foe,
Stirr'd up their ardour for the fight,
Taught them with doubled rage to glow,
And where with surest wound to bite.

" There, where the parts, scarce wool or hair,
Lie, midst the opening belly, bare, —
I taught them *there* their fangs to lay,
And fasten furious on their prey.
Myself, I press an Arab steed,
Of finest form and noblest breed,
Soothe with soft hand his rising fear,
Or urge with spur his sharp career,
Aiming my lance with force so true
As 't were to pierce the figure through.

" Though my horse rear'd and champ'd the rein,
And my dogs moan'd with wild affright,
I did not from the task abstain
Ere they were harden'd to the sight.
Thus, day by day, I train'd them on,
'Till now the third new moon had shone;
Then, all prepar'd, with rising gale
For Rhodes I spread the eager sail;
And soon — 'tis now three mornings past —
Safe anchor in this haven cast;
Whence landing, without halt or rest,
On instant to the work I prest.

" For — to stir higher my bosom's flame —
Fresh tidings of disaster came:
Two herdsmen, who had sought the moor,
Were found all mangled in their gore;
So, taking counsel from the heart,
I straight resolv'd me on my part,
Call'd out my bounding dogs, in speed
Bestrode once more my fiery steed,
And then, with heedful pace and slow,
Went calmly forth to meet the foe.

" Thou know'st the Chapel of the Rock —
A master's spirit rais'd the pile —
Fast moor'd against the tempest's shock,
And glancing far o'er sea and isle.
Though poor in outward look, and plain,
A miracle its walls contain, —
The Mother with her Babe Divine,
Given by THE THREE KINGS to the shrine.
Thrice thirty steps, midst crag and thorn,
The wayworn pilgrim climbs forlorn;
But when the dizzy height he gains,
What sweet refreshment for his pains!
What bliss, beyond all earth's reward,—
The presence of his Saviour Lord!

" Deep 'neath the cliffs' o'erbrowing height
A cavern lies, half clos'd in night,
Cheer'd by no sun's refreshing beam,
And dripping with the fen's dank stream.
Here hous'd the worm; here, night and day,
Lurk'd watchful for his coming prey:
Prowling around, like the Dragon of Hell,
Even at the foot of God's own cell,
He seiz'd poor wanderers on their road,
And bore them to his grim abode.

" The rough ascent in safety trod,
First — ere the combat I begin —
I kneel before the Infant God,
And purify myself from sin;
Then, with the sun's returning light,
Gird on my armour for the fight,
Descend into the bordering plain,
Leave parting orders with my train,
And lightly vaulting on my steed,
And without witness to the deed,
And breathing still to Heaven a prayer,
Move onwards to the monster's lair.

" Scarce had I cross'd into the vale,
When loud and quick the dogs gave tongue,
And snorting, snuffing up the gale,
My horse in backward circles swung;

For, coil'd up in the sun's warm ray,
Before his cave the serpent lay.
Swift rush'd my hounds to the attack,
But swifter still came rushing back,
As, yawning from his jaws so foul,
The beast sent forth his jackal howl.

" But soon their fainting hearts I cheer,
And fierce they fasten on the foe,
Whilst, with redoubled arm, my spear
Full at his bounding sides I throw;
Yet powerless as a reed it flew;
And, ere the stroke I could renew,
Confounded, aghast, at his towering size,
At his venomous breath and his flaming eyes,
My horse he began to plunge and rear,
And all now seem'd over with my career.

" Down springing from his back amain,
With lightning's speed, my sword I drew;
But thrust and stroke alike were vain
To pierce his rocky harness through.
And now, with tail swift swinging round,
The beast had swept me to the ground;
Already at his feet I lay,
His jaws already grasp'd their prey,
When my brave dogs, to madness stung,
Fierce on the monster's belly sprung,
That rousing, writhing, at their bite,
He yell'd with anguish and affright;

" And swift, ere he could disengage
His body from their burning rage,
All breathless from the ground I start,
Spy out his bosom's barest part,
And slake my vengeance in his heart.
Up to its hilt I drive the blade;
His blood streams, blackening, o'er the glade;
Down rolls the giant mass, whilst I,
Half-crush'd beneath its ruin, lie.
I knew no more; all sense had fled;
But when, at length, I rais'd my head,
I found my servants hanging o'er me,
And the dead dragon stretch'd before me."

He ceas'd. Applauses, long supprest,
Burst wildly forth from every breast.
Mix'd shouts of triumph, rapture, wonder,
Roll, echoing through the aisles, like thunder.
And, first, the brethren, pressing round,
Insist at once he shall be crown'd;
The crowd, in pageant state the while,
Would bear their hero through the isle.
" Peace! peace!" the indignant master cries;
Then fixes on the youth his eyes,

And says, " Thou 'st slain, with valiant hand,
The dragon that laid waste the land;
Thou stand'st a demigod below,
But not the less thine order's foe;
For, dire as was the serpent pest,
A direr harbours in thy breast;
A worm which deeper, deadlier stings,
Which fiercer strife and anguish brings:
That is, a proud, rebellious soul;
A spirit, spurning all control,
To reason, law, and duty blind —
'Tis *that* which desolates mankind.

" Courage the Mameluke displays;
Obedience is the Christian's praise.
For, where the Lord of earth and skies
Walk'd humbly forth in servant's guise,
There first, e'en on that blessed land,
Arose our order's holy band,
Earth's strictest duties to fulfil,
And learn subjection of the will.
'Twas vain ambition urg'd thee on; —
Away, then, from my sight — begone!
For he who Christ's dear cross would wear,
Must not disdain his yoke to bear."

Ill could the people such rebuke,
Such sentence on their hero, brook;
Loud rings the roof with their uproar;
The brethren too for grace implore;
All but the youth: still firm, though lowly,
He bows him to the stern command,
Doffs from his breast each ensign holy,
And, kissing his reprover's hand,
Withdraws. With lingering eyes his track
The prince pursues, — then calls him back,
And cries, " Embrace me, my dear son!
Thy hardest battle now is won.
Here, take the cross; 'tis due to thee,
As prize of thy humility —
Humility, o'er SELF victorious,
Of all earth's triumphs the most glorious."

INDEX TO VOL. III.

A.

Academy, Royal, strictures on some of its members, 532.
Affghanistan, description of the country and people, 422.
Althorp, Lord, his scientific researches in conjunction with Lord Brougham, 98.
Annuals, literary, their injurious influence upon Art, 63.
Architecture, On Style in, 348.
Art, how influenced by annual publications, 63. Progress and present state of, in England, 525.
Atmospheric Resistance on Railways, 185.
Austria and the Italian Liberals, 153.

B.

Ballad Poetry of Ireland, 385. Distinctive characteristics of Irish humour, 386. "Words music, intonation," the constituent elements of the comic song, 392. Notice of, and extracts from, Mr. Croker's collection of the "Popular Songs of Ireland," 393. Croker *versus* Moore, 394. Samuel Lover, 400.
Barry Cornwall, notice of his edition of Ben Jonson's works, 168.
Battle with the Dragon, The, (poetic translation from Schiller,) 563.
Bees, dissertation on instinct as exemplified in, 98.
Books, Notes of a Lover of, 56. 167.
Brougham, Lord, review of his lordship's work on natural theology, 97.
Brunel, jun., Mr., extracts from his published Report on the Great Western Railway, 4.
Buckingham Palace, discovery of a romantic inmate at, 92.

C.

Calderon, the Spanish poet, critical analysis of his "Life, a Dream," 489.
Campaign of 1799, Suwaroff and the, 329. 456.
Canada, notice of Mrs. Jameson's "Summer Rambles" in, 68.
Clerical Dustmen, 93.
Comte's (M.) System of Positive Philosophy, 227. Abridgment of his "analytical scheme," 231. Remarkable omissions in this scheme, 232. Mode of treating the subject of natural theology, 233. The doctrine of "final causes," 236.
Constant, Benjamin, 436. Sketch of his early career, and subsequent advancement to the tribunate, 436. His opposition to the designs of Buonaparte, 441. Retirement to Switzerland, and final return to France, 442. Apathetic submission to female influence, 445. Review of his more prominent political acts and writings, 446.
Contributions to the History of Forgery, 366.
Cooper, the American novelist, his "Eve Effingham" noticed, 82.
Corn Laws, 116. 193.
Covent Garden Theatre, success of the Shaksperian performances at, 85.
Croker, Mr. T. C., review of his collection of "The Popular Songs of Ireland," 385. Strictures on his criticism of "Moore's Melodies," 394.

D.

Darling, Miss Grace, 93.
Debate (Irish), History of the late, 466. Motion of Lord John Russell, and Sir R. Peel's amendment, 467. Analysis of the discussion, 468. Result highly satisfactory to the friends of Government, 479.
Diary of a Dutch Diplomatist in London, 283. 379.
Drama, the Spanish, 488.
Drury Lane Theatre, representation of "Guillaume Tell" at, 88.
Dustmen, Clerical, 93.

E.

"Eve Effingham," notice of Cooper's novel of that name, 82.
Exhibitions, Public, 259. "Love of amusement" a leading principle of the human mind, 260. Comparative view of ancient and modern recreations, 260. "Home amusements" indicative of a high state of civilisation, 263. The drama the "highest attainable point of popular and rational amusement," 263. Increasing facilities for the promotion of a general taste for music and painting, 264. Brief notices of the Diorama, Panorama, Gallery of Practical Science, &c., 265.
Experiments on the Great Western Railway, 7.

F.

Flaxman, remarks on the genius and works of, 527.
Flowering Trees and Shrubs of June, The, 508. The genus Ribes, &c., 508. Roses, their number and variety, 513.
Forgery, Contributions to the History of, 366. Recent change in the public mind with regard to the nature and treatment of this offence, 366. Comparison of the various enactments passed for its suppression, 367. Cases of the Perreaus, Dr. Dodd, Fauntleroy, &c., 370. Abolition of capital punishment, 377. The unmitigated rigours of transportation demand instant amendment, 378.
French Literature, The Present State of, 218. Literature, properly so called, at present non-existent in France, 218. "Despondency

and scepticism" the prevalent sentiments of the French *hommes de lettres*, 219. Popular poetry necessarily banished, 219. Effects of the revolution of 1830, 224. Strictures on the writings of Jules Janin, and others of the same school, 225.
Fry, Mrs., her exertions in the cause of prison reform, 173.

G.

Gardens, hints for laying them out in accordance with the styles of the buildings to which they may be attached, 429.
German Manufactures and English Corn Laws, 193.
Gonzaga, the Portuguese poet, translation of one of his pastorals, 32.
Grace Darling's Levée, 93.
Great (The) Western Railway Inquiry, 1.
Grievances of the Navy, 124.
Guest, Lady Charlotte, review of her Translations from the Welsh, 76.

H.

Hanmer, Sir J., critical notice of his story of "Fra Cipolla," 561.
Hazlitt, notice of a volume of essays by, 83.
"Henry the Fourth," undeveloped characters in Shakspeare's play of, 139.
Historical Speculations of Niebuhr, 351.
Horne, Mr. R. H., his "Studies of Undeveloped Characters in Shakspeare," 37. 139. 239. 361. 450.
Household (The) Question, 481. Unprecedented nature of Sir R. Peel's proposition relative to the ladies of the bedchamber, 481. The Queen's household no part of the Constitution, 487.
Huguenot," "The, Mr. James's novel under that title noticed, 81.
Humour, Irish, distinguishing peculiarities of, 386.

I.

Imp of the Palace, The, 92.
India, viewed in connexion with threatened Russian hostilities, 422.
Influence of the "Annuals" upon Art, 63.
Ireland and Lord Normanby, 289. Calamitous condition of that country originally attributable to English maladministration, 290. Beneficial results of Lord Normanby's government, 292. Groundlessness of the Tory charges against his lordship, 295.
Ireland, The Ballad Poetry of, 386.
Irony, The Socratic, 247.
Italy, Letters on the State and Prospects of, 401. 515. Quotation from Sismondi, 401. The country calumniated by those who should be its best defenders, 403. All check to misrepresentation hopeless in the absence of a free press, 404. Public character and writings of Sismondi, 405. The "Rome of the people" not yet built, 407. Obstacles to the emancipation of Italy, 408. Her history the history of her people, 515. Causes of the failure of revolutionary movements, 516. Italian regeneration can never be the offspring of monarchical principle, 518. Colletta the only honest historian of the "Neapolitan movement," 521. Carbonarism, if not a revolution, has at least paved the way for one, 523.

J.

James, Mr. G. P. R., notice of his "Huguenot" and "Book of the Passions," 81, 82.
Jameson, Mrs., review of her work on Canada, 68.
Jonson, Ben, critical estimate of his literary character, 168.

L.

Lamennais, M., the French philosopher, 317. His humble origin, and subsequent brilliant advancement, 317. Sketch of his character and writings, 319.
Lardner, Dr., account of his series of experiments on the Great Western Railway, 7.
Laws of England, On the Composition and Promulgation of the, 202. Exposure of several striking anomalies, 204. The construction of the statutes in most cases "unintelligible, barbarous, and absurd," 209. Incapacity of those to whom law-making is intrusted, 211. Other legislative evils pointed out, and remedies suggested, 212.
Letters on the State and Prospects of Italy, 401. 515.
Literature, French, present state of, 218.
———, Portuguese, 20.
———, Review of, 68.
———, The Scandal-mongers of, 414. Different classes of dealers in literary scandal, 414. Indulgence in the practice an evidence of baseness of character, 416. Delinquencies of this nature regarded generally with too much lenity, 417. Various degrees of offence, but all censurable, 418. Glance at "Chevely," and the well-known "Diary" of Lady Bury, 419. Turning the weapons of such authors against themselves the only efficient mode of retaliation, 420.
Love and Will, 56.

M.

Manoel, Francisco, English translation of one of his odes, 35.
Manufactures, German, and English Corn Laws, 193.
Mayo, Dr., review of his work on human pathology, 302.
Mazzini, M., his "Letters on the State and Prospects of Italy," 401. 515.
"Merchant of Venice," undeveloped characters in the, 38.
Milnes, Mr. R. M., his definition of poetry, 552.
Mind, Human, Pathology of the, 302.
Month, Notes of the, 92. Notes *on* the 95.

N.

Natural Theology, review of Lord Brougham's work on, 98.
Navy, British, inefficiency of the, 124. Injustice of certain parliamentary regulations, 128. Difficulty of procuring seamen, 129. Pamphlets of Admiral Hawker and Captain Napier, 131. Suggestions relative to obtaining an efficient body of young seamen, 134. Sir John Barrow's "Life of Anson," 136.
Niebuhr's Historical Speculations, 351. Futility of inquiries into the origin of nations, 351. Politics the "predominant element" of Roman history, 352. Niebuhr's opinions respecting the origin of Rome, 353. Anti-poetical style of the Roman historians, 358.

Normanby, Lord, the Irish administration of, 289. 466.
Notes of a Lover of Books, 56. 167.
—— of the Month, 92.

O.

"Othello," undeveloped characters in, 239.
Orangeism, Irish, Lord Normanby's discouragement of, 293.

P.

Pathology of the Human Mind, 302. Incorrect notions with regard to insanity, and mental disease generally, 302. Dr. Mayo's observations on the subject, 305.
Peel, Sir R., strictures on his proposed interference with the Queen's household, 481.
Philosophy, positive, Comte's system of, 227.
Pleasure Grounds, the Planting of, 429. Suggestions for laying out gardens, &c., in accordance with the several styles of architecture, 430.
Poems of Shelley, critical estimate of the, 340.
Poetry (Original):
Battle with the Dragon (from Schiller), 563.
Sonent — "We know not why we love," 514.
Sonnet — "Farewell! it is a common word," 524.
Poetry, Recent, 552. Nature and definition of poetry, 532. Poetic feeling far more generally diffused than is suspected, 553. Characteristics of the poetry of the present day, 554. Critiques on, with illustrative extracts from, Mr. Reade's poem of "The Deluge," the "Prothanasia" of Mr. Wade, Sir J. Hanmer's "Fra Cipolla," &c., 552. 561. Eulogium, *en passant*, on Mr. Moyle's "State Trials," 562.
Poetry, Irish ballad, characteristics of, 385.
Police, Rural, Expediency of a, 537. Benefits already resulting from its partial establishment, 537. Reply to objections, 538. Advantages of "centralisation" illustrated by reference to the working of several public departments, 539. Inefficiency of the present constabulary force, 539. Remarks on, and extracts from, the First Report of the Commissioners appointed to inquire into the subject, 540.
Portuguese Literature, 20. Inquiry into the causes of its present barrenness, 20. Dialogue from Moraes, 22. Ribeiro, Saa de Miranda, Antonio Ferreira, Camoens, &c., 23. Specimen of the poetry of Garzaon; sonnet from Francisco Manoel, 24. Prose writers, 26. "Platonism, Christianity, and Chivalry" the distinguishing characteristics of Portuguese literature, 27. THE

MONTHLY CHRONICLE.

THE THAMES STEAMERS AND THE WATERMEN.

The Laws and Constitutions of the Master, Wardens, and Commonalty of Watermen and Lightermen of the River Thames. Printed for the Company. 1828.

Rules and Bye-Laws for the Regulation of the Watermen and Lightermen of the River Thames, by the Court of Mayor and Aldermen of the City of London. 1828.

Rules or Bye-Laws of the Company of Watermen and Lightermen of the River Thames, by the Court of Master, Wardens, and Assistants of the said Company. 1828.

New Rates of Watermen. 1828.

Minutes of Evidence taken before the Committee of the House of Commons on the London and Blackwall Railway Bills. 1836.

Public attention has of late been directed so strongly to the prospects of steam in its new application to long voyages, that there has been little chance of the progress of inland steam navigation receiving that notice which it appears to deserve. While those leviathans of the deep, the "Great Western" and the "British Queen"*, have attracted universal curiosity, the small fry, which are latterly peopling our shallow waters at home, have been almost wholly overlooked. Yet on the Thames there has been growing up during the last few years a steam traffic offering various points of interest in the adaptation of the steam-boat to new circumstances, which we think demands and will well repay inquiry. And connected with this subject, there are certain other considerations of economical and social concern, which are equally interesting and important. We allude to the controversy between the Thames steam-boat companies and the free watermen, the new claimants and the established possessors of the traffic of the river. Having carefully watched the progress of this dispute during the busy months of the past season, we have collected certain facts, and arrived at certain conclusions which we propose to submit to our readers at this moment, when the traffic of the river steamers is at its height.

The view from London Bridge gives, perhaps, the best idea of the extent of the steam navigation of the river. Looking downwards, the eye is attracted by a forest of funnels belonging to steamers lying off the Custom-house, and various quays from that point to St. Katherine's Dock, and thence as far as the sight can penetrate. These, however, are chiefly foreign and coasting vessels, and as such belong only partially to our present subject.

* A steam vessel of greater magnitude and power than either of these — the largest, we believe, that has ever been built — and, in respect to internal arrangements, the most elegant and commodious, is shortly to be launched, to ply between England and America. This vessel, called "The President," and commanded by Lieut. Campbell, R. N., is expected to make her first voyage for New York on the 1st of August. — Ed.

But close under the bridge, both above and below it, are clustered on the City side the river steamers; for here it is that the rival Gravesend and Greenwich companies, as well as various others, have their wharfs. Here, during the summer months, prevails throughout the day the constant bustle of arrival and departure; and few spots of this busy metropolis are better calculated to convey, in the spring and summer, a true impression of the out-of-door intercourse and movements of its teeming population. During the winter the scene is comparatively still; fewer steamers are plying, and at longer intervals. We will endeavour to give an idea of the extent of the traffic carried on during the past season (1838); not pretending, indeed, to furnish a complete list of the vessels employed, but noting such as came under our own observation.

To Greenwich, there were steam-boats starting every quarter of an hour, the two companies, the old and new, running alternately. To Woolwich, twelve times a day, from Hungerford Market pier. To Gravesend, the Star company had six boats daily; the Diamond Company, seven; the Commercial Company, one, which proceeded to Sheerness and Southend; the Eagle and Falcon Company, two, from Waterloo Bridge; besides which, there was one from Hungerford. Many, if not all of the Gravesend boats, are accustomed to call at Blackwall; and all receive and put down passengers when required at various points of their course. To Ramsgate, Margate, Herne Bay, and other favourite resorts of the inhabitants of the metropolis, there are likewise numerous steam-boats, especially in the season. The following particulars as to the traffic in previous years may be added from the Evidence on the Blackwall Railway. Mr. John Taylor, a Thames pilot, gives (March 23d, p. 4.), as the average number of steamers passing through the Pool, up or down per day, from May to September, from 120 to 130. Captain John Fisher, one of the harbour-masters, states (March 24th, p. 15.) that he counted 96 in a day, between eight in the morning and eight at night, passing the London Docks, up or down. And (p. 16.) that in the month of July, 1,801 was the total number, likewise from eight to eight, which gives a daily average of about 60. This latter average probably comes nearest to the truth; the former was given only as a guess, this as an actually observed fact. The difference is lessened, if we consider the one to include, as it probably does, the whole twenty-four hours, while the other expressly excludes the night. In both numbers it will be remembered the foreign and coasting steamers are included, besides those properly belonging to the Thames.

Turning our attention up the river, to Richmond, there plied last season four boats daily from Queenhithe and Hungerford, one of which proceeded to Twickenham. This was the station on which the first Thames steamers were introduced. The up-river boats which remain to be noticed are of a more recent date, the "London and Westminster" company having commenced operations in 1837, and the "Iron Steam-boat" company only during the last season. The former company had boats every quarter of an hour from London Bridge to Westminster Bridge, calling on the Southwark side of Southwark Bridge and at Hungerford; also to Putney three times, and to the Southampton Railway pier, a little above Vauxhall Bridge, twelve times a day. The latter company's iron boats plied every half hour from London Bridge to the Southampton Railway pier, calling on the City side of Waterloo Bridge, and the Westminster side of Westminster Bridge.

From this enumeration, incomplete though it be, it will appear that the facilities afforded to the inhabitants of the metropolis, for enjoying the fresh

breezes of their noble river, and visiting the various scenes of beauty on its banks, are very numerous, while the competition of the different companies has the effect of ensuring low fares. It is difficult to form a calculation of the multitudes who avail themselves of these means of locomotion, but we will give a few data, which may assist the reader to do so. In the report of the Eagle and Falcon company, presented in the spring of last year, it was stated that in three months they had carried by means of their two boats 66,000 persons to and from Woolwich and Blackwall; and that during the first thirty days of their boats plying from Waterloo Bridge, their passengers to and from Gravesend had amounted to 7,600, notwithstanding the unfavourable state of the weather. In Gravesend boats we have counted 200 passengers, when they have been not by any means uncomfortably filled; and though they are often to be seen with much fewer passengers, they are, on the other hand, especially on fine Sundays, very frequently still more crowded. Supposing an average of only 60 passengers per voyage, the 17 boats each way between London and Gravesend will give upwards of 2000 passengers daily journeying the one way or the other — an estimate probably much below the mark. From the evidence of Mr. Charles White, a proprietor and director of the Star company (April 14th, pp. 15, 16.), it would appear that the average number of passengers during the four best months of the year is 300 to each boat — that they sometimes take as many as 600, and "on one day of public rejoicing carried 900." Mr. Redman, another director of the same company, states (May 14th, p. 9.), that they have received and started about 3,000 passengers in about forty-five minutes; of course with several boats. Mr. T. H. Sinnott, clerk to the solicitors to the Herne Bay Pier Company (March 28th, p. 18.), gives 30,102 as the number of passengers landing and embarking at that pier in 1835, from March 25th to the time when the boats ceased running.

The above-bridge traffic presents certain peculiar features, which will probably repay a separate consideration. It is a kind of omnibus traffic; — not, indeed, that one may hold up one's finger at any point of the boat's course and be taken on board or set ashore; but in the space of less than two miles, between London and Westminster Bridges, we have seen that there are appointed by one of the companies one, and by the other, two intermediate stopping places, which gives passengers the opportunity of choosing among three several points of communication within that distance.

To these advantages is added speed in most states of the tide; the length of voyage between Westminster and London Bridges varying from a quarter to half an hour or somewhat more. An additional inducement is offered by the low fare of the steamers, which is fourpence from London Bridge to the Southampton Railway, or any intermediate distance. The number of passengers by these boats is very considerable; in ten trips, taken at different hours of different days, during last autumn, but never in boats crowded, as we shall hereafter have occasion to observe that these vessels frequently are, we found the average to be 40. Indeed the populousness, if we may so describe it, of the river is so great as to attract the activity of the bill-stickers, who sedulously follow their occupation on the piers and under the arches of the bridges, throughout the whole of the busy season; and they are not a class who waste their labours where there are none to look upon them.

It is curious to observe the adaptation of the machinery of the steam-boat, and the mode of navigating it, to this omnibus-traffic. Small of build, shallow of

draught, and proportionately short in funnel, the up-river steamers generally clear the bridges easily, except at high tide; and then, the inexperienced observer who looks on from the shore in momentary expectation of a collision which shall carry away the funnel, is surprised at the adroitness with which, like geese under a gateway, they stoop their necks and pass on in safety. Again, to one accustomed to the usually lengthy process of "bringing a vessel to," alongside of a pier to land her passengers, it would seem impossible for boats, succeeding each other every quarter of an hour, not to run into one another's way, and present a scene of inextricable confusion at the calling places. But what will not practice effect? A stoppage of a couple of minutes generally suffices to land twenty or thirty passengers, and take in as many more; every one walking on and off with the utmost ease and security. At low water, indeed, it may take longer at some places; but, ordinarily, the boat is off again even in less time. The vessels draw up to the pier much like omnibuses to the office door; and the "ease her," "stop her," "back her," "go a-head," &c. of the steam-boat master, are as familiar in the utterance, and as prompt in the action, as the "hold hard," and "all right," of the omnibus cad.

It was not to be supposed that a change so great as that occasioned by the introduction of steamers on the river, should take place without opposition on the part of those already engaged in the traffic. The Thames watermen, trained by a long apprenticeship to the knowledge of every shoal and current of the river, legally licensed for the conveyance of passengers, and looking to the broad stream as the highway on which to ply for bread, would have been something more or less than men to look on with indifference, while the newly introduced steam-boat was superseding the long-privileged wherry. And incorporated as they are by a charter conferring upon them certain rights, while it likewise imposes upon them certain duties, they possess a power, which they have been by no means slow in using, to resist, to a certain extent, the progress of their rivals. But before we enter upon an inquiry, respecting the matters in dispute, it will be necessary to give some account of the constitution and immunities of the Watermen's Company.

The Thames watermen furnished the subject for various early legislative enactments. Acts of parliament were passed in the reigns of Henry VIII., Mary, and James I., regulating the fares to be taken, and appointing certain forms of government for the watermen; and under William III. and Anne, acts were obtained whose principal object was to systematise their impressment, with a view to manning the fleet. They were not, however, incorporated till the year 1827, by the act 7 & 8 George IV. cap. 75., entitled "An Act for the better Regulation of the Watermen and Lightermen on the River Thames, between Yantlet Creek and Windsor." The company consists of the watermen, wherrymen, and lightermen enrolled before the passing of the act, and of such as become freemen under it.

The freedom of the company is to be obtained only by serving a seven years' apprenticeship to a freeman, or a freeman's widow: the number of apprentices that each freeman may take is limited, and proportioned to the number of his craft. Apprentices are bound only between the ages of fourteen and eighteen; and none are allowed to have the sole care of a boat till they have served two years. The fee for the admission of an apprentice, at the end of his seven years, to the rank of a freeman, is 1*l.* 12*s.*; and he pays quarterly what is called a quarterage of 9*d.* to the company; which is to be applied to the posting of the fares, and the fixing of half-mile posts along

the river. Freemen only (with certain exceptions) are allowed to ply for hire; and no boat may carry passengers without a licence, specifying the number allowed; that number being determined by the size and build of the boat.

The government of the company is vested in the court of master, wardens, and assistants, in all 26 members: they are appointed for life by the act, but removable by the court for misbehaviour, &c. The master and four wardens (one senior, three junior) are elected yearly by the court, subject to the approval of the lord mayor and aldermen. Vacancies in the court, caused by death, resignation, &c. are filled as follows: — the court selects three names from among the freemen, and from these three, one is selected by the mayor and aldermen. The court appoints inspectors of plying places, &c.; binds apprentices and admits freemen; and, in general, regulates the affairs of the company, having power to make bye-laws for its government, but subject to the approval of the court of aldermen.

The court of aldermen are likewise empowered to make bye-laws, and alter those of the company, subject, however, to the approval of one or more of the Judges; and due notice must be given to the Watermen's Company before such bye-laws are submitted for approval, as ordered above. The court of aldermen, likewise, have the power of fixing the fares to be taken; which must, however, be further allowed by three members of the privy council.

In conformity with this constitution of the Watermen's Company, certain bye-laws were passed in 1828, by each of the courts authorised by the act, and certain fares laid down. Of these laws we need only say, that their object appears to be the regulation of the traffic, with a view to the safety and convenience of the public, and the equal division of employment among the free watermen. A few of the enactments will necessarily be quoted in connection with the contest which we proceed to relate. One observation, however, in passing: — the Act of George IV., strange as it may appear, does not even, so far as we remember, mention the name steam-vessel. Indeed, one of the first if not the very first of the legal proceedings on the subject, *Tisdell* v. *Coulee*, had for its object the trial of the question, whether the bye-law of the court of aldermen, regulating the speed of steamers in the Pool, was valid or not — whether, under the act, they had the power of making laws for *steamers?* — a question which was decided in the affirmative. The fact is, that even so late as the passing of that act, the Thames steamers, properly so called, were so few and insignificant as scarcely to attract notice; and the watermen obtained, only just in time, an act which but a few years later could not have passed without important modifications, which the rapid increase of steam power on the river would have imperatively demanded.

The greater part of the legal proceedings of the Watermen's Company against the various steam-boat companies, have been instituted under the 42nd bye-law, enacted by the court of aldermen, prohibiting steam-vessels under a penalty not exceeding 5*l.* from navigating at any rate beyond five miles an hour in the Pool; that is, between London Bridge and the eastern limits of Limehouse Reach, a distance of about three miles. Having carefully observed the progress of these proceedings, we think we can give in few words a tolerably accurate view of the merits of the case presented by both parties.

The first movement took place on Thursday, May 3d, at the Thames Police Office, a public notice having been previously issued that the 42d

bye-law would be enforced. On the part of the Watermen's Company, it was given in evidence, that on April 11th, certain steamers named in a list presented, had been carefully timed in their passage through the Pool, and been found to exceed the legal rate of five miles an hour. Their speed appears to have varied from about seven miles an hour, the lowest, up to fifteen, the highest. On the part of the steam-boat companies, it was contended, first, that the bye-law was indistinct, inasmuch as it did not appear whether the speed allowed was five miles an hour past the land, or five miles through the water; that is, supposing the tide to be coming up, for instance, at the rate of three miles an hour, it did not appear whether the rate allowed for a steamer coming up with it was five miles or eight miles of positive motion from a fixed point on the bank. And when the presiding magistrate held the former to be the plain sense of the law, that is, five miles an hour of positive locomotion independent of the tide, it was urged, secondly, that when the tide is flowing as it sometimes does at the rate of four miles an hour, a steamer coming with it at the rate of only five miles has positively not steerage-way, and cannot be safely navigated at that speed. This is indeed an *ex parte* statement, and watermen and others were brought on the other side, to give an opinion that the steamers might in all cases be safely navigated at the prescribed rate. The opinion of Captain John Fisher, one of the harbour-masters, may probably be considered of weight in such a case. He says (Blackwall Railway Evidence, March 24th, p. 16.), "I think it would be a very difficult thing to legislate as to the speed of steamers, because they are frequently obliged to put on an excessive power in passing tiers and passing vessels, when in fact, if they were not to put on that speed, I think great danger at times would occur." And (pp. 17 and 18.) he states, that a steamer must go faster than the tide to keep herself clear, that the tide runs down three knots and a half an hour, probably on an average two knots and a half; that she must make two knots for herself; consequently in the strongest tide she must go at the rate of five and a half, which is half a knot above the legal rate. And even a pilot, Mr. J. Pennam, who speaks out his mind very fully against the steamers and the swell they make, when asked the lowest rate of speed at which a steamer should come up the Pool, replies (March 24th, p. 12.), "Three miles and a half with the tide is quite enough;" and for spring tides he allows three knots; which makes for the rate which he considers "quite enough," six miles and a half an hour. Samuel Grainger, a lighterman of forty years' experience, gives it as his opinion (May 12th, p. 6.), that if the speed of the steamers were diminished, "although the craft would be benefited, the steamers themselves would be put in jeopardy." Such were the opinions expressed in relation to this subject, two years before the present action was brought: the law of the case appearing however perfectly plain, the magistrate had no course open to him but to convict the offending parties; and he imposed on the captains of the four boats which had been selected for the prosecution, the mitigated penalty of 40*s.* each, and costs.

Similar proceedings took place on May 8th and 21st, and August 21st: the rates of speed noticed were within the limits given above; and the penalties imposed ranged mostly from 40*s.* to 3*l.*, according to circumstances; in one case only, where it appeared that the party had been previously convicted, was the full penalty of 5*l.* enforced.

The impression produced on the mind of any person ignorant of the facts respecting the navigation of the Thames, by the newspaper reports of these legal proceedings, would be, not only that the lives and property of the

watermen and their passengers are put in constant and fearful jeopardy by the "reckless speed" of the steamers in the pool, but that the steam-boat captains take a pleasure in running down the watermen, and pride themselves upon it as a feat of seamanship. Mathews, in one of his inimitable *divertissements*, introduced a hackney-coachman discoursing with his friend on the inner mysteries of their common profession: "Did you ever drive over an 'en?" says he. "No," replies his friend. "I dare say not," is the answer, "I seldom find any one that has; it is one of the difficultest things in natur' to drive over an 'en,—but I have drove over three in my time." The worthy magistrate who performed a part in the following extravaganza, must have fancied that with steam-boat captains, it was esteemed a proof of the nicest skill to "drive over a wherry."

Magistrate: "If some of the captains were sent to the treadmill for three months, that would stop the evil."

The two captains, bowing: "We are much obliged to you, sir;—thank your worship."

For our own part, we knew enough of the Thames steamers and their mode of navigation, to acquit their captains of any intentional mischief, or even of rashness and carelessness: we implicitly accredit the testimony to the character of the captains generally, which "several members of the Watermen's Company stepped forward" to bear to that of the two gentlemen, who, as stated above, bowed in return for the magistrate's handsome compliment,—that they are "very respectable and civil men." Yet, in deference to the repeated expressions of witnesses, solicitors, and others, that "boats are hourly destroyed," and "the watermen and lightermen of the river, and the passengers in the wherries, are constantly placed in great peril," we diligently searched the columns of *The Times*, for the express purpose of collecting all accounts of these accidents with which we could meet. And we especially looked for the results of those days on which evidence had been given before the magistrates, of steamers having been timed and found in some instances to treble the legal speed of five miles an hour. On four of these days of remarked and recorded "reckless speed" in April, and two in May—the first six that we met with,—we found the sum total of wherries, barges, and crafts of all kinds, run down by steamers or swamped by their swell, to be ..... NONE.

We will now give the result of a more lengthened and complete inquiry, extending from April to September of the past year, both inclusive; being six months of great activity among the steam and other craft upon the river. Our data is derived from *The Times*, which has been carefully examined for the whole period, the file of a weekly paper, remarkable for the extent of its information on accidents and offences, which we have referred to throughout the first three months, and other sources of personal observation, which we especially put in train for the purpose. We believe we may confidently assert, that no accident of a serious nature within the term selected can have escaped our scrutiny.

To mention, first, a class of accidents which have properly no connection with the dispute between the steam-boat companies and the watermen, we find five cases of steamers running foul of one another, or of vessels of a larger size than the wherries and barges with which the Watermen's Company have to do. Four of these accidents happened below London Bridge; and were attended with no injury or inconvenience to passengers beyond alarm and slight delay. The remaining one is the case of an up-river boat running against a pier of Westminster Bridge, whereby one

passenger was thrown overboard, but rescued by the keeper of a floating-bath, who has frequently distinguished himself on similar occasions.

Secondly, we have a list of five barges, four laden with coal, and one with barrels of ale and beer, swamped by the swell caused in some instances by one steamer, in others by more. These accidents all happened in the Pool, to which we have already referred as the chief seat of danger, owing to the crowds of shipping that constantly frequent it. The cargoes were, for the most part, lost, and the barges were generally sunk or floated away. In none of these accidents, however, were any lives lost: we rejoice to see how frequently the bargeman is reported a good swimmer, as he ought in all cases to be, considering his trade; and how constantly, in such instances, the watermen of the neighbourhood are on the alert, and render most effectual assistance.

It remains to notice the accidents occurring to boats conveying passengers, of which, by a curious coincidence, we find five again. Of these, all occurred below London Bridge, with the exception of one, which happened near the pier of the London and Westminster Steam-boat Company at Westminster, just as the steamer was starting; three passengers were all saved, the first we must observe by the keeper of the floating-bath, before mentioned. One of the accidents below the bridge occurred to a lady and gentleman who were crossing the river, and whose boat was nearly swamped by a steamer coming down on her way to Greenwich; the boat, half full of water, was towed to land by other watermen who came to her assistance. In a second instance, a boat crossing the stream shot out from a tier just as a steamer was passing, and was run down by her, swamped, and broken; of three passengers, two supported themselves by swimming till picked up by boats, and the third clung to the steamer and was taken on board. In all these three accidents, the boats were under the charge of licensed watermen; in the remaining two such was not the case. A boat with three passengers coming up the Pool, met a Woolwich steamer going down; and the rowers, in their alarm, threw down their oars, and got right in her way: the boat being struck, began instantly to fill; two of her passengers clung to the steamer, and were taken off by watermen, who likewise rescued the third from the sinking boat. Thus far we have had to record no loss of life; one fatal accident remains. A large boat, three tons register, containing seven persons, under the charge of a man who, though not a licensed waterman, has been on the water twelve years as a cutter of osiers, was struck by a Woolwich steamer: the collision threw overboard four persons, two of whom (women) were drowned. One of the passengers (a landsman) thinks the steamer was going as much as nine miles an hour; tried to get them to turn from their course when about 150 yards off, but saw no attempt made to stop the steamer. The verdict returned by the coroner's jury was "Accidental Death," it appearing that the steamer was in the right course, and the boat in the wrong one. The captain, however, who stated that he had commanded steamers twenty years without accident, received a caution to avoid accidents in future even though a boat were in the wrong course.

This summary of accidents in which the Thames steamers were concerned during the six months in question, seems then to show that life and property is not, after all, so fatally endangered even in the Pool, as the public generally imagine. In former years fatal accidents have certainly been frequent, as appears from the evidence on the Blackwall Railway Bill. Mr. James Evans, chief surveyor of the Thames Police (May 24th, pp. 13–14.), gives particulars of five fatal accidents in the Pool, in which nine lives were lost

in little more than four months, between June 9th and October 17th, 1835; and he was prepared with more, but the committee intimated that they had heard sufficient evidence on this point. He was succeeded by Mr. Peter Charles Burrell, who being asked, "*Q.* What is the number of accidents between June and December? you counted them, I believe?" replied, — "*A.* Fifteen men and one boy," — lost, we presume. It is no concern of ours to impugn these statements; they are doubtless correct, and correct, we should suppose, to the very utmost of the actual mischief, as the dangers of the Pool formed a strong point in the parliamentary case of the railway companies. The following statement, however, from the Report of the Blackwall Railway Company, recently published, does not appear to us incorrect. "The case made out in the first application to Parliament was a very strong one, and so far from anything having since occurred to weaken it, it is well known that the steam-boat traffic has enormously increased, the vessels are of much larger size, and, *consequently*, navigate the river with *greater risk to other craft, and especially to persons in open boats.*" The increase of the steamers, both in number and size, is undeniable; and the Railway Company's inference from it, which we have marked with Italics, would seem *à priori* to be a legitimate one. Suppositions, however, must always give way to facts; and the supposed greater risk cannot be maintained in the teeth of the fact, that whereas, in 1835, "fifteen men and a boy" were lost by steamers in the Pool during six months between June and December, while in 1838, during six at least equally busy months from April to September, but one fatal accident occurred, involving the loss of two lives only — so far, at least, as we have been able to discover from the newspapers, in which inquests are seldom omitted. Since, then, it plainly appears that from whatever cause — whether from the greater vigilance of the Watermen's Company, or the growing prudence of the watermen navigating small craft, or the increased skill of those employed on board of steamers — accidents are now becoming comparatively rare, it is evident that the language used concerning them, however just it may have been in former times, is no longer applicable.

We have further to observe, that it is by no means evident that these accidents have been altogether the fault of the steamers, though such appears in general tacitly assumed to be the case; and thus it is that the accounts of such accidents are headed in the newspapers — "Fatal steam-boat accident" — "Another steam-boat accident in the Pool," &c. &c. With respect to the swamping of barges, for instance, we hear constantly that "the swell raised by the steamer was so great," &c., and then our attention is called to the narrow escape of the waterman, and the immense loss of property which the owner of the barge has sustained by similar accidents "during the last six months;" and thus a degree of virtuous indignation is excited in the reader's mind against the steamer which "cut such a swell." All this time not one word is said about the extreme loading of the barge; we are not informed how few inches, even in the smoothest water, the gunwale stood out above the surface. Yet we put it to the experience of every unprejudiced person who has ever passed down the Thames, whether the barges are not frequently laden to so outrageous an extent as to be certain of swamping in any water less smooth than a fishpond in a fine summer day. Had it so happened that the steamers in the progress of invention had preceded the barges, steam having the sanction of antiquity, and holding possession of the public mind, while the barges were the interlopers, we doubt not such accidents would be recorded somehow thus: —

"ANOTHER ACCIDENT IN THE POOL.—OVERLOADING OF BARGES.—As the Gravesend steamer, quick as thought, was proceeding through the Pool on Wednesday last, at her usual moderate pace of from ten to fifteen miles an hour, an overladen barge, with her gunwale within a foot of the water, was swamped by the swell. Every possible assistance was rendered by Captain Go-a-head and his crew, whose nautical skill is only equalled by their humanity; and the waterman was saved by their exertions. We have repeatedly noticed the senseless overloading of these lighters, and wonder how much longer their owners will be blind to their own interest. But the evil is now reaching such a pass, that the interference of the legislature is indispensable. It is intolerable, that a public conveyance of such importance, respectability, and antiquity, as the Thames steamers, should be liable to delays of this nature," &c.

Again, of the five accidents with boats conveying passengers, mentioned above, we think it clearly appears that in three the fault lay with the navigators of the rowing boat, not the steamer; in the other two instances the accounts are hardly sufficiently detailed to enable us to judge. The three that we charge on the rowing boats rather than on the steamer are the following: — 1. The case in which the boat that was run down had just shot out from a tier of shipping, which concealed her from the view of the steamer; — this was the fault of the waterman, who ought to have looked out well before he crossed the channel in which he knew that steamers might be expected at any moment. 2. In the case where the only fatal accident is recorded, the fact of no deodand being allowed shows that the jury acquitted the steam-boat captain of all substantial blame, notwithstanding the caution which they administered to him. 3. The accident to the three landsmen who were conceited enough to navigate the Pool without a waterman, and ignorant enough to throw down their oars when they found themselves in the steamer's way, must be attributed solely to the indiscretion of the adventurers themselves.

So much for the navigation of the Pool, and the legal proceedings resulting from it. On the establishment of the London and Westminster Steamboat Company, whose boats did not appear within the limits of the Pool at all, the Watermen's Company showed themselves prepared to oppose their competitors on this new field also. For some time after the starting of the London and Westminster boats, they were prevented by the Watermen's Company from plying for hire, and were obliged to content themselves with the voluntary offerings of their passengers, dropped into money-boxes fixed on board for contributions towards the maintenance and repair of the vessels. Under what clause of the act or the bye-laws the proceedings were instituted which caused this phenomenon of boats plying gratis, we have not been able to ascertain; there is, however, in the act a clause prohibiting boats from plying without a licence, expressing the number of passengers they may carry; and in the bye-laws of the Court of Mayor and Aldermen, another requiring the master or chief steersman of steam-boats and sailing passage boats to be licensed by the Watermen's Company; under either of which we imagine the action may have been brought. How the proceedings terminated, or whether they have terminated, we have not been able to ascertain: various rumours of a composition between the companies having been effected, are current, but we know not on what authority: one thing, however, is clear, that the steamers ran without obstruction all the past season, and a good part of the previous one, at a regular public fare.

It has doubtless been seen already by the extracts which we have made, that the Watermen's Company possess in their act, and the bye-laws founded upon it, considerable means of legally annoying at least, if not seriously injuring, their competitors the steam-boat companies. When we state

further that other clauses exist which might probably be enforced to the great inconvenience, if not the complete prohibition, of the steam navigation, the reader will be at a loss to account for the apparent lenity with which the Watermen's Company have used their power, and doubt whether to refer it to their disinclination to press matters to extremity, or to their want of funds to maintain the war in the courts. This phenomenon is explained by the fact, that the interests of the great number of free watermen employed on the steamers hamper the Watermen's Company, and prevent them from defending to the utmost their chartered rights. There is not a man engaged in navigating the Thames steamers who is not a free waterman; even the boys employed on deck are mostly regular apprentices. The engine-men and stokers of course are excepted; but the whole of the crew, whose station and business is on deck, have passed their legal apprenticeship — an excellent security by the way for their knowledge of the river and fitness for navigating it with safety. When we consider that the small up-river steamers, of the London and Westminster Company for instance, require for their management on deck, a captain, mate, and steersman, and fore-end boy to look out, and have the fender ready on approaching the pier — that the Greenwich boats are worked by five men, and the larger ones by a still greater number — it will be seen that the watermen employed on board the steamers are sufficiently numerous to make their interests an important check on the anti-steam propensities of the company.

There are not indeed wanting among the watermen those who think their company remiss in their conduct of the contest, who quote with exultation clauses in their act and bye-laws amply sufficient, in their estimation, to put down the steamers altogether, and who express a strenuous desire to use their power to the utmost. Such are to be found especially among the older watermen, long inured to the oar, and looking upon the steam-boat as a wretched smoky modern innovation. There are not, however, many of this sort, we believe; generally they must feel that the steamers will go on in despite of them, and that if the steamers were wholly abolished the traffic of the waterman would experience scarcely any perceptible improvement; for the facilities created by the steamers create in fact the traffic by which they are supported. We mention these facts as symptoms of the decline of that spirit of caste which is still strong among the elder watermen, and which prevents many from taking employment on board the steamers. To a young man indeed just completing his apprenticeship, and looking about somewhat anxiously for a means of exercising advantageously the business he has learned, the service of the steam-boat companies offers certain advantages which are not to be slighted. If he would at once enter on business on his own account, he must somehow or other find money to buy and keep in repair his wherry, or else hire one, whose rent will be a heavy deduction from his gains; and when the boat is provided, he must take his station at some one or other of the already crowded plying places, and wait for his turn among a number of eager candidates. On the other hand, the steam-boat companies offer him regular and certain wages, free from the fluctuations to which the waterman's life at best is subject. Many enter into their service from inability to procure by any means a wherry for their own use; still, however, looking with regret on the watermen as they row by, and fondly wishing they too could still take oar in hand, and respond to rather than raise the cry "Scul-*lers!* scul-*lers!*" when the steamer needs to land a passenger on her way. Many likewise we doubt not, of less adventurous disposition, prefer the certainty of steam-boat wages; and the longer the new

traffic continues, the more firmly it becomes established as a regular and recognised system, the more will this latter class increase, furnishing to the steamers a constant supply of skilful watermen, content with their occupation, and looking to it as their natural means of support.

Besides their chartered rights, the watermen appeal to their public services as a ground of support against their rivals the steam-boat companies. We have seen above, that some of the earliest of the acts relative to the watermen of the Thames had for their object the regulation of impressment; and it appears that at the present time, this body is liable, on the breaking out of a war, to be called upon to furnish five hundred men towards the manning of the navy. This we believe to be a condition on which the rights of the watermen are secured to them; so that so long as those rights are maintained, the watermen have no ground for complaining of their being subject to the levy in question. Nor indeed do they complain of it, they seem ready and willing enough to perform their part of the bargain; but it appears to us that they press somewhat over-eagerly upon the Government the policy of keeping up the Watermen's Company as a means of supplying sailors to the fleet. For we conceive, that on occasion of any future war, however great may be the demand for sailors, and however well fitted the hardy and experienced watermen of the Thames may be to supply that demand, still as our steam marine is becoming very considerable, and appears to be destined to act an important part in future naval warfare, it is by no means sound policy to discourage the Thames steam craft in order to preserve the Thames wherries. For steam-frigates requiring to be manned as well as sailing ones, Government will probably find five hundred men accustomed to the navigation of steam craft, fully as valuable as an equal number of the watermen whom they formerly called from their oars. The bargain, in short, may have been good for both parties at the time it was made; but now it would be preposterous to confirm to the watermen as a compensation for their liability to naval service a monopoly of the river traffic, which experience has proved to be conducted more conveniently and economically by the use of steam power.

In these observations we express no opinion respecting the claim of the watermen to compensation in case of their privileges being curtailed or cancelled. The rationale of compensation for vested rights and chartered privileges appears to be very simple and clear, whatever may be thought of its equity. Let any change be imperatively demanded by the altered circumstances of the times, and it is ultimately effected; and they who suffer by the change receive compensation — if they are able to speak loud enough to obtain it. It remains to be seen whether the Watermen's Company have sufficient weight and interest to obtain a good price for the withdrawing of their opposition; but one thing we conceive is already decided — that their opposition cannot stop, though it may for a time retard, the progress of steam navigation on the Thames. The traffic of the river cannot return to its former channels; the watermen can never again have the sole conveyance of passengers till father Thames turns back his tide and flows from Yantlett Creek to Windsor.

It is impossible for the watermen to compete with the steamers, either in speed or cheapness, in the general traffic between steam-boat stations; but a sufficient incidental traffic remains, which it is in their own power to increase to a very considerable extent. They would do well to take a lesson from their rivals. By the steamers, the fare is fixed and well known; it is paid without trouble or annoyance, and received with civility. By the wher-

ries the rates are no less clearly fixed; for sixpence, a passenger may buy a list of them, and have it always at hand to refer to: by law, each waterman is bound to have a true list in his boat, and to produce it for examination by any passenger on demand, under penalty of forfeiting his fare; but it is notorious that the legal fare is never received with civility, the passenger who proffers it being generally treated with abuse. It would seem as if the watermen, in this respect, act upon the principle which led Mr. Squeers, in the memorable scene at the Saracen's Head, Snow Hill, to box the ears of the little boy whom he had secured as a pupil, through his vexation at having ensnared no more: just so the waterman, soured by the decline of his business, vents his ill-humour on those who do come to his boat — treatment not the most likely, certainly, to lead to a renewal of the intercourse.

Another petty annoyance — part of the same system — is, that at almost every stairs or landing place passengers are assailed by a little ragged boy with cold-looking bare feet, begging coppers for "Jack who keeps the stairs clean," an office which the watermen are bound by their regulations to discharge themselves, and for which they would seem to have plenty of time while waiting for passengers. These things must be amended before the watermen can expect to make the most of the traffic that remains to them.

That fewer watermen are employed since the introduction of steam power on the Thames, notwithstanding the numbers engaged in connection with the steamers, both on board, and in boats conveying passengers to and from the vessel at various points of her course, is an undoubted fact, as is attested by various witnesses examined before the Blackwall Committee: yet, when we consider the vast amount of labour employed in the production of the machinery, which enables a smaller amount of men to navigate vessels conveying a number of passengers increased beyond all means of calculation, we cannot doubt that the extensive employment of steamers on the river has called into exercise in other quarters a much greater quantity of labour than it has superseded on the river; and so it always is with mechanical improvements; while the old system declines, the new rises into a more vigorous life than ever the old enjoyed. Thus, in the present instance, while the watermen stand idle at their plying places, the workshops of the mechanics engaged in the construction of the steamers are in unceasing activity; and happily the declining and the flourishing occupation are here exercised side by side, so that the difficulty of transferring labour from the one to the other is not increased by distance. This circumstance plainly suggests to the watermen a most important means of accommodating themselves to the change which they cannot prevent. We do not expect that they should quit the oar themselves, and take up the hammer and file; except, indeed, in rare instances, where their skill has proved to be such in the occasional repair of their boats, as to give them a better chance of living by a mechanical occupation than by their own accustomed business; but we point to the new occupation as supplying ample means for the advancement of their children, and as being well calculated to make an adequate satisfaction to the succeeding generation for the temporary injury inflicted upon the present race by the inevitable progress of science.

Having thus endeavoured to give an idea of the present state of the river traffic, the constitution of the Watermen's Company, the powers with which they are invested, and the use which they make of those powers, we come to the consideration of the equity of the present state of things, and the question whether there is any need of alteration in the existing provisions for the government of the river craft. From what we have already stated,

it must appear sufficiently evident, that the interests of the steam-boat companies are not sufficiently represented in the bodies which have the power of making regulations for their government: indeed, they can hardly be said to be represented at all. Their sailors are, it is true, all free of the Watermen's Company; but that company, as we have seen, is not so constituted as to feel the influence of the opinion even of a majority of the freemen, and we do not contend that those employed on board of steamers are at present a majority; and not only is the labour employed by the steam-boat companies totally unrepresented in the court of Warden and Assistants of the Watermen's Company, but their capital, also, large as it is. In the Court of Aldermen, which, as before stated, has a veto over the Watermen's Company, and the power of making bye-laws, the capital of the steam-boat companies has the same chance of making itself respected, and its interests attended to, as property invested in any other way. It has, however, the disadvantage of being comparatively a newly established investment, while the watermen appeal to long standing and vested rights, a difference the effects of which are always felt in civic bodies. This is, however, a natural consequence of a feeling independent of all law, and superior to all legislative enactments, the respect paid to antiquity; and of it, therefore, no reasonable complaint can be made. But we submit, that the present constitution of the Watermen's Company is manifestly unjust towards the steam-boat companies. It may have been perfectly equitable for the watermen to have the power of making laws for the regulation of the traffic, while they alone were concerned in it, and owned every boat on the river; it may have been very fair even at the passing of the watermen's act of incorporation, to confirm to them this power by positive enactment, the steam craft on the river being as yet so insignificant as to claim little notice; but now, when the amount of capital invested by the steam-boat companies has become by no means unimportant, when it is probably equal in amount to that invested in wherries and barges by the free watermen, if not even greater, it appears to us to be by no means equitable that this large amount of capital should be unrepresented in the Court of Warden and Assistants, they (the Watermen's Company) being thus interested parties, while at the same time they are legislators.

As a natural consequence of this state of things, the steamers on the Thames are at present a nuisance in the eye of the law, and liable at any time to be put down by law as such; and enactments almost obsolete are still suspended *in terrorem* over the heads of steam-boat captains, ready at any moment to be enforced at the mere pleasure of the Watermen's Company. Now, we ask the steam-boat companies, are they content still to lie under the lash of their rivals, wincing only when it falls, but humbly thankful when they are allowed to break the law without punishment. It may be, though we very much doubt it, the best policy in a pecuniary point of view, for the steam-boat companies to pay no attention to the dormant powers of the Watermen's Company, content with fighting them on the ground of each clause in turn, as they bring it forward as the subject of legal proceedings; but sure we are, that a bolder and more determined course might be expected from those who have the working of one of the mightiest powers of modern times, than thus to succumb to the fast-failing strength of an institution more fitted to the past than to the present age.

It is not, however, by individual or casual exertions, that the steam-boat companies will obtain such modifications of the Waterman's Act as shall suit it to the altered circumstances of the river navigation, — there must be

energy and unanimity. The bills introduced into parliament last session failed, from the want of this union among the companies; and so far as we were able to judge of the nature of their provisions, we do not regret their loss, as we fully expect they will be succeeded by much better measures. They proceeded too much on the principle of destroying the existing machinery, or erecting new contrivances by its side, instead of the more rational and feasible plan of adapting the old, by reconstruction, to the altered wants of the case. The idea of leaving the watermen under their own company's direction, and putting the steamers under another management, was injudicious, as tending to perpetuate the existing state of hostility between the parties; whereas the two kinds of navigation have surely enough in common to make it desirable to keep them under a common direction, in which the interests of each should be fairly represented. This plan would also be found by far the most convenient in the adjustment of claims of compensation for damage resulting from the collision of steam and other craft, which will occasionally occur even under the most careful management. Again, we would most undoubtedly preserve the institution of apprenticeship: if the present term be needlessly long, let it be shortened; if it be fenced in by unnecessary restrictions, let it be opened; but all experience is in favour, as even our short list of accidents will show, of an apprenticeship as a guarantee for skill and knowledge in the safe navigation of the river. It is plain, also, that the same knowledge of the river being necessary for both kinds of navigation, one apprenticeship is sufficient, and, at the same time, by including rowing and steam-boats under one system of common management, labour will be the more readily transferred from the one to the other as circumstances may require.

It will, we doubt not, be granted without hesitation, that the interests of the steam-boat companies require a revision of the Waterman's Act; it may appear less obvious, but we believe we shall be able to prove that the public safety no less requires such a revision. The Watermen's Company are generally looked upon as the guardians of the public safety on the river, but whether it be from the want of the will or of the power, they have certainly neglected to enforce certain of the bye-laws made under their act, which we hold to be clearly of the highest importance in this respect. In the case which we select as an instance of this neglect, it will be seen that it is the lives of the passengers and the property of the *steam-boat companies* that are put in jeopardy; in the case in which the Watermen's Company have bestirred themselves most, the speed of steamers in the Pool, it is on the other hand the property of the *watermen*, in addition to the lives of the passengers, that is alleged to be endangered. It is perhaps natural for the Watermen's Company, if their means be limited, to pursue such a course; still, if it be proved, that from any cause whatever the public safety is not efficiently secured under their guardianship, we come to the same conclusion, —that the system needs a careful revision.

The 33d section of the bye-laws of the court of Mayor and Aldermen, enacts, under a penalty not exceeding 5*l*., "that no person shall act as master or chief steersman of any steam-boat or sailing passage boat within the limits before stated, till approved or licensed for the office by the master, wardens, and court of assistants;" and further, under a similar penalty, "that he shall not carry a greater number of passengers than allowed by the license granted to his boat; the tonnage of such boat, together with the number of passengers allowed to be carried therein, to be painted upon the after or most conspicuous part of the companion, or some other conspicuous

part of the vessel, in large capital letters and figures not less than two inches long, and broad in proportion." This section appears to have become a dead letter. Respecting the first clause of it, we make no very heavy complaint; the Watermen's Company have probably come to the conclusion, that the mere fact of the owners of a steam-boat entrusting her to the care of a person, is as efficient a guarantee for his ability and experience, as even a license granted by themselves. Still if it be so, if this clause be unnecessary so far as steam-boats are concerned, the word "steam-boat" should surely be struck out; this, in short, is one of the rods suspended *in terrorem*, which we would have removed.

The second clause, however, does appear to us very important, and the neglect to enforce it totally inexcusable on the part of the Watermen's Company, if it be indeed their office to watch over the safety of passengers by the river conveyances. The newspaper complaints of the over-crowding of steamers are becoming nearly as frequent as those before mentioned, of the reckless speed of the steam-boats in the Pool, and they are, in our opinion, much the better founded of the two. The rule, indeed, appears in general to be with those who have the management of steamers, to receive on board as many passengers as offer, so long as there is but room for one more to insert himself edgeways. The Greenwich and Gravesend boats are reported as crowded to excess on fine Sundays and holidays. Besides the inconvenience to passengers, which of itself is discreditable to the companies that undertake to convey them, there is likewise danger of a part of the crowd being pushed overboard, on the occurrence of those fluctuations to which crowds are always subject even on land, and much more on water. These are however large and substantial boats, and there is little chance of an upset, however heavily they may be laden. The London and Westminster Company's boats, on the other hand, designed for above-bridge traffic, are small, seldom amounting to more than forty or fifty tons, and shallow built, rarely drawing more than from two and a-half to three feet of water; yet, on a fine summer Sunday evening, we have seen these tiny craft staggering under a cargo of 200 passengers, all on deck too, making the boat top heavy, as few could be prevailed upon to forsake the fresh air by going below. We have heard even of 260 having been stowed, when the cabins also were full, as the night air became cool. There is indeed a degree of safety in your deck being so crowded as not to have a square inch to spare, your passengers *must* stand still, and so cannot upset the boat by crowding to one side. But suppose any thing to occur to alarm them; suppose such an accident as we have related to have happened to one of these very boats, the running foul of the pier of a bridge. The result would probably be, — first, the shaking off, not of one, but of many passengers crowded round the taffrail, and probably the upsetting of the whole from the motion excited by alarm among the crowd on deck. It will be said, no accident has happened from over-crowding; happily not at present, but is not such an accident as we have supposed possible? Is it not probable? If it be only possible, the Watermen's Company are proved inefficient guardians of the public safety, and a revision of their act is requisite. Our too usual mode of proceeding with respect to accidents, is this, — we allow them to occur by the neglect of the most ordinary precautions suggested by common prudence. Then "an intelligent coroner's jury, after a protracted and laborious investigation," brings in a verdict, charging the owners of the machinery, or whatever it was that caused the accident, with gross and culpable negligence, and inflicting upon them a heavy deodand, as a warning to be more

careful in future. Thus do we first of all lose lives, before we bestir ourselves to prevent lives from being lost. Fearful indeed will be the experiment in the case which we have imagined; such an accident, "at one fell swoop," will exceed the total destruction of life in the Pool probably since the first river steamer disturbed its waters.

We will now endeavour to indicate a few points on which the amended act for the government of the river should contain provisions for the regulation of steam-boats. The very passing of an act for their regulation recognises them as a legitimate conveyance, and at once frees them from the imputation of being a nuisance to be barely tolerated, rather than a great public convenience to be used and encouraged. It being decided that they are not to be put down by law, it follows necessarily that no enactment must be allowed to continue, inconsistent with their safety in navigating the river. The allegation universally brought forward by those connected with the steamers, and supported, as we have shown from the Blackwall evidence, by habour-master, pilot, and lighterman, that the present legal rate of five miles an hour in the Pool is not sufficient in all states of the tide, to allow the necessary steerage-way, must be carefully examined. The bare assertion of watermen, however respectable, must not be taken as conclusive evidence on this point; for in the present state of feeling on the subject they are not disinterested witnesses. And besides, we greatly doubt their competency to form an unerring judgment on the subject; we would not take their opinion unhesitatingly on any point of steam navigation; just as we should not admit the dictum of a stage-coachman respecting the rate at which it would be safe to work a steam-coach on a turnpike road. The facts of the case are readily ascertainable by experiment; and experiments must be made, at all times of the tide, by properly authorised persons, competent, but disinterested, before a rate of speed can be satisfactorily determined. Such a commission it would not, we imagine, be difficult to constitute; probably the best persons to form it would be officers of the navy, chosen partly from those commanding steam frigates, partly from commanders of sailing vessels of war: their experience would enable them to decide most, if not all, the questions at issue; and their total independence of both parties on the river would be a satisfactory guarantee for their impartiality. When once it is ascertained what is the lowest speed at which steamers may be navigated with safety, a rate *at the least* equal to that must be allowed to them, unless it is resolved to put them down altogether. And if this rate, whether four, five, six, seven, or eight miles an hour, be found inconsistent with the safety of wherries and lighters, as at present built and loaded, then the wherries and lighters must adapt their build and loading to the state of the river for which they are intended. The Thames, in short, must be considered as subject to a peculiar kind of swell,—not exactly a land-swell, nor a sea-swell, but a steam-swell; and those who embark upon it in boats unsuited to its navigation, after the fair notice given by a well-digested legislative enactment on the subject, will have no more cause of complaint of upset than the little Cupids whom we see represented in pictures paddling about in cockle-shells upon the sea —a mode of conveyance picturesque no doubt, but somewhat dangerous, except to passengers who, like themselves, have wings to depend upon in case of accident.

In conducting these experiments, the attention of the proposed commission should be drawn to the consideration of the best construction of steam vessels, a subject on which we have yet much to learn. Every improvement

in this respect, diminishing the resistance to their passage through the water, lessens the swell, at the same time that it gives greater power of rapid motion. For this part of their inquiries it would probably be desirable that the commission should be assisted by one or two members of general scientific acquirements, in addition to their own practical experience in steam and sailing nautical affairs. It is curious to observe the difference in the smoothness with which different steamers work: one bustles through the waves, raising a prodigious disturbance both at stem and stern, and *churning* with her paddles most vigorously, reminding the looker-on of a stray goose, twenty yards behind the rest of the flock at feeding time; while another, as rapid as graceful, glides along like a swan, with scarce a ripple before or behind, and only a slight wave proceeding from her paddles. That it is the interest of steam-boat proprietors to adopt improvements, thus economising the power of their engines, while they add so much of beauty and of grace to their boats, and of comfort to their passengers, cannot be doubted; it might, however, perhaps quicken their eye to their self-interest, to license their boats for a speed adapted to their build, and proportioned inversely to the disturbance they create as they pass through the water.

It has often occurred to us, while crossing the bridges, that the nuisance of the steamers passing underneath is so intolerable as to argue great patience on the part of those who day by day endure it; for friendly as we are to steam, we are hostile to smoke; and we can only suppose that so little notice is taken of the subject, from its being everybody's business, and therefore nobody's. We would, therefore, suggest to the commission, as a point of inquiry, whether it be not desirable to impose upon the up-river steamers a penalty for not consuming their own smoke; probably, likewise, on the river boats in general, and on sea-going vessels while in the river, as the nuisance is great to the shipping and the neighbourhood. Abundance of schemes are afloat for the consumption of their own smoke by steam-engine furnaces; the measure proposed would speedily bring the best of them to bear. And meanwhile, the only evil inflicted on the steam-boat companies, in return for the good to the public, would be a temporary increase in expense in the burning of coke, either by itself, or with a proportion of anthracite coal, which produces no smoke. This increased expense in steam navigation would of course be covered by a slight advance in the fares, if necessary; though we believe it would be so trifling as not to require any such measure. We have precedent for an enactment of this kind in the case of locomotives on railways, which are compelled by their respective acts to use coke. And the steam-boat companies themselves would have reason to be thankful for the gentle force which had constrained them to their own profit, when once the system of home-smoke consumption had thus become general; for the smoke, by no means ornamental when turned out of the funnel, is useful and economising fuel when consumed in the furnace.

An important point on which the proposed commission would be called upon to report, is the means of relieving the Pool from the over-crowding of shipping, which is, beyond a doubt, the main source of danger both to steam and sailing craft. Two undertakings of great importance are at present in progress, which will tend, when completed, to effect this desirable object. The Blackwall Railway, the works on which are, according to the late report, all contracted for on condition that they shall be completed by the end of the year, is expected by its promoters to offer inducements sufficient

to detain at Blackwall many of the vessels which at present come up to various points of the Pool: and the Thames Haven Dock, with a branch railway uniting it to the eastern counties line, is likewise advancing towards completion; the object of it is to offer to colliers especially a point for discharging their cargoes with greater expedition and less risk than is at present effected in the Pool. A third plan for the same object as one or both of these, is that of the Deptford Steam Ship Dock Company, to communicate with the Greenwich Railway, which has advertised its intention of bringing a bill into parliament during the present session.

That great additional accommodation will thus be afforded to shipping in the port of London is beyond a doubt. It will be an important point to be considered, whether these new companies should be left to attract craft to their docks and termini by the indubitable advantages they can offer; or whether a legislative enactment is called for, to distribute the craft into classes; as, for instance, to detain the steamers at Blackwall and Deptford, and the colliers at the Thames Haven Dock. Considerable diversity of opinion on this subject prevails in the Blackwall Railway evidence. On the one side, many proprietors and directors of steam-boat companies expressed an inclination to stop their vessels at Blackwall when the railway is completed, with a view of avoiding the expensive dangers of the Pool, and at the same time expediting the journey to their passengers. Others, especially such as are interested in wharfs along the Pool, strongly maintained that no inducements could be offered by the railway sufficient to keep the steamers at Blackwall, without a compulsory enactment, the idea of which they denounced as unjust and inexpedient. Other witnesses connected with the general navigation of the river were pretty equally divided in opinion on these points. A few suggestions which have occurred to us in the course of this inquiry, are offered as an assistance towards arriving at a conclusion.

And first we would ask, why are the *steamers* especially selected as the description of craft that should be detained, either voluntarily or by compulsion, at Blackwall? The Pool is granted on all hands to be over crowded: which vessels, then, must be removed? We should suppose those which are most dangerous in a crowd, as being least manageable; and it seems natural to expect that a steamer, having her source of motion *within herself*, should be more under control than a vessel moving mainly by wind and tide. And what says the evidence? Hear Mr. Joseph Adams, proprietor and managing owner of some Leith and London steam ships (March 29, pp. 3, 4.): — "I have found, from upwards of twenty years' experience in managing the smack company's vessels, that the damages paid by the smack company were greater than we have ever paid for the steam vessels." "*Q.* With respect to the running foul of other vessels, a sailing vessel would be more liable to do damage? — *A.* Yes; they have not the same power to get out of the way." Captain John Fisher, harbour-master (March 24th, p. 20.), states, "I have seen vessels coming up to St. Katharine's Docks with (that is, towed by) a steamer on each side of her;" and he very properly reprobates the practice, which it is plain must be charged against the sailing vessels under whose orders the tugs are acting. The following question and answer from the cross-examination of the same witness (March 25th, p. 7.) will show that other causes of danger exist besides the steamers: — "*Q.* Have you not said before a committee, on a former occasion, that until the steam-boats were in the habit of towing these large vessels up to St. Katharine's Docks we never had the complaints which you describe with respect to the state of the Pool; that formerly we had less than 300 feet (that is, water-way

between the tiers riding at anchor in the mid-river and the vessels moored alongside the wharfs), and we never had a complaint till those large vessels came so high up the river, and caused damage?—*A.* That answer does not allude to steam-boats." We quote it as alluding to sailing vessels of 600 tons burden, or thereabouts; and take for granted that, if the question did not correctly report the captain's evidence "on a former occasion," he would now have protested against the inaccuracy. It seems, then, to be proved, that these large ships, besides helping to fill up the Pool, are not so manageable as the steamers: if they cause fewer accidents by swamping, they cause more by fouling; and such being the case, we submit that the very raising of the question, whether the *steamers*, rather than others, should be compelled to stop at Blackwall, is another symptom of the prejudice against them as dangerous interlopers, and tolerated nuisances, which it has been one object of these remarks to remove.

But even supposing that the steamers were, as seems by some parties to be supposed, always in the wrong, a serious difficulty would attend a prohibition of their navigating the Pool. Take, for example, the case of the Waterloo Bridge and Gravesend boats, which offer to the inhabitants of the Strand and parts further west the readiest way of going down the river to that favourite resort of the Londoners. These vessels being put down by the general prohibition against steamers navigating the Pool, the journey from the Strand to Gravesend, at present so easily performed, would be cut up into three portions — to the Blackwall Railway terminus by omnibus, or by steamer to London Bridge—the railway to Blackwall — and the steamer forward. Similar inconvenience would attend the projected prohibition in the case of all the Hungerford boats that go below the Bridge; and, consequently, we ask, whether the degree of danger still incurred by the navigation of steam vessels through the Pool is so considerable, and at the same time so totally irremediable by better harbour regulations and other means, as to call for a prohibition leading to such decided abridgment of public accommodation?

It will perhaps be said, these Hungerford and Waterloo Bridge boats are so small in build, in order to allow of their going up so high, that they may safely be excepted from the general prohibition, and allowed to navigate the Pool under certain restrictions as to speed; but that the large steamers engaged in the coasting and foreign trade must be prohibited from coming higher than Blackwall, or Deptford at most, in case of the projected steam dock being constructed there. And certainly this exception would so far obviate our objection; a single change of conveyance at the beginning or end of a voyage of several hundred miles would be less felt than two changes in the course of twenty or thirty miles. Coasting and foreign steamers might land their passengers with considerable convenience at Blackwall or Deptford, giving them the option of taking their own conveyance thence, or from the stations of the railways in town, as they might prefer. For the *goods*, however, which these vessels carry, there would be considerable inconvenience in compelling them to stop at the points mentioned. Such as are to be delivered in town would not, indeed, be exposed to more than one trans-shipment, as the wharfinger objectors seem to suppose; for we doubt not the railway companies would make arrangements to load the goods at once from the steamers into the waggons of the consignees, and deliver them at the termini, waggons and all, ready to be immediately horsed away for delivery. A considerable part of the goods forming the cargo of these coasting and foreign steamers are, however, consigned to par-

ties in the country; London is the mere *entrepôt* where they are trans-shipped to coasting vessels or canal boats, which carry them to their ultimate destination. These goods are at present brought up to the very centre of the inland canal and coasting traffic, and loaded, in many instances, at once on board their last conveyance, without the intervention of lighters at all. The compulsory stopping of the steamers at a remote point would render it necessary to trans-ship them in most cases by means of lighters; at least while the traffic continues to flow in its present channels, as for a long time it must.

Having said so much of the inconveniences that would arise from compelling unnecessary changes of conveyances, especially in short journeys, we should not be satisfied without expressing our conviction that this argument has been pressed too far by many, and the inconvenience indefinitely magnified by woful ignorance of the advantages possessed by railways for the conveyance of passengers. The Leeds and Selby Railway comes down to the side of the river Ouse, where steam packets attend to carry passengers to Hull; this (to compare small things with great) is a case tolerably parallel to that of the Blackwall Railway with the steam-boats lying off Brunswick pier. The ease and expedition with which passengers and luggage are transferred is very great; and the fear expressed by witnesses on the Blackwall Railway Bill, "that gentlemen might miss the boat," receives no countenance from fact. Certain trains are waited for by certain boats; and it is only by "gentlemen missing the train" that they will be in any danger of missing the boat — a danger not peculiar to any kind of travelling where stated hours of departure are fixed. It is no part of our object to give particulars of railway arrangements; but, in the face of the question, it would appear as easy to convey Gravesend, Margate, Ramsgate, and Hull passengers from London by the Blackwall line, as Aylesbury, Stamford, Leamington, and Sheffield passengers by the Birmingham Railway.

From these considerations it would appear that the idea of compelling steamers to stop at Blackwall or Deptford, and colliers at Thames Haven, would be attended at any rate with great difficulties. The following mode of proceeding seems more simple and easy, as well as equitable. Let the proposed commission examine into the whole matter of the harbour accommodation of the port of London, and especially let them report on the state of the Pool. Let it be decided what width may be allowed along the wharfs at each side for vessels to lie when loading and unloading; and what amount of accommodation may then be granted for tiers in the middle of the river, still leaving abundant room for the passage of ships up and down. We shall thus have the Pool mapped out into disposable berths, and clear water-ways; then let the berths be filled up by vessels of all sorts, that will only pay the dues, and obey the regulations. But let it be made a *first principle not on any account to encroach on the water-ways.* When the berths are full, no vessel can reasonably refuse to discharge at another, though less convenient point: there being no room, she plainly cannot come into the Pool. Under such a course of treatment, we believe the various descriptions of craft would speedily find their most advantageous points of loading and unloading; certain companies and certain merchants might be allowed to rent certain berths, and room in abundance would be left for all craft, whether steaming or sailing, to pass up and down. And with regard to steamers and colliers, we should find at length some such arrangement form itself as the following. The up-river boats to Gravesend, &c., would ply

through the Pool without danger or obstruction; they would still take up at London Bridge and elsewhere such passengers as found that the most convenient point of embarkation. From Blackwall and Deptford, down-river boats would ply, in opposition to these, and tending mutually to keep one another in order, and serve the public well and cheaply. The steamers in connection with the railways would of course attract such passengers as found their termini their most convenient points of joining; and especially such as, having little or no luggage, cared not for changes of vehicles, looking mainly to speed. So with the coasting and foreign steamers; some would start from one place, some from another, as was found on the whole most convenient with reference both to the passengers and the goods which they carry. With respect to the colliers, a considerable portion of them would at once crowd to the Thames Haven Dock; that is, such as supply the north-eastern portion of the metropolis, for which the Eastern Counties Railway terminus will be the most conveniently situated. Here too the plan might be adopted, of landing the coal at once into the waggons of the consignee, and sending up waggons and all by the railway. And the distance into town to which the supply would reach from the railway terminus would depend on the advantages offered by the new dock and railway over the old channel; for the present coal wharfs up the river would of course remain, for the convenience of such quarters of the town as they are by situation best fitted to supply.

Some such plan as this would, we think, effectually relieve the Pool, by bringing into use the new accommodations which will speedily be provided; at the same time that it would not interfere with the vested rights and interests of parties already engaged in the traffic of the Thames. That traffic is just now in a state of transition, from what formerly was a system, before steam power was known, through what is at present no system at all, to what we hope will ere long be a practical and perfect system. Through this transition state we would have the proposed commission empowered to guide it; and when the dock and railways which are soon to be completed, shall have come into full operation, and the traffic of the river have settled into its new channels, the flood which now troubles the old ones having subsided into a constant and gentle stream, we would then, but not till then, have them surrender their temporary powers into the hands of proper permanent authorities, selected, not from the watermen or the steam companies exclusively, but in due proportion from all parties interested in the river traffic, and constituted by a well considered act the future guardians of the Thames.

GEORGE SAND.

A LATE writer in the British and Foreign Review expresses his astonishment at the silence so generally observed by the periodical press of this country on George Sand. He is the more astonished at this, because he fancies he discovers a tendency gaining ground in a portion of the press, in some degree analogous to the tendency predominating in the works of George Sand; and he then proceeds to assign for this silence certain causes, which we confess appear to us of no great value. These are, on the part of the friends of that remarkable genius, a species of diplomatic tact, a little *ruse* of kindly fellowship, the hope of more easily introducing a few of the favourite ideas of the writer by leaving the name aside, as one calculated to excite too vivid an attention, or perhaps distrust. On the other hand, there would be — at least we have a right to suppose so — on the part of enemies, a sort of terror (for there can be no mention of contempt), that would prefer an affected indifference to a combat hand to hand, against talent so brilliant and varied, and a power of thought so incontestable. We know not exactly how much there may be in this; but, for ourselves, whenever we have thought of this silence, we fancied we discovered other causes, more simple and more natural: — on the one side, the consequences of a position once taken, of a judgment pronounced *ab irato* on performances incomplete and ill understood,—the consequences perhaps also of a political feeling that presided, though in disguise, at the condemnation, and which, for weighty reasons, loves not discussion: on the other side, an anxiety, an uncertainty, mingled with respect, as to the future path of the writer, a fear of being deceived and of being unjust or adulatory in anticipating the final route of a high intelligence matured amid storms, and eminently progressive.

There are intelligences whose mother-principle (one, definite, and unchangeable, like that which rules the architectural monuments of the Indies,) reappears, and reproduces itself whole and entire in each of their works, just as the other reappears in every one of the parts composing the monument; the successive manifestations may certainly enlarge the proportions, but it is to be found identical and complete at the basis of each. There are others, on the contrary, whose conception develops itself by little and little, and progressively, as in the labours of Grecian architecture, and, above all, of Christian architecture; so that its unity shines forth only in the mass: it is only by embracing the mass of its successive expressions, by running through every page in the life of the writer, that we can seize and estimate it; a fragment, a detached portion, will never yield the secret. Schiller — considered in his dramas, not in his lyrical poetry — seems to us to belong to the writers of the first class. George Sand, with almost all the great intelligences occurring in a period of transition, evidently belongs to the second. Hence, therefore, this tendency once recognised, a considerable reserve was imposed on criticism: and this it is that has not been forgotten by those who have kept silent till now; and this also it is that has been as entirely overlooked by those who were the first to speak.

At this present day, silence would be no longer seasonable. The productions of the woman who has adopted the pseudonym of George Sand, are sold and read every where, not only in Piccadilly, but we believe even in Albermarle Street. The anathema hurled against her three years since, seems to us singularly to have lost its force; and of this we desire no other

proof than the language held in the Review we mentioned at the commencement of our article. Moreover, the author has since then entered into a phasis of her development that explains, and, we have no hesitation in saying, redeems, her former aspect. The calm has succeeded the tempest; hope and faith, to doubt and the unquiet tossings of a soul in trouble. Her recent works doubtless contain many things that may still excite just alarm in certain parties, but nothing that can raise a blush in the youngest reader, or disturb the most modest conscience. Perhaps the time has now arrived for an effective protest against a judgment ill-founded in fact and equity. Most certainly Criticism has now-a-days something better to do than to say, "*Do not read.*" She would run the risk of being no longer obeyed. If she sincerely desire the welfare of her readers, she would say, "Read in such a manner, and under the safeguard of such a belief: do not read this without reading that also: never read without distinguishing the principle of the author from that of too great a number of her contemporaries—that which there is in her writings of objective exposition, from that which issues as precept from the depths of her soul." To us this would seem far better than to cry out, *Latet anguis*, and to launch an excommunication at one of the finest talents of our day, leaving inexperienced youth, who will encounter the hazard, were it only from the seductiveness of forbidden fruit, to contemplate its progress without a guide.

We know that the ground on which we are proceeding is slippery. We know that the judgment we seek to invalidate was pronounced in the name of something holy for all time and for all men—in the name of social morality. For no consideration on earth would we offer the slightest insult to this last. Once for all do we here declare, that we know nothing more hideous than genius coupled with immorality. With us art is great only by the apostleship which it fulfils in the sense of the education of the nation and of the human race. In our eyes the artist is either a priest, or a more or less practised mountebank. Severe towards all those whose labour is faithless to the eternal aim of all literature, the investigation and proclaiming of the truth, we are still more so towards genius, for with us duty and responsibility are in a direct ratio to capacity. But even as we have seen the noble name of liberty inscribed in the title of many charters manufactured with the object of shackling all liberty, so we have often heard a performance, the joint offspring of intolerance and superstition, adorned with the name of morality. We felt then, as in the case of George Sand, the right of claiming, in all honour and sincerity, a new trial before a better-informed public. Evidently our ideas of morality, or our applications of the principles she dictates, differ from those which presided at the decree of condemnation. We find in the article that has done the most to provoke a re-examination, certain names* quoted as "authors of better reputation," and whose "comparative inferiority of circulation and popularity prove the real depravation of public morals." And who are these? Coupled (Heaven pardon the reviewer) with the chaste and ingenious talent of M. Alfred de Vigny, are Messieurs Jules Janin and Eugene Sue, who we ourselves, in our article on "The Present State of French Literature," have stamped as the chiefs in the school of *immorality*. We find there the *naïve* affirmation, that if in the general corruption there be still hope for France and for Europe, it is in the personal character of Louis Philippe. We conceive, and certainly in good company, that Louis Philippe, by *his* system, has a right to the first rank among the corrupters of existing France. All this makes us doubt. In this eulogium of the king—in this predilection for the *feuilletoniste* of the *Journal*

* Quarterly Review, April, 1836.

des Debats, and for the parasite of the Duc d'Orleans—have we not a right to suspect some of those sympathies that may at times obscure a superior judgment? Madam Aurore Dupin belongs to the democratic faith; her works breathe a love of the people, and a contempt for aristocracies, great and little; she is allied by esteem and friendship with M. Lamennais and the most marked men of the rising faith; she was seen, when her friends were under prosecution, to encourage them by her gestures from the gallery of the public tribunals. Is there not here enough to disturb the impartiality of every honest *Conservative?* Might not the spirit of politics have slipped in—*anguis in herbâ*—unknown even to the writer himself, under the robe of morality, to throw the fatal *theta* into the urn?

It is not good to prostrate oneself lazily and blindly before the grandeur of intelligence, and to make a vow to follow it without inquiring where it leads. There are moments in which the pale and modest star that God has placed in simple bosoms—and that we call *conscience*—throws more light on the path of truth than does the blazing comet of genius in her haughty wanderings. But, thanks to God, these moments are rare. The giants by intelligence are, whatever they may do, nearer to heaven than we all; and neither is it good to pursue them, as in these days we are but too inclined to do, with distrust and intolerance: for very rarely does Genius—and it is one of the most consoling verities that we have saved from the shipwreck—ally herself with immorality. Just now, one would say, that our principal business is to establish the contrary, so zealous are we to confirm and to aggravate the slightest weakness, the most trifling slip of those powerful by mind. Tolerant enough towards ourselves and the mediocrity about us, we become puritans in virtue as to all that is elevated above the common level. We watch, as convicted of guilt, those beings whose eminently sympathetic organisation is destined to assimilate something of all the evils, of all the passions of their age. We criminate their tears, we stigmatise the least cry of revolt that escapes from their trembling lips, without reflecting an instant if it be not an exclamation of profound grief; we pitilessly curse them for the evil that we have contributed, all of us, to inoculate them with. Is this just? Is it profitable? Are we satisfied that there are so many points of belief left standing, that we may, without much inconvenience, thus weaken the belief in Genius?

To require of the artist that, in all his long career, he should never make a false step—that he should be calm and pure as an angel in the midst of a society agitated and corrupted,—that he should commune with God alone, whilst men, with all their passions and all their intrigues, are pressing around him, is, in truth, too much. That he should recover from every fall—that he should combat bravely and ceaselessly against the ill that is in himself and others—that whilst initiating us into the secret of his struggles, he should teach us also hope and duty—that he should die only when pointing the finger to heaven and the path of victory—this we may, this we ought to require, but nothing further. It is not Faust that chagrins us in Goëthe; it is that, after having there stated the problem of humanity, Goëthe died, without having found for our instruction, as its solution, aught else than indifference.

George Sand has done far more for us all; and it is not well of us to take only a fragment of his work to judge of the entire whole.

There is evil, much of evil now existing in France. There is more or less everywhere, but we have here to do with France alone. There exists there all that characterises a period of transition—want of a common faith, a relaxation of every bond, social disharmony; thence individualism—thence

the oppression of the strong on the weak. This exists not only in politics, but in industry, in literature, in everything, and that even by the admission of those who show themselves the most severe towards George Sand. We have said *in everything*, and consequently, therefore, in family life; for man is one, and if he carry the forgetfulness of the moral law into all his relations with society, it is not, we may be sure, at the threshold of the domestic fireside that he will reinstate it in his heart. If there be the habit of egotism and tyranny abroad, there will be the same also at home. If the weak is everywhere oppressed, the woman must be also. Of this, he who knows human nature will ask no proof.

In a society thus constituted, there must also exist what is inevitable wherever there is inquietude and moral anarchy — complaint, protests, reaction. Each wound draws its moan; each one oppressed makes his grievance heard, in a tone exaggerated, if you will, but always founded on reality; and if woman is numbered in the ranks of the victims, she will inevitably be heard in her turn. In France a protest was raised, in the eighteenth century, against religious oppression, by Philosophy; in 1789, against political oppression, by the Revolution; under the Restoration, against literary oppression, by Romanticism; since 1830, against domestic oppression, by the attempts of the Saint Simonians — attempts to be condemned as absurd and immoral, but exhibiting, nevertheless, an historical phenomena, and an indication of the state of things worth recollection. All these protests are being continued at this day under other shapes; and, whatever may happen, will be continued, until a change more or less radical affords full satisfaction.

Now, amidst this moral dissolution, — between this oppression and complaining, everywhere and for ever reproduced, in a society where the half of the marriages that take place are *mariages de convenance*, that is to say, marriages in which only the *interests* of two families are consulted, never the hearts and dispositions of the married — where, a little later, when the husband and wife begin to feel solitary, the first finds a social tolerance for his irregularities almost unlimited, and the other, at each step, encounters seduction spreading its snares for her weakness — where no power comes to aid the remonstrance of the woman against the errors of the man, and where, to shield her own crime from his vengeance, there is left to her only hypocrisy, — place, we say, a woman great in heart and in mind, endowed with lively passions, frank, high-spirited apart from poetry and enthusiasm,— forcibly weigh down her soul by unhappiness, make her drink drop by drop the sad experience of an ill-assorted union, of a yoke guided by a coarse and unintelligent hand, — emancipate her of a sudden, and throw her into the midst of an immense city, corrupt, exciting, and tumultuous, where her individual miseries are reproduced before her eyes on all sides, yet where the hour has arrived that every sufferer may freely express himself, — then place a pen in her hand, — could she write, at first, aught else than words of reaction, a rash and heated protest? Could you prevent a recollection of what she has suffered from transpiring in her effusions, a reflection of the hell that surrounded her from beaming on pages vividly felt and rapidly penned? And this being so, suppose that this woman, after an energetic complaint — after the agitation of a period devoted to the search after a happiness not to be attained here below, but which every gentle soul with a craving and a capacity for love has been caught dreaming of once in its life, at least, — suppose she gains calmness, and seeks to make her readers partake it, just as she had laid open to them in a book each phasis of her past existence of tempest — that her language purifies itself by degrees of all

scepticism and violent reaction — that she continues frankly to say to society — *There are great iniquities which you ought to correct;* but at the same time proclaiming to the individual, *Better is it to submit and sacrifice thyself, than to be a defaulter and a traitor to duty,* — would you brand with an ill-considered anathema the existence and the labours of such a woman? Living — and this you admit whenever you speak of France — living in a period of transition, on a soil quivering and incumbered with ruins, in a world where every great and generous belief is dead, and the hideous idol of *self, self* egotistical and sensuous, is throned alone in the midst, will you throw the stone at the artist, because his brow has not remained pure as the peaceful lake, whilst the storm is rolling in the heavens and over the earth — because his hymn has not arisen calm, solemn, and religious, as in the era of social order and harmonious belief? Will you confound the accent of grief with the cold language of that band of writers who themselves also see the evil, and depict it in their works in all its nudity, but without feeling its woes, without a struggle, and without making a single step to break from it, and to carry you with them?

Such is George Sand, his life, his labours. *She* has suffered — she revolted, — she has struggled — she has sought, hoped, found; and she has told us *all.* The long series of her compositions form a grand confession. Spirits young, pure, and innocent, not worn by unhappiness, whom contact with the world has not yet endowed with the knowledge of evil, may well — perhaps, should — abstain from reading it; but let the rest, numerous as they are, boldly go through the whole; they cannot, we say it with profound conviction, but rise the better.

It was in 1830, a short time after the insurrection of July, that Madame Aurore Dupin, then four or five and twenty, arrived at Paris. She had just taken one of those steps decisive for the whole of life, that place one thenceforwards in opposition with society—she had flown from her husband, M. Dudevant, at Nohant, near La Châtre. United to him, without the slightest inclination, since 1822, she was the mother of two charming children, Solange and Maurice, who had for a long time formed her defence against the distastes of an ill-assorted marriage, as they now form her most agreeable and favourite occupation. But the chasm between the pair, widened by opposition of character, was too profound for even the love of children to fill up; far from that, their education often became the source of bitter quarrels. These two beings could not love each other; for to love, is to understand one another, and M. Dudevant could understand neither the head nor the heart of his young and pretty wife. This gentleman, who had been a soldier, and of whom we suspect some traits to have insinuated themselves into the sketch of M. Delmare in "Indiana," was a man prosy to a degree, just according to law, loving his money, his personal comfort, and the calm of indifference, distrusting all emotion, ignorant of all enthusiasm, a thorough positive country gentleman, prone to sum up life by figures, and to regulate it by the watch. His wife, a being of poetry, of impulse, and of love, bearing Genius on her noble forehead, often thwarted and always misunderstood in her aspirations towards the infinite, art, and liberty, must have been thoroughly unhappy. An orphan at an early age— her father, M. Dupin, one of Murat's aides-de-camp, having died on the field of honour — confided to the care of her grandmother, whom she often mentions with tenderness*, and enjoying a considerable fortune, she

* "Listen; if you proclaim the republic during my absence, take all that I have at home, be under no constraint. I have lands, give them to those who have none; I have a garden, make it a pasture for your horses; I have a house, make it a hospital for your wounded; I have wine, drink

was able in her early youth to develop, without constraint, her intellectual bias, and that independent character which — under the inspiration perhaps of her own youthful recollections — she has given to her Edmée, that sister of Diana Vernon, in "Mauprat." Suddenly under the necessity of suppressing this, she long-time struggled valiantly to give a change to the peculiar faculties that were stirring within her, to her vocation now new moulded, to the fire of love and poetry that were henceforth to burn, "lost, unheeded, unseen," like the volcano in a desert isle. She poured out the crowd of unshared emotions that her heart contained in a multifold correspondence with her friends, to which she devoted a portion of her nights. She made it her active occupation to relieve misfortune; the poor of Nohant found an angel in the young wife; in the house she inhabited were supplies for their distresses, remedies for their diseases. Nothing availed. On one day, her domestic trials exceeded her strength. She broke her bonds, and left. That day was born the authoress, for necessity as well as her natural vocation placed the pen in her hand. She had brought M. Dudevant 500,000 francs; but, harassed by him, who demanded his wife or the money, she sacrificed the greatest part of it to preserve her independence, and to obtain the privilege of keeping her children with her.

We are telling facts; we judge not. Agreeing with the world on the general rule, we do not recognise in ourselves, or in any person whatsoever, the right of judging a special case, without positive *data* on the nature of the fact. Neither have we any thing to say on her life since 1830, on her travels, or her habits; we know too little of them to speak upon them, and did we know far more, we should still maintain silence. That whether from womanish caprice, as when, at sixteen, in her excursions on horseback, or from the belief that she would find it a kind of protection, she has often assumed the male costume; that she has been seen in various places with a *cigarete* between her lips — sinners that we are, we are compelled to declare at all risks that we do not consider a cigar decidedly *immoral;* — all this is not our business. We like not the intrusion of the press into the recesses of private life, under the pretext of morality; and it appears to us more than indelicate, as regards a lady. The life of *the writer* is whole and entire in his works; that is properly ours; the rest belongs to friendship alone. We should not have permitted ourselves even to touch on the principal event of the life of Madame Aurore Dupin, if it had not appeared to us directly connected with the tendencies of the writer, and if she herself had not often made allusion to it in one of her works.

These works, we have said, contain the history of her soul's life — the most complete autobiography, the most striking in its truth, and useful truth, that we know. Taken as a whole, they offer us an ascending line of progress towards good that is going on even whilst we are writing. *Indiana*, *Lelia*, *Jacques*, the *Lettres d'un Voyageur*, *Spiridion*, appear to us to mark the culminating points; her other productions come in, as valleys between the mountains, among the five books we have just named, and establish in some sort their continuity.*

---

it; I have tobacco, smoke it; I have my works in print, stuff them into your muskets. In all my patrimony, there are but two things whose loss would be cruel to me — the portrait of my old grandmother, and six square feet of turf planted with cypress and rose trees. It is there that she sleeps with my father." — *Lettres d'un Voyageur.*

* We are not here making a literary examen; we are suggesting a point of view at once moral and literary, for those who may be desirous of undertaking it. If we were speaking of beauties purely literary, we should place "André," among works of the first class. "Mauprat," generally little appreciated, also possesses in our opinion beauties of a superior order. "Valentine," notwithstanding its incontestable merit, with us ranks after; and after that still, "Simon." The

We know not in what manner "Indiana" has been read, so that an accusation of immorality against the author could be drawn from it; but we do know, that we read it before knowing this accusation, that we have re-read it before writing these lines, and that, on both occasions, we have found in it weighty precepts and a powerful lesson of morality. Without doubt, if by morality in a work of art, we are to understand the absence of all representation of the evil that really exists in the world, or that, following the old rule of classic tragedy, the evil should, visibly and in the fiction itself, bring on its punishment — the morality, in a word, of "Estelle," and "Nemorin," or of the educational fictions of Miss Edgeworth — we confess there is none in "Indiana." But what elisions should we not have to make throughout the whole of literature, did we limit ourselves to a view so narrow, and at the best good only for childhood. The morality of a literary performance appears to us to consist far less in the choice of the things represented, of topics, than in the manner in which they are treated, in the final effect which the book, by whatever means, produces on the soul. Whether virtue be unsuccessful or triumphant, whether evil finds its penalty or remains unpunished, in the work, matters little, if we are taught to revere and love virtue notwithstanding its misfortunes, to abhor evil notwithstanding the seductiveness of the temporal and temporary good fortune that may attend it. Not to the eyes, but to the heart, should the author speak; to our own hearts in particular should he remit the hatred of evil and the punishment of the guilty. Perhaps even from a certain sluggishness inherent to human nature, the moral impression on the soul is far less when the author charges himself with the execution of justice, and she can repose on the emotion produced in her by the representation of the offender in the act of expiation, than when, quitting the theatre or the book without justice being done, she herself feels called on in some way to avenge the innocent, and to blazon crime by an internal emotion to which the author has impelled her. Towards this kind of emotion it appears to us the soul must be impelled in reading "Indiana;" and the end, the inevitable consequence, is aversion for the seducer. Wherefore has it been said that "Indiana" is *a plea* against marriage? It is not even one against the husband. Certainly the inconveniences of a union between two persons whose incompatibility is beforehand written on every feature of their existence, are there strongly pointed out. But is that doing a work of immorality? Delmare, old, infirm, in character violent and domineering, is he, in the opinion of most persons, a suitable companion for a very young, beautiful, and impassioned woman, whose heart rebounds at all oppression? Unions like that, destructive of all happiness, are they not themselves a covert for great immorality, by rendering seduction a hundred times more to be feared? George Sand has made this thoroughly felt; but we would say that she was afraid of being unjust to the individuality she has chosen for the symbol of these particular unions, causing to bear on the woman all the responsibility of the fatal consequences they bring on; so much impartiality, moderation — we might say delicacy — has she thrown into the part that regards M. Delmare. His faults are shown; but not one of the good qualities that are usually met with in similar characters is left in the shade; his fits of despotism are almost counterbalanced by impulses of kindness; and when, just before his

shorter performances, such as "Le Secretaire Intime," "La Marquise," "Savenca," "Aldo le Rimeur," "Metella," &c., are of an unequal classification as respects their literary value. All, however, sparkle with beauties, and we make no absolute exception, save "Uscoque," which seems to us a sin against Art, against Byron, and against the natural tendency of the genius of George Sand. "Rose et Blanche," written in conjunction with another author, must not be reckoned among her works.

death, she places in his mouth a few words of love and protection for Indiana, murmured in his slumber, we feel that her intention is to turn from his hoary head every malediction, and to endeavour that pity be the only sensation. The indignation, the bitterness, the force of the burning scorn that is swelling the author's bosom, is wholly reserved for the seducer. There she is at ease; she has no fear of creating over-excitement. Never was there a portrait sketched with so absolute an intention of calling forth disgust, as that of Raymon; never any with so much art not to render the individuality too hateful at the risk of destroying the effect of the lesson. Raymon, with his talents and success in society — a seducer by liking, and indefatigable from the love of triumph — not accustomed to recognise woman in the *grisette*, descending to her from mere listlessness, and making himself beloved without thinking of the consequences — at times capable of a generous thought, but adept at repulsing it, and at tranquillising his conscience by sophistry — expressing passion with art, and growing really impassioned by force of eloquence — is the very type of the dangerous seducer so often to be met in the world: his love is thoroughly that *love-passion*, a hideous compound of sensuality and vanity, that exercises so powerful a charm — fascination we might say — over the weakness of inexperience. And in "Indiana," he is laid bare to the eye — a hundredfold beneath the husband-oppressor, cowardly, cruel, criminal as selfishness, of which he is the very highest expression. And the consequences of the seduction stand before the face of each of them, all frightful and irremediable; before the seducer, the corpse of poor Noun; before the seduced, the wreck of her illusion. For Indiana is *illusion:* she believes in goodness beyond the line of duty; she trusts blindly to the realisation of the ideal love that she bears in her own bosom, to the sincerity of the passion expressed, to the man's constancy, to a few glowing words whose source she has never studied. It is sufficient to read the letter of Indiana, in chapter xxii., to understand the mystery of her unhappiness; the secret of the book is contained in the ejaculation that the author puts into the mouth of Indiana herself, when Raymon reproaches her with having learnt love from romances, in the usual fashion of waiting-maids: "*What alarms and terrifies me is, that you are right,*" says Indiana. These words appear to us to contain — and we appeal to the sex as judges — a warning for all women of hearts ready to sacrifice duty to hope, more efficacious than twenty common-places of morality. How is it that puritanical criticism has forgotten these? How has it been forgotten that the author was writing, not an apology, but the history of Indiana — that the epithet *crime* is not spared to the flight of Indiana — that a passage of the tenth chapter reproaches her "with being too soon disheartened with her lot, and with not having given herself the pains of trying to make her husband better?" And why is there forgotten the love of Ralph — a love of the heart, respectful, and devoted, uniting in itself something of the threefold affection of the lover, the husband, and the father, a happy contrast with Raymon's harassing, unrestrained, and daring love of the imagination — which, till then mute, dares not manifest itself but at a moment of solemnity, and when the tomb of the *husband* has long been closed? Strange that the criticism which stigmatised the book as *immoral* should have quietly got rid of Ralph by calling him "a stupid cousin."

The same remarks that we have just made on "Indiana" apply to "Jacques," the only one of George Sand's books, by-the-bye, that contains a story of adultery*, if we except "Valentine." It describes a woman who

* M. Nisard in France, the critic of the Quarterly here, and twenty others after them, have nevertheless affirmed that adultery and a hatred to marriage form the subject of all these volumes.

sees not all the evil; a man who falls into it from wantonness of spirit! Is this not too often met with in the world? But it contains also a man who suffers and who dies, irresistibly driven to a disgust for every thing and to death by the selfish error of the guilty pair; and this man, in whom dwell virtue and devotedness — this man, to whom every thing attracts us, whose lofty figure stands out in the book like the statue of a god on its pedestal, whilst not a single sympathy is suggested to us for the cold and common lineaments of the *seducer* — this is Jacques, the *husband*. Jacques, then, is the entire book. If we sympathise with Jacques, the work, as to its moral effect, is absolved. If, whilst reverencing, we pity this man (misunderstood and sacrificed) who has not a single fault to reproach to his love — who lives solely by the heart, and to whom the sophistry of crime is hardly willing to accord a life of the head, a life of ideas,— then we abhor the crime, and we learn to distrust the sophistry dictated by selfish passion. If we feel all of the sublime there is in this husband, who at the eve of death pours out a benediction on the woman who has betrayed him, and whose only anxiety is how to spare her a pang, we are saved; for we it is who shall pass sentence for him on the two criminals. And if there be a woman who may be near falling, from imprudence, from passion, or from the impulse of a too precipitate judgment on her husband, she will say, on reading "Jacques" — "Perhaps I am working the irrevocable misery of a man better than myself;" or expect nothing more from books for her: "Jacques" is not written for women whom sacred love and the angel of modesty has for ever abandoned.

"Jacques" is written for those wives who, erring, not wanton, — hurried on, not corrupted — tremble, fascinated, on the abyss; who would recoil perhaps, could they measure its profundity, but in whom the insinuating voice of the seducer perverts the good instincts and sentiments, in their source generous, that murmur in the recesses of their breast, by decking the crime with the colours of devoted affection, by saying to them, "You are about to make one being happy, without injury to others, at the price only of a few twinges of conscience; you are going to transfer to love what indifference is unworthy of, and cannot comprehend." To such as these Madame Aurore Dupin cries aloud in her "Jacques" — "Stop; you will not fall alone into the abyss: you are responsible for another life, which you will kill with your own. There is one whose whole existence reposes on one word that you uttered to his ear, your hand clasped in his; — one in whom your fall will shake his faith in virtue, in love, in the faithfulness of promises, in human nature, and in God. You spread a desert around him; you wither all his present joys — all his future hopes; you inoculate an immortal soul with despair. Say not that you have only indifference to deal with, that you disturb no happiness, that the cloak of silence will cover your fault, and that none will care to raise it. How know you this? Perhaps this man whom you fancy busied with something else studies your looks, the embarrassed coolness of your caresses, the sudden blush that at times reddens your brow, to read there his destiny, his condemnation. Perhaps, a hundredfold more faithful and

---

"Permit me," wrote George Sand to the former, "to except 'Lelia,' in which there is not a word relating to social institutions. . . . . 'Indiana,' where no adultery is committed. . . . . 'Le Secretaire Intime,' which has for its subject the sweets of conjugal fidelity. . . . . 'André,' which is neither against marriage, nor for adulterous love. . . . . 'Simon,' which ends at the altar. . . . . 'Valentine,' where the old fatality intervenes to prevent the adulterous wife from enjoying in a second marriage the happiness she had not strength to wait for. . . . . 'Leoni,' in which the question of marriage is not at all brought into play." We may add to this list "Mauprat," "Spiridion," "Les Mosaistes," and every thing our authoress has published since her letter to M. Nisard.

devoted than you are, he is silent because he trembles to lower you before him, because he is conscious of his rights, and because it is to you, to your love, and to your virtue, rather than to his power, that he desires to owe his safety. Thus you fall into vice, and you misunderstand virtue: you are basely selfish and forsworn. Your crime is double; the consequences of it may be irrevocable, and repentance itself will be impotent to repair them." Such, in our opinion, is the lesson resulting from "Jacques." Is this immorality? Is it wrong that a woman should not despair of her sex, and that instead of crying, as do our tales of morality — "*You will be infamous and accursed before society, for your husband himself will tear the veil from your shame, and vengeance will pursue you till the last day*," — she should say, — "*None will know of it, but your husband will die of grief; none will know of it, but whilst you will be enjoying in forgetfulness, the father of your children will sink under the weight of the deceit and the dishonour that belongs to you, and which he will still endeavour to spare you.*" Yes, we confess it: our society is wholly founded on force: we educate by terror; at the top of the social ladder we have placed the scaffold for virtue to lean against. But is our system of amelioration so incontestably good and efficacious that we feel the right of branding as a rebel the writer that seeks to introduce into it love, that essays to preserve souls by reasons purely moral? There are women, believe it, whom the material vengeance that you threaten will not frighten. In the paroxysms of certain characters, personal danger will invest the crime with an appearance of devotion towards the object of unlawful love. To such women give "Jacques:" it will perhaps do what your laws have been unable to do.

In a class more elevated, more open to exceptions — near Faust and Manfred — must be placed "Lelia." This is not an immoral work — far from it; but for young spirits, who have not passed the double initiation of meditation and suffering, "Lelia" is a dangerous book. The perusal of it should be under restraint, or at least there should be the means of following it by one of the "Lettres d'un Voyageur," or by those "Lettres à Marcie," so admirable for resignation and faith in the future, that George Sand published in "Le Monde," when it was under the direction of M. Lamennais. "Lelia" is food for the strong; let the weak abstain, for there is in it that which may be the salvation of strong and tried organisations, but which may kill the tender and frail. It is a lesson whose aim is sanctified; but the details are horrible — such, perhaps, as may be necessary to act on society in a state of gangrene. Doubtless, courage was required to trace this picture of desolation, in which hope after hope is unlinked, torn by some diabolical hand from the tree of life, and falling, like dead leaves, into the sepulchre of decay and nothingness; and perhaps the writer, like Dante's shipwrecked voyager, now that she has traversed the gulf and reached the bank, cannot look back and reperuse her own pages without a shudder.

"Si volge all' onda perigliosa e guata."

Courage also is required to read it to the end; for we fear, at each step we take, that we are bordering on the desert of spiritual suicide: as before every general formula we feel a sensation of dizziness; and it is a formula of destruction, of negation without change, that "Lelia" undertakes to teach us. And yet her's is truly a high and sacred formula. The work of destruction that she fulfils, is that of a world worn out and corrupted, that rules over us yet, though in its agony. It is the world of *individuality*, the world that proposed to itself no other end, no other reason for its existence, than the search after prosperity. This, taken as the end of life, necessarily results in selfishness.

Lelia, whether the author intended it or not, is a symbol. The *dramatis personæ* exist not as human beings; they are speaking and moving formulas; and hence it is that they strike on the brain rather than on the heart; they cause us not to weep, as "Indiana" — they make us think. Trenmor is human *reason* — reason pure, solitary, dry, deprived of impulse and sensibility. Stenio is *passion*, — not that of the heart, but empthatically that of the imagination. Pulcherie is *sensualism*, — calm, logical, and elevated even to theory. Magnus is still sensualism, but that of the instinct, fiery, unreflecting, and at enmity with superstition. Lelia is the wandering spirit on the search amid all these varieties; she is the other half of Faust, the woman-Faust, the woman of the world we have just pointed to. What seeks she? Temporal happiness. And what seek all these personifications, all these *ideas* we would say, that are revolving round her like spectres, whom she follows each in turn? Temporal happiness: the one by the enjoyments of the flesh, or by repentance and humiliation before God; another by the exaltation of the poetic faculties; a third by the philosophic calm of stoicism; but all, whatever they may say, are only occupied with their existence. This, indeed, is the mother-principle in Faust; only as man lives more by the brain, and woman by the heart, whilst Faust seeks happiness in knowledge, Lelia seeks it through love; we feel that there rules in Faust a deep craving for power — in Lelia, a deep craving for life, for the expansion of sympathy. In Goëthe, Mephistophiles is destined to destroy power by doubt, much as he appears desirous of satisfying it by degrees. In George Sand, Trenmor destroys love, much as he appears to protect Stenio by his sympathies. Trenmor — Reason — the being who thinks, but whose heart beats not — who, instead of thinking how to *direct* the passions — instruments that God has placed at our disposal for good — fancies "that where they finish, man begins," and in whom the extinct passions have left only a mass of recollections and reflections, whose life is only the intellectual life, the *me* that contemplates and communes not — in a word, the being that muses (§ xiii.) — Trenmor sways Lelia. She has a heart less ardent and less powerful than his mind; her faculties are inferior to his musings. Tormented by a lively thirst for love, but bent on there meeting with absolute and infallible happiness, when she finds it not there, — when in submitting her experience to the cool analysis of individual reason, she finds only the *finite* to satisfy a spirit full of aspirations for the infinite, she curses life and love; — she leaves herself to be tossed between scepticism and faith, and resumes her internal struggle, her desires and her impotence, with this sorrowful cry, "Happy those who can love." Schiller, the poet of grand thoughts, had already given the answer, when he said, "*Those only love that love without hope.*" There is, in these few words, more than poetry: they contain a whole religious philosophy that we do not yet well understand, but that futurity will.

Life is a mission; its end is not the search after happiness, but the knowledge and fulfilment of duty. Love is not enjoyment, it is devotedness; if on the path of duty and devotedness God sends us some beams of happiness, let us bless God, and bask our limbs enfeebled by the fatigues of the journey; but let us not suspend it for long; let us not say — "We have found the secret of existence;" for the action of the law of our existence cannot be concentrated in ourselves; its development must be pursued without. And if we meet only suffering, still march on: suffer and act. God will measure our progress towards him, not by what we have suffered, but by how much we have desired to diminish the sufferings of others, by how much our efforts have been directed to the saving and the perfecting our brethren. Lelia,

like the world she represents, too often forgets this. Bound as she is in the folds of a philosophy that steps not beyond the *individual*, she never rises to the conception of the *social* life of her mission in the world; between her and the crowd there is no exchange; "she has no sympathy for the human race, though she suffers the same evils, and sums up in herself all the sorrows scattered on the face of the earth." She comprehends not God in humanity; she prays not with it; she looks aside at her own weak and solitary individuality; thence it is she fears it, and feels ready to revolt from it. Like her, and more than her, Trenmor, the philosopher, has not knowledge of a social end; he has no communion with what he calls *material life*, but what he should have called *exterior life*. He lives in himself and of himself, "without projects, without desires," so that no person can "make or unmake his happiness." Thought is the sphere of both; action they know not. They pretend to be acquainted with pity, love, and friendship, but it is not so; of these things they possess only the *idea* — not the *feeling;* they can advise, therefore, not persuade; negations and disenchantments are all they have to teach; they save no one — they make no one better. When Stenio separates himself, neither of them knows how to bring him back, and prevent his fall. Trenmor re-appears to him only when the evil is irrevocably consummated. In causing us to be born from one man, and in making us beings eminently social, God willed that our power for good should be enlarged just so much as we shall be careful to steep it in the common spring, and he has condemned to barrenness all philosophy that aims at confining itself within the circle of individuality.

Lelia is the development of this principle as to woman, as Faust — more perhaps by the instinct of genius, and by a logical necessity, than from the intention of the author — is as to man. Goëthe found man marching in the path of science without any other aim than *his* pride and *his* happiness; George Sand found woman marching in the path of love without any other aim than the full budding of *her* faculties, *her* happiness; and both have inscribed at the goal of these two courses — "Impotence and nothingness." By what fatality, by what injustice — so much the greater that Goëthe stopped there, and George Sand has advanced — has the first had absolution, while the latter remains under the burden of an accusation of immorality? Why has it been made a crime for one to have proved by a *tableau* — frightful we confess — that it is an illusion to desire happiness in life and love, of what kind soever it may be, while the other has been praised for having taught that to seek happiness in knowledge and power is an illusion often criminal? Is it from weakness of perception, or from malignity, that criticism has persisted in reading and judging as a vulgar tale what evidently is not so? And if no other resolution than that could be made, ought there not at least to have been recognised in Lelia — what certainly cannot be immoral — a negation of sensualism, a personification of exalted spiritualism? Decidedly, without more acumen, but only with a little more charity, criticism might have seen in this exposition of "a heart all bleeding, in this broken moan, mingled with groans, adjurations, and melancholy laughter," other matter than a subject for an anathema. The reproaches of the Prior of Camaldules to Magnus, the letter of Lelia to Stenio (§ xviii.), and, above all, the beautiful pages in which Stenio, before dying, holds up to our indignation Don Juan, the type of vain immorality, might well, we think, have weighed something in the scale.*

* Instead of this, the reviewer, — "honest, honest Iago," — has gone out of his way to pick out an immoral phrase put into the mouth of Pulcherie *the courtezan*, and has quoted it without explanation, as a maxim of the author! — *Vide Quarterly.*

"Lelia," "Jacques," "Indiana," are, of the longer works of Madame Aurore Dupin, those which have called forth the most exclamations against the immorality of the author; and if we have succeeded in pointing out a more just and more favourable route for the appreciation of these works, our task is nearly completed. We only desire to provoke a fresh and more considerate examination. We ask this, upright in conscience, proud of being the first to demand it in this country, and convinced, on the one hand, that there is benefit in reconciling society with genius — on the other, duty towards the author, if it can be done without inconsistency, in rectifying the decree that bears upon him. Social reprobation is a heavier load for high intelligences than we had believed it to be, and we have not been able to reperuse without emotion the following passage in one of the books of the lady we are speaking of: —

"Oh God, how sweet had been indissoluble ties, if a heart like my own had accepted them! Oh no! I was not made to be a poet, I was made to love! It is the unhappiness of my destiny, it is the hatred of others, that has made me a traveller and an artist. I — I wished to live the human life; I had a heart, it has been torn with violence from my breast. They have left me only a head, a head full of noise and grief, of horrible recollections, of images of mourning, of scenes of outrage. * * * And because in writing tales to gain the bread they refused me, the recollection of my misfortunes has crossed me — because I have dared to say that there are beings miserable in the marriage state, by reason of the weakness ordained for the wife, by reason of the brutality permitted to the husband, by reason of the infamies that society covers with a veil, and protects with a mantle of abuse, they have declared me immoral, they have treated me as if I were the enemy of the human race."

This springs from the bottom of the soul, and merits that attention be paid to it.

Those who shall undertake the examination we ask, will certainly find some hasty passages, some crude descriptions, that we should like better to be able to suppress; they will find some phrases hazarded, in which the abuses, the absurdities, the prejudices, and the vices of society are expressed by the collective word "*society*," some where there is used "*marriage*" in place of "*persons married.*" But, looking over a few details to get at the *ensemble*, judging the spirit rather than the letter, we are sure they will find true and high morality where superficial critics have pronounced themselves scared; the *seducer* depicted, exposed, and branded, under every form, by the side of the *husband*, judged with impartiality, often pitied, sometimes idealized; existing society painted with its vices undisguised, but always with an accent of indignation and affliction, that we never discover in writers such as Sue, Janin, Balzac, and Soulie; — these last condemn with a sneer. They will find that whilst these dispense their most brilliant tints in the colouring of vice, and thin them in their representation of virtue, never in the pages of George Sand is vice presented in a way to seduce the young imagination, never does virtue appear but surrounded with that glory of art that impels us to prostrate ourselves before it; there is always a protest in the face of crime, aspiration after good in the face of evil. They will find that it is not the *institution* of marriage, but the corruption of that holy institution; that not husbands, but *bad* husbands are dealt with; that if she has been led to think that "the scandal and disorder of women are *very often* provoked by the brutality or infamy of men, and that a husband who wantonly neglects his duties in idle talk, merriment, and drinking, is sometimes less excusable than the wife who betrays hers in tears, in affliction, and in repentance," she is at the same time ready to revere "that grand, noble, excellent, *voluntary*, and *eternal* love," which is marriage such as Christianity made it, such as St. Paul explained it; such too, if you will, as that of which chap. vi. title v. of the civil code expresses the reciprocal

duties (Letter to M. Nisard); such as the world, in the midst of which she lives, has but too much depraved.

And above all this, if they shall desire to reflect more conscientiously than has yet been done, they will discover that cry of deep and solemn sadness that springs from almost all the writings of Madame Aurora Dupin — that plea against the illusion of a tendency that consecrates life to a search after present happiness — that ever recurring *refrain* that she has put into the mouth of Jacques, one that our puritans in morality may find too severe, but surely not *immoral:* — "Life is a terrible waste: repose is a chimera; prudence is unprofitable; sterile reason serves only to dry up the heart; there is but one virtue — the eternal sacrifice of self." They will then demand, astonished, how this woman, a writer that fulfils with extraordinary powers a mission in the world of Art so substantially austere, could have been so mistaken, so little understood, so calumniated? And, thinking on the storm of misfortune that swept over her years of youth — on the immense and unsatisfied needs of this ardent spirit — on the blindly hostile, or servilely flattering world that she has had to traverse — on all the strong intelligences that pass away in this crisis of dissolution, dried up in the thirsty sands of despair, or prostituting their divine nature in the bye-ways of corruption — they will pardon the errors and the reaction that has signalised the first part of her course who has never betrayed the cause of truth, who has always pleaded the cause of suffering, and who has never, under trial, lost sight of the goal that alone could save her.

Yes, the trial has been rude, but it has been surmounted. The struggle no longer makes itself felt in the writings of Madame Dupin, unless by a kind of distant tremor, that makes us, children of the struggle, sympathise with her voice as with the voice of a sister — a sister in desires, in suffering, in resignation, and in that faith in a future, that we shall not see perhaps, but to which we owe ourselves entire. The "Lettres d'un Voyageur," to which should be added the "Lettres à Marcie," are, in our opinion, an immense step gained.* This work, full of poetry, and without which it is impossible to appreciate Madame Dupin, is the one we *love* most. It is a vast and beautiful country, calm and fragrant, and dimpled with fresh and limpid streams; true, here and there are tombs, but flowers, graceful as hope, grow above them, and the horizon opens to infinity.

The few pages we are about to give are taken from this book; they form a portion of a *morceau* suggested by the sight of the château of the Prince de Talleyrand, and were printed during his life. We believe our readers will thank us for substituting these for some pages of our own, which would have given them a far more feeble idea of the particular beauty of the book.

"THE PRINCE.

"'For, in short, of what use are we?' said he, sinking on a stone bench in front of the château; 'What noble employment do we make of our faculties? Who will be the better for our passage through life?'

"'We are of use,' said I, seating myself beside him, 'to do no harm. The birds of the field make no projects the one for the other; each of them watches over its own brood. The hand of God protects and feeds them.'

"'Cease, poet,' replied he, 'I am sad, and not melancholy; I cannot play with my grief, and the tears that I shed fall on an arid desert. Dost thou not understand what virtue is? Is it a stagnant pool, where the very reeds are rotting, or is it rather an impetuous stream that foams and hurries on its course incessantly, to give life and moisture to unknown shores? Is it a diamond, whose brilliancy the flint is to entomb in the bowels of the earth,

* "Spiridion," marks another; but it would carry us into a train of ideas that we cannot now follow out.

or is it rather a light that should shoot upwards like a volcano, and cast the magnificence of its splendour over the whole world?'

"'Virtue is, perhaps, neither of all these,' said I; 'neither the sepultured diamond nor the torpid pool, and still less the overflowing river, or the devouring flood. I have seen the Rhone precipitate his impetuous wave at the foot of the Alps. His banks were unceasingly despoiled by his impatience, the herbage had not time to grow and to flourish; the trees were borne away ere they had acquired strength to resist the shock, and the shepherds and their flocks fled to the mountain. All this tract was but a long desert of sand, of rock, and of stunted osier thicket, where the crane, planted on one of its sinewy legs, feared to rest the entire night. But I have seen, not far from thence, slender rivulets noiselessly stealing from the bosom of some secret grotto, and gently spreading o'er the neighbouring pastures that were drinking in their limpid streams. Balmy plants crossed the very bosom of the peaceful flood, and the nest of the water-bird hung o'er its crystal, and its little ones, gazing on themselves, fluttered their pinions, and thought they beheld the arrival of their mother. Virtue, bear in mind, is not genius, it is goodness.'

"'You deceive yourself,' cried he, 'it is both one and the other. What is goodness without enthusiasm? What is intellect without sensibility? You are good, and I am an enthusiast; believe me, we are neither of us virtuous.'

"'Well! let us be contented,' said I with a sigh, 'that we are not dangerous. Look at this palace, think on those who inhabit it, and tell me if you are not reconciled with yourself?'

"'Hideous consolation!' replied he, in a tone that affected me deeply. 'What! because there are serpents and jackalls, am I to congratulate myself on being a tortoise! No, O my God, thou hast not created me for inertness, and the more vice is prowling and yelping around me, the more I yearn to extend my wings and pounce on these vile animals with an eagle's beak. What mean you by your gentle streams and secret grottoes? Do you imagine that virtue is like those poisons that become wholesome in small portions? Think you that twelve good men, vowed to obscurity, and confined to the narrow limits of a retired life, are more useful than one pious man who journeys and who exhorts? The times of the patriarchs are past. Let the apostles arise, and make themselves seen and heard.'

"'Patience! patience!' said I, 'the apostles are on their way; they are coming by different routes, and in small parties; they are called by various names, and are clothed in divers colours. . . . What matter their divisions, their errors, their reverses, and their faults? They calmly answer,—"We shall die, we are men. But ideas perish not, and that which we have cast into the world will survive us. The world treats us as fools, ridicule assaults us, the shouts of the people pursue us, outrages and stones are showered upon us, the most hideous calumnies have wounded our souls, the half of our brethren have fled dismayed, misery eats us up; each day our feeble flock decreases, and perhaps not one of us will remain on foot to hail from afar the horizon of the promised land. But we have sown in the universe of mind a word of truth that shall germinate. Calm and satisfied shall we die on the sands of the desert, as that people of God that covered with their bones the limitless plains of Arabia, and whose new generation arrived, all youth, at the green hills of Canaan." Are these the words of a fool? And this priest who, all alone, one morning crossed his arms on his breast, and rising up in the midst of his prayer, with face and eyes raised to heaven, cried with a loud voice:—"Christ! chaste love! holy pride! patience! courage! liberty! virtue!"—were these priestly words? The walls of his cell trembled at them, and the angels in heaven, moved at them, cried,—"All-powerful God, a brilliant flame has just shot upwards from below, from that prostrate world. We have beheld, and lo! the light traverses immensity, and comes to expire at thy feet; abandon not yet this world, O merciful God, for at times there issues thence a ray that may rekindle the sun of its murky atmosphere; feeble cries, dispersed sounds, complaining aspirations from time to time pierce the sombre cloud that envelops it, and those remote voices that ascend even here, attest that virtue is not extinct in the heart of unfortunate man." Thus speak the angels, and be sure, O my friend, that not one of our good intentions is lost. God sees them, he hears the most humble prayer, and at the hour that we are speaking, these stars, that look down on us and hear us, repeat to him the words of thy suffering, and recount to him the virtuous anguish of thy soul.'

"'O, my friend,' cried he, throwing himself into my arms; 'Why art thou not always thus? Why so many days of apathy or of bitterness? Why so many hours of sarcasm or disdain?'

"'Because I am a man of weak health, and of a weak head,' said I, 'subject to spasms and megrims. God grant me his pardon for being unjust and ungrateful at such hours. The reproaches that I address to Heaven, and the hatred that I feel towards men, recoil on my heart like a wave of corroding bile; the purity of the stars is not tarnished by it, and Providence is not moved at it. Fatigue brings about the return of resignation, and once or twice a month it happens, that between anger and imbecility I feel myself in a good and calm disposition, in which I can receive and pray.'

"'Well, when thy soul attains these hours of calmness and consolation,' cried my friend,

'run and shut thee in thy garret, take the pen and write, — write with thy tears, with thy heart's blood, and be silent at the other time. When thou sufferest, come with us, — go not alone below to pace the length of those humid grottoes by moonlight; light not thy lamp at midnight, and do not stay in the dawning morn with thy elbows rooted to the table, and thy face buried in thy hands. Tell us no more that there are epochs when the good man should tie his hands and his feet that he may not act. Tell us not that Simeon Stylites was a saint, and admit that he was a fool. Tell us not that virtue is like the chastity of vestals, and that it must be interred alive to purify it. Affect not this tranquil indifference, and this voluntary inertness, which ill conceal the energies that distract thee; or, if thou sayest all this, say it only to us, who will endeavour to combat thee; say it only to me, — I will weep with thee, and shall suffer less in not suffering alone.'

"I pressed the hand of my friend, and said to him, after a moment's emotion, — 'Do not think, however, that my individual indolence makes me counsel repose to my ardent friends. When we can prevent a crime, it 's cowardice to wash the hands as Pilate did; but when, as is our case, we are lost in the vulgar mass, reason, and perhaps conscience, command us to remain there. . . . . Let us content ourselves with being upright in this retired life, where uprightness is easy for us. Let us be pure, since every thing is favourable for it in the bosom of our families and our rustic roofs. Let us not go to risk our little cargo of virtue on that surging ocean where so much innocence has perished, where so many principles have foundered. Are you not seized with an unconquerable disgust and a secret horror for active life at sight of this château, where so many foul projects and secret villanies are for ever hatching and brewing in the silence of the night? Know you not that the man who dwells there, has for sixty years been playing with peoples and crowns on the chess-board of the universe? Who knows if the first time that man seated himself at a table to business, there was not in his mind an honest resolution, in his heart a noble sentiment?'

"'Never!' cried my friend, 'profane not honesty by such a thought; that cat-like lip, closed on its fellow, large and overhanging as that of a satyr, a mixture of dissimulation and lasciviousness; those soft and rounded features, indices of suppleness of character, the scornful fold on that determined brow, the arrogant nose, and the reptile eye, so many contrasts in a human physiognomy, reveal a man born for great vices and petty actions. Never has that heart felt the warmth of a generous emotion, never has an idea of loyalty traversed that scheming brain. This man is an exception in nature, a monstrosity so rare, that the human race, while contemning him, has watched him with imbecile admiration; I defy you to bend before the most wonderful of his talents. Let us invoke the God of honest men, the God that blesseth simple hearts.' . . . . . .

"'Your indignation is bitter and your anger is cruel,' said I; 'if this man could hear us, this is how I should address him: — "May God prolong thy days, unhappy old man! Meteor soon to repass into eternal night! light that destiny has thrown on the world, not to lead men to good, but to bewilder them in an endless labyrinth of intrigue and ambition! In its inscrutable designs, Heaven has refused thee that mysterious emanation that men call a soul, — faint but pure reflection of the Divinity, — beam that sometimes gladdens our eyes, and yields us a glimpse of immortal hope, — mild and gentle glow, that from time to time reanimates our dejected spirits, — love sublime and undefined, — holy emotion, that makes us yearn for good with delicious tears, — religious terror, that makes us hate ill with energetic palpitations! Being without a name, thou wast furnished with an immense brain, and with keen and delicate senses; the absence of that divine and unknown something that makes us men, has made thee greater than the first amongst us, and less than the lowest of all. Infirm, thou steppest on men healthy and robust; the most vigorous virtue, the finest organisation before thee was nought but a fragile reed, thou wast master over beings more noble than thyself; that which was wanting in thee of their greatness made thine own, and now thou art on the brink of a tomb, that will be for thee hollow and cold as thine own bosom of petrefaction. Beyond this gaping vault there is nothing for thee, nothing of hope perchance, not even the desire of another life. Miserable! the horror of that moment will be such, as that it will expiate perhaps all the ills thou hast done. Thy approach was fatal; it is said thy glance fascinated like the viper's; thy breath was as the breeze of an April morning, withering the buds and flowers, and scattering them at the foot of the saddened tree; thy voice scared hope and candour from the face of those who approached thee. Animate problem, enigma of humanity, how many blossoms hast thou stripped? How much holy faith and pleasant imagining hast thou trampled on? How many recreants hast thou made? How many consciences hast thou falsified or destroyed? Yet, if the pleasures of thy declining years are limited to the satisfaction of an overfed vanity, to the uncertain enjoyments of a fastidious stomach, eat, old man, eat and breathe the odour of incense mixed with that of thy viands. Who can envy thee thy lot, and wish thee a worse? For ourselves, who pity thee as much for having lived as for having to die, we shall pray that at thy death-bed, the farewells of thy family, the tears of some faithful servant, may not awaken in thee an emotion of sensibility or unknown affection, that no spark may be struck from the flint that serves thee for heart. We will pray, that at the close thou mayest be extinguished

without ever having taken light at the beams of that sun that is instinct with love, that thine eye may not be moistened, that thy pulse may not beat, that thou mayest not feel the flutter that love, hope, regret, or grief excites in us; that thou mayest go to inhabit the damp bosom of the earth, without having felt at its surface the warmth of vegetation, and the sensation of life; that at the moment of passing into eternal nothingness, thou mayest not feel the tortures of despair at beholding hovering above thee the souls that you scornfully disowned, — immortal essences, that you boasted of having crushed under your haughty feet, and that will be ascending to heaven when thine own will pass away like the empty wind; we shall beseech that at that hour thy last word may not be a reproach to the God in whom thou believest not!' . . . . . .

"We quitted our seats, and my friend, returning to his first idea, said to me: — 'Whence comes it then that men (and I among the first, in spite of myself) are so jealous of the gifts of intellect? Wherefore do these alone obtain immortal crowns without the aid of any one virtue, whilst the purest honesty and the mildest goodness remain buried in forgetfulness, unless accompanied by genius or talent? Admit that this is grievous, and that it may confirm to wavering souls, that virtue is labour lost here below.'

"'If you consider it as a labour,' I replied, 'it is indeed a labour lost. But is it not a mild necessity, a condition of existence in hearts that have early and sincerely embraced it? Men pay it with ingratitude, because men are grovelling, credulous, and indolent, because the charms of curiosity have more power over them than the feeling of gratitude and the love of truth; but, in serving mankind, is it not from God alone that we must look for a reward? To labour for men with the sole end of being carried in triumph, is to act with a view to one's own vanity, and that kind of emulation will be extinguished and lost at the first slight that it encounters. Let us never expect any thing for ourselves when we enter on this barren route of devotedness. Let us endeavour to acquire sufficient sensibility to weep and to rejoice over our reverses and our successes alone. May our own heart suffice for us, and may God strengthen and renew it when it begins to fail!'

"'And yet, I confess,' said my friend, pursuing the thread of his reverie, 'that I cannot keep myself from loving this Bonaparte, that scourge of the first order, before whose shade all the secondary scourges, laid in the dust by him, appear thenceforwards so petty and so little mischievous. He was a great killer of men, but a great builder, a bold architect of societies, a conqueror, alas! yes, but a legislator! Does not that repair the evils of destruction? Is not to make laws a far greater good, than to kill men is a great ill? I seem to behold a great cultivator, a beneficent divinity, Bacchus arriving in India, or Ceres landing in Sicily, armed with fire and sword, clearing the soil, piercing the mountains, turning up the moors, burning the forests, and sowing in the ashes and in the wreck new plants destined for new men, the vine and the grain, inexhaustible benefits for inexhaustible generations.'

"'It is not proved,' I replied, 'that these laws are lasting. But admitting that, I cannot love the man whom God has used as a hammer to give us a new form. Like others, I was fascinated in my childhood by the force and activity of this destructive machine, on whom we confer the title of a great man, neither more nor less than on Jesus or Moses.' . . . .

"'But you are aware that there would be much fewer great men in the world, if the title was granted only to good men?'

"'I know it; but call them what you please, these are the only men whom I esteem, for whom I have any affection, and whom I would wish to register in the calendar of human greatness. I should enrol there the humblest, the most ignorant, from the Abbé de Saint Pierre, with his system of universal peace, to Father Enfantin, with his ridiculous dress and fantastic Utopia; all those who to some abilities have joined conscientious studies, patient reflections, sacrifices or labours destined to render man better or less wretched. I should be indulgent to their errors, to the meannesses of our condition, more or less prominent in them; I should forgive them many faults, as was done to Magdalen, if they had loved much. But those whose intent is cold and haughty, those lofty men, who build for their glory and not for our happiness, those legislators, who empurple the world and oppress the people to gain an extended territory, and there erect immense edifices, who are moved neither by the tears of women, nor the starvation of the aged, nor the fatal ignorance in which the children are reared — those men who seek nothing but their personal grandeur, and who fancy they have made a nation great, because they have made it active, ambitious, and vain as themselves, I disown them, I erase them from my tablet—I inscribe our *curé* in place of Napoleon.'

"'As you will,' replied my friend, who was no longer listening. The night was so beautiful, that its contemplation engrossed me; flashes of lightning from time to time blanched the horizon, and shed their pale light on the dark outlines of the forests that stretched along the hills. The air was fresh and penetrating, without being cold. This spot is one of the most beautiful in the earth, and no king possesses a more picturesque park, trees of loftier growth, or turf of greener hue spread over undulations of more fertile land. This fresh and tufted valley is an oasis in the midst of the dull plains that surround it, and prevent a suspicion of its presence. In a ravine, set round with rocks and forests, we sud-

denly come on royal gardens, in the midst of which rises an elegant and poetical Spanish palace, that from the rocky height reflects itself in the waters of a blue river. It seems as if we had arrived in a dream in some enchanted country that would vanish on awaking, and that in fact does vanish at the end of a quarter of an hour, when we have but traversed the valley, and are pursuing the road to the south. Endless plains, yellow heaths, flat and naked horizons reappear. What we have just beheld seems imaginary.

"We followed the path that leads to the grottoes. The poplars of the river stretched over us their tall and slender shadow, — the deer fled at our approach. We reached those forsaken quarries that are clothed with the richest verdure, and whose depths offer a scene truly theatrical. 'Enter this resounding vault,' said my friend, 'and sing me thy *Gloria*. I will go and seat myself below to catch the echo.'

"I did as he asked, and when I had finished, he came back to me, repeating the simple words of the hymn, — 'Glory to God in the highest, and peace on earth to men of good will.'

"'You see,' said I, 'the hymn does not say "Glory on earth to men of knowledge or intelligence." Quietness is the most precious gift that God has to grant us; God alone can worthily bear the burden of glory, and simple men who desire good, are greater before him than great men who commit evil.'"

Such is the tendency of George Sand's writings — such are the principles of works that have been denounced for their immorality, if not without examination, certainly without reflection.

It will be remarked that we have hardly spoken of the purely literary merits of Madame Dupin. It is because on that count we have had nothing to combat. Every body knows that as far as regards the language, the style, the poetry of the forms and imagery, she ranks second among the existing writers of France. She would be the first were Lamennais no more.

SONNET.

A Shape of Grief it is words cannot paint
  That on my weeping heart its gaunt hand places,
And with relentless strength, that leaves me faint,
  Crushes its salt tears out. Time, that effaces
All other memories, makes this immortal,
  As if the deepest woe should also be
The longest-lived: as though it were not well
  To suffer and forget — but, lingering, see
The shadows darkening day by day upon
  The earth, blotting out all things fair and good,
But showing still their spectres in the sun,
  Making the Past our Present. Hope, that stood
Upon the horizon's verge, is vanished,
  And I am left alone, companioned with the Dead!

ON ALBERT DURER, AND THE MODERN GERMAN AND ENGLISH SCHOOLS OF PAINTING.

It is not long since some of our critics drew the attention of the English public to the immeasurable inferiority of its limners to the rising artists of Germany. English writers, and, above all, English painters, had so often arrogated to themselves the foremost station among the living schools of Europe, that the animadversions of a certain noble and distinguished connoisseur were received as ignorant paradoxes by that irritable race, who, like women, when they hear a shot fired, raised a squall ere they knew who was hit; but were regarded as the decisions of true taste and undeniable learning by all who really had any feeling for art. It cannot be disputed that among our living artists there is no one name worthy to awaken our enthusiasm. Exhibition after exhibition proves that genius is dormant, and art nearly extinct. England, with the exception of Hogarth, has never produced an original painter deserving of being enrolled among the great names of Catholic Europe for having extended the domain of art by the addition of a new sentiment or inspiration. While music, literature, and science have every where felt and obeyed the impulse of the age, and art itself is pervaded by an unknown feeling of indefinite expansion and progress, painting has remained stationary, or retrograded with us; nor will posterity discover in its productions a symptom of regeneration, or a mark of originality to distinguish the present from past ages of barrenness and nullity: — painting, in fact, is not a liberal art in England; and so long as its professors continue as they are, it has no pretensions to be so. When society finds them, like the great artists of the sixteenth century, at once philosophers, naturalists, mechanicians, geometers, and poets, not merely on a level with the acquirements of the age, but extending their respective bounds by original discovery on all sides, we may expect to find the fine arts honoured, and the works of their professors of a more exalted character; but until then, we must be content to yield the palm of superiority to our rivals. And let no one object that the times are different, and that the horizon of art has so greatly extended since the days of Michael Angelo, Leonardo da Vinci, or Albert Durer, that life would not suffice at the present day, even with the most consummate genius, to master the various branches of which we speak. Philosophy teaches us otherwise, for if art has extended, methods have simplified; and, in the balance, the efforts of two ages are pretty nearly the same as to labour. Let any one peruse the life of Raphael, of Murillo, of Cellini, or of Da Vinci, and he will learn the prodigious labour they underwent in their studies; let him look at the great Albert Durer,

"Noctes atque dies niti præstante labore;"

but coming forth at the age of twenty years a sublime artist; let him learn how well they wrote; and comprehend with what dignity, clearness, and simplicity their compositions expressed their internal sentiments; and let him then compare the moderns with those who belonged, as old Homer says, to the race of "articulate-speaking men;" and treading under foot

both their works and their apologies, he will turn away his regards to ancient Italy, the sacred mother of the arts and sciences, —

"Das land wo die citronen bluhen."

Germany, that land of dreaming sentiment and ideal beauty, has, on the contrary, in these latter days, awoke from her lethargy of ages, and in the imitation of her ancient greatness, sought the inspiration which created such marvels. The schools of Dusseldorf and Munich, by a happy anachronism, have sought, in the revival of the religious faith and chivalrous manners of the middle ages, to resuscitate the past, and to reinstate in art the religious thought and faith which were then the sources of their beauty and perfection. Works of surprising merit, both of conception and execution, have already sprung from this development, which has been prepared and fostered by the writings of their most eminent poets and critics. Art cannot fail to feel the happiest effects from this sudden and national impulse. Fashion will pass away, and leave the elements of a new and purer taste. The error which seeks to revive the past will endure only for a time, for it has no life in it; and in the words of Scripture, "leaving the dead to bury their dead," a new school will arise from the ruins, and a new inspiration, the reflex of the present age. Like the daughters of Pelias, who slew their father, desiring to restore him to youth, German art has cast into its crucible the life of the past — the life of the fourteenth century; whence is to come, like the world from the flames of the last judgment, a world unalterable, incorruptible, and definitive. That world has not yet come; but it is slowly elaborating, and the future will surely produce it.

It is not merely in the higher requisites of art that our own school is inferior. In knowledge of the human figure, that great basis of all beauty and perfection, the French and Continental artists infinitely surpass us. Artists should be advised, as poets were by Horace, to labour their nine years in the elements of their science, before they commence the labours of the brush, and that surprising knowledge of the human form which enabled Michael Angelo and the great Italians to draw it in any conceivable posture with the most perfect accuracy in the play of its muscles *from memory alone*, and without the aid of any model, would not then be a tradition of doubt and amazement to their pigmy successors. The English method of study is radically defective. In this respect, the French and Germans are not only more learned, but more classical: they follow the identical process laid down by the great masters, by means of which they gained their wonderful precision and freedom of design. By outlining for years with chalk, upon tablets of blackened wood, figures of a natural or colossal size, either from the life, or from antique statues, they acquired astonishing facility, and that freedom of hand which can never be attained by practising figures of cramped and minute proportions. After outlining of a natural size, nothing is easier than to draw small figures, but the converse does not hold good.

It is not our intention however to dwell upon means, but upon results, nor do we wish to pass any invidious remarks upon the present exhibition. We pass over the landscapes of our land surveyors, and the dogs and deer of our Dutchmen, merely noticing that even in the rising art of wood engraving, our superiority as engravers does not blind us to our inferiority as designers, and to the superior beauty and merit of the French. We pass over these topics to examine the German school, the founder and type of which, the representative of his country's genius, laborious, learned and profound in every department of human knowledge, is the great Albert Durer. We do this with the view of examining how far an imitation or

infusion of this school of design might, like the infusion of their romantic literature into the spent and exhausted life of our times, create a new and copious fountain of beauty. In music and painting, this imitation might be carried to some profit, but we must ever protest against the infusion of German mysticism which some writers have poured into our literature; never shall we cease to lament, that German boars should have been suffered to muddy the "clear well of English undefiled;" never shall we cease to lament with Virgil's Corydon —

"Heu! liquidis immisi fontibus apros."

Goëthe has not disdained to write the history of the new German school, and to trace in a little work, which greatly accelerated the rising taste, its progress from the days of Winkelman. Dr. Waagen, who recently paid our English galleries a visit, bears the reputation of being a great artistical critic, with what truth we know not. These writers convey just notions of their subjects only when they cease to affect to see farther into plain matters than their fellows, and to perceive something more in every thing than other people can. The result of their profundity will generally be found to be words; in fact, this general disposition of their countrymen to be more profound than their neighbours, is well illustrated by the joke regarding the German, who having read in some English newspaper a eulogy upon George Cruikshank as the "real Simon Pure," immediately went home and wrote in his biographical notices of the caricaturist, "He is called Cruikshank, but his real name is Simon Pure!" There are certain criticisms on works of art in certain of our contemporaries, which we regard as the very *ne plus ultra* of this mystic conceit and ridiculous affectation of profundity. Some *savant in us* must have written them.

The pagan spirit of the Italian revival of learning could never be acclimatised under the skies of Germany; and yet it was Germany which first commenced all that great movement of the Reformation. It is true Germany protested in the name of the idea, whilst Italy protested in the name of the sentiment and practice. The character of German art, and, above all, the character of its artists, differ essentially from the character of Italian art. In Italy, the revived worship of plastic beauty was followed by a parallel revolution in manners. Practising art after the manner of the Athenians in the days of Pericles, the Italian masters of the sixteenth century lived like Alcibiades; — the suppers of Aretino rivalled those of Aspasia. The Italian school soon came to neglect the basis for the form, and from the sixteenth century, art was reduced, as it is with us, to the simple mechanism of execution. Germany, on the contrary, preserved her quaint manners and austere prejudices, and German art is at all times more profound, more reflective, and more metaphysical than Italian art.

The history of Albert Durer, at the beginning of the sixteenth century, so brilliant and progressive, is strikingly calm and simple. Albert has left a collection of notes and letters, recently come to light, in which he has related almost the whole of his life, and from which we shall give some extracts. The son of a Nuremberg goldsmith, and one out of eleven children, he came into the world on "the sixth hour of the day of Saint Prudent, on the very Friday of the holy week, in the year 1471."

"My father's life," continues he, "was very miserable and wretched, and sadly covered with clouds. Almost all his children died, some in the flower of their youth, others while yet babes in the lap of their mother, who mourned continually to see them die. During all his life, he never had for himself, wife, and children, more than the bare necessaries of life, bread coarse and black, moistened with sweat, and gained with labour. Add to this, all sorts of tribulations and adversities, as well as a thousand temptations; but he was

a good Christian, my father, peaceful and quiet, and submissive to Providence, good and modest towards every body, who died looking towards heaven, and who is in heaven now. His whole life was uniform and grave, interrupted by few worldly joys, solemn and silent. He saw very little of men, because he was not fortunate; nevertheless, as he loved them from the bottom of his heart, he was beloved by them. This dear father paid the greatest attention in his soul and conscience to bring up his children in the fear and glory of God, for that was his greatest ambition — to bring up his family well; for this reason it was that he daily exhorted us to the love of God and our neighbour, after which he taught us to love what is beautiful — art was our second worship. He was partial above all to me, seeing me diligent and full of zeal; he sent me to school by times, and when I had learned to read and write tolerably, bound me an apprentice to a goldsmith. I remained a tolerably long time at that work, but feeling myself in the end more of a painter than a goldsmith, I therefore begged of my father to allow me to become a painter; he at first was very dissatisfied at my request, and had great regret for the time I had lost with my goldsmith. Nevertheless, after some refusal, my father yielded, and on St. Andrew's day, 1483, he placed me in the study of Michael Wolfmult. With Master Michael, God granted me such great application, that I made great progress, according to the word of my master."

Albert Durer was, in fact, from the twentieth year of his age, an able artist. He was far from having lost his time with his goldsmith. He had executed, among other works of exquisite finish, a "Passion of Jesus Christ," in relief, which equalled the best sculptures of the time. It was there also unquestionably that he acquired that fineness and firmness of the modeller, of which he always preserved the traces in his engravings and designs. The engraver and painter reproduced the qualities of the carver. In 1490 Albert commenced the travels which in those days completed the education of an artist. He placed himself in communication with Martin Schœn, Israel de Malines, and other good painters. It does not appear that he was in Italy at this period, as many of his biographers have asserted. On his return to Nuremberg, in 1492, he made, in order to be admitted into the association of painters, a design of "Orpheus torn in pieces by the Bacchanals." The success of this composition determined his marriage with the beautiful Agnes Frey, who was destined to embitter his life by all sorts of domestic troubles, and who caused him to die at the age of fifty-seven years, worn out by hertormenting; — the poor Albert, so quiet and simple, so enthusiastic and meditative, whose poetical visions were so perpetually darkened by the clouds of conjugal reality, the sublime and natural artist, had this fate in common with another great German painter, Hans Holbein, who was forced to fly from his wife, and go and paint his masterpieces at the court of Henry VIII. It is to this lady that we owe the portraits of Sir Thomas More, of our English tyrant and his numerous courtiers and victims; and it is to the wife of Albert Durer, perhaps, that we owe all that deep melancholy impressed upon the greater part of his creations.

Meanwhile Albert's reputation increased, and his engravings on copper and wood spread as far as Italy. It is said that it was in order to obtain reparation from the famous engraver Marc Antonio, who had counterfeited many of his designs, that he undertook, in 1506, a voyage to Venice. Albert was received with the greatest eagerness.

"Would to God that you were here," writes he to his friend Bilibald Pirkheimer; "really there are charming men among the Italians — they came to me almost instantly; and every day attach themselves to me more and more; and this does me much good at heart. They are men well educated, elegant, learned, great players on the lute, full of dignity and wit, very affable and very good towards me. Nevertheless, it must be owned, that if there are so many excellent men in Italy, there is not wanting a great many knaves, infidels, rascals, and liars, who have not their equals under heaven. To see them you would take them for the most amiable folks in the world. They laugh at every thing, even at their own bad reputation. You know well that I was warned in time by my friends to take good care neither to eat nor to drink with these gentry, nor with the painters their friends. Among these painters there are some who have set themselves to tear me to pieces openly, and who copy, with the utmost effrontery, my works in the churches and palaces, all the time crying

out that I ruin art by departing from the antique, which has not prevented Giovanni Bellini from bestowing upon me many praises before a numerous company of gentlemen; still more, he has requested to have something of mine, and came to see me himself, and to beg a design, adding, that he was in the intention to pay me handsomely for it. He is a man beloved, respected, and admired by all — all the world speak of his goodness and genius — although very old, he is still a master who has few equals."

After having painted a "Saint Bartholomew" for the Brotherhood of German Merchants residing at Venice, Albert went to Bologna, and from Bologna returned the same year to his home, where he found his wife, whose absence had cost him few regrets. It appears that in Italy he had seen Raphael. It was at Nuremberg that he painted from recollection a portrait of Raphael, and sent it to Raphael, who replied by a letter and another portrait.

Albert Durer painted almost all the remarkable men of his time. He made portraits of Philip Melanchthon and Erasmus. He also painted the Emperor Maximilian, who summoned him to his court, and granted him one day handsome armorial bearings, after having held the scaffold upon which the great artist had mounted to decorate the ceiling of his palace. He also painted John, Baron of Swartzemberg; Albert, elector of Mayence; Ulrich Varnhuler — a noble head, full of intelligence and sentiment; his friend Bilibald Pirkheimer, senator of Nuremberg — a magnificent countenance, full of fire and dignity, with much resemblance to the aspect of Luther; — finally, he has left his own portrait and that of his wife, in the gallery of Prague. The portrait of Albert is adorned with flowing hair and a long beard which fall capriciously around, as in many of the old masters' heads of the Saviour. Portraits, however, are only rare episodes in the laborious life of Albert. There are reckoned as many as a hundred and six engravings on copper, and three hundred and twelve on wood, executed by himself, or after his designs, without including the great triumphal arch of the Emperor Maximilian. Albert has drawn a great portion of his subjects from the Bible and Christian legends, a portion from Greek mythology, and the greater number from his own imagination. There are histories of the Virgin, histories of Christ, in an infinite number of plates; histories of saints — Adam and Eve — the Apocalypse of St. John — the Martyrdom of St. John the Evangelist — the Holy Trinity — the Last Judgment — the Beheading of St. John the Baptist — St. Christopher walking over the Waves — St. Jerome, St. George, St. Sebastian, varied in a thousand different manners. There is the Judgment of Paris — Apollo and Diana — the Family of the Satyr — the Rape of Amymone — Hercules Fighting, and many others. Lastly, there are among the subjects drawn from imagination the magnificent engraving of *Melancholy:* one of its author's masterpieces — the Horse of Death — the Little Horse — the Great Horse — Death presenting his Hourglass to a Soldier — the Column — the Philosopher seated upon a Throne — a Schoolmaster — a Man and a Woman embracing at the foot of a tree — the Siege of a Town — the Offerings of Love — the Three Peasants — the Market Peasant — the Violent Man beating his Wife — the Peasant and his Wife — the Hostess and the Cook — the Sorceress mounted backwards on a He-goat — the Rape of a Young Woman — the Effect of Jealousy, and a crowd of armorial devices and caprices for decorations.

It may be seen from this abridged catalogue of his subjects, that Albert separated himself from the other painters of the north who were his predecessors,—Van Eyck, for example, who drew nothing but religious subjects. Albert drew the people and mythology. The spirit of the restoration began to penetrate the customs of art. But what constitute Albert Durer the

restorer of German art, and the resembler of Michael Angelo in Italy, of Alonso Berruguete in Spain, and of Jean Cousin in France, are the purity of his style, and the sentiment of physical beauty. Until this time, artists in Germany, as every where else, were very little solicitous about form, and, above all, about variety of form; there were imperfect models, or consecrated types, which were supposed to represent every religious symbol. Albert descended from the heights of mysticism to contemplate the magnificence of nature, and became impassioned before the presence of all those different notes which constitute the sublime harmony. He studied the reality of bodies, sounded the mysteries of science, resembling in this respect all those great artists of the sixteenth century, who, as we have said before, were at once philosophers, naturalists, mechanicians, geometers, and poets. Like Leonardo da Vinci, Albert Durer was almost a universal man. How wonderful seems the spectacle of so many men of poetry, so many meditative artists devoting themselves to the positive sciences, like the mathematics and fortification! Albert has written a "Treatise on the Fortification of Towns," published in German, at Nuremberg, in 1527. He has written four books of the "Elements of Geometry," in which he treats of lines, surfaces, and solids in a very useful and necessary way, not only for mathematicians, but also for painters, artists, workmen in metal and wood, lapidaries, sculptors, — to all, in fine, who wish to render an account of their works by means of certain measures. Lastly, he has composed a "Treatise on the Proportion of the Human Body," in four books, the whole with explanatory plates from designs by the master. Some verses, *Reime*, have also been attributed to him.

In spite of all these prodigious labours accomplished in less than forty years, Albert Durer found time to devote a good deal of leisure to painting. His masterpiece in painting is the famous *Crucifixion*, at Vienna, executed in 1511. The master must have then been in the prime of his talent. His style has the grandeur of the Florentine, with less elegance but more gravity. How great and desolate are his *Mater Dolorosa!* How much his Christs have suffered to redeem the world! Of what a beautiful race, and how full of will, are all his figures! English critics say that the engravings of Durer have spoiled the taste of his modern countrymen, and that the German design would also spoil our precious English school,— poor Albert Durer! but, above all, poor English critics.

On the death of Durer, at Nuremberg, in 1528, his influence lasted to the end of the sixteenth century. The Germanic style was eclipsed by the Flemish and Dutch styles — by Rembrandt. It is only in our own times that it has been revived by Cornelius, Overbeck, and their pupils, whose works adorn the walls of the Pynacothek and Glyptothek of Munich, and whose designs finally reaching England have awakened a feeling of our own inferiority.

Before his death, Albert, in 1520, undertook another great voyage into the Low Countries. The narrative, which he has written of it, is so quaint and curious, and acquaints us so well with the man and his times, that we shall translate a few fragments of it. The whole of his *reise beschreibung* are as entertaining as Benvenuto Cellini's Memoirs.

"I, the poor Albert Durer," says he, (*ich armlich Albrecht Durer*) "departed from Nuremberg at my own cost and expenses *with my wife*. We passed one night in a village of Bavaria, where we spent three pieces of silver, less three deniers. Thence we went to Antwerp. The following Sunday was the festival of St. Osputh: the corporation of painters invited me to a grand gala, with my wife and daughter. Vessels of silver, service of crystal, excellent cheer — nothing was wanting. All the women were dressed in their holiday clothes; and when I was conducted to my place, the people crowded from both

sides of the table, as if to see Mister Celebrity. Many people of quality were there,—princes and dukes, who received me with the best grace, and offered me their services and protection for whatever was useful to me. When I was seated, the *major domo* of Messrs. d'Antorff came up to me, accompanied by two pages, and offered me, on the part of the Messrs. d'Antorff, four pints of wine, which those noble personages prayed me to drink immediately, and accept as a sign of high consideration. I submitted me to this loyal invitation, and protested my devotion to that illustrious family. Afterwards Master Peter, the carpenter of the town, came up to me, and presented me with two pints of wine, and the offer of his services. After having passed joyously the greater part of the night in drinking and singing, all the guests arose and accompanied me with torches to my abode, like a true Roman consul. I took leave of them at my door, after which I went to bed, and slept until a good hour in the morning. I was afterwards at the house of the Master Quentin Matsys. Herr Fishcher has bought of me, on account of the Messrs. d'Antorff, six images of the Passion, for four florins; six others on the same subject, but of smaller size, for three florins, besides twenty other half-sheets of all kinds, pell mell, for one florin. Item: I sold to my host a little image of the Virgin, painted on bad canvas, for two Rhenish florins.

"The day after St. Bartholomew I was brought to Mecklin. The Master Ronsard, and a painter, whose name I forget, invited me to supper. This Master Ronsard is the famous sculptor, who is in the service of Madam Margaret, daughter of Maximilian. On Monday we went to Brussels. I there saw in the council-room four beautiful pictures of the great master Rudiger. I saw also the present brought from Mexico for the king: it is a sun of gold as large as an ell, and a moon of silver equal in size to the sun; and above the sideboard all sorts of vessels, harness, foreign furniture, plates of gold and vermilion, so splendid, that it would be difficult to find the like. All this is so costly, that they are reckoned at a hundred thousand livres of gold. I have never in all my life seen any thing that pleased me so much. I gazed at all those things of gold so finely worked, and was astonished at the ability and subtle genius of men of distant lands. Madam Margaret has ordered me to be told that I would always find a protector in her, with the King Charles. She showed herself entirely devoted to me. I sent her a fine proof of my engraving of the Passion. When I went to the chapel of the house of Nassau I saw the admirable portrait made by the great master Hugo. Master Bernhard, the painter, invited me to dinner. The repast was so magnificent, that I do not think Bernhard could have given it for less than ten pieces of gold. At this repast were present many distinguished persons, whom Master Bernhard had invited to keep me company. Among others, the treasurer of Madam Margaret, whose portrait I have drawn; the king's chamberlain, the city treasurer, to whom I sent a proof of the Passion, engraved on copper, and who, in exchange, sent me a black stool carved in the Spanish style, which is well worth three pieces of gold. I also sent a proof of the Passion to Erasmus of Rotterdam, the secretary of Bonisius. Afterwards I made the portrait of Master Bernhard, Madam Margaret's painter, in charcoal, and I drew once more that of Erasmus. But six persons, whose portraits I made at Brussels, gave me nothing for them. I then went to Aix-la-Chapelle. I there saw the coronation of the emperor Charles V. On Friday I left Aix for Louvain. On Saturday I was at Cologne, where I bought, for five silver deniers, a treatise by the Doctor Luther, and I gave one denier for the book entitled "The Condemnation of the Holy Man Luther." On Sunday I saw the festivals and rejoicings, and assisted at the banquet which was given in honour of the coronation. On Monday I received from the hands of the emperor the diploma of painter to the court. The Saturday after Easter we departed for Bruges, with Hans Lixben of Ulm, and San-Plos, a famous painter born in that town. I saw in a house of the emperor's, the chapel painted by Rudiger, and the pictures of an old master, probably Zemling. At Jacob's I again saw some pictures of great merit by Rudiger, Hugo, and other great masters. I saw the alabaster statue of the Virgin which Michael Angelo carved, as well as the pictures of John Van Eyck, and other painters. Another superb banquet was given to me: the councillors of the city caused twelve pints of wine to be sent to me; and the company, composed of sixty persons, attended me home after the repast. Thence I went Ghent. The deacon of the painters and the notables received me with enthusiasm, and conducted me to the high tower of Saint John. I there saw the famous picture by John Van Eyck, so beautiful, so wonderfully fine, that it is beyond all price. Above all, the Virgin Mary and the Eternal Father are of admirable expression. The painters and their deacon did not leave me for a moment: during all my stay in that town they desired that I should dine and sup with them every day. Lastly, I departed on my return to Antwerp. After passing some time there I returned, with my family, to Mechlin, to Madam Margaret. I showed her the portrait which I had made of the emperor, and which I wished to give her as a present, but she would on no account receive it.

In all that I have done in the Low Countries I have only experienced losses. Nobles as well as citizens — nobody paid me: Madam Margaret no more than the rest. For all the presents which I made her, for all the sketches which I sent her, she has given me nothing. When I was about to depart, I suddenly received a letter from the King of Denmark,

Christiern II., who enjoined me to betake myself to him in all haste, to paint his portrait and that of the lords of his court, and which announced to me that I should be well treated, and that I should eat at the table of the king. Next day I went on board a ship of state, and betook myself to Brussels to the King of Denmark, unto whom I gave what I may call my best pieces of engraving. It was a sight for me to behold the curiosity with which the people of Brussels gazed upon Christiern as he passed. I saw also the emperor, who was there before him, and received him with magnificence. I also again assisted at the splendid banquet which the Emperor Charles and Madam Margaret gave him the day afterwards. The King of Denmark gave a superb banquet in his turn; the emperor and Madam Margaret were both invited to it: I also was among the number of the guests, and I was seated at the table of kings. I painted in oil the portrait of Christiern: he caused thirty pieces of gold to be sent to me. Lastly, I departed from Brussels to return to Nuremberg."

This extract is a curious picture of the lives of great artists in those ages. The curiosity and enthusiasm for art, and the imposing ceremonies of courts, the modesty and justice towards others, the triumphs as well as disappointments and poverty, which Albert Durer here portrays, paint his character completely. We confess that it is a fine and noble life, that of *poor Albert Durer*, in spite of his wife and his adversities, seated with generous fraternity and affable simplicity at the table of kings.

At Nuremberg, that Thebaid of the middle ages, we find the types both of the form and sentiment of the German school. Nuremberg is the very first of old German cities for the integrity of its decrepitude. It is a perfect hypogee of the fifteenth century. The blackened stone recesses of the street lamps are still engraved by steel halberds with the madrigals of the minnesingers who composed their verses while carving their wooden crucifixes in the sun; for Nuremberg was formerly a manufactory of poetry as well as of clocks. In threading its deserted streets, where the houses seem to sleep, and not a blade of grass rustles, where the winged dragons and the smoked madonnas of the street-corners stretch forth their gaping throats and wooden visages, the tiresome monotony of an abode, where the women knit from morn to eve, is relieved by the masterpieces of painting and sculpture with which it is absolutely encumbered. Every house is embellished with a kind of lantern above the principal entry terminated with a lamp-iron; the profile of this cage commonly represents the half of the perimeter of an octagon, a form which admirably suits the flowers and indentations of the Gothic carving with which it is festooned. Little loopholes garnished with painted glass windows, immemorial armorial bearings, bird cages, flowers and herbs in pots of Japan porcelain, complete the decoration of these strange boudoirs, which are so detached from the architectural system of the house, as to make the inhabitants have the appearance of never being at home, or the passengers of being at home with all the world. And if the dwelling of a citizen must be transparent as glass, Nuremberg is the model of a diaphanous city. From morning to night the women, young and old, married and unmarried, pass their time in these oratories. There are sometimes to be seen and heard in these places certain flowers which are an enigma, certain beats full of mystery, and sometimes in a corner, far from all profane eyes, a little sacred taper, burning for one knows not whom. In one of these places the ancient poet Pfintzing wrote his "*Theuerdank*," the most ancient poem of Germany after the "*Niebelungen*." When placed in the court of Saint Sebald, among the images and carvings in black stone, with the chapel of Saint Maurice, and the street which leads towards the royal burgh, and the choir of Pfintzing in the perspective, it is impossible not to believe yourself a robber of Albert Durer's or an archer of the Emperor Barberossa's. The chapel of Saint Maurice, with its clumsy pillars and monastery of the time of Chilperic, and the Lombard architecture, summons one to knock at its iron-bound doors like a pilgrim of

old, for it is the sanctuary of the ancient German painting. It is no longer a chapel, but a museum; but God still remains the same, for the Catholic faith was the genius of that painting. Like the galleries of Cologne, Dusseldorf, and Munich, the chapel of Saint Maurice represents the two schools of Germany, but with an assortment much superior to that of its rivals. The Byzantine school of the Lower Rhine, the disciples of William of Cologne, the first appearances of the first ages of the really German workmanship — Meckenen, Engelbrechtson, Bless-Homsen, are followed by pupils of more renown, who prepare the way for Albert Durer — the masters of Upper Germany, Cramer of Ulm, Schaufflein of Augsbourg, Kulmbach, Wohlgemuth, Schaffner, Zeitblom, next lead us to the great Holbein. Three portraits strike one above all the rest in this mysterious gallery, the "Ecce Homo" of Durer, the "Paracelsus," and the "Unknown Man," by Grimmer, a spectre which seems to start out of its frame, and fix itself in your memory for ever. The portrait of the handsome Durer naturally brings to mind his fossil-like villa, which solves an historical problem. It is evident that the artists of the fifteenth century, imitating the Greeks, worked in the open air. There is neither light nor space for a workshop in this immortal bird's cage, where the great painter of Nuremberg died.

The castle of Nuremberg is a curious monument of the architecture of the seventh century. In its halls, where the emperors of Germany formerly held audiences and feasted the states, we are transported in imagination into the presence of Mathias, Otho, and Conrad, — we hear their ghosts shudder, and see their armour glare. Nothing has been taken from the halls but the men. Pausing for a moment before the wainscoat, where Holbein has sculptured a monkish ballad or mystic symbol of the passages of the Christian faith, we see religion travelling under the figure of a beautiful young maiden, a favourite allegory of the fifteenth century. You fancy you see Venus and her doves drawn in her shell over the waves. The traveller walks through halls still furnished as if the Empress Cunegonda were waiting for him impatiently in her inmost boudoir — where the great eagle of Franconia spreads gigantically on the ceiling his raven plumage. Holbein, Wohlgemuth, Durer, Kulmbach, Schoen, and Cranach, have royally tapestried with their most curious pages these secular chambers, whose walls scale off in cinders under the finger; and the crevices of which it has been necessary to solder together with cramps of iron, to prolong the dying moments of the monument. The Byzantine masters — those demigods of the fabulous epochs of painting — whose very names are dead, are, however, the principal parties to do the honours of the Reichfeste. Nothing can be more melancholy than to wander as through a cemetery, along these jutting timbers where worms are gnawing the figures, where time has eaten the gold from off the backgrounds; where the planks of the wainscoat are furrowed with deep trenches, and peel and split off in leaves. where Confessors may be seen bursting with laughter upon the red-hot gridiron, madonnas grimacing at the infant Jesus, and angels tumbling topsy-turvy in the presence of the Most High.

The Byzantine works at Nuremberg, have retained no more traces of their native expression than the skeleton does of the living man. We cannot, therefore, fairly judge from these remains the intellects which communicated to them their fire, or the pencils which bestowed their form. Opening next the little casements of Queen Cunegonda's room, at the risk of crushing to powder the glasses of Heidegger, which are only retained in their sashes by the laws of equilibrium, looking through those little windows exactly squared, and following with a pious eye the turnings and meander-

ings of the Dolorous Way, from the palace of Caiphas to the mountain of the Two Thieves; for Nuremberg has localised the passion within its walls, and its dead who are borne to its cemetery pass between fantastic emblems of the redemption, the traveller is shown the gigantic print of a horse's foot on the rampart. A beautiful page—so runs the story—forgot that he was with the queen, when the halbardiers of the guard from the tower of the Romans signalised the return of the imperial husband, falcon on hand, to the chamber of the great Eagle of Franconia. The leap which Cherubino's horse, spurred to the quick, took across the rampart under the eyes of Cunegonda impressed his footsteps in the living rock. The page was sadly jolted, but Cunegonda sent him her love. The triumph of Maximilian by Durer, the glasses of Volckamer, the fountain in the market place, the monumental houses, churches, ruins, all the private grandeurs of the Germanic empire, transport us at once to the period when the diets of the fourteenth century drew up the golden bull, which in fourteen years will have completed its fifth century. They would afford study and amusement to an artist for a month, and initiate him at once into the knowledge of the past, so necessary to prevent the anachronisms of our English designers.

It was in the thirteenth century that Europe beheld the return of the sciences with Aristotle, the arts with the Crusades, and the philosophy of Plato in the fifteenth century with the fall of Constantinople, to preside over the face of Christianity. The ideal began to be sought in other things than the love of God, to which the gospel and the fathers were supposed to be confined in the ages of exclusive Monachism. There was the hope of Paradise, and while waiting for Paradise, painting sought to realise upon earth divine forms. They believed in the Celestial Jerusalem, while Leo X. raised his temples and palaces to the skies. The doctrine of the ideal at this period produced its fruits to overflowing. Science and art had received the illumination of baptism. Dante, Petrarch, Michael Angelo, Raphael,—each came in his turn, like runners in the Panathenaic Games to receive from his precursors, and carry still farther the torch of life.

Inter se vitai lampada tradunt,

and the spirit of Plato hovering over all, from "the Divine Comedy," to "Paradise Lost," and "Childe Harold," claims as its posterity each sublime monument of art impressed with idealism, and defies the world to produce a work having any elevation of sentiment which does not proceed from the same source. Italian artists of the sixteenth century were fully imbued with the philosophy of their day. Michael Angelo's poetry is pervaded by its spirit, which was derived not from the study or imitation of Petrarch's amatory sonnets, but from the more philosophical ideas and conversation of Ficino, and those whom he met at the table of Lorenzo the Magnificent. The every day form of nature was not that to which his studies aimed, but the ideal to which his soul as to its ultimate end aspired.*

"Non pure intende al bel ch'agli occhi piace
Ma perche è troppo debile e fallace
Trascende in ver la *forma universale*."

MICHAEL ANGELO'S *Rime*.

It is in religion† that the German artists have sought the fountain of the

* See also the sonnet "*Per fido esempio alla mia vocazione*," nobly translated by Wordsworth.

† There are some verses by Michael Angelo, in extreme old age, profoundly religious:—

"Oimè oimè che pur pensando."

"Ah, woe is me, when I reflect on all
My years long past, and muse on life misspent.

ideal, to attain by its means the dignity of our nature and the height of their art. And they are right we take it.

Yes, Plato has said true. We gravitate towards God, attracted to Him who is the Sovereign Beauty, by the instinct of our nature loving and rational. But as bodies placed on the surface of the earth do not gravitate towards the sun, but together, and the attraction of the earth is, so to speak, but the centre of their mutual attraction, in like manner we gravitate spiritually towards God by the intermediate forms of beautiful human nature idealised. Let us gaze on the beautiful St. Catherine, by Raphael, now in the National Gallery, and bow down before the ideal.

——————— Quod semper acerbum
Semper honoratum (sic Dii voluistis) habebo,

for, in Art, we owe all to it.

Alas! no day of all I reckon mine;
Idle desires, vain fears, fallacious hopes,
Wishes and sighs, and grief and pride and love,
Whate'er the manly heart hath felt — have been
A part of me — they are all numbered now!
Alas! how far from good, how far from truth!
Yet I go step by step towards the grave,
And the shades deepen round me, and the sun
Becomes to me as night: soon sink I powerless.
O, my weak soul! since thus the forfeit years
Of thy frail body steal on hour by hour;
Since even now thine ancient weary load
Stands prompt to fall, and then thou in another,
Thine own true father-land thyself wilt find.
Still canst thou all thine ancient impulses,
In age and weakness, thus infirm of will,
Scourge and resist, rebuke — yet still obey? —
Alas! thou dost — O God, lend me thy strength!
From thee conceal I nought: dejected, I
Envy the annihilate deed — so much before me
Trembles my downcast soul. — Reach thou to me,
Thou from afar, to me in a far land
Thy saving arm, and snatch me soon away
Unto thyself, and make me — what thou wilt!"

GREEK FUNEREAL INSCRIPTIONS.

"Diis Manibus!"

Poetry among every nation of the world may be considered as the first expression of that superfluity of intellectual life which is produced in their being in proportion as the most urgent wants of their physical condition and social instinct are appeased. It is the first cry of man satisfied and happy, when he has had time to penetrate into the wonders of creation, and his imagination has reflected, like a mirror, the sympathies of his heart. It springs up in society like a flower which unfolds its virgin coronal as soon as it has received from the earth and air the necessary elements and conditions of its existence. Thus the birth of poetry among mankind presupposes a certain degree of maturity in the mind and in the language which serves it as an instrument — for before this maturity man only thinks of his appetites, and only pronounces inarticulate sounds; and so long as his sentiments have no other excitement than matter, his reason is incapable of quitting the narrow sphere within which it is confined by the wants of his first necessities.

But when once he has arrived at this state of maturity, he allows himself to be influenced by the concurrence of an infinite number of causes which act immediately upon his body, sentiments, and imagination. Their union operates so important a modification upon poetry, that, from that moment, it assumes a peculiar character, the traces of which are preserved throughout ages, and in despite of vicissitudes and events. Climate, which affects all parts of organisation, and gives more or less elasticity to the vital action — the aspect of the country, which presents perpetually the picture of nature, whether shrouded in the shades of night or clothed in the most dazzling colours, here diversified by mountains and woods, there changing to the monotony of plains — religion, which from our first entry into life takes possession of our ideas and sentiments, and stamps them with a seal whose impression is rendered still deeper by the hope of reward and the fear of punishment — the customs of nations, which lead them into terrible and bloody wars, or keep them in the peaceful occupations of pastoral or agricultural life — such are, in general, the circumstances that determine the prevailing character of poetry. We shall find marks of their influence among all the nations of the globe, if we study their poetical history. Rome will exhibit to us a poetry, rude, harsh, and savage, like the founders of the eternal city; — Arabia, a poetry sweet and pompous, monotonous as the desert, and impregnated with the warmth of the climate, and the perfumes of the East; — the North, a poetry gloomy and melancholy as its atmosphere; — Greece, finally, a poetry changeable as the character of the Hellenes, heroical as the warriors who overturned the walls of Troy, voluptuous as the groves of Paphos, and elevated and sublime as Olympus.

In applying these principles to the elegies and funereal inscriptions of Greece, we find them fully confirmed. The Anthology shows us the spirit of a people who received the inspirations of genius, and were affected by the illusions of imagination in a climate which unites every description of scenery. Mountains affording the most picturesque combinations, the purity of an atmosphere presenting continually a serene sky and stars shining in

all their splendour, vegetation full of vigour and beauty, meadows enamelled with odoriferous flowers; every thing in short that surrounds man in those delightful countries, charms his senses, and excites in his mind that sentiment of welfare, that repose and tranquillity so favourable to meditation and the free exercise of thought.

The oldest compositions that deserve the name of poetry are all the products of these great causes. Such are those celebrated ballads and romances of modern Europe, which are so much admired for the elevation of their thoughts, and the force of their sentiments. Reality has nothing finer, nature and truth are nowhere more faithfully depicted. Like these, we can easily suppose that the contents of the Greek Anthology were not the fruits of a very laborious application. They were inspired not by imaginary divinities, but by vehement passions, by the admiration that great actions are always sure to excite, by love of country, confidence in the Deity, and, in a word, by all that ennobles the heart, elevates the mind, and animates the genius. What distinguishes them is their perfect simplicity, and a style that never departs from the most familiar construction, dictated by the heart. No foreign ornament, no artificial research indicate study. Their subject is the description of a battle, the portrait of a hero, a prayer to a god, or a dedication to the nymphs. On reading them we fancy ourselves transported to the primæval ages: whether they breathe the classic beauties of Homer and Horace, the elegant facility of the poet of Augustus, or, like the verses of Posidippus, reflect the sombre majesty of the prophet-king, or the savage melancholy of Job in the most ancient elegy of the World.

Epitaphs are more important things in the eyes of the church than in those of any other portion of the community. The poor widow who suffered a prosecution on account of a verse from the "Apocrypha," is a warning to those who meddle with heterodox stones and Romish inscriptions. "Pray for the soul of Joseph Woolfrey; it is a good and pious thing to pray for the dead!" is harmless only *out* of a churchyard; but those with which we propose to deal, treat not of dogmas but of affections: and the prayer of our petition is, that all those who have badly translated them heretofore may be brought before the bar of criticism, and not under the jurisdiction of the Arches Court. We desire to unbury the spirit of the Greek funereal inscriptions, like the scholar who disinterred the soul of the licentiate Pedro Garcias. Happy if, in an attempt in which so many have failed, we should invest them with a garb more befitting the taste of the originals than that which they have been made to assume in the smoothly-flowing verses of contemporaries.

This species of writing, which we may call the style lapidary, is a species between prose and poetry, hitherto unknown to our literature, but which has been treated *con amore* by the Italians. Many collections of Italian inscriptions have been printed and a small but precious volume has been selected from them. The inscription is a species not less beautiful than difficult; and among all literatures there are but few that possess it in perfection. Italy gave the world the first example of it in the Roman magnificence, and after eighteen centuries has again renewed it. Morcelli, in regard to the Latin, has reduced into a science this department of study and has written a book of learned elegance, "De Stylo Inscriptionum." The best of these epitaphs speak worthily of the antique household virtues, and in translating these elegiac flowers, the task ought to be done with a full feeling of the transitory and perishable nature of every thing but the affections, such as that with which Goëthe was inspired in the bosom of Rome,

and which he has painted in his first elegy in verses which have acquired European celebrity from the quotation of Madame de Staël: —

" Eine Welt zwar bist du, O Röm! doch, ohne die Liebe
Ware die Welt nicht die Welt: waren das Röm auch nicht Röm! "

Tell me ye stones! O speak high palaces,
Ye streets now answer, — Genius up and soar!
Yes, in thy walls all things a soul confess
Eternal Rome! and I thy power adore.

Oh, who doth whisper wheresoe'er I gaze
Of her who still retains her pristine power!
What voice doth still recall the ancient ways,
Where I in loving spent each precious hour!

Now dome and church and pillared aisle I scan,
With worldling look, to win the traveller's prize;
Yet soon 't is o'er, and each immortal plan
Love's airy temple blots out from mine eyes.

With visioned presence wheresoe'er I rove,
Telling how sweet the haven is of home;
O Rome, thou art a world; but, void of love,
World were no world, nor Rome herself a Rome!

The sentiment of rhyme and symmetry, whether it be a reflexion of Arabian genius, an indigenous instinct, or both at once, is not found in antiquity. It properly belongs to the language of the Troubadours; and is totally misplaced in all translations from the classic languages. In the Provençal songs, if the verse be of admirable structure, the form of the strophe is not less exquisite and precise. The strophe is not with them a mere assemblage of verses; it is a perfect and harmonious whole in itself, as much from the sense as the rhyme — it is a close tissue, of which you cannot change a single thread without destroying all — a group of youthful dancers, carved from the same block and closely entwined, who perform their dance separately and diversely, but in one wonderful unity. And these strophes, limited in number, knitting themselves one to another in the most intimate manner, both by the identical measure of the verses and the constant repetition of the same rhymes, and sometimes by the return of a certain verse, form in their result a work which, in its form, and in the exactness, precision, close contexture, and symmetry of each of its strophes, composes a real crystallisation of thought. We quote one by Charles of Orleans, who flourished in the first part of the fifteenth century.

BALLAD.

" En la forest d' ennuyeuse tristesse."

Far in the forest of wearisome dole
One day it happened I found me astray,
There I met Venus, the queen of my soul,
Who called me, and gently demanded my way.
Deftly I answered, of fortune the prey,
Exiled in that wood I was long time ago;
And that, by right, of myself I might say
I am the lost pilgrim, nor know where to go.

Then smiling benignly, with sweetest control,
She held me and answered, friend, who are they
Who have caused this affliction of thine? with my whole
Strength, will I aid thee their malice to stay,
And henceforth thy heart I shall place in the way
Of all pleasure on earth: none shall rob thee, for oh!
It grieves my heart sadly to see thee to-day
Roam like a pilgrim, nor know where to go.

Alas! said I, sovereign princess, my dole
  Know then in a word; but why sing thee the lay?
'Tis death who o'er all his destruction doth roll,
  Who tore from my arms what I loved so away;
What made all the hope that I had in the fray,
  What guided my steps, both in weal and in woe,
So that ne'er while she lived, in the light of her ray,
  Was I lost like a pilgrim, nor knew where to go.

ENVOY.

Blind am I now! nor know whither to stray,
With my staff here and there I go feeling my way;
  I stumble in fear, and walk painful and slow:
What pity it is, that it suits me to say,
  I am the lost pilgrim, nor know where to go!

These are the qualities which distinguish a modern poem or elegy from an ancient one. The beauties of the Greek, varying as the music of their sonorous language in each sentence, depend less upon the musical element than upon the Attic delicacy and precision of the phrase, its relative propriety to the subject, and the σοφροσυνη, or sobriety, which is the highest excellence of perfect taste. Many fragments from the garlands of Meleager, Phillippus, and Agathias, as well as from Sappho, Erinna, and Nossis, have been beautifully translated by various poets in "Blackwood's" and in the "New Monthly" Magazines: but Herder is the prince of translators; and in his specimens, which, like those of our own Shelley, give the spirit as well as the form of antiquity, we have the hexameter and pentameter lines of the original carefully preserved. Many of the pieces in the Anthology have the air of Poussin's landscapes, —

"Elysian beauty, melancholy grace,
  Brought from a happy, though a pensive place."

WORDSWORTH.

The greater part of those of a longer limit have already been translated by countless hands, especially into elegant Latin by Grotius. Those which follow are a few of those which, from their insignificance, have hitherto escaped those honours. Herder, in his "Blumenlesen aus dem Griechischen Anthologie," has collected most of them, and united them to his comprehensive work, "The Voices of the People in Song," which first gave the spur in Germany to the romantic school, and the profound study of national literature. The German language is so very flexible that scarcely any form is unfit to be comprehended in it, from the Spanish *asonante* verses to the intricacies of the Troubadours. We shall make a feeble attempt to render them into their native measures, although aware that the hexameter is almost inadmissible in the English language; but Southey and Sir Philip Sydney have tried them, and we know the Grecian epigram,—

"Fair art thou, Aglaia, amid beauties all beauty surpassing;
  Fair in each garment, but, naked, thou art perfection itself!"

THE OFFERING OF YOUTH.

These the locks of his springtime, and this an early Cicada,
To you, ye shining Hours, Kallisthenes devotes;
Fresh as the morning glows the stripling. Beautiful Powers!
As youth is now to him, let age be also sweet!

THE HOURS.

Be ye propitious to me, who round Jupiter's throne eternal
Happiest Hours! ay dance. O! ever be gracious and kind!
Over me float, now grave, now gay; and the joyful nymph
That saw me born to the world softly entomb me in bliss!

DEATH OF AJAX.

Wanderer! this is the grave of Telamonian Ajax,
He who, with his own sword, himself of life deprived:
For, when arrived the hour the Fates to him decreed,
Among the Fates was found for him no conquering hand.

THE OBELISK ON THE GRAVE.

Behold Nicœa, yon grave with starry splendours all beaming
Over its pillars, — it shows who the entombed ones are;
He, Sacerdos, and she, his Severa; — they had to the stars
Nigher ascended than here this overshadowing spire.

EPITAPH ON A SHEPHERD.

Slowly the timorous herd, all powdered with wintry snows,
Wind from the mountains; the herd follows the shepherd no more.
Ah! Therimachus sleeps below his eternal slumber,
Under the forests where fire from heaven consumed his life.

THE CHARITIES OF DEATH.

Ye who upon the mountains now stray, O wandering shepherds!
Hear Clitagora's wish — the wish of your comrade entombed;
Here let the white flocks bleat: here let them wander, — the shepherd
Sit upon yonder stone, and play his most delicate song;
And garland my grave with crowns of the first-born children of spring;
And quicken my dust with libations of sweet refreshing milk.
Do this, ye swains, to a swain: also midst the departed dwell
Graces — and also here love they reward with thanks.

ACHILLES' GRAVE.

This is Achilles' grave! for terror of future Troys
The Grecians placed it here upon the Trojan strand.
Son of the ocean goddess, thou liest entombed on the shore,
That ocean's billows to thee may sound thine eternal praise.

ON THE PICTURE OF MEDEA, BY TIMOMACHUS.

When Timomachus' hand, O cruel Medea, traced
Thy picture here, how Art has fought thy passionate fight!
Then hath wisely ended. In sparkling furious eyes
Hang the tears where rage melts in maternal love:
Farther he painted not. "Her children's blood to shed,"
Said the artist then, "becomes Medea alone."

ON A BEAUTIFUL LANDSCAPE.

Shepherd, O speak, unto whom are those beautiful trees? The olive
Is Athenaia's; the vine winds around Bacchus her arms;
To Ceres the corn; and these flowers, so fragrant and bright, unto Juno,
And Cypris, — fragrant and sweet, bearing such beautiful gems.
O friend Pan, now warble, take not from thy lips thy pipe;
Here, in the rosy vale, the echo thou surely wilt find.

WOMAN'S LOVE.

Alas, poor woman! the youth they love not as we women love:
For, when strong passion affects them, each, grief to another imparts
In friendship, trusting to friend; they soothe the griefs of the soul:
Seek dissipation, and see nature, and mankind, and art;
But we, poor prisoners, we, desponding and pining in soul,
Loving and longing in solitude draw to the grave.

THE SWEET SECRET.

Naught is sweeter than love — of all the fairest on earth
It is the sweetest bliss, — honey to it is gall.
This, says Nossis, but only to those whom the goddess hath loved, —
What in the rose doth bloom, lovers only can tell.

THE PENCIL.

Fairest Leontium, take, O take this pencil of silver,
Within thine accomplished hand golden will it become:
For to thee the Gods have given what they on so few bestow,
Cypris, the fairest form — Pallas, the wisest art.

THE COQUETTE BEFORE HER MIRROR.

No, Cleopatra, no! thy mirror, trust me, deceives thee;
See thyself as thou art! Sawest thou ever within?

LAIS HANGS UP HER MIRROR IN THE TEMPLE OF VENUS.

Dione! to thee who for ever art fair,
This mirror I give; and deplore,
That no longer, alas! I can look and compare
The Lais that is with the Lais of yore.

Ever-blooming Dione! thy Lais grown old,
This mirror divine now surrenders to thee;
Alas! I no longer would wish to behold
What I have been, or what I may be!

THE SHIELD OF ACHILLES.

This shield by Achilles of yore empurpled with Hector's blood
Ulysses stole; but in vain. Ithaca ne'er shall it see.
Round him the waves in tempest arose, and to Ajax's grave
Bore it afar; the grave clanged with the billows, and spoke, —
"Sleepest thou, Telamon's son? Here is the shield of Pelides!
That which the Grecian had robbed, Poseidon gives thee again."

LEONIDAS.

As the mighty Leonidas, now a generous victim
Under the corpses buried, Persia's monarch beheld,
O'er him in haste he threw his purple mantle, — the Grecian
Murmuring, started and spoke, — "Fly and dishonour me not
With the glory of traitors! — This shield shall adorn me alone
Among the shadows — I go now like a Spartan to death."

PSYCHE SAILING WITH TWO DOLPHINS.

Whither steerest thou, Psyche, on thy two sea-dolphins borne?
Over life's stream I glide, O wanderer, away!
Thrice fortunate o'er it are muse-loving guides to me
Who towards ports secure their oars and rudder lend.

APOLLO.

Alas! that Apollo, the shepherd, no more upon lovely Peneus
Dwelleth! alas! that earth has lost the echo divine!
"Believe, he forsakes it not; he shepherds the flocks of men;
But a barbarian ear hears not the song of the God."

IMMORTALITY.

Pillars of marble and brass, and statues and tablets of fame,
Give to the living, while here, pleasure both lasting and high, —
But only so long as he lives. Into region of shadows when glided,
For him no statue will rise — no writing recording his praise.
Virtue alone, and the graces of wisdom will follow us there
Undivided, and here leave us the blooming fruit.
So lived Plato — so Homer lived: they took of bright wisdom with them
The fountains away, and to us bequeathed the quickening stream.

THE DAUGHTER'S GRAVE.

Oft lies over the grave of the daughter the weeping mother,
And mourns and invokes the shade of her Philanis to rise.
"My daughter! hast thou departed so soon, ere thy nuptial bed
I had adorned, by the stream under the shadows to dwell?"

THE WAY TO ORCUS.

Every where leads the path to the region of shadows alike ;
Alike, whether thou from Athens, or thou from Meroe come.
Also grieve thyself not, when thou to far lands must stray,
There, amid foreigners too, straightway to Orcus it goes.

ON A BEAUTIFUL LANDSCAPE WHERE PARIS'S IMAGE STOOD.

Silence ! thou forest of oaks ! ye fountains under the rocks,
Murmur lighter, and ye bright flocks and herds too cease,
Before the dwelling of Pan, whom here the delicate flutes
With sweetest songs delight, and soothe to slumber soft :
And round in rings, ye Nymphs and Hamadryades float,
And the Naiades choir in their exulting dance !

VARIOUS FATE OF LOVE.

Ah me ! the various fortune of lovers' destinies : — one,
Whom soft persuasion befriends, slumbers in Venus's lap ;
Another unwinds himself scarce from needy poverty's gripe ;
And this one locks on himself a melancholy jail.
And yet mankind still deceive themselves with insanest hopes,
That, where Amor appears, there, an Elysium blooms.

TO A NIGHTINGALE BEARING OFF A CICADA.

Attic songstress ! why, Philomela, thou honey-fed queen,
Dost thou to thy young ones in nest poor little grasshopper bear ?
Rob the adorned-with-wings, the harbinger singing of spring,
The voice that, a bough beyond, with thee all summer time sang ?
Nightingale, leave her forlorn — she is a stranger as thou art ;
For no child of Apollo's the death of another becomes.

THE BOND OF FRIENDSHIP.

Of our friendship, Orestes, our deep eternal friendship,
A slight memorial is, this slight recording stone :
Ever will I seek thee ; and thou too, under the shades,
Drink thou over me never the Lethean wave !

WHAT SMARTS.

That I to thee did trust ; that thee, as a friend, I selected,
Believe me, pains me more than does the secret itself,
Which to the world was blabbed. A secret deeper, thou tellest,
Mine understanding's fault in choosing thee my friend.

THE DRIED-UP FOUNTAIN.

Wanderer ! thou who whilome my sweetly-refreshing waters
Didst know, thou seekest in vain a flowing fountain in me :
Since once a murderer, here resting, his terrible hand
Washed, and my gentle sides spattered with hideous blood ;
Since then, the light of day, my nymphs all fled : unto Bacchus
Only they spoke,—" Ourselves we mix not with blood-reeking Mars."

THE AGED VICTOR.

I who, at Alpheus once, and once at Castalia's fountain,
A victor doubly hailed, two glorious crowns have graced :
And in Nemea, too, and on the resounding Isthmus,
Fleeter than wind have passed the all-envied goal :
Aged and time-worn, now to heavy labour condemned,—
Work in the mill : to you, Greeks, an eternal reproach !

THE CICADA.

Wherefore follow you me, ye race unjust, and envy
To your Cicada possession of one dewy twig ?
She the hermit, the songstress — she, who ever the way,
During the noontide heat, points to the fountain for you.
Seize on another foe, who pilfers you of your seed ;
Me, the innoxious, please the green leaves and the dew.

THE REVENGE OF JUNO.

Through royal Juno's soul the thorns of jealousy pierced
When shining Ganymede, first, before great Jupiter stood:
And she spake to herself, "Because, O Troy, thou sendest
To me a flame, whose glow within mine entrails burns,
Therefore will I to thee a flame dispatch, — young Paris!
A vulture visits thee next, instead of a ravishing eagle."

ASTACIDES.

The Cretan shepherd Astacides have we, the gentle Nymphs,
From this mountain borne away? Divine Astacides! now,
Thou herdest under the oaks within Jove's forest. Ye shepherds,
Sing your Daphnis no more; sing now Astacides' praise!

THE FOP.

Thou, who the Stygian pool dost ferry with oaring arms,
Sable Charon! O take gently my Ciniras up!
Reach forth thy hand to him when, from the boat of shadows, he slowly
Steps out, so by thine aid he spare his beautiful foot;
Which still, when living, with corns, the prettiest shoe distressed.
"Ai! ai!" he limping cries, soon as the shore he treads.

THANKS TO THE NYMPHS.

Ye Nymphs, ambrosial daughters of fountains — ye Hamadryads,
Who, on your rosy feet, over these waters do float,
Fare ye well! and keep sound Kleonymus, who to you
This picture, with his thanks, amid your pines doth place.

THE VALIANT PHYSICIAN.

Wanderer! see where lie, within one grave entombed,
Seven dead men: And who seven hath laid so low?
Askest thou? — Knowest thou not the wand of mightiest Hermes,
Which, in physician's hand, marshals mankind to the shades.

LAND AND SEA LIFE.

As good Archippus, a forester, under the earth departed,
His last farewell he took, and called his son to his side;
Then said, — "Dear son! now take the plough and the harrow I leave,
And, as you love me, love, as I have loved, the land;
Trust not the stormy ocean, nor its deceitful calm;
Nor yet the gain, for whose sake its waters tempt you away.
How much sweeter to children, their own beloved mother,
Than every stranger, is — is land before sea to me!"

LE MALHEUR D'ETRE.

Of life, which life? for, in the forum, law
With strife and envy rage; and in the town
Are cares; the country, labours; fear and awe
At sea; in travel, risk, if aught you own;
Want, too, brings pain; a wife, distress. Alone
Hast thou existed, thy survivors saw
Thy solitude; yet children ne'er atone
For ease: and childless who life's chain would draw?
And, midst the heavings of this changeful ocean,
With youth still foolish, and old age forlorn,
The sea of life leaves all its fountains dry.
Once more commencing its alternate motion.
Therefore, of these, choose thou: — or, to be born —
Never; or, born — immediately to die.

POSIDIPPUS.

OUR EASTERN RELATIONS.

Convention between Turkey and Great Britain.

Non ita certandi cupidus quam propter amorem.

THE few reflections we propose to offer upon the policy adopted towards the countries whose affairs now prominently occupy public attention, are dictated less by a desire to cavil at such measures as the wisdom of our Government may have thought fit to adopt, than by an anxious wish for their examination by the public. With this view, we shall divide them into two separate heads: Turkey and India. On the one hand, we perceive that Russia, fatally forced by the necessities of her population to command the Black Sea, into which all the great rivers that traverse her Asiatic dominions debouch, and to prevent any foreign power from sealing her fate by taking possession of Constantinople and the Dardanelles, on all occasions shows symptoms of restlessness when the two most potent sons of Mahomet threaten to come into collision. On the other hand, Persia and the powers of Afghanistan, deserted in their hour of need by English policy, have been cast by the inevitable force of events into the arms of Russia, whose schemes of conquest in India they have become the instruments of forwarding, and which, on our part, it were now insanity to doubt.

It cannot be denied, that the English nation feel great apathy upon this momentous question. They may be hostile to the Russians, but do not sympathise with the Turks. Political reasons are not powerful against Christian feelings; and the power which for centuries has been regarded by Christendom as the scourge of humanity, does not, all at once, change its nature, or vindicate its claims to civilisation in the eyes of the people, by sending out a few ambassadors, who may more properly be termed the heralds of its fall. It is now some time since the daily press, aided by the indefatigable Mr. Urquhart, has laboured to raise the Russo-phobia to its periodical height in this country, and many grounds have been found for an attack upon Lord Palmerston's policy and that of our ambassador at Constantinople; but a *mezzo termine* between hostility to Russia and support to Turkey may be suggested, which, perhaps, will not seem improbable to those who will give themselves the trouble to examine the state of the case.

We hold it to be sheer folly in any statesman of the present day to think of supporting, by force of arms, the doctrines of the "*Mare clausum*" of Selden. That the maritime *statu quo* can be preserved for ever is a pure delusion.

Civilisation must advance, and the warm shores of the Euxine and the delicious recesses of the Taurida yield their forests of oak to the navy of their possessors; but for the safety of England those possessions must not be Russian, and need not be, because the elements of another power exist in abundance on the spot in the indigenous population in whose favour all European feelings are warmly interested. Russia is the great bugbear of modern times, as the power of France was during the reign of Louis XIV.; and, although history has proved that the attempt to preserve the balance of

power which united Europe of old was a chimerical scheme, there are many in this country who still conceive it a good ground for a crusade against Russia. If we are to have a war, let not the sword of England be drawn for the vain and useless purpose of supporting such a worm-eaten throne and crumbling despotism as Turkey.

Nations as well as individuals have their term of maturity, and decay. Even during the height of their power, the Turks concealed within their bosom the germs of a decay as rapid and premature as their prosperity was precocious. United and invincible, they experienced for the first time a check under Bajazet, from the Tartar conqueror Tamerlane and his horde of shaggy demons. A short half century re-invigorated the irresistible scourge, and the tide of their conquest again swept all before it. Alarmed at their formidable progress under the warlike Mahomet the Second, Europe beheld them with dismay, advance from the deserts of Arabia, roll like a torrent over Syria to the borders of the Euxine, and finally end with the capture of Constantinople itself. Their religious enthusiasm aided by the distractions of the neighbouring countries of Christendom, continued to swell the tide of their triumphs, until in the middle of the seventeenth century, a victorious army of 200,000 fierce fanatics penetrated into the heart of Germany, and encamped before the walls of Vienna. All of a sudden appeared that "man sent by God, whose name was John;" and before the sword of Sobieski the terrible flood was stayed. From that moment the star of Mahometanism has waxed dim, and Europe, recovered from her fright, has had leisure to examine into the causes of a decay so singular in the history of nations. No glimpse of prosperity since that time has ever shone upon the receding fortunes of the Osmanlis; Prince Eugene following up the successes of the heroic Poles, weakened still more that prestige of victory which was wont to inspirit them in their battles with the Giaours. They have not been permitted to remain stationary in their course, but have been forced by successive defeats into a retrograde path which has ended in the total demoralisation of the chief officers of the empire, and the universal prevalence of bribery and corruption in all the offices of the state, until at length we have seen a rebel pacha, wresting from the Sultan the vast and fertile province of Egypt, his son Ibrahim advancing in triumph from the plains of Koniah and threatening the walls of Stamboul, and lastly a Russian army, passing the Balkhan, occupying Varna and Adrianople, and only staying its victorious march at the command of the potent voice of the lion of the seas.

At the same time that these disastrous events occurred, the Sultan destroyed the species of feudal organisation which gave to his immediate vassals a sort of liberty recognised and confirmed by the most ancient laws and customs of the empire, and the sweeping destruction of the Janissaries, who composed the flower of their military force, and the nucleus of all the fanaticism of the people, completed the overthrow of their institutions. The Ulemas, who still remain, and who compose the dignitaries of the religion of the true believers, are the inveterate opposers of all reform; and Sultan Mahmoud cannot be said to have done more than commenced his reform so long as a vestige of that all-powerful body remains. As all despotisms are said to be tempered by assassination, the chief of the Osmanlis and his new European system hangs upon the breath of the Ulemas, for he dare not, though he well knows his predicament, venture upon their destruction, but waits in patience, until his spring, like the tiger's, shall be once and for ever.

From the peculiarities of their faith, the Ottomans have exhibited this

difference from other nations of conquerors, that from the first moment of their occupation they have never either mixed with, or conciliated the native populations. The Turks have never been more than encamped in Europe; three millions of them at the present day hold the whole population in subjection, living in idleness as lords of the soil. The original inhabitants of it still form a race apart, divided by the most mortal hatred, from the Armenian and Christian Ryahs of Turkey in Europe, to the Copts of the Nile. These Christian populations every where begin to raise their heads, and to perceive the vast superiority of their numbers, compared with those of their haughty oppressors: and, in a word, the iron net is broken. These are the people to raise up into a nation: five hundred years have amply proved that the Turks, as a nation, do not contain within themselves the elements of civilisation. No voice has been heard, no hand has been raised to form them into a fit brotherhood of the great European family, and the attempt made at present by a great man, worthy of a better fate

> "The last star of the night
> If better it belongs not to the dawn,"

is a foreign and extrinsic plant, which so far from taking root, must perish when the fostering hand which at present protects it is withdrawn. It is the population of Ryahs which alone has the capacity of improvement, and to his sagacity in discovering this fact is the success of Ali Pacha in Egypt to be attributed. But the pride of the lordly Turk would not in European Turkey permit the hated Greek, the abhorred Jew, the despised Armenian, or the schismatic Arab, to possess those rights and privileges essential for the unfolding of their capacity. Rather than this, he will cry, "Bismilla! it is the will of God."

Such is the crumbling despotism which many would support by involving England in a war with Russia, — a country which we have seen advancing from a state of barbarism scarcely one century ago, to a foremost rank among European powers.

The Sclavonic races, in their rapid career, have exhibited that docility and aptitude for improvement which is so much wanting in their ancient enemies. As fast as Turkey has declined, Russia has advanced, until at length we have seen a power which a century ago was hemmed in and overshadowed by Sweden, dilated into a Colossus, making war against Napoleon with one hand and the emperor of China with the other.

The inventions of steam and gunpowder have put an end for ever to the fear of having to fight a second Marathon and Salamis for the liberties of mankind; but above all, the habits and tastes of the millions of barbarians organised by the genius of Peter the Great, which form a security for an increased demand of European manufactures which would not be affected by the inevitable fall of the Turkish empire, to the prejudice of English merchants, in any material degree.

The Ryahs are the people whom England and France ought to raise to the dignity of a nation, as a barrier against Russia; but we own with Voltaire, that we never could feel any sympathy for those villainous Turks who shut up their women, and do not cultivate the fine arts.

It is with a higher order of truths than those of detail that statesmen on great occasions have to deal. It is only in its infancy that history deals with the battles, treaties, and commerce of nations; but men a little later begin to discover that these are only consequences of other causes; and then it is in their institutions that we seek the reasons of the decline of one and the prosperity of another. Guided by these views, we have traced a

little sketch of the relative situation of Turkey and Russia, which may not be courteously received by the critics of tariffs. We have neither touched "barbaric pearl nor gold" for the pleading, nor advocated the cause of the autocrat Nicholas. It is not intended that our remarks should contain an ungenerous or illiberal allusion — for it is impossible not to extend one's sympathy to the chief who now fills the throne of Othman, or behold the spectacle of a brave man —

"Greatly falling with a falling state,"

without admiration and enthusiasm. It is a false opinion that this empire has nothing to do with the rest of Europe, and that it ought to be a matter of indifference whether Carlos or Christina rules in Spain, or Mahmoud or Nicholas at Constantinople. Putting aside the question of commercial interest, England will always extend the hand of fraternity to every nation struggling through misery and ignorance for the high prize of freedom, sometimes even at the cost of her own interest; for a great nation, as La Bruyère says of a great soul, would be invulnerable if it did not feel compassion. But what is to be taken into consideration in examining this immense question is whether the genius of Mahometanism be or be not compatible with a high degree of civilisation? Without deciding, like the ancient Greeks, that all other nations are barbarians, we submit that it is very doubtful if the precepts of the Koran be capable of amalgamating with those of other nations; at all events, if a contest between civilisation and the Mussulman dogmas should arise in Turkey, it is not by throwing his sword into the scale that Mahmoud will decide it. Peter the Great made men of his serfs, but he did not change their religion. Of all the Mahomedan kingdoms which history has recorded, the Moorish power in Granada is said to have made greatest advances in civilisation; and yet it could not go beyond a certain point, nor keep pace with the progress of the Spaniards. The insuperable obstacles are polygamy and fatalism.

In whatever climate of the globe a registry of the population has been kept the result has almost always exhibited an equality of male and female births; and this remarkable law of nature is a stubborn argument against the defenders of Turkey — laying out of mind the moral degradation of one half of the human race, (videlicet the females) which must result from this barbarous institution. Monogamy then is the law of nature and the condition of civilisation; and what civilisation has in view is not the man alone but the family; for the individual dies, but the race is perpetual. Marriage is thus the basis of society, and that too, it appears, upon philosophical principles — for we have not desired to couple with the argument any religious prejudices; although the Christian dogma of the equality of all in the sight of God has perhaps proved the foundation of European superiority. Voltaire's saying has not only wit but philosophy to recommend it.

The policy suggested has however other grounds to rest upon. Whatever reforms may have been introduced by the Sultan are wholly dependent upon the accident of his life for their duration. They have no root in the feelings of his people, notwithstanding we have heard from Mr. Urquhart that the powerful influence of the Ulemas in the state and their fanaticism are at an end, and that those reforms upon which civilisation is based are marching steadily and rapidly on; that schools are everywhere established, useful public works, roads, bridges and canals in progress; that the powers of the pachas are greatly limited, the venality of office nearly destroyed, admirable and beneficial commercial arrangements been formed for all classes of

subjects, and their lives and properties been secured, for arbitrary punishments by death and confiscation are no more; that national prejudices have been to a great degree overcome; the costume of all functionaries assumed a more European character, an improved military system been adopted, and ambassadors now seen in all the courts of Europe, and many promising and intelligent young men been sent to England, as well as to other countries, to acquire military and scientific knowledge.

We confess that all this shows the prudence, wisdom, and patriotism, of the greatest potentate that for centuries has wielded the Ottoman sceptre: but whatever possibility existed of interfering with propriety between Russia and Turkey, it was at the time when another administration lost sight of the golden opportunity. Fifty ships of the line would not now effect what might have been done by a few frigates during the siege of Varna. Whatever desire we might have to assist Turkey, it is perfectly useless, because we are so remote from the scene of operations, that an army of 50,000 Russians might be in possession of the country ere we received notice of their march; and all the armies and fleets of England and France could not dislodge them from Constantinople, assisted as they would be by the whole Ryah population. Our opponents have admitted the truth of the assertion that the Ryah or Christian population of Turkey in Europe feeling the iron net broken, begin to lift their heads; but they contend that it is for the purpose of blessing the beneficent rule of the Turk, and of contrasting their felicitous condition with that of the subjects of Russia. For the correctness of our view of the subject we may cite as an authority the current rumour that there is or was throughout all Turkey an immensely extended conspiracy of the Christian population similar to the Greek Hetairia to overthrow the dominion of the Sultan, and to substitute a Christian prince at Constantinople. Whatever be the fact, we believe that the great mass of the indigenous inhabitants of the soil are more bound to the religion of Russia than to the civil reforms of Mahmoud.

We think that the policy of neutrality is sound, because as the inhabitants of the Crimea, Wallachia and Moldavia, hailed with joy the stipulations of Ackerman and Adrianople, and have improved under Russian government; it is reasonable to suppose that her further influence would be beneficial in like manner to all those vast countries now withering under the sceptre of the Sultan, and nothing by which civilisation is advanced can in any manner hurt the interests of England; because whatever advance Russia may make in conquest, England in the increasing prosperity of her arts and commerce, will always at any given time be more than a match for her: the two countries progressing in lines parallel though different; because on like grounds. England has forcibly seized during the last century three square leagues for every one taken by Russia; because Russia has a great desire to excel in the arts and commerce which is even demonstrated by her tariff and her excessive wish to emulate England in her manufactures; and England is in no dread of such competition, but, on the contrary, finds her interest in the increasing taste and demands of the Czar's subjects for the comforts of civilised life; because the trade of England with Russia amounts to more than two millions annually; whilst that of England with Turkey and continental Greece amounts to one million and a half only; lastly, because Turkey is in a dying state, brought about by the force of events long foreseen and predicted.

We who have read of the massacres of Ipsara and Scio — of the nightly sackings of their women — of the Golden City with its horrible slave market — of its streets encumbered with the bodies of slaughtered wretches, and the

palaces of their abominations set round with the heads of their Christian victims, may be allowed to have some feelings of incredulity. We believe nothing of their alleged civilisation; we who have read of the fairest portion of Europe made for centuries the proverbial abode of poverty, slavery, idleness, polygamy, and the plague, may also be allowed to express a hope that the Byzantine empire will one day arise from its long sleep of death a worthy daughter of the great European league. But whatever may be the inherent vices of this people, and however much Christian sentiment may revolt at their existence in the heart of Europe, in the calculations of political necessity it is far otherwise.

The integrity of the Ottoman empire is considered at the present moment as a fixed element of all sound political calculations, as a condition incontestable by all who do not admit that the balance of power can be permitted with safety to be deranged by any one party to the detriment of the others. The stability of the throne of Othman is thus of paramount importance to civilised Europe, for the identity of their interests is complete. Whatever therefore tends to consolidate its strength, and place its institutions beyond the attempts of hostile nations, whether concealed or overt, is viewed with favour by Great Britain, whose interests are so intimately associated with its welfare. The present convention of commerce and navigation between her Britannic majesty and the Sultan, together with the additional articles, must be hailed as the germ of incalculable benefits to Turkey — as an instrument of good capable of indefinite expansion, provided those means be adopted to insure its development, without which it must become a dead letter, or, at most, a trivial improvement. We learn that an outcry has been made against this treaty, and that Mr. Urquhart has denied that it is his treaty, or that he had any hand or part in it at all. Another opponent of the measure who has great influence with the merchants at Constantinople, prophesies its complete failure, and even goe. the length of accusing Lord Ponsonby of being overreached in the business. But, if we mistake not, the very same party were so blindly ignorant, not only of their own interests but also of the common principles of commerce and exchange, as to propose to the Porte an additional duty of 3 per cent. on all goods imported into its dominions, provided the former would undertake to keep the exchange always at one fixed rate! It is incredible that such ignorance should have nearly succeeded in this piece of quackery, of which it is needless to say the effect could only have been to fasten perpetually an additional duty upon trade, without obtaining—what indeed it was impossible for the Porte to effect—an invariable rate of exchange. As a civilising and restoring means, we deem this convention so highly important that a few observations may not be misplaced.

To develope the vast physical resources of Turkey, to vivify the latent spirit of commerce, to bring her means into contact with European markets, and to enable her to exchange her rich productions for the manufactures of Europe with profit to her subjects and augmented resources to her treasury, such are the ends which it is proposed to attain through a skilful administration of her financial department.

One fundamental reform is yet required to crown the Sultan's labours, and to insure to the nation the benefits he has sought to confer upon it — that is, a reform of its money. Unfortunately, a succession of impolitic errors has reduced the coinage of the empire to a state of depreciation which has rendered it useless as an implement of external commerce and unjust as one of internal valuation. In Turkey there is no standard of

value — no common measure by which property can be estimated. If one was fixed yesterday, it has been changed to-day by successive adulterations, the consequences of which were, not to give it an increased value in the eyes of foreigners, nor to cause it to pass for more than its intrinsic value with its own subjects, (for among them the prices of commodities invariably rose to the extent that the coin fell, simply because it was impossible for copper to be changed into silver, and silver into gold by an imperial decree,) but to occasion by these disordered movements sudden deficiencies, which, exorbitantly raising prices, were the scourges of the lower orders, by unsettling their habits, and inflicting grievous privations upon them; so that their operation may be compared to that of devouring ebbs and tides, sweeping away in a day the gains of years from the Turk, and converting commerce into a career of alarms and perpetual dangers for the foreigner, by the disastrous and sudden rise and fall of the exchanges during the period that he held any commodity. The necessities of the Porte have driven it in a circle where every measure in its own favour has acted immediately in an inverse sense on the interests of all its subjects. A true equilibrium of all interests can be established only upon the basis of a sound standard of value.

This being assumed as the result of experience, it will be seen upon examination, that the monetary system of Turkey, though doubtless encompassed with difficulties, nevertheless appears susceptible of arrangement. Placed in a critical position, when compared with other countries Turkey may even be said to have some features in its favour, inasmuch as it has merely to construct, without having previously to destroy, to erect its financial fabric, according to the lights of European experience, without having to retrace any false steps of the past, in this order of things at least, or to compromise any existing factitious interests. It has no redundant paper currency to correct, no representative of national debt to make good, and is simply confined to the task of creating a circulating medium, representative of commercial credit, or the *bonâ fide* bargains and exchanges of its community. To give the case its most general expression, the object of all monetary systems is to form a representative, exactly corresponding to the bargains of a country,—neither more nor less: Turkey is so far fortunate that she has a *tabula rasa* to begin upon. On the other hand, she will have to contend with the difficulty of obtaining the money necessary to commence, with the defects of the existing laws of debtor and creditor, and with the habits and prejudices of a people, unaccustomed to paper money, and suspicious of every transaction which does not resolve itself into one of mere barter.

The par of exchange between any two countries depends on the intrinsic value of the standard coin of each, estimated by the quantity of silver in each, which is the common standard of value throughout Europe. Thus the piastre being the standard coin of Turkey, and the pound sterling that of England; and the pound, containing 113 grains of pure gold, which, at the market price of 78*s.* per oz., is equivalent to 1782 grains silver — if the piastre contain 17 grains silver, the par of exchange will be at its present rate of 108. If the piastre contain more silver, the par will be below 108 — if less, above it. Such being the par of exchange, all fluctuations in the rate of exchange between two countries depend on two causes,—

First — The balance of payments between them.

Second — Any alteration in the quantity of silver contained in their standard coin.

With regard to the first, if the debts due from one country to another, as for instance, from Turkey to England, exceed the debts due from England to Turkey, there will be more merchants at Constantinople, who have payments to make in London, than merchants in London who have payments to make in Constantinople. Consequently the demand for bills, which are the most common and convenient mode of remittance, will be greater at Constantinople than the supply, and they will bear a premium, —in other words, the exchange will rise or become unfavourable for Turkey.

This action generally takes place from the balance of trade being for the time against Turkey, that is, the value of the imports into Turkey exceeding that of the exports: but it may arise from any other cause by which Turkey is obliged to pay money to another country, as for instance by the debt to Russia, incurred by the treaty of Adrianople. But from whatever cause this fluctuation may arise, it cannot exceed a certain limited amount; viz., the expense, including interest and profit, of transporting the precious metals from one country to the other.

This fluctuation must also always right itself if the standard be preserved unaltered (for no country can go on permanently importing more than it exports), and cannot materially affect the interests of commerce, being in fact the natural means by which commerce adjusts itself.

But the case is different with respect to the other fluctuation in the exchanges, which is caused by a depreciation of the standard coin of one country. So long as the quantity of pure silver in the piastre is not ascertained and is continually varying, it is impossible to keep the exchanges steady. If the Turkish government, to meet the necessity of the moment, diminishes the quantity of silver in the piastre, a higher rate of exchange must be the consequence, for a greater number of piastres must be given as an equivalent for the pound sterling. Thus if the quantity of silver in the piastre was reduced to $8\frac{1}{2}$ grains of silver, the real par would be 216 instead of 108; and the nominal par remaining at 108, the rate of exchange, supposing the balance of payments even, would be 108 against Turkey.

The provisions of the treaty of Adrianople having caused a great exportation of the metals from Turkey, which was not supplied by a favourable balance of trade, caused the exchange to turn against her; but this rise could not, as we have shown, have exceeded a certain very limited amount, had the value of the piastre remained fixed. The great rise and fluctuations which have taken place, and which have caused much inconvenience to commerce, prove that the real value of the piastre must have been diminished. In order to restore the exchange and to fix it, a sapient plan was proposed by the very parties now opposing the convention of Lord Ponsonby, of levying an additional duty of 3 per cent. on imports, and thus creating a fund by means of which the Turkish government was to operate on the exchanges and keep them steady.

The duty on imports being fixed by treaty could not have been altered except by consent of the parties; and it is evident this could never have been obtained. It is idle to think that all parties importing goods into Turkey would voluntarily consent to pay an extra duty of 3 per cent. But even supposing that the additional duty could be levied, or that the Turkish government were to set aside part of the existing duty to form a fund for the purpose of regulating the exchanges, it is clear, from the principles above laid down, that such an attempt would be totally ineffectual.*

In the first place in order to produce any action whatever on the ex-

* We are indebted to one of our most eminent mercantile authorities for these hints.

changes, it would be necessary for the Turkish government to place a fund at London, Paris, and perhaps even other great commercial towns, on which to draw in order to be able to bring bills at pleasure into the Constantinople market,— in other words to carry on banking operations, which is a separate business, in which no government ever did or ever can succeed. But in the second place, even if this difficulty could be obviated, no sacrifice on the part of government could keep the exchanges steady so long as the value of the piastre is uncertain and liable to fluctuations. The first step which the Turkish government should take is to ascertain the exact value of the piastre, that is, the exact quantity of silver which it contains when compared with the Spanish dollar which it purports to represent. This proportion having been ascertained, a proclamation should then be issued from the mint that in currency so many Turkish piastres for so many Spanish dollars should be a legal tender for payments between individuals, and be taken by government in all payments made to it.

Such has been the course adopted by Russia and Austria. The paper rouble of Russia is convertible by law into the silver rouble at a certain fixed rate, and the Austrian paper florin into the metallic florin in like manner.

The real value of the piastre, and consequently the real par of exchange, being thus fixed, the Porte, in order to keep the fluctuations of the exchanges within certain moderate limits, has only to keep its circulation at this value, and to abstain from any attempt at debasing the piastre. This it is imperatively called upon to do, both by the regard it owes to foreign commerce and the good faith it ought to observe with merchants, as well as by its own interests. If it adopts this course it will be quite unnecessary to revert to any other scheme for regulating the exchanges, which, as the whole history of commerce shows, will regulate themselves, and oscillate within fixed and moderate limits. If it does not accomplish this duty, every attempt to regulate the exchanges by other methods will be a complete failure, and can only cause great embarrassment to commerce, and end in utter disappointment.

The necessity of this reform has already been explained to the intelligent Redschid Pasha. To call in the circulating medium of Turkey and re-issue a new and pure coinage would, however, require a loan to the state, of perhaps five millions sterling, — a sum which the Turks are not likely to borrow from capitalists. A bank might be instituted with British capital, a portion of which might be lent to the Porte, upon condition of receiving the necessary privileges; and as such an institution might have a charter from the British crown, it would be a more secure depository of Turkish, Greek, or Armenian money, than any bank purely Turkish, as it would have the shield of British protection over its operations —a shield which in the instance of other institutions of the same character in foreign countries has been found most efficient in creating confidence. It is understood that Mr. N. Rothschild, in the year 1834, secretly visited the Sultan, by whom he was well received, for the purpose of proposing a loan to the Porte to put their circulating medium in order. He did not succeed, however, owing to the religious scruples of the Turks whose creed forbids the payment of interest upon loans. It may be doubted also if paper money, without which a bank could not live, would ever be received or understood by the Turks.

It appears, therefore, that until the monetary system of Turkey is reformed the recent commercial treaty by which all internal duties are abolished upon imported goods, and one fixed duty substituted in their place, will be inoperative.

STUDIES OF UNDEVELOPED CHARACTERS IN SHAKSPEARE;

FROM SKETCHES AND SUGGESTIONS IN HIS PLAYS.

No. VI. — *Measure for Measure.*

The first of these characters with whom we propose to make acquaintance in the present play, is the "Sanctimonious Pirate." This very conscientious individual, as we are informed by Shakspeare, "went to sea with the ten commandments," painted, or carved, it would appear, upon good stout board; but after having had the ten fairly written, so as to establish the fact, he then scraped one of them out from the tables. By this ingenious device he most religiously went to sea with the sacred ordinances, wherein there was no command to be found tending to prohibit the exercise of his calling. But the philosophic and moral satire widens in the dialogue which ensues: —

"*Second Gent.* Thou shalt not steal?
"*Lucio.* Ay, that he razed.
"*First Gent.* Why, 't was a commandment to command the captain and all the rest from their functions; — they put forth to steal! There 's not a soldier of us all, that, in the thanksgiving before meat, doth relish the petition well, that prays for peace."

Act I. Sc. II.

The sanctimonious pirate is, therefore, a class. It is a tolerably wide one, and includes all those individuals who assume an extra degree of outward observance in conventional virtues, the better to cover the one point of exception which they make in favour of their peculiar passions, interests, habitual prejudices, appetites, and tastes. He who prays for a forbidden thing, is very apt to consider himself an exemplary man, because he never swears oaths; and he who goes thrice to church or chapel on Sundays, often thinks the "tradings" of the other six days cannot be otherwise than full of truthfulness and virtue; while the greedy fellow, who covets every thing belonging to his neighbour, except his wife (to whom he happens to have a natural antipathy), is fully satisfied that the sanctimonious distance with which he always regards her, renders his whole state of feeling and sentiment towards his neighbour a most unexceptionable condition of moral, — nay more, of highly respectable existence.

We next come to the scene in which Elbow, Froth, Clown, and Officers, first make their appearance. A long scene occurs, which has no more to do with the movement, illustration, or elucidation of the plot of "Measure for Measure," than any discussion which may take place at any time before a London magistrate: it is, however, an amusingly ridiculous specimen, in itself, of that absolute inability to make an intelligible statement of the grievance, or defence of the innocence, which sometimes characterises the plaintiffs and defendants among the uneducated classes, while at the same time they are confident in the feeling that they are explaining and proving the whole truth with the most clear and conclusive breadth and precision. The impossible attempt which distinguishes the present instance, is that of the plaintiff and the defendant's witness, who would state their respective cases in the matter of certain alleged insults offered to Elbow's wife. Whether the case might have assumed a more definitive shape by the

appearance of Mrs. Elbow, we cannot determine; but as the affair stands, nothing can be made of it.

"*Elbow.* My wife, sir, whom I detest before heaven and your honour.
"*Escal.* How! thy wife?
"*Elb.* Ay, sir, whom I thank heaven is an honest woman.
"*Escal.* Dost thou detest her therefore?
"*Elb.* I say, sir, I will detest myself also, as well as she, that this house, if it be not a bawd's house, it is pity of her life, for it is a naughty house.
"*Escal.* How dost thou know that, constable?
"*Elb.* Marry, sir, by my wife; who, if she had been a woman cardinally given, might have been accused in fornication, adultery, and all uncleanliness there.
"*Escal.* By the woman's means?
"*Elb.* Ay, sir, by Mistress Overdone's means: but as she spit in his face, so she defied him.
"*Clown.* Sir, if it please your honour, this is not so.
"*Elb.* Prove it before these varlets here, thou honourable man, prove it!
"*Escal.* [*To Angelo*]. Do you hear how he misplaces?
"*Clown.* Sir, she came in, great with child, and longing (saving your honour's reverence) for stewed prunes. Sir, we had but two in the house, which at that very distant time stood, *as it were*, in a fruit-dish—a dish of some three-pence: your honours have seen such dishes; they are *not* China dishes, but very good dishes.
"*Escal.* Go to, go to: no matter for the dish, sir.
"*Clown No, indeed, sir*, not of a pin; *you are therein in the right:* but to the point:—as I say, this Mistress Elbow being, as I say, with child, and being great-bellied, and longing, as I said, for prunes, and having but two in the dish, as I said,—Master Froth, here, *this very man*, having eaten the rest, as I said, and, as I say, paying for them very honestly; for, *as you know*, Master Froth, I could not give you three-pence again?
"*Froth.* No, indeed.
"*Clown. Very well:* you being, then, if you be remembered, cracking the stones *of the aforesaid prunes.*
"*Froth.* Ay, so I did, indeed.
"*Clown.* Why, very well: I telling you, then, if you be remembered, that such a one, and such a one, were past cure of the thing you wot of, unless they kept very good diet, as I told you?
"*Froth.* All this is true.
"*Clown.* Why, *very well then!*
"*Escal.* Come, you are a tedious fool: to the purpose;—what was done to Elbow's wife, that he hath cause to complain of? Come me to what was done to her.
"*Clown.* Sir, your honour cannot come to this yet.
"*Escal.* No, sir, nor I mean not.
"*Clown.* Sir, but you shall come to it, by your honour's leave: and, I beseech you, look into Master Froth, here, sir; a man of fourscore pound a year,—*whose father* died at Hallowmas:—*Was 't not at Hollowmas*, Master Froth?
"*Froth.* All-hollond eve.
"*Clown.* Why, very well: *I hope here be truths?* He, sir, sitting, as I say, in a lower chair, sir,—'t was in the Bunch of Grapes, where, indeed, you have a delight to sit—have you not?
"*Froth.* I have so, because it is an open room, and good for winter.
"*Clown.* Why, very well, then: I hope *here* be truths!
"*Angelo.* This will last out a night in Russia,
When nights are longest there: I'll take my leave,
And leave you to the hearing of the cause;
Hoping you 'll find good cause to whip them all.
"*Escal.* I think no less: good morrow to your lordship. [*Exit Angelo.*
Now, sir, come on: what was done to Elbow's wife, once more?
"*Clown.* Once, sir, there was nothing done to her once.
"*Elbow.* I beseech you, sir, ask him what this man did to my wife?"

ACT II. Sc. I.

We never get any further in the progress of this arduous case, as to the statement of the charge, which is hopelessly entangled in the mass of irrelative facts and deductions of Froth's witness. We undertake to say that nothing was done to Mrs. Elbow. She had merely been to the house of Mrs. Overdone, with a view to engage her official husband in a job, which should redound to his credit in the exercise of his function, if it did not ex-

tort money from Master Froth; and in all cases her own virtue and general value was to be exhibited. In the course of the trial, a touch of the pen introduces us, by a masterly *non-sequitur* of the loquacious witness, to the father of Master Froth (who died on All-holland eve) and to Mistress Overdone's nine husbands. She derived her present name from the last; but the respected Mr. Overdone has followed his loving predecessors, for she is stated to be a widow during the arduous investigation of the "nothing" that was perpetrated upon the immaculate Mrs. Constable Elbow.

Lord Angelo, persisting in his determination to have the full force of deadly law carried into execution upon Claudio, declares that he would not act otherwise had it been his brother, or his son. The brother never appears, however, and perhaps, as Angelo was a bachelor, the son was only coined by a figure of speech. Isabella also mentions her father and mother, the fact of whose existence transpires in a way which is very characteristic of our procreant bard. She exclaims, "Heaven shield, my mother played my father fair!" We hear no more about either of them. Shakspeare's opinion of the ladies of his time is far from complimentary to them, as we have before had occasion to remark. Mariana's brother Frederick is spoken of as an important personage, being designated as "Frederick, the great soldier." There is good cause, however, for his never presenting himself on the stage, as it would appear that, by this time, the gallant and unfortunate gentleman was (if any where), at the bottom of the sea.

"*Duke.* Her should this Angelo have married; was affianced to her by oath, and the nuptial appointed: between which time of the contract, and limit of the solemnity, her brother Frederick was wrecked at sea, having in that perished vessel the dowry of his sister. But mark, how heavily this befel to the poor gentlewoman: there she lost a noble and renowned brother, in his love toward her ever most kind and natural; with him the portion and sinew of her fortune, her marriage dowry." — Act III. Sc. II.

We learn from Mistress Overdone, who must be an excellent authority on the point, that Lucio has a son by one Mistress Kate Keep-down, whom he had promised to marry; and that the said young gentleman will be "a year and a quarter old, come Philip and Jacob." We presume that the very sanctified and most catholic Mistress Overdone alludes to the saints, Philip and James, preferring with familiar latinity to understand the latter as Jacobus: whence it is clearly deducible that the son afore-mentioned was born between the first and second days of May, fifteen months since the date of this declaration.

There is a rich nest of these non-apparent folks in the following speech of the Clown, who has just been ushered into prison.

"*Clown.* I am as well acquainted here, as I was in our house of profession: one would think it were Mistress Overdone's own house, for here be many of her old customers. First, here 's young Master Rash; he 's in for a commodity of brown paper and old ginger, nine score and seventeen pounds, of which he made five marks ready money: marry, then, ginger was not much in request, for the old women were all dead. Then, is there here one Master Caper, at the suit of Master Three-pile, the mercer, for some four suits of peach-coloured satin, which now peaches him a beggar. Then, have we here young Dizy, and young Master Deep-vow, and Master Copper-spur, and Master Starve-lackey, the rapier and dagger man; and young Drop-heir, that killed lusty Pudding; and Master Forthright, the tilter; and brave Master Shoe-tie, the great traveller; and wild Half-can that stabb'd Potts; and, I think, forty more; all great doers in our trade, — and are now for the Lord's sake!"

Act IV. Sc. III.

Every one of the foregoing batch is identified by a touch that renders his character apparent, either instantly, or by a moment's synthetical reflection. A simple process of imagination places their ruling features and qualities into the given or suggested condition of action, and forth step the

rogues in all their luckless vain glory. What shall we think of Master Rash, but that he was an equally humorous and unprincipled swindler? Go to! Master Rash: what! upwards of one hundred and eighty pounds of lawful Elizabeths, when money was worth so much more than at present, and all incurred for a precarious speculation on the necessary economy of antiquated stomachs in a variable cold climate! — fye, and go to Master Rash! avoid thee, most rumble-witted, belly-trading thief! Touching young Master Caper, we see at a glance that he was a most luxurious dog; and that Master Three-pile must have been a weak foolish man, whose whole soul was in his trade (an expression generally used as a compliment in certain shop-keeping countries), or he would never have trusted such a soft-handed, glib-tongued, high-scented, dancing-off customer, as this same Caper, with *some* four suits, half a dozen or more, of peach-coloured satin, one after the other, and without ever seeing the colour of the money that was to pay for them. He gazed lovingly on the costly article through his black tortoise-shell glasses, while it lay enrolled in his dainty warehouse; he gazed upon it with critical acumen, when its several portions became "suits," before he sent them forth; he gazed profoundly into his books, where the debt reposed in security. His whole soul was in his trade: wherefore he was a prey to the swindler; verily to the rich glossy man who purchaseth in profusion and patronage, but who payeth never. Of young Dizy there seems little to say, except that he would have been an incurable idiot, but for the fiz-brained activity which prevented his standing still long enough. He had not the least idea he was spinning himself into this scrape, nor knew at whose especial suit he was imprisoned. Young Master Deep-vow, we have reason to believe, was a sentimental tallow-face, with a cast of the morbid hypocrite: he was an ever-injured piece of fancied sensibility, half conscious of his want of sincerity. He made a good associate for the bold imbecility, and bare-faced manners and doings of the impudently worthless Master Copper-spur, and they were attached to each other, in a sort, from the pleasure of a contrast, by which each fancied himself set off to advantage. Master Starve-lackey, the rapier and dagger man; the seedy swell about town; half fencing-master, half bully; the fomenter and elbow-nudger of duels, and the interpreter and go-between, either to show off a fool's superfluous valour, or to screen (for a consideration) the cowardice of those fools who burn to have the credit of superfluous valour, is a class of character very well known, and "as fresh as the day." You shall see such a fellow any time, at all the disreputable places of fashion and resort. Of young Drop-heir, we are verily at liberty to entertain what populous conceits shall pleasure us, and to imagine him ambling through a lane of stentorian brats, to whose sweet quire for provender he turneth an indurated deaf ear (since they were not heirs at law), till his onward eye encountereth the fierce glance of lusty Pudding, the uncle of one of the deceived maternal maidens; whereof came the lunges of rapiers, and the subsequent death of the sore-wounded Pudding. The reason of honest Master Forthright, the tilter, finding himself in prison, was that he had won so many matches by his prowess, he could not conceive there was the least necessity for him to consider any further about the dull material of sober existence: in short, he mistook a part for the whole, as we but too often see done; and in the poetry or bright spots of his existence, was merged all other considerations of providing for the levelling and everlasting monotony of eating and drinking. For brave Master Shoe-tie, the great traveller, and inexhaustible middle-aged pedestrian; he, whom the sun in all his gradations of ascent and decline, hath so often gazed upon when he was empha-

tically a man of "dust" — *rejoicing* in his dust, we had more worthily said, —for him we feel the same commiseration as for the preceding unfortunate. His mind had been led astray by just the same error. He had seen so many romantic spots, that he at last fancied he could live by the recollection. For, in sooth, the habituated admeasurement of pleasant lands with the feet, had gradually given him the sense of a certain sort of possession at the time,— and was all this "to go" for nothing? When his landlady came with a high voice to demand payment for the one, small, dingy, back parlour in which he sojourned, he actually laughed in her face. He became incredulous; thence perplexed; thence confounded; thence boastful of his miles and eye-sight; thence hurt in his feelings; thence contumacious and indignant. Wherefore was the brave Master Shoe-tie, in full strength of leg, though he had become somewhat thin of late, and sprinkled with a fresh fall of grey in his hair, sent to the flag-paved prison; therein, bereft of all transition of light and shade over highways wide and pastures of green tone, to tie and untie his dust-embrowned and sun-baked shoe, and meditate on the rich valleys and long clear uplands, through which, "in glory and in pride," his forked prowess wended in the better days he had known.

As to wild Half-can and Potts, whom the besotted young animal stabbed (and there would have been no loss to society if he had been hanged for killing him), we are not disposed to offer any remark upon them, nor upon the "forty more" who are all in "for the Lord's sake." In like manner we shall pass over the pirate Ragozine, whose head was cut off in prison, and being then shaved, was substituted for the condemned head of Claudio. Flavius, a favoured noble of the duke's court, together with the other lords, Valentinus, Rowland, and Crassus, are also merely nominal characters. Those deserving of mention in our list are the following:—

The Sanctimonious Pirate.
Elbow's Wife.
Mariana's Brother Frederick.
Kate Keep-down, and Son.
Master Rash.
Master Caper.
Master Three-pile.
Young Dizy.
Young Master Deep-vow.
Master Copper-spur.
Master Starve-lackey.
Young Drop-heir.
Master Forthright.
Master Shoe-tie, &c.

HINTS TO COMMENTATORS.

THERE are few things more amusing to a quiet observer of the various bootless contentions of the world, than to see two men quarrelling over — the truth. Where there is error on one side, and correct reasoning on the other, we must suffer many painful emotions during the discussion, especially if it terminate in something more corporeal than philosophic blows. In the latter case, he who has the sound argument not unfrequently gains his conclusion accompanied by a sound "settlement" of the grosser kind, because those who persist to the last in a vulgar error are generally men of strong animal will, and have become used to these "illustrations" of their cause, from an old habit of being always wrong. Where there is no endurable reason on either side, and *both* the disputants are wrong, we can only recommend their heads to be set *ram-wise* to a brick wall, with earnest

exhortation that they should remain there in full enjoyment of their "damnable iteration." But where two men enter into violent altercation about a question in which they are both right, without knowing it, few things can be more ridiculous to the understanding, or more ludicrous to the titillant humours.

Shall we give an example of this? The following story was told by a Dervis in the market-place of Adrianople.

"A young man who had passed all his life in business, being suddenly left a considerable property, retired from all his occupations, and went to live with an uncle some leagues distant from the city. His uncle had a niece of considerable personal attractions; but, the young man being of a phlegmatic temperament, it was several years before he became sensible of her merits. At the end of this period he became desirous of possessing her, and proposed to her father to marry her; when, the girl being equally anxious, a day was fixed for their union.

"It so happened, about this time, that a youth living hard by who had been blind from six years of age, and about whom many hundred pieces of gold had been expended, in consulting all the great physicians of Turkey and Persia, (from each of whom a different account of the causes of the blindness was obtained, till his parents were quite tired of paying for theories,) gradually recovered his sight by an effort of nature. He was in company with the young girl only a few days, and was so struck with the beauty of her person that he fell desperately in love with her. She had scarcely bestowed a second look upon him during this time, and *before* the appointed morn she was married to the other; for, though quite indifferent to him the first two years of their intimacy, she could not now bear the delay of as many days.

"The youth was so miserable at thus losing the object of his affections, that, after wandering about several days, he went into a wood, intending to put an end to his life. He took off his sash, and stood dejectedly trailing it about on the ground. At this moment, the young widow of an ancient bashaw, to whom the wood belonged, chanced to pass that way; and, seeing him thus standing like one on the brink of the grave, inquired into the cause of his misfortune. He told her his brief story. After some conversation, and the kindest advice, she dissuaded him from his intention of destroying himself. These conversations were renewed next day, and the day after also. They continued thus; the youth gradually discovering more in her to love at every fresh meeting, although she had none of the personal attractions of the woman who had been the first object of his attachment, and eventually he married her. They were happy, and continued so.

"The other woman, whose impatience could not brook the delay of a few days in an event that was to influence her whole life, had not been married six moons ere she became suddenly and deeply enamoured of an officer of the imperial guard. He was of a fine person, and had a high and commanding air. To her passion for this man she made no scruple of sacrificing herself and her husband at the first opportunity, and would have sacrificed all the world, had it been placed in the scale.

"The officer, however, regarding the whole affair as a mere commonplace intrigue, and a part of the meed of admiration which he considered due at all times to his handsome person, departed shortly after, without even bidding her farewell. Finding he was gone, and for ever, she poisoned herself.

"Her husband, being informed of the occurrence as he was taking his

siesta, in an alcove at the bottom of the garden, would not come till he had finished his nap."

The Dervis remained silent; and his audience, finding he had concluded the story, began to express their opinions on the subject. There was great diversity among these; the prevailing tone, however, was that of disapprobation. "The Dervis," they said, "having promised to relate true stories to them; whereas, this one *must be false*, because the circumstances were *unnatural*."

Now there chanced to be present two learned men from Bassora, who considering that there was a want of proper respect and deference towards them, in the freedom with which these opinions were expressed in their hearing, immediately took the opposite side of the question. At the sound of their voices everybody became utterly silent.

"Good folks," said one of them, "ye are all talking at random; and this must ever be the case where people will speak upon subjects that they do not comprehend. The story is natural enough, though you cannot understand it, because it is not to be found in every highway."

"Natural!" echoed the other, "to be sure it is; I remember half-a-dozen such!"

"When men's passions," proceeded the first, "have lain dormant a long while, they frequently break forth with yet greater strength, gathered from repose. This was the case with the young merchant, whose life having been passed in the constant hurry of mercantile employments, his feelings had no time to find vent, until the sequestration in his uncle's house gradually threw him upon his nature, and passion became the necessary result."

"The *necessary* result, certainly!" exclaimed the other; "and the same rule may be applied to the youth that was blind so many years, who very naturally fell in love with the first woman he saw. But, as the optic nerves could not at once arrive at any correct action after so long an inactivity, it was equally natural for him to get rid of the first impression — a circumscribed or imperfect one, no doubt — and fall in love a second time."

"Justly so," said the first; "I was about to say all this. He might have fallen in love as quickly a third or fourth time, upon the same principle."

"And again," interrupted the other, speaking rapidly, "the same rule will also account for the girl who had lived so long in retirement suddenly falling in love with the officer of the guard. The story is as natural as can be."

"No, it will *not* account for this; because she was very slow in falling in love the first time — that is, with the young merchant; whereas nothing could be more instantaneous than the commencement of her passion the second time. The same rule will *not* account for this."

"Oh! that difference in the second time might be occasioned by constitutional temperament at the moment, or ——"

"*Might* be occasioned! ay, but *was* it?"

"You show a small wisdom in requiring me to speak positively to a thing I neither witnessed nor have read proof of: would you have me swear to an abstract theory?"

"Certainly, provided it were a true one: but he who cannot analyse justly and distinguish justly must mutilate and confound; he who confounds can have no clear ideas of the parts of his subject; and not to understand well the parts of a subject argues an incompetency to cope with the whole; and he who cannot cope with the whole of a thing is not

capable of mastering the given question, and can therefore form no abstract theories upon it."

"And what has this — what has this, I say — supposing the alleged incompetency applied to either of *us* — what has this to do with the *swearing* to an abstract theory?"

"Why, simply, that he who cannot form one cannot swear to it."

"But are you then so unenlightened as not to know that many of our theories are involuntary, and that men are commonly more positive in these than in any others?"

"Yes, ordinary men; but, with philosophers, reasoning supposes volition. As, however, you have chosen to class yourself with the former — and the admission, no doubt, was involuntary — I must beg you will not interrupt me again in my expositions and demonstration to these good people, who are all waiting impatiently till you shall suffer me to proceed unmolested — and unechoed."

"To confound you at once, then," exclaimed the other, "know that the discovery of our most positive theories being involuntary is not mine, but I got it from the writings of the great Mirza Basha Taleb, with whose profound volumes you can have no acquaintance, or you would not have committed yourself to such an extent. Again, does not the learned Ibrahim say" — here he quoted a passage of considerable length — "and does not Ferdousi say" — here he quoted another — "and is it not written in the sublime books of Shemzeddin Mahomed" — here he began to lose his breath — "all, all of which proves you a fool!"

But his opponent was not to be silenced in this way; and he immediately fell to quoting author after author, in such a manner, and with such applications, that it was well for him none of them were alive to hear him.

The other, being now put upon his mettle, set to work in a style that made all the bystanders quake with admiration. He recited passages from all the Turkish, Persian, and Arabian authors, and quoted the names of more books than his antagonist had ever thought of, even in a dream; and concluded his peroration by calling him "a dog."

"And you are a dog, too!" vociferated the first; "and your father and mother were *both* dogs! and when you die your works will go back to the moon, and nothing will be remembered of you on earth but the ears and tail!"

"And when *you* die," retorted the other, with cold bitterness, and looking like a spiteful goul, — "when *you* die, the moths and grubs will come to your grave, and whisper, 'Baibourdi! — Baibourdi! we've finished all your books!'"

The learned critics having thus introduced each other to posterity, we are not bold to say whether they could have proceeded to any further extremities, when the Dervis, advancing slowly between them, addressed them, with an air of great modesty, to the following effect: —

"That an unpretending individual like myself should have been even the indirect cause of a violent dissension between the two greatest sages of the time is a thing to be surprised and grieved at beyond measure; yet, if you will permit me a few words, I think I can set the matter at rest, and chiefly, inasmuch as I hope to show that you are disputing about that in which, fundamentally, you both agree. I believe, also, it may not be impossible to convince some of my host of disapproving listeners, who stand round, that they have not seen the story in a proper light."

The crowd expressed readiness to hear the Dervis, and promised not to interrupt him while speaking, or abuse him when he had finished.

"The youth who had been blind and fell in love so suddenly, in the first instance," pursued the Dervis, "did so from a quick sensibility which had remained hitherto unexercised, except to a limited extent, and also from a sense of beauty in his mind, which he transferred to the first beautiful object that met his sight, not having had experience to know that the beauty of external form or outline is by no means necessarily associated with a corresponding beauty within, (the contrary being far more common,) while his brief communion with the woman did not enable him to discover her deficiency by other means. The optic nerve and *anatomy* of the eye has nothing to do with the question, as I should think. The organs of passion are not the elementary principles. But to take it upon your own grounds: the senses may convey to the mind a wrong translation or impression of the outward object, yet the passion resulting from it may be as positive as if it were a true one. This, however, in the present instance, being evanescent, from having only struck upon a disproportionate part of the youth's feelings, was, of course, superseded when he became tangibly aware of what *his nature most affected;* and the reason his love for the young widow *continued* was because he found in her a sensibility and sentiment which the other woman did not possess; and, even if she *had* possessed it, he had not discovered or felt it. The latter woman married the young merchant, after two or three years' continual intercourse, in the absence of another more fitting object, and also from a degree of desperation at this circumstance, aided by an ardent temperament, when once she had resolved upon taking the step. Nature will generally give way to habit, but it will almost always assert its primitive feelings upon great occasions: hence, she fell in love with the officer the moment she saw him; for her strongest bias of nature was towards such a man: hence, the results. Her husband's conduct all through the story shows that he was of a cold phlegmatic disposition, with scarce any passions at all. I pray you then, gentlemen, to cease this violent altercation; for you were both right in stating at the outset that the story was consistent with nature. Retain this simple fact, and strike off all your *commentaries.* There really need be no dispute on either side: the thing is as plain as the first three letters of the alphabet."

At this speech, which was delivered in the most inoffensive and conciliatory tone, the two sages looked furiously at each other, then with one accord made at the Dervis, intending to beat him severely; but the Dervis had a steady eye, and easily evaded them, so that their foreheads came violently in contact, and they both fell to the ground.

"I shouldn't at all wonder," said an old water carrier, who had witnessed the whole affair very attentively, "but that there are thousands of learned men who can pour forth abundance of arguments, when they are in the wrong, for one man who can give a single good reason when he is in the right."

PAST STRUGGLES.

" Being humane, 'tis reason'd will, alone,
That makes man great, with high security."

Cosmo de' Medici.

At eventide of life,
Man stands, without more strife,
Upon the clear, cold upland, gazing round;
His melancholy soul
Hath miss'd its loftiest goal,
And can no longer tow'rds the future bound:
His fancy's bark with fire-winged sails
Is wrecked; but, stranded high, fears not the brawling gales.

No glory can illume
The depths of evil doom,
Because the heart joy's light reflects no more;
In vain the Pleiadēs
Should glitter o'er the seas,
If they were black and stagnant as death's shore:
Gorgeous the clouds may sail through heaven;
Yet what imports the scene to those by tempest riven?

Into the womby hall,
Where folding shadows pall
The buried hopes whose wings were burnt to dust,
We gaze, and see tall urns
Stand, like decaying ferns,
When breathless midnight breeds on fear, distrust;
While, in a soul-bewilder'd maze,
Old memory wanders round the tombs of other days.

There! there! the mighty dreams
Which moulded solar beams,
And then ascended — but to melt in dew! —
There! there! lost passion sees
Ardours and agonies,
Bereft of all that once was more than true;
And, tow'rd annihilation's maw,
Deems that the iron-lipp'd fate, all acts shall drive and draw!

Through sad and solemn vale,
Hallow'd by moonlight pale,
Or gloomy lane, chequer'd with moveless shades
Of tall black trunks and boughs,
Through which some hoar cloud flows,
Spreading across the dim and silent glades;
The spirit of the ruin'd heart
Wanders in vain — it ne'er can from itself depart.

Its home is not within,
Nor in the coarse crowd's din;
Nor midst the splendour of the festive halls:
Its home was in its hope;
But dreams have had their scope,
And into life's blank field the eagle falls!
Yet not from this let weakness crave
To rule the soul of him whose trust burns through the grave.

Oh! once I trod the fields
Like one to whom time yields,
And felt immortal as the morning star!
Still, though my heart be torn,
The spirit ne'er undone,
Shall wrestle on, despising every scar.
The limbs and veins must waste away,
But man shall never quell fate's honour'd enemy.

Then loose, ye dryads fair,
Your rich and beaming hair;
Toss high your arms, the glittering timbrel whirling!
Come forth, ye wood-gods old,
Let destiny be told,
Her evil yarn is vain as vapour curling:
Blow deep the full-ton'd thick-set reeds,
And wake the silk-hair'd fawns, to dance upon the meads.

I would not that the song
Of revelry held long,
Deriding echo on the breezes soaring:
My grief-refinèd brain
Would rather court the strain
Of Lydian flutes, their sweet-breath'd measures pouring:
For though resolve withstand the ill,
The shout of mirth afflicts — the nerves are human still.

R. H. H.

THE BOOKS OF THE SEASON.

"It appears," says Mr. Beale, in his "Natural History of the Fishery of the Sperm Whale," "it appears from all the observations I have been enabled to make, that when this whale is inclined to feed, he descends a certain depth below the surface of the ocean, and there remains in as quiet a state as possible, opening his narrow elongated mouth until the lower jaw hangs down perpendicularly or at right angles with the body. The roof of his mouth, the tongue, and especially the teeth, being of a bright glistening white colour, must of course present a remarkable appearance, which seems to be the incitement by which his prey are attracted, *and when a sufficient number*, I am strongly led to suppose, *are within the mouth, he rapidly closes his jaws, and swallows the contents.*"

Now we are at this moment very much in the situation of this ratiocinative but most gluttonous sperm whale. Whether we present a remarkable appearance we will not pretend to determine, but certain it is, that during the last few months, with "premeditation dire," we have descended below the surface of the great book current, and remaining there in as quiet a state as possible, have suffered the lower jaw to hang at right angles, until such a shoal of volumes has rushed in, that, believing the mouth to be full almost to choking, we are about, in the manner of the oily leviathan, to swallow the contents.

But it must not be supposed that we intend to give a detailed account of this promiscuous fry; such an elaborate undertaking would be neither profitable nor entertaining. A sort of panoramic view of this critical passage of the Books of the Season, will be as much as the reader is likely to desire, or, in this age of activity, can be expected to have leisure enough to enjoy. If our notices are short, however, they shall be to the purpose, expressing the spirit of our current literature with brevity and truth, and reducing into a succinct form the final impressions left by a careful examination of each work. We believe, after all, that this kind of criticism, as applied at least to the bulk of the productions of the day, is more useful in its results than that minute and exhausting process which, in such instances, exhibits a wasteful expenditure of time and power, the consequence of haste rather than deliberation.

Dividing the publications before us into such general departments as may assist us to a simple arrangement for classification and reference, we will begin with the works that come under the denomination of FICTION.

This department is, as usual, crowded. The appearance of Miss Martineau as a novelist is perhaps the most remarkable incident it presents. In her "Illustrations of Political Economy," Miss Martineau exhibited so much facility in depicting natural characters and domestic traits, that her success in a more extended field of social interest might have been reasonably anticipated; nor does the novel of "Deerbrook"[1] disappoint the prediction of her early labours. It is marked by the same quiet truth and homely pathos, is full of little touches of practical sagacity and every-day experience, and developes with singular felicity that inward life and struggle of the affections, which it is the especial province of women to note and illustrate. Its scene is a country town, the principal actors belong to the

[1] *Deerbrook: a Novel.* By HARRIET MARTINEAU. Three Vols. London: Edward Moxon, 1839.

middle class, and the plot is a household trouble, perplexed by village gossip, tattling rivalry, and vulgar jealousies. The medical practitioner of Deerbrook is captivated by a beauty, who, like most beauties, is not very intellectual, and when he has committed himself to a proposal, discovers that he is really in love with her sister, who is a being of a higher order. It is too late however to retract, and so he marries with the consciousness of loving his sister-in-law, who, by the adversity of circumstances, becomes a member of his family. From such a state of things, the worst results are to be anticipated, but fortunately the lady is ignorant of his attachment, and she is too purely-minded to suspect it. Country towns, however, are proverbially scandalous, and rumours get abroad, which gradually alienate from the lady her real lover to whom she is betrothed, and in the long run the physician loses his practice. Matters are now reduced to an extremity, when an epidemic breaks out, which opens a fortunate opportunity to the medical man to regain his professional reputation. The lover, still anxious about his mistress, returns, explanations are given at both sides, and the *imbroglio* is ultimately cleared up to the satisfaction of all parties. The morality of the issue is doubtful; the reader naturally asks, could such circumstances have taken place in real life? Could the sister-in-law have continued to the end in ignorance of the reprehensible attachment of her sister's husband? Her purity is not a sufficient solution of this strange problem. Her woman's wit, her woman's penetration, must have detected a sentiment which the art of the other sex is so rarely capable of concealing. But however this may be, there is a triumph of virtue in the sequel, that offers some compensation for the improbability of the events through which it is produced. The details of this story are painted with the utmost fidelity and delicacy; the passions of the scene are delineated with a softness of colouring, deficient, perhaps, in strength and boldness, but very truthful; the characters, especially that of the sister, which is profoundly beautiful, are drawn with great distinctness and refined feeling, and the general effect is that of a history of emotions, related with all the sensibility and close judgment of a woman. Had the narrative been written by a man, the agony of the trial would have been more fierce, and the catastrophe more impressive.

Under the appropriate title of "Trials of the Heart[2]," Mrs. Bray has published a series of tales, the main design of which is to exhibit, under various circumstances, some of those conflicts and troubles to which the affections are exposed in the agitated passages of life. The task was a responsible one, but Mrs. Bray has executed it with considerable ability. Her little stories have such an air of truth, that they may be almost accepted as transcripts from real life, — as brief chronicles of actual occurrences, rather than creations of imitative fiction. The charm of such vignette tales consists in the miniature beauty of their details, the fineness and accuracy of the filling up, and the success with which comprehensive images of nature are dwarfed into their circumscribed limits. They must combine the vivid graces of enamel painting with the power of historical portraiture; and, as far as the moral scope of their purpose extends, they must be as complete as if they were wrought upon a more expanded surface. Mrs. Bray's stories fulfil these conditions; there is nothing wanted to render each narrative perfect in its kind. They are highly suggestive, natural, and pathetic, and their domestic interest is heightened all throughout by a wise spirit of Christian philanthropy.

Mr. James has given two novels to the libraries during the period over

[2] *Trials of the Heart.* By Mrs. Bray. Three Vols. London: Longman & Co. 1839.

which our retrospect extends — "Charles Tyrell[3]," and "The Gentleman of the Old School."[4] These works are precisely of the same stamp: the same set of family features are transmitted through both — English scenery, English characters, rustic lovers, manor houses, murders, duels, false accusations, trial by jury, the vindication of the innocent, and the restitution to heroes and heroines of their rightful possessions in lands and hearts. It is not a little curious that the stories should so closely resemble each other, and that the paramount interest of each should turn upon a murder (committed, however, under different circumstances), and that the suspense in each should be created by the doubtful issue of the trial. The most striking parts of both are those in which our native customs and provincial character are delineated — for example, the rural groups and cottages of the peasantry, and the portrait especially of Sir Andrew Stalbrooke, who, although he is a little overlaid with moral sentiment, is a fair specimen of the courteous and humane gentleman of the last century. The great faults of both are the rapid and somewhat confusing accumulation of incidents, and the occasional negligence of style. The fertility of Mr. James's labours may, probably, account for these defects.

"Births, Deaths, and Marriages[5]," by Mr. Theodore Hook, belongs to that class of satirical and humorous novels in which personal eccentricities and vulgar peculiarities form the staple material. In this novel we miss that power of generalization by which, in former fiction, Mr. Hook discovered so happy a talent for painting the salient characteristics of the different classes of society; and we have in lieu of it a motley picture of individual nature, one moiety of which is recommended by its ludicrous extravagance, while the other revolts us by its improbability and superfluous coarseness. The *parvenu* of the story is drawn to the life; the eternal fidget, the low and uneasy ambition, and the starched affectation of the official are touched with an illuminating pencil, that shows us the recesses of that order of meanness in their remotest depths. Of equal excellence is the portrait of the blunt city merchant, coiled up in his own notions of comfort and independence, and intensely despising the arts and surface refinements of fashionable life. But when we pass from this part of the story to the subsequent fortunes of a young lady who is married to a *roué*, the narrative sinks into a series of stage horrors only fit for the galleries. A modern Blue Beard steps in and turns the humour into frightful convulsions — just as a roll of thunder may turn some cask of fine rich old ale sour all of a sudden.

The popularity of the Irish novel has latterly been rapidly declining; or, perhaps, it would be more accurate to say that very few specimens worthy of popularity have latterly appeared. As it has happened in other forms of fiction, the successful novels of Lady Morgan, Miss Edgeworth, and Mr. Banim generated so many indifferent imitations, that the public began to grow a little wearied of second-hand humour and monotonous Hibernicisms. From this general verdict, however, the admirable story of "The Collegians," by Mr. Griffin — a work of the highest merit, — the graphic "Tales of the Peasantry," by Mr. Carleton, and the characteristic novel of "Rory O'More," by Mr. Lover, must be specially excepted. A new national

[3] *Charles Tyrrell; or, the Bitter Blood.* By G. P. R. James, Esq. London: Richard Bentley, 1839.

[4] *The Gentleman of the Old School. A Tale.* By G. P. R. James, Esq. Three Vols. London: Longman & Co. 1839.

[5] *Births, Deaths, and Marriages.* By the Author of "Sayings and Doings." Three Vols. London: Richard Bentley. 1839.

fiction[6], by a member of the Irish bar, has just been published; but we apprehend it is not sufficiently skilful in design or treatment to restore the original charm of the class to which it belongs. "The Manor of Glenmore" is a picture of the political rather than the social condition of the Irish peasantry: it unfolds to us the influence and effects of agitation on the masses; gives us glimpses of the meetings and discussions of the lower orders, of the terrible atrocities of the Rockites, the heartless cruelties of the middlemen, the wild justice of the ejected tenantry, and the internal combinations of the people in their great movement for civil and religious freedom. The time of the story is immediately before the Emancipation Act, and one of the scenes described is the Clare election; a proceeding to be lamented on personal grounds, but which must, unquestionably, be regarded as having been decisive of the Catholic question. The sentiment of the work is thoroughly Irish; but the interest is so completely and almost exclusively political, that it is hardly likely to acquire a very extended popularity. Nor has the author been quite successful in his sketches of Irish character, which are neither very striking nor very well sustained. There are some vivid passages and *tableaux*—such as the retreat of the Outlaw and the Idiot Girl, the gatherings in the chapels, and the dispossession of the tenants on Viscount Littleheart's estate. But, considered artistically, the "Manor of Glenmore" is an unequal and ineffective performance.

Mr. J. P. Robertson, the senior author of the publication on "Paraguay," which we reviewed some months ago, has ventured into a new path of authorship in a novel of real life, called "Solomon Seesaw."[7] The characters in this novel constitute its principal merit; they are apparently drawn from personal observation, and some of them will be readily recognised by the reader. The vigorous, dramatic spirit of the dialogues — the irregularity of the frame-work in which the broad incidents are set — the frequent interruption of episodes — and the grotesque, exaggerated, but world-wise ridicule of the follies, quackeries, and eccentricities of society, which prevails throughout the whole, will occasionally suggest a recollection of such works as "Gil Blas," and "Chrysal." But the resemblance is merely incidental, for the humour of Solomon Seesaw's "ups and downs" is perfectly original; the channels through which it runs are not so deep; it plays more upon the surface, and satirises habits and externals rather than fallacies of opinion and conduct. The work is clever and amusing, although it must be admitted that the drollery too frequently verges on the extravagance of farce.

Mrs Gore's novels of manners are amongst the most agreeable and faithful pictures of English society we possess. They are not surpassed by any works of a similar kind with which we are acquainted, and they are equalled by few. But she sometimes commits herself to an infelicitous plot, and runs into inexcusable excesses in the attempt to endow improbable materials with human interest. So long as she confines herself to in-door experiences she is eminently successful: her dowagers and flirts are portraits, — her simpering beaux and fashionable loungers, her drawling peers and vulgar commoners, are counterparts of people we meet in society every day; but when she meddles with politics, explores cabinet councils and parliamentary intrigues, and spreads her canvas for elections, party dinners, and public debates, she falls into common-place generalities and

[6] *The Manor of Glenmore; or, the Irish Peasant.* By a Member of the Irish Bar. Three Vols. London: Edward Bull. 1839.

[7] *Solomon Seesaw.* By J. P. Robertson, Senior Author of "Letters on Paraguay." With Illustrations by Phiz. Three Vols. London: Saunders & Otley. 1839.

preposterous errors. Her "Cabinet Minister"[8] is of this latter class. The plot is in the last degree unlikely, the figures are overdrawn, and the events, instead of flowing naturally out of each other, are from time to time jerked forward by the clumsiest expedients. Perhaps these faults would not be quite so palpable, if Mrs. Gore had not adopted the startling device of introducing Sheridan as an actor amongst her fictitious personages. Such a device could be palliated only by the most exquisite wit and delicacy in the portraiture; and here, unfortunately, Mrs. Gore signally fails. Her Sheridan is a mere punster and humourist, and as flat as champaign with the cork drawn. The political part of the work is vapid and absurd, and the only redeeming points are certain groups and individuals, in which we detect the hand of power to which we are already indebted for so many able and *vraisemblable* fictions.

"The Romance of the Harem[9]," by Miss Pardoe, has the burning complexion of the East on every page. It is a slight thread of narrative — the plot of a Greek girl to possess herself of the first place in the harem of a Turkish pacha — upon which several Oriental fictions, derived from the countries whose habits they illustrate, are strung. The passionate character of these stories, the richness of the style, and the poetical fervour of the descriptions with which they abound, leave no doubt as to their origin; and Miss Pardoe is entitled to high praise for the skill which she exhibits in preserving their identity unbroken throughout.

Mr. Miller, whose pleasant rustic books are always welcome, abandoning for a season his quiet woods and pastures, has taken an excursion into the remote regions of historical romance. His "Fair Rosamond"[10] is a good specimen of the kind of excellence that can be attained by perseverance in the chace of materials. He throws a new element into the old story, marries the beautiful victim to the king, and so contrives to excite an unexpected interest in a love plot with which the whole world of readers is familiar. His treatment of the subject is marked by great care and diligence; he gives us a picture of costume at once accurate and full, and brings the court before us, if not with royal elegance, at least with royal pomp. The characters stand out well on this rich tapestry of a chivalric age, and no further liberties are taken with historical truth than may be held justifiable in works of this nature.

This is, perhaps, the appropriate place to mention William Howitt's charming little volume of the "Life and Experiences of a Country Boy[11]," one of the most fascinating fictions for young or old, but especially for the former, that has ever graced our literature. In this miniature book, crowded with gems of wood-cuts, we have in the shape of an auto-biography the entire mystery of rural life laid open — the first impressions of a country boy — his happy amusements and occupations in the meadows and tangled orchards, in tracking the streams, bird-nesting, nutting, and gardening. All the resources of the country in all the seasons are drawn in: ingenious philosophical recreations, puzzles and fire-side pranks for the winter, endless out-of-door delights for the summer, the bursting of flowers and the dawn of botanical wonders in the spring, and the bounteous harvest and

[8] *The Cabinet Minister.* By Mrs. Gore, Author of "Mothers and Daughters." Three Vols. London: Richard Bentley. 1839.

[9] *The Romance of the Harem.* By Miss Pardoe, Author of "The City of the Sultan." Three Vols. London: Henry Colburn. 1839.

[10] *Fair Rosamond; or, the Days of King Henry the Second.* An Historical Romance. By Thomas Miller, Author of "Royston Gower." Three Vols. London: Henry Colburn. 1839.

[11] *The Boy's Country Book; being the Real Life of a Country Boy, written by himself: exhibiting all the Amusements, Pleasures, and Pursuits of Children in the Country.* Edited by William Howitt. London: Longman & Co. 1839.

clustering fruits in the autumn. No other writer of our time could have described these scenes with so much zest, with such picturesque eloquence, such touching simplicity and poetical beauty as William Howitt. The book is all throughout a piece of enchantment. It has all the bounding freshness and eager hopefulness of youth, combined with practical knowledge and an enduring spirit of love. Of more value as an instructor of the affections and the understanding than a hundred school books, we recommend it to the youth of England in preference to any publication addressed to similar objects in the language. We hope it may find its way into every house and cottage in the country.

Dr. Millingen's "Stories of Torres Vedras"[12] are scarcely entitled to be placed under the head of fiction, although they are not sufficiently veritable to come under a more authentic category. They relate to the Peninsular war, and belong to that numerous class of military tales which sprang from the events of the most picturesque campaigns in which our soldiers have, probably, ever been engaged. The stories abound with the usual adventures, anecdotes, hair-breadth escapes, mess-room dialogues, convent intrigues, and awkward mishaps, which have already afforded so much amusement to the lovers of fife-and-drum traditions. We have our gallant regiments "stepping in music," or hushed in the camp — picquets and guard-room roystering — nuns — monks — commissariat troubles, — personal sketches, and all the rest of the animated scenes, related as flippantly as your genuine officer, who does not like any very serious demands to be made on his attention, could reasonably desire. Dr. Millingen's humour, however, is somewhat shallow and artificial. He cannot tell a comic story with the requisite gusto; and he mixes up fact and fiction so incongruously that it is quite impossible to discriminate between them. To our taste these things are unutterably dull and flimsy; but perhaps the military contemporaries of the author may find some sources of entertainment in them which mere civilians cannot discover.

If it were not for the title of Lieutenant Johns's African and European Sketches[13], we should be tempted to rank them in the list of travels. They present, in a series of stories, a succession of pictures of African life, and of those links of human interest that connect the two continents, which, externally dissimilar, possess points of affinity that are revealed to the close observer of customs and national character. The attraction of Lieutenant Johns's work consists chiefly in the breadth and energy of his style, and the basis of truth upon which he builds up his vivid descriptions. His illustrations of the iniquities of the slave trade are powerful and instructive; and his incidental delineations of remote races, hitherto but little known, are not less valuable than exciting.

The remaining works of fiction in our catalogue may be briefly dismissed, as none of them require any special observations. "Love's Exchange,"[14] founded on the threadbare incident of changing children at nurse, is half romance and half novel, tolerably well written in the literary sense, but deficient in probability and knowledge of human nature. "The Prince and the Pedlar"[15] may be described as a genuine romance, wanting originality in the characters and incidents, but so ingeniously involved, and so

[12] *Stories of Torres Vedras.* By the Author of "Adventures of an Irish Gentleman." Three Vols. London: Richard Bentley. 1839.

[13] *Legend and Romance, African and European.* By RICHARD JOHNS, Lieut. Royal Marines. Three Vols. London: Richard Bentley. 1839.

[14] *Love's Exchange. A Tale.* By CHARLES JOHN BOYLE. Three Vols. London: Longman & Co. 1839.

[15] *The Prince and the Pedlar; or the Siege of Bristol.* By the Author of "The Heiress," &c. Three Vols. London: Richard Bentley. 1839.

skilfully conducted to the close, as to fascinate attention in the perusal. Like all other works, however, in which the interest turns upon the rapidity of the details, rather than upon the higher elements of fiction, it is no sooner read than forgotten. "Argentine"[16] is a little story of sensibility, with a great many sorrows and villanies, pressed into a narrow space. "The Husband Hunter"[17] belongs to the class of imitations of the Irish novel, written no doubt by a native, but one who does not seem to have been born to the *manner* of his country. "The Banished[18]," a free translation of a German historical romance, by M. Hauff, who explicitly declares himself to be a follower in the footsteps of Scott; it is highly characteristic of Swabian habits, and gives us a very striking portraiture of an antique age and an obscure people. "The Highland Inn[19]," an odd composite of sketches, tales, and anecdotes, sprinkled with travelling reminiscences and national traits, thrown off in a spanking hand-gallop. "Nan Darrell[20]," an unconscious resuscitation of the Waverley style, sprightly and clever, but lacking force and original invention. "The Fergusons[21]," a birth of the goddess of Leadenhall Street. "Henry Acton[22]," a collection of tales, full of drivelling sentiment, and that mockery of pathos which used to send our grandmothers "weeping to their beds."

In the department of BIOGRAPHY, several new works of an interesting rather than an important character, have appeared recently.

Sir John Barrow's "Life of Lord Anson[23]," rendered memorable by a vindication of the state of our navy, which he adds, very much out of place, as a supplement to it, and in which he attempts to contravene the assertions and opinions of nearly the whole body of the profession, contains a diligent account of the useful services of a distinguished officer. The work is a good compilation from official documents and published statements, but makes an exaggerated estimate of the respectable abilities of an admiral, who was more remarkable for zeal and perseverance than brilliant talents. This grand error, however, is balanced by certain revelations of some of the hidden springs in the machinery of promotion and departmental interests, that are not accessible to the curiosity of the public at large. If Sir John Barrow increases the stature of Anson on the one hand, he deals fairly enough with administrative secrets on the other.

"The Memoirs of John Bannister[24]," a comedian, by Mr. Adolphus, like almost all lives of actors, disappoints us of the kind of interest which, notwithstanding the frequency of such disappointments, we are tempted to expect. The incidents of Bannister's life were few, and all of the same sort; and Mr. Adolphus ekes out his pages with episodical dissertations, some of which are excellent in their way, but all of which interrupt the progress of the narrative, such as it is, plentiful anecdotes of the stage, and such floating memoranda of contemporaneous biography as his intimate

[16] *Argentine. An Auto-Biography.* London: Smith, Elder, & Co. 1839.

[17] *The Husband Hunter; or, Das Schiksal.* By DENNIS IGNATIUS MORIARTY, Esq. Three Vols. London: Richard Bentley. 1839.

[18] *The Banished.* A Swabian Historical Tale. Edited by JAMES MORIER, Esq. Three Vols. London: Henry Colburn. 1839.

[19] *The Highland Inn.* Two Vols. London: Henry Colburn. 1839.

[20] *Nan Darrell; or, the Gipsy Mother.* By the Author of "The Heiress," &c. Three Vols. London: J. and W. Boone. 1839.

[21] *The Fergusons; or, Woman's Love and the World's Favour.* Two Vols. London: Henry Colburn. 1839.

[22] *Henry Acton; or, the Gold Smugglers, and other Tales.* By the Hon. LOUISA SAYERS. Three Vols. London: 1839.

[23] *The Life of George, Lord Anson, Admiral of the Fleet, &c.* By Sir JOHN BARROW, Bart., F. R. S. London: John Murray. 1839.

[24] *Memoirs of John Bannister, Comedian.* Two Vols. London: Richard Bentley. 1839.

acquaintance with the Bannisters enabled him to collect. This motley gathering of jokes and reminiscences is on the whole dull enough; for theatrical hilarity, sufficiently exciting at the moment, is too vapid to bear the process of repetition. But the work is not wanting in interest of another description: Bannister was an excellent private character, amiable, cheerful, and modest; and if the memoir of his life be not very entertaining, it at least points a moral that ought not to be indifferent to the members of his profession. It shows that an actor has it in his own power to overcome conventional prejudices, and, even in the midst of seductions, to surround himself with the attachment and respect of the soberer part of the community.

M. G. Lewis — "Little Mat," as he was called by his familiars, and "Monk Lewis," as he was popularly designated, — furnishes the subject of two portly volumes [25], which are more indebted for their expansion to his private correspondence, than to any material facts connected with his life or writings. His celebrity, perhaps, justifies this rather tardy tribute to his memory, although there was nothing whatever in his public or private character likely to inspire such a publication with general interest. The editor of the work, however, seems to entertain a very different view of his subject, and to have wrought himself in the progress of his labours into a clear conviction, that the fame and position of the author of the "Castle Spectre" demanded an elaborate, if not a national apotheosis. We will not undertake to decide, but we may observe, that if the biography had been compressed into about one third of the space it occupies, it would have been greatly to the advantage of the reader, and possibly of the publisher. The prominent features in the career of Monk Lewis may be dismissed in half a dozen lines. Born to a handsome inheritance, he early displayed talents for company, poetry, and romance. He wrote "The Monk" before he was twenty years of age, and became all at once an object of curiosity, and, we are told, a marvellous favourite with the ladies. It seems that he was unconscious of the tendency of that pernicious publication, and was exceedingly surprised, and even wounded, by the strictures of some serious people upon it; yet almost all his subsequent works partook, more or less, of the same character. He wrote immorally without knowing it, and could scarcely write otherwise if he had tried. As a dramatic author, his success was equally decisive; his melodramas and monkish tragedies produced quite a sensation, and filled the town with the most agreeable horrors. It was the fashionable practice of the day to fall into hysterics at his winding-sheets and gory nuns; and, for a time, the stage of the metropolis took its tone from his "thin-sheeted phantoms." The ballads, songs, and ghostly tales with which he filled up the measure of his literary labours, distinguished, as many of them unquestionably are, by a complete mastery of that grave-yard style in which he delighted, confirmed the general impression that he was an individual of a morbid and melancholy cast; yet in private life he was exactly the reverse — lively, amiable, and good-natured. He indulged in some of the fripperies of the day, was fond of parties and lionising, and had a turn for personal display, which he was enabled to gratify by his fortune. But in the essential discharge of the responsibilities of his station, he was kindly-hearted, frank, and unaffected. After a comparatively short life of social enjoyment, he died in excruciating torture on ship-board, on his return to England from the West Indies, where he went to visit his estates, and the body of the poet was cast into the sea.

[25] *The Life and Correspondence of M. G. Lewis.* Two Vols. London: Henry Colburn. 1839.

A new biography of Mrs. Hemans has been published by her sister[26], forming the first volume of a complete edition of her works. It is the fullest account that has yet been given to the world of the retired life of that highly-gifted woman, and possesses the additional advantage of being enriched throughout by numerous *excerpta* from her journals and correspondence. The simplicity of the narrative, the affectionate feelings that breathe through it, and the true devotion of the author to the memory of one she loved so well, and who so well deserved her love, contribute to render it one of the most delicate and affecting pieces of biography extant. When the monthly issue of the volumes shall have advanced a little farther, we hope to be able to dedicate a separate article to a critical examination of Mrs. Hemans' poetry.

In the entire range of English history there is scarcely any woman occupying a prominent position in public affairs, whose character is so well known as the celebrated Sarah, Duchess of Marlborough, the wife of the famous general, and the tyrannical confidante of Queen Anne. Yet the story of her life has hitherto escaped without a suitable record. The only facts that have been preserved concerning her are scattered through a variety of works coming in merely incidentally by way of illustration or evidence. A biography of her was published shortly after her death, but it added nothing to the narrative drawn up by herself, in her own vindication; and until the appearance of Mrs. Thompson's very able memoir[27], which has just been published, there was really no book extant from which a complete view of the singular career of that remarkable woman could have been derived. Such was the obscurity in which the incidents of her life were buried, that the place and manner of her death were unknown, and even her birth-place was a matter of dispute. With considerable industry and acuteness Mrs. Thompson has supplied this desideratum, and furnished us with a memoir, which is more likely to be blamed for the expansion than the deficiency of matter. The reign of the arrogant duchess — for she literally reigned over England through the subjugated sovereign — her ultimate overthrow by the plots of Mrs. Masham, her subsequent retirement, her authorship, and her old age of political coquetry and private remorse, are traced with sound discrimination; and we believe that it would be difficult to discover any facts of importance omitted by the writer. The character of the duchess is fairly brought out; her genius for intrigue is allowed to make itself visible in the curious fret-work of her bed-chamber ascendancy; and, while a due measure of applause is conceded to her great powers for correspondence and negotiation, her capacity for business, and her vigorous intellect, the faults of her temper, the ruinous ambition of her nature, and the imperious disposition which she contracted in the latter years of her court supremacy, are impartially exposed and condemned. The work is carefully written; numerous authorities have been consulted to verify its details, and, independently of its striking merits as a biography, it is valuable as a pendant to the history of the period.

The "Diary of the Rev. Mr. Ward[28]," who was vicar of Stratford-upon-Avon thirty or forty years after the death of Shakspeare, promises on the

[26] *Works of Mrs. Hemans. With a Memoir, by her Sister.* In Six Volumes. Edinburgh: Blackwood & Sons. 1839.

[27] *Memoirs of Sarah, Duchess of Marlborough, and of the Court of Queen Anne.* By Mrs. A. T. Thomrson, Authoress of "Memoirs of the Court of Henry VIII.," &c. Two Vols. London: Henry Colburn. 1839.

[28] *Diary of the Rev John Ward, A. M., Vicar of Stratford-upon-Avon.* Extending from 1648 to 1679. From the original MSS. preserved in the library of the Medical Society of London. Arranged by Charles Severn, M. D. Published by permission of the Council. London: Henry Colburn. 1839.

title-page a world of discoveries, an expectation which is heightened to enthusiasm by the flourishes of the editor in the preface. But when we explore the book we find that the reverend gentleman had never read Shakspeare's plays — that he was aware, however, of the existence of such a person, and that he had heard that Shakspeare died of a fever, contracted by a night's hard drinking with Drayton and Ben Jonson. It is needless to conjecture what manner of man Mr. Ward must have been, to have lived so many years at Stratford, in the midst of so many Shakspearian associations, and mixing, as he must have done occasionally, in his double capacity of leech and divine, in a society to some of the members of which the poet was personally known, and to all of whom he was familiar in a thousand traditions, and not to have carried away a single anecdote concerning him who had rendered the place immortal. Yet this Mr. Ward was a fussy person, who kept a diary, and who carefully noted down the most trivial gossip that happened to strike his fancy. His journal is an olio of anecdotes, recipes, axioms, and theological scraps. He had a soul for every thing but poetry. Herbs and simples he studied with as deep a relish as biblical controversy; and he had no mean taste for prurient jokes. Poetry alone seemed to him shallow and insignificant. His diary, as may be anticipated, is as dull as his genius, and as bigotted as his narrow spirit.

A very enthusiastic memoir of the Lady Margaret Beaufort, Countess of Derby, and mother of Henry VII., celebrated for her piety, learning, and munificence, by Caroline A. Halsted[29], is one of the pleasantest books of its class that have appeared since the date of Mrs. Jameson's "Beauties of the Court of Charles II." The writer has fairly fallen in love with the noble character of Margaret Beaufort, and delineates her life with a freshness and exuberance of feeling, that is more congenial to the warm temperature of romance than the colder latitudes of history. But the character is beautiful — a model of true devotion, of practical Christianity, domestic virtue, and boundless charity. We can excuse the zeal that is somewhat lavishly expended upon the portrait; and although we cannot accord to the work the merit of being profound in the treatment of political affairs, its generous qualities as a biography cannot fail to render it extensively popular.

A new edition of the life or auto-biography of Gibbon has been published under the editorship of the Rev. Mr. Milman.[30] The principal points of difference between this edition and that which was published by Lord Sheffield, in 1795, are the division of the life into chapters, the separation of the correspondence from the text, and a judicious addition at proper resting-places of such letters, anecdotes, and observations as appeared necessary to elucidate the original. Mr. Milman has executed this undertaking with judgment, avoiding that which was most to be dreaded at his hands — an undue interposition between the auto-biographer and the reader. The volume is carefully arranged, and highly creditable to the enterprise of the publisher.

We have a few specimens of DRAMATIC POETRY, which may be advantageously introduced by a glance at a very able *brochure* on the past and present state of the Dramatic Art and Literature.

Amidst the many one-sided theories, opinions, and assertions, which have been promulgated from time to time on the causes of the decline of the British drama, and the degradation of the stage to mere scenic displays, this small, but comprehensive pamphlet[31] condenses and elucidates the

[29] *The Life of Margaret Beaufort, Countess of Richmond and Derby, mother of King Henry VII.* By CAROLINE A. HALSTED. London: Smith, Elder, & Co. 1839.

[30] *The Life of Edward Gibbon, Esq. with Selections from his Correspondence and Illustrations.* By the Rev. H. H. MILMAN. London: John Murray. 1839.

[31] *The Past and Present State of Dramatic Art and Literature.* London: Mitchell, 1839.

whole truth of the question. How should there be a revival of the drama without dramatists? Since it is well known that there is no adequate demand for dramatic literature, except in the case of acted dramas, how should dramatists appear but through the ready medium of a stage? And how can there be this ready and sufficient medium while only three theatres in this huge and populous metropolis are permitted to give the true drama, which three are virtually reducible to *one*, because the two large patent theatres are closed during the principal portion of the season for the small patentee; and because while the two large houses are open, one of them scarcely ever gives the true drama, and *never* without some temporary compulsion of rivalry, characterised by abstract aversion, or private malignity? Thus, then, the concentration of that dramatic spirit, which is a characteristic of the strong feelings of the English nation, has long had but one outlet in this vast civic aggregate, which gives an influential tone to the whole country. Under the impression that no real dramatist exists, a great many critics plant themselves with sledge-hammers at the doors of the publishers, to knock down the author of every drama the instant he appears. But this is not the reason why we have no resuscitation of the drama; the reason is that the struggling throng of dramatic carpenters, concoctors, and translators quite blocks up the one entrance. Nothing but a long course of years, or some paramount interest, or popularity in other respects, obtains the chance of representation for any man of ability; and when two or three of these have made their position, there is literally no room for any more, even if the one door were not still blocked up by the aforesaid strugglers for admission. Many of these latter do effect an "appearance" upon the stage, being regarded as safe men — regular hands, who never infringe the established common-places or mediocrities. They come, and they pass, with a very temporary or equivocal success; and often, peradventure, they are damned outright. No harm is done, however, because little was expected, and the money spent upon their productions was proportionately small. But the impression thus conveyed to the public by the managers through these fallacious infirmities of their playwrights is, that of all the dramas offered to them, those selected for representation are of course the very best they could obtain. It was the manager's express interest to give the best — *and where are they?* A list of the new pieces produced during the last two seasons, as the picked and paramount specimens of all that were offered, would constitute a ludicrous yet equally plausible *non-sequitur*, as to the amount of dramatic genius now extant in the country. In addition to the almost insurmountable difficulties previously mentioned, a new circumstance seems to have rendered the one door hopelessly impracticable to all those who have not already a given position in the theatres — we allude to the prodigality of expense with which five-act dramas and pageants are produced. We had much rather see Mr. Macready's Hamlet in a small theatre, with a stone or earth-coloured background, than his Henry the Fifth, with all its exquisite "scenery, dresses, and decorations," however splendid and however true. A wider and a deeper truth is in the higher province of the drama; and we shall live to see this recognised with the downfall of the patent monopoly. Meantime we strongly recommend the perusal of the pamphlet which has induced the foregoing remarks.

If illustrations were wanted of the hopelessness of cultivating dramatic poetry, with a view to representation, which, in truth, is the natural aim of all dramatic poets, we have enough of them in the pieces before us. A play entitled "The Landgrave[32]," written by Mrs. Montagu, and founded

[32] *The Landgrave. A Play, in Five Acts. With Dramatic Illustrations of Female Character.* By Eleanora Louisa Montagu. London: Smith, Elder, & Co. 1839.

on the well-known tale of "Klosterheim, or the Masque," was composed expressly for the stage; and the author tells us in her preface that in order the better to adapt it for that purpose, she carefully restricted her dialogue to the necessities of the performance, excluding all mere poetical passages that had no influence on the conduct of the plot. Here, then, is an extremely effective play, written with considerable skill, the action judiciously distributed, the plot striking, and the characters boldly drawn, which, designed for representation, is forced by the monopoly and perverted taste of the great houses to appear in a shape in which it is impossible that its success can be commensurate to its merits. Some dramatic illustrations of the female character, drawn chiefly from exciting passages in history, which fill up the volume, discover a high dramatic capability; and this genius, accomplished and versatile, is prohibited from the only sphere in which it could be fully developed and fairly rewarded. "The Lords of Ellingham[33]," a drama, by Mr. Spicer, is not so well adapted for representation: the plot—founded on Raleigh's conspiracy—is too involved, and there is not room enough left by the flurry of the incidents for the clear play of the passions; but the piece exhibits a vigour and freedom in the dialogue that sufficiently indicate the power to achieve future triumphs, were the times more auspicious for such efforts. "Gertrude and Beatrice[34]," by Mr. Stephens, and "The Cathedral Bell[35]," by Mr. Jones, are tragedies written for representation, and both the authors state the measure of their disappointment at being unable to procure a hearing of their pieces before an audience. In these cases, however, the experiment would scarcely have succeeded. The scenes in both are over-crowded, and the effects are so rapid and tumultuous that it is difficult to concentrate the attention even upon the perusal.

Of other descriptions of POETRY our specimens are not very captivating, with the exception of a delightful little volume by Mary Howitt, called "Hymns and Fireside Verses."[36] The main object of this pretty book is to exemplify in simple and picturesque verses the abiding beauty of the Christian faith, the practical charities of life, and those elevating principles that obliterate in a common bond of social sympathy the unworthy conventions of artificial society. The poetry is sweet and musical; the breath of nature is in it; and the gentle truths it enforces have rarely been expressed with such touching earnestness. A satire upon the scientific and literary quackeries of the day, called "An Old Man's Gossip on Literature and Criticism[37]," is not less masculine in its grasp of the subjects to which it is addressed, than just in its running commentaries on the spirit of the age — especially in reference to science. The copy transmitted to us has numerous footnotes in manuscript, extracted from an article which appeared a few months ago in our pages, so that the author has drawn us into court as an evidence on his side against all forms of modern affectation. Two tiny volumes of songs have found their way into our catalogue—the one, "Whistle-Binkie[38]," an excellent collection of Scotch songs, and the other, "Minstrel Melodies[39]," a medley of miscellanous lyrics addressed to all manner of circumstances that can be put to music.

In SCIENCE there are some works of great value in course of publication, to which we will briefly draw the attention of the reader.

The tenth part of the "Flora-Boreali-Americana"[40] has just issued from the press—a work no less remarkable for its mode of production, under the auspices of a department of the English government (a rare fact in the history of literature!) than for the accuracy of its illustrations, and the importance of its matter. Three new willows, one pine, one najas, one heterostylus, one phyllospadix, two species of smilax, two of streptopus, a uvularia, a simlacina, a tofieldia, a trillium, two frittillaria, four allia, one hesperoscordum, and one triteleia, are added to the science in this fasciculus; and the whole work embraces drawings and descriptions of about 250 rare plants, the native birth of the northern regions.

"The Botany of Captain Beechey's Voyage[41]," of which the sixth part is before us, is published under circumstances exactly similar to the last, and the same remarks will apply to it. This portion adds ten species to almost as many genera, and as a single plant says more than a volume of the nature of the soil and the character of the climate, we know not where so much instruction of this kind can be found as in such works as these. They have now been some time before the public, or we should have felt it necessary to go into a more minute analysis of their contents.

We are now arrived almost at the conclusion of a series of works on the natural history of this island[42]—its ichthyology, ornithology, and zoology. The fishes are already completed, and the supplement, including some thirty species observed between the publication of the last number of this work and the present month, affords satisfactory proof of the attention which the undertaking has drawn to the subject. The supplement suggests a new feature for the second edition, which will probably appear shortly—we mean the craniology of fishes, a part of comparative anatomy that has not yet been sufficiently investigated. "The History of Reptiles" has only reached its second number, but enough is done to exhibit the arrangement, which is admirable. Mr. Jones's General Outline forms the natural and appropriate introduction to the works of Mr. Bell and Mr. Yarrell, and the student may be congratulated upon the valuable addition to the means of instruction which these important publications present to him.

Mr. Bauer's "Genera Filicum"[43] deserves particular notice for the interest of the subject, and the ability that has been brought to bear upon its illustration. "Let me live with the fern and foxglove!" was the exclamation of Robert, Earl of Huntingdon, when he assumed the name of Robin Hood; and who could blame his taste? These plants recall us to

Supplement to Yarrell's History of British Fishes. London: John Van Voorst. 1839.

A General Outline of the Animal Kingdom. By T. RYMER JONES, F.Z.S. Parts III. IV. and V.

[43] *Genera Filicum; or Illustrations of the Genera of Ferns, from the original coloured drawings of Francis Bauer, Esq., Botanic Painter to her Majesty, with descriptive letter-press.* By Sir WILLIAM JACKSON HOOKER, K.H., &c. Parts I. and II. London: Bohn. 1839.

the woodland and the heath, to the deer in the glade, and the falcon in the air, and the craggy half-wooded banks, between which mountain currents rush into the plains, and the wild wastes, luxuriant in unprofitable fertility. Veneration for the fern appears to have been a characteristic of the northerns; the fern-seed was supposed to render the wearer invisible, — ever instructive metonomy, signifying that peculiarity of the plant which in the word cryptogamia was given by Linnæus to the whole class which includes the several genera — Filices. But the generative systems of these plants, though still concealed from the uninquiring eye, are now easily detected, exciting new admiration at the wonderful variety of means lavished on the great end of nature, and at the singular and indescribable beauty enfolded in the delicate organs of reproduction throughout these curious families. The value of the ferns, and their extraordinary beauty, are no longer unappreciated. Our principal gardens are now embellished with fern-beds under glass and in the open air; at Cheshunt the fern-bed of W. Harrison, Esq. is one of the chief ornaments of the range of green-houses, and is highly creditable to the skill of Mr. Pratt, his able and successful gardener. There are several other instances of the high cultivation of ferns, independently of Sion, and Chiswick, and Trenthem, &c. Nothing, however, can be more conducive to their study, because nothing can be so explanatory of their nature and illustrative of their attractions, as the "Genera Filicum." The work is an imperial octavo, and it will be completed in ten numbers, each including 100 plates, each appropriated to a separate genus: and how appropriated?

A small square piece of the fern, as cut out, is represented in the first instance, either of the natural size, or magnified from 2 or 3, to 8 or 10 diameters, according to the size of the sori, which it is the object to exhibit in considerable number in their arrangement on the fern, and in their due proportion to the other parts of the plant. The sorus is then exhibited; its own little square of frond magnified many times, so as to show the character of its indusium, and the insertion of the sporangia. A part of the indusium is then represented separately, magnified a great number of times, and then the stipites magnified 100 or more times, and the sporangia in several periods of their progress, until they open and exhibit the sporules, which last are again figured separately, magnified several hundred times. Thus every portion of the system is distinctly and intelligently explained. Mr. Bauer's original drawings are copied in the plates in zincography by Walter Fitch, under Dr. Hooker's own eye, and then coloured, with no less regard to accuracy, by George Graves. In his descriptions of the genera, Dr. Hooker does not rely implicitly on his yet imperfect observation, nor would he dictate to the reader as to the complete correctness of the assigned genera; but he has been guided, in a great measure, by the "*Tentamen Pteridographiæ*" of Professor Presl, of Prague, a work of great authority; and he undertakes, in the course of his investigation on this subject, to correct himself wherever he finds reason to suspect an error. The varying forms of the fronds are not more marked than the diversities in the character of each of the parts. The indusium is now rough, like tortoise-shell, and armed with long ragged testacula; now it is a six-petalled calyx, like a leathery flower; now an irregularly ranged envelope; now marginal; now pod-shaped, with eyes; now elliptic; now globose, and now wanting: now it is leathery; now hairy; now membranaceous. And so with the sporangia; they are now clubs; now accompanied with jointed hairs, that make crooks of them: and no less irregular and uncertain are the stipites; they are stars, tubes, snares, flowers, hooks, reeds, handles, rods, &c.; and the sporules, although maintaining a general and characteristic likeness, are still amazingly varied, angular, ovate,

rounded, closed, open, star-shaped; in short, variety riots in the fern. We know how curious are many of the roots, how strange the stems, how singular the fronds, how different the shades of colour, and the habits of growth: hence we have a new series of wonders in the internal organisation enough to induce every lover of nature to echo the prayer of the outlaw, "Let me live with the fern and the foxglove!"

The first series, by Mr. Phillips, of "Lectures on Natural Philosophy[44]," devoted to an exposition of the chemical nature, the mechanical properties, and atmospheric phenomena of the air, may be recommended to attention as a useful manual for the young; and the second edition of "A Brief Treatise on Geology," by Biblicus Delvinus[45], may be described as an ingenious essay towards the reconcilement of the discoveries of modern geology with the Mosaic history of the creation.

Under the head of HISTORY, and HISTORICAL TREATISES, one of the most erudite and important is Mr. Sharpe's "History of Egypt under the Ptolemies."[46] Mr. Sharpe has already acquired a high reputation by his previously published works on Egypt: his "Early History, from the Old Testament, Herodotus, Manetho, and the Hieroglyphical Inscriptions," "Egyptian Inscriptions, from the British Museum and other Sources;" and his "Rudiments of a Vocabulary of Egyptian Hieroglyphics." In the present volume, a brief introduction leads us from Abraham to Alexander the Great, and may be regarded as an abstract of the author's "Early History of Egypt." The ten Ptolemies and the four Cleopatras have here each their brief biography, and the work concludes with general reflections. The authorities are quoted regularly in the margin, and every page has its subject for title. This order and arrangement are seconded by a very simple and intelligible style, and the narrative is clear and succinct. The invasion of Egypt by the Greek army, Ptolemy's generosity to the son and brother of Alexander, his piety to the remains of his former master, which led to the building of Alexandria, the war with Antigonus, the Theban coinage, the arts at Alexandria, are illustrated in the memoir of Ptolemy Soter, in an easy and familiar manner, and with an intimate knowledge of events and persons, which gives surprising life and truth to the narrative. The procession at the proclamation of Ptolemy Philadelphus, the story of Berenice's hair in the memoir of Ptolemy Energetes, the sketches of the schools and scholars under both these kings, the intrusion of Philopater into the Holy of Holies at Jerusalem, the origin of the Rosetta stone in the memoir of Ptolemy Epiphanes, the men of science who flourished under Philometer, the sketch of Cleopatra, and the anecdotes and incidents throughout, should make this work as popular as it is deserving.

"An Essay on the Neo Druidic Heresy in Britain[47]," develops the history of a remote system which has long occupied and perplexed the researches of learned men. The Polytheists of antiquity were very tolerant. To admit into the Pantheon the new-found god of a lately conquered people, was an easy compliment on the part of the Roman people; and to join in the worship of the local deities after the manner of the natives never shocked their conscience: but this forbearance was not extended to Druidism. That system of polity was dark and subtle, and too powerful to be tolerated. It embraced within itself all the means of education, and to itself confined

[47] *An Essay on the Neo-Druidic Heresy in Britannia.* Part I. By the Author of "Britannia after the Romans." London: H. G. Bohn. 1839.

them; it exercised with unrestricted power all judgment in matters civil and criminal, and the administration of religious rites and ceremonies was exclusively its own. The nominal monarch might be the king of men in the day of battle, but the archdruid was the lord of power at all times. The kings were only captains of the host, whom the Druids sent forth to fight or restrained from warfare at their pleasure. The minister in this theocracy assumed over all ages and classes of the people the power of light or darkness, of life or death, of heaven or hell; and to this dark and awful priesthood the military genius, the civil policy, and the mild worship of the Romans were alike repugnant. No truce could be made with them, no trust could be placed in them,—the Druids were to be destroyed; and so effectually was this necessity enforced, that for some centuries we hear no more of them; except, indeed, of the most pleasant of their orders, the bards, who seem to have appeared alike the Heathen and the Christian, and to have sent down their songs and their names to the latest posterity. Notwithstanding, however, the utter desolation of the original Druids in Gaul as well as in Britannia, their doctrines and their practice did in part survive; and it is a curious question, what portion of the original precepts of the Druid priests was mingled with that corrupted Christianity and those Mithraic observances which combined to form the Neo-Druidic heresy of the 4th and 5th century. The author of "Britannia after the Romans" approaches the question in a learned and inquiring spirit; but with a strong prejudice against the bardic rites, and a fierce hostility to the Druidic practices,—with a contempt of the modern discoveries in British lore, and with a readiness to construct his own theory out of as few scraps of evidence and authority as will enable it to hold together. To persuade us that Saint Patrick was an apostate Jew, or rather a devotee of Mithras ready to become a Jew, if the Jews would place him on the throne of David,—that after failing in a well-concerted effort to secure Jerusalem, he should come to Britain, establish himself in the central seat of the round table (Arthur's), the seat of the concealed Christ, as the second Moses, or the avatar of Mithras,—that he should collect the Jews of Britain, which island should be miscalled Crete, and that he should drown them in a pretended attempt to lead them as Moses did (in his first incarnation!) across the sea,—and that out of this should grow the legend of St. Patrick banishing the serpents, is a task in which to fail is no dishonour, seeing that to succeed in it would be impossible. Yet, if this be not the end of our author, we confess our inability to comprehend his aim. But this is the first part only of his essay, which may be wrought out to more purpose in the sequel; yet this portion is more complete in itself than satisfactory in its result. Indeed, this is evident to the writer, who thus winds up this portion of his essay:—"The crown and sword of David, the ship of Solomon, the wand of Moses, the perilous seat of Julian at Jerusalem, all transferred into Britannia, and the legend of the false Moses (drawn from cotemporary Greek accounts as well as Celtic tradition), seem to show us that the Judaism mixt up with bardism was not merely doctrinal in its rise, or borrowed from cabalistic books, but historical, and connected with some actual movements in the Jewish community. Further than that I cannot attempt to define or conclude any thing, until exacter studies or fortunate discovery shall have furnished ampler data."

There are two or three works on periods of MODERN HISTORY, several volumes of TRAVELS, and a few on subjects of CRITICISM, which we are compelled to postpone; and we will devote the remainder of our space to publications that may be more briefly treated.

A very curious volume, by Mr. Dunlop, on the drinking usages of this

country[48], is the most complete exposition of the evils of intemperance—of the vices to which it leads—and the ridiculous ceremonials traditionally connected with it, that we have seen amongst the numerous works on a question intimately associated with the highest interests of civilisation. Mr. Dunlop exhausts the inquiry, and has produced a book that is equally entertaining and instructive. Notwithstanding all the success that has crowned the *cuisine* labours of eminent gourmands, we are disposed to recommend a little volume, called "Cookery made Easy[49]," as the most perfect, practical, and simple hand-book of its class that has appeared. It is especially adapted to the use of families of moderate fortune, showing how to combine much table luxury with strict economy. The "Law Chronicle of Ireland[50]," contains lists of all the legal officers of that country, an accurate account of their several tenures, a history of their predecessors and charters, tables of fees and allowances, and a great variety of valuable information connected with the profession, collected with great industry, and perspicuously arranged for reference. "The Year Book of Facts"[51] is a repository of practical knowledge in almost all departments of inquiry: one of those laborious productions of patient industry, for which all classes of readers are bound to be grateful. A volume entitled "The Footman's Guide[52]," is addressed to the humble, but, in a domestic point of view, extremely useful object, of delineating the details of the footman and butler's duties, every part of which the patient author skilfully and clearly investigates. It forms an appropriate companion to a series publishing under the title of "A Guide to Service."

Amongst other gorgeous tributes to genius, there are two illustrated editions of two popular poems that demand especial notice. The first is a magnificent reprint of "Lalla Rookh[53]," to the illustration of which the utmost splendour of the arts has been dedicated. The union of poetry and painting has rarely before produced so costly and so chaste a volume, or one in which a poem that has grown as familiar to the world as the fables of childhood has been presented in a shape so worthy of its extensive and increasing popularity. The other is a polyglott edition of Gray's "Elegy in a Country Churchyard[54]," with versions in five different languages, and a series of exquisitely finished wood cuts illustrative of each separate stanza. The engravings are exceedingly beautiful, and the volume is a perfect gem in this difficult branch of art.

THE MONTHLY CHRONICLE.

CHARACTERS OF PUBLIC MEN.

Etudes sur les Orateurs Parliamentaires. Par TIMON. 2 tom. 9me Edition. Paris: Paguerre, 1839.

St. Stephens; or Pencillings of Politicians. By MASK. London: Hugh Cunningham, 1839.

Memoirs of the Life and Times of the Right Hon. Henry Grattan. By his Son, HENRY GRATTAN, Esq., M. P. 2 vols. London: Henry Colburn, 1839.

PUBLIC characters are said to be public property; but, like some other kinds of public property, the title to them is not very satisfactory. It is difficult to decide at what period the public acquires this property, or, in other words, at what time during a man's life, or how soon after his death, he may be engrossed and handed over to the community. If you venture to speak truth in the only way in which truth ought to be spoken — boldly —of a public character during his lifetime, the chances are at least an hundred to one that this common property in which you thought you had as clear a right of way as if you were skipping on the top of Snowdon, or galloping over Epsom Downs, will have you in the Queen's Bench, or send a slug through your cranium before you have time to recover from the enthusiasm natural to the exercise of your proprietary rights. If public characters be really the property of the public, it is by no means so clear that the public have any right to make use of their own property. Indeed, this sort of property seems to be altogether a pleasant political fiction, and to resemble the statues and pictures that are supposed to belong to the people, but which the people are never permitted to approach too closely. "Sticks and umbrellas to be left with the porter," is the condition of admission; and your property in public men seems to be as nearly as possible of this *noli me tangere* class. Mr. Grattan the other day called Lords Brougham and Londonderry to account for taking the liberty of making a commentary upon a commentary which he was himself reported to have made upon the Tories. Now if the report was true that Mr. Grattan had made that commentary on the Tories—charging them with murderous designs against the Queen—he must have done so under the impression that they were public property, a supposition which is confirmed by his refusal to admit the right of any person to question him whether he did make that assertion or not. By the same rule it would appear, that their lordships had an equal right to criticise Mr. Grattan, if Mr. Grattan considers himself to be a public character; for we know not how he could insist upon the recognition of such a privilege himself, and in the same breath stoutly deny it to others. The inference then is either that the rule must be regarded as a pure delusion, or that Mr. Grattan, in his own estimation, is not a public character.

On the other hand, if you sit down to the task of examining the character of a public man after his death, it is not at all unlikely that his son will

demand satisfaction, and that you must expiate the offence of investigating your own property by bequeathing to your friends, like Acres in the comedy, the choice of having you "pickled and sent home," or consigning your remains to a "snug lying in the Abbey." That public characters belong to history is as antique an axiom as that two and two make four, and apparently quite as obvious. Yet it has never been determined when the prerogatives of history begin, when the entail may be cut off and posterity may enter upon possession. In some cases the difficulty has been got rid of by the unanimous consent of a nation, and history has at once foreclosed the mortgage of time. But this is only where the inheritance is a wondrous piece of glory, in which no flaw can be made out to raise a question of litigation. Washington became at once the property of history. Heaven knows how long a time may elapse before Sir Robert Peel shall be quietly inclosed in her pages, if, indeed, the substance — so little is there of him — be not exhausted in the contest to decide the validity of the claim.

While, however, these impediments exist in the way of exercising the right of property in public characters, the right itself is, we think, undeniable. Nor does this state of the case — this right without impunity — involve any paradox, since we find it hold good in a variety of other instances. For example, every man in India has a right to go into the jungle and hunt elephants, and catch them if he can; but he must take the risk of being swallowed alive, or torn to pieces, in the assertion of his right. Every man has a right, also, to swim in the sea; nor is his right in the slightest degree abated by the peril he runs of meeting a ravenous shark that has no respect for the freedom of the waters, or a razor-fish that is just as likely to cut him in two as to suffer him to splash at liberty.

But being called a right of property, it is presumed that it should be enjoyed as property is enjoyed, and that the public may treat a public man as a farmer treats a field — turning it into wheat one year, and into potatoes the next. The analogy, however, is correct only so far as the different natures of the tenure are analogous. Such men as Lord Lyndhurst, or Sir James Graham, or Sir Francis Burdett, are convertible into an endless variety of crops; they may grow Radicalism in one season, and Toryism in another; but the growth is the effect of circumstances over which the treasury exercises a greater control than the public. The sun that ripens the hybrid seed in such soils is the sun of Downing Street, and not the sun of opinion. The whole population might till them for fifty years in vain, while one sweep of the ministerial plough would produce turnips, or *phormium tenax*, or any other growth, just as it might be wanted. Besides, it is not exactly true of property that you may do what you like with your own. You may not kill pheasants on your own land, even if you can prove their genealogy as clearly as you can the birth, parentage, and education of the goose you have reared expressly to the spit. You may not distil your own corn, nor set fire to your own house; and perhaps the highest right of property you possess in any shape is no better than that which you possess in reference to public men — the right of saying that it is your own.

Some doubt is occasionally expressed by timid, and, as the world goes, well-meaning people, as to the propriety of canvassing too familiarly the acts and characters of public men during their lives. But it may be asked, when can their acts and characters be so advantageously canvassed? Are we to wait until they have accomplished all the mischief in their power, before we take the liberty of protesting against their errors? Or must we postpone the acknowledgment of their virtues until they are insensible alike

to rewards and punishments? If we are not to cry out before we are hurt, may we not at least throw up our arms to avert the blow? Must we look on at the game where our lives and liberties are staked, and be prohibited from warning the players against false moves? Are we to apply to the political world the humility of the Christian principle, and when we have been smitten on one cheek, bow with a simper and turn the other to receive a similar favour? We are told that men are not legitimate subjects for free discussion until after they have passed away, and that posterity alone is the dispassionate judge of their actions. If death alone can render public men legitimate, the sooner we have a revisal of the bastardy laws the better; and as for all posterity can do for us, we need not be under much alarm about giving offence to that respectable personage. But the argument is curious, as it would have the effect of making each new generation neglect its own affairs to attend to the affairs of its predecessors, so that nothing should at last come to be done in the world but to dress mummies. Our posterity in course of nature must be displaced by a posterity of its own, whose sole business should consist in settling the accounts of its grandfathers, in reconciling the contradictions of its venerable progenitors, and putting in order the houses of the dead. In the meanwhile, the public men of the day would be providing ample materials for the pious cares of the succeeding race, secured against all interruption from their own public, who, occupied by their appellate labours, would be "too busy to bark at them." What would come in the long run of this mode of government it would not perhaps be very hazardous to conjecture; but without allowing ourselves to be carried away into so tempting a utopia, we may suggest that if public men are to be left to the dispassionate judgment of succeeding ages, all present guarantees are at least superfluous and idle. Of what avail are the limitations of the constitution, if their violation is to be referred to the cool decision of races wholly unaffected by them? Why should we have a monarchy any more than a republic, or a republic any more than an oligarchy, if we are in no way concerned in the matter, and those who come after us alone are interested in the decision? If we are to live only in our ashes, what is the use of caring about what becomes of us in the flesh? If we are not to audit our own ledgers, it is quite immaterial how soon we are gazetted, since a dividend cannot be declared until long after we are dead.

That the verdict of posterity will be dispassionate there can be no reason to doubt; but the value of a dispassionate verdict in such a case — except by way of a scare-crow, which is as dispassionate as any thing we can at this moment think of — may be reasonably doubted. A real bird, with blood and life in it, would make a bad scare-crow; a red nightcap stuffed with straw answers the purpose better. But neither one nor the other can restore the grain that has been already pillaged by the thieves of the garden. What is wanted is not only to prevent such spoliation for the future, but to stop it in its progress, and, when we can, to obtain indemnity for it. Your dispassionate scare-crow cannot accomplish these functions. It comes rather too late, and is too inert when it does come. Our legislators legislate for the passions of mankind; and it is right they should be made to know the scope and power of the passions they are required to sooth, restrain, and direct. Can posterity supply them with this knowledge? And who can so well discern the true spirit of the passing movement as those who are stirred by it? We should like to anticipate the opinion of some critic a century hence upon Macready's Henry V. That would be the perfection of dispassionateness. But for all its philosophical equanimity, Mrs. Partington in the third row of the pit would pronounce a more accurate judgment. If

we would measure the claims of public men, we must adjudge them with all our passions fresh within us, under all the strong influences of contemporary events, and while they are yet face to face before us. We alone who see them act, and who feel the force of the circumstances by which they are surrounded, can truly interpret their motives; we alone can detect the springs of policy, the choice of alternatives, the relations of cause and effect, and the minute agencies that in a few years shall have faded into oblivion. Are senators alone entitled to be moved by human affections and human interests, and the people required to disembody themselves of the same attributes that they may escape the risk of throwing too much passion into their judgments? Are we to be ruled item by item in the practical details of life, and, separating all the feelings of men from the issue, must we shape our conclusions in the abstract? To be sure,

> "The flesh will quiver where the pincers tear,
> The blood will follow where the knife is driven,
> And sighs and tears by nature grow on pain."

But we must not, for all that, according to the doctrine of posterity, dissect the characters of living men. We must wait till the procession has passed away, even if it should trample us on its path into dust.

Maintaining the opinion that the best time for examining the actions of public men is while they are living — the time most profitable of useful results, most favourable to truth, when slander can be most readily stripped of imposition, and when the vindication, as well as the impeachment, can be most fairly sifted — and that such examination, independently of the immediate good it produces, has a salutary operation *in terrorem*, we congratulate the public upon every fresh manifestation of this spirit of fearless inquiry, which, perhaps, never was exercised at a moment when it was more needed than the present.

The similarity of the domestic situation in which France and England has of late been plunged by ministerial difficulties, reflect from one to the other a strong sympathy when the conduct of public men comes under consideration. In all representative governments we get at the character of the whole body through the character of individuals. "L'histoire des états représentatifs," says M. Timon, "est renfermée presque dans l'histoire de leurs parlements, et l'histoire des parlements dans celle de leurs orateurs." Accordingly we find that, both in France and England, an unusual degree of attention has recently been directed to the leading politicians — to their views and principles — their past proceedings and present positions — and their talents as statesmen and orators. In France, the interest has been heightened by a cabinet crisis unparalleled in the annals of Europe, during which the functions of the legislature were suspended, and the country was literally without a government, and exposed to the will of an absolute king in a representative state; while, in England, a cabinet dissolved by a day's thaw, and frozen back again in the night, has furnished nearly an equal source of wonder and speculation. Sketches illustrative of the principal actors in these strange harlequinades have appeared in Paris and in London, and given a personal direction to the natural curiosity of the people. Lord Brougham's contemporary outlines are already so well known, that it would be a needless occupation of our pages to introduce them to the notice of the reader. We have preferred taking the piquant studies of M. Timon, and the more recent pencillings of Mask, for a few likenesses to niche into the historical gallery; and to these we have added, by we hope an excusable anachronism, the life of Grattan, whose name, although it does not belong

to the present day, still exercises a strong influence over the destinies of his country.

The celebrity of M. Timon in France is as great as Junius enjoyed in England, and much of the same kind. He addresses himself to the immediate subject of the hour, and by the force of an acute intellect, and a style brilliant, sarcastic, and original, puts the question he takes up in such a light as to determine at once the aim of the popular movement, which he either originates or controls. A pamphlet from the pen of M. Timon produces a sensation which would be scarcely credited in our wintry atmosphere. It becomes at once a subject of universal discussion. The crowded cafés and gay salons of Paris are agitated to their centres by his sprightly and caustic wit; his sentences are coined off into current maxims; and from the faubourgs to the heart of the Palais Royal, the whole population rings with the echoes of his antithetical sarcasms and searching criticisms. He penetrates wherever the wind whispers, and they might as well try to keep out the air from the chambers of the Tuilleries as to keep out M. Timon. His "Lettres sur la Liste Civile et sur l'Apanage," and his "Tres-humble Remontrances de Timon au sujet de la loi dite des *Lapins*," had a greater effect upon the public mind than a hundred *projets* of law. For some time the mystery of who this M. Timon could be, helped to give a deeper zest and relish to his publications; but secrets of this description are not likely to be long preserved in the fluttering circles of Paris, and every body now knows that M. Timon is M. Cormenin, a silent member of the Chamber of Deputies, who always votes on the popular side, and who, incapable of oratory himself, is an exquisite judge of oratory in others.

His "Etudes sur les Orateurs" is the most remarkable of all his works. It opens with a logical division of the matter, and introduces the portraits of the orators by an examination into the nature of eloquence, considered under a variety of heads, in reference to the genius of different countries, in a comparison between orators and writers, different modes of speaking, the professions which predispose to deliberate eloquence, the classification of orators, the general tactics of the opposition, the majority, and the minister, the particular tactics of the ministers of each department, of diction and carriage, and precepts of parliamentary eloquence. In the treatment of all these topics M. Cormenin exhibits an intimate knowledge of the art of public speaking, and singular acuteness in reducing it to practical principles. To have acquired so close a view of the science of managing assemblies of men without having had personal experience of its difficulties, is a proof of vigilance of observation extremely rare amongst the taciturn representatives of the people; and it is only surprising that one who can describe so accurately the various resources and diplomatic shifts of eloquence should be unable to exemplify them himself.

When he undertakes a portrait, he finishes it with infinite pains. He is not satisfied with catching the general cast of the features, and giving you the *tournure*, expression, and colour of the subject; but he traces every line and curve, the play of the muscles, the light, and air, and tone, until he brings it out, not as it were a likeness upon paper, but as if the whole figure, with all its emotions, moved into open space, so that you could walk round it and examine it on all sides. To produce this effect, there must be a wonderful impartiality in M. Cormenin's characters. The patient toil of the artist, who seeks neither to flatter nor deform, is every where visible in his pages. His own sentiments are clear enough all through; he thinks that the monarchy of July was no better than a trick of thimble-rig; and the boldness with which he avows this conviction, and takes up his ground

with the people, raises his censures above suspicion, and confers additional value upon his panegyrics. Of M. de Villèle, he says,

"Les gens de son parti avaient plus d'impétuosité que de prudence. Il les assouplit au frein et il les disciplina. Ils ne connaissaient guère ni les hommes ni les choses au milieu desquels ils arrivaient du fond de leurs provinces, il les leur apprit. Soldats obéissants, ils marchaient sous ses drapeaux, et rendaient un hommage incontesté a sa supériorité naturelle. Il n'avait point de fleurs dans son style, de pompe dans ses images, de véhémence dans son oraison, de nœud dans sa dialectique. Mais il était clair, plein, ferme, raisonnable, positif. Il ne lui échappait pas dans la chaleur de l'improvisation, de ces mots hasardés dont le commentaire s'empare, et qui défraient les moqueries de la presse."

The contrast that follows between M. de Villèle and M. Casimir Périer is not less remarkable for justice than sagacity.

"De tous les ministres que le régime chartique a dévorés, il n'y en a que deux qui aient fait du bruit et qui laisseront quelque trace dans l'histoire, M. de Villèle et M. C. Périer. Tous deux antipathiques par leurs opinions, leur tempérament, et leurs facultés. L'un assis sur les bancs de l'opposition, l'autre sur les bancs du ministère. L'un poli et réservé, l'autre impérieux et colère. L'un ne montant à la tribune que pour réfuter l'autre qui en descendait. L'un ne se servant que de la figure vive et parlante de l'apostrophe, l'autre procédant par les voies logiques du raisonnement, sans se déconcerter ni sans se reprendre. L'un poussant la brusquerie presque jusqu'à la grossièreté, et l'autre la finesse presque jusqu'à l'astuce.

"Mais tous deux hommes d'état, avec des qualités éminentes, quoique diverses. Tous deux naturellement habiles dans l'art de commander aux hommes et de s'en faire obéir. Tous deux conduisant leur majorité, l'un par la peur, l'autre par la séduction. Tous deux enfin, quoique adversaires, rapprochés par un point important, c'est qu'à la différence des autres ministres, ils ont compris la vérité du système représentatif, et qu'ils ont gouverné le pays en laissant régner leurs maîtres."

It is not to be expected that M. Cormenin should praise M. Guizot; the sect of the doctrinaires is too severe and axiomatic for his practical mind and expansive spirit. Speaking of M. Guizot, he observes,

"C'est un pédagogue dans sa chaire, qui laisse toujours passer sous sa robe la petit bout de sa férule. C'est un Calviniste dans son prêche, froid, sentencieux, morose, qui enseigne la crainte plutôt que l'amour de Dieu."

Yet he acknowledges M. Guizot to be distinguished as a man of letters and an historian, and gives the following estimate of his style as a public speaker, developing a system admirably adapted for a deliberative assembly, which is not, as he afterwards observes, carried away by a great number of ideas, but by a single idea, adroitly chosen, completely worked out, and frequently reproduced in different forms.

"M. Guizot est bon littérateur, historien distingué, et il tient une haute place parmi les publicistes de l'école anglaise. Il est très-versé dans l'étude des langues anciennes et modernes. Il ne brille, comme écrivain, par aucune qualité supérieure de style, ni par la précision, ni par l'imagination, ni par la profondeur des raisonnements, mais il est moins nuageux que M. Cousin. Il n'a pas la belle et large manière de M. Royer-Collard; il a plus d'abondance d'idées que lui; il est plus étendu, plus varié, plus positif. On voit qu'il a été mêlé davantage au maniement des affaires humaines.

"Comme tous les prédicants de l'école génevoise, de cette école sèche et rogue, il procède dogmatiquement. Il néglige les fleurs du langage. Il manque de souplesse et de mouvement, et sa diction est monotone, quoique grave et assurée. Sa passion se révèle dans l'éclat de ses yeux et passe rapidement sur les traits de son pâle visage; mais elle s'absorbe vite, et elle est plus concentrée qu'extérieure. Il emploie rarement de ces personalités blessantes qui s'attaquent droit à un adversaire désigné par son nom ou par son siége sur les bancs de l'assemblée. Mais, tout en protestant de la parfaite innocence de ces intentions, il lance à l'opposition des sarcasmes collectifs, qui laissent dans la plaie leur trait envenimé.

"M. Guizot traite les questions politiques philosophiquement et d'un certain point de vue élevé. C'est la manière de son maître, M. Royer-Collard. Il choisit une idée, il la formule en axiome, et il établit autour de cet axiome l'échafaudage de ses raisonnemens. Il y revient sans cesse; il la présente seule à la vue du spectateur, il y attire, il y fixe son attention. Son oraison n'est que le dévélopement d'un thème. Si l'idée est vraie, tout

le discours est vrai ; si l'idée est fausse, tout le discours est faux. Mais les députés de la majorité, prévenus à laquelle il s'addresse, ne conviennent jamais que la thèse soit fausse, et M. Guizot conserve auprès d'eux tous les avantages de sa méthode." :

The character is drawn with the most minute precision. The writer labours hard against his own prejudices, and when some bitter expletive escapes him, unwilling to modify or recall it, because he believes it to be just, he tries to balance it by some graceful reference to the accomplishments of a man, who, however ill adapted to a period of vivid transition, confers lustre upon it by the elevation of his genius. In a single sentence, setting aside details, we have the true image of M. Guizot distinctly delineated.

" Grave dans sa vie publique, opiniâtre dans son but plus que dans ses maximes, ambitieux par système et par tempérament, laborieux et décisif, M. Guizot a toutes les qualités et tous les défauts qui constituent un chef-doctrinaire. "

M. Thiers, on the other hand, impresses us with the young life of the movement; and although M. Cormenin is not altogether in love with his character, it is quite evident that he admires him beyond all his contemporaries. He compares him to Voltaire, says he is nervous and impressionable, and that he exhibits the caprices and pettishness of a child with the pretensions and gravity of a philosopher. M. Cormenin emulates the sparkling satire of Voltaire himself in such pithy strokes as the following, speaking of M. Thiers: —

" Il est plus homme de lettres que homme d'état, et plus artiste que homme de lettres. Il se passionnera beaucoup pour un vase étrusque, peu pour la liberté."

The contrast between M. Thiers and M. Guizot draws out the salient characteristics of both with great felicity. We will give one passage as a sample of the pungent spirit of these delineations.

" Entre M. Thiers et M. Guizot, antagonisme du tout au tout. L'un ductile, l'autre gourmé; l'un que ses vieux retours de jeunesse entrainaient à la dérive vers la gauche, l'autre que les surprises du légitimisme portaient vers la droite. Réunis par la peur, au moment de perdre le butin de juillet, séparés après la victoire par la convoitise des dépouilles, ils ne pouvaient se donner la main l'un à l'autre sans la retirer le sang aux ongles; et leurs baisers sur la joue, en plein spectacle, n'étaient que des baisers de trahison et de mort. Il était bien temps que ces inséparables amis se quittassent.

" Et, à vrai dire, il y avait entre eux encore plus d'antipathie de caractère que d'opinion, et, comme il arrive des forts aux faibles, M. Guizot se serait accommodé plus volontiers de M. Thiers que M. Thiers de M. Guizot.

" C'est à qui maintenant de ces deux spadassins d'état renversera l'autre du haut des tréteaux dans la boue. Noble pugilat!

" Dans les dernières sessions, M. Thiers a ramé entre Carybde et Scylla, avec une incroyable souplesse d'aviron, évitant la gauche sans donner à droite. On voyait bien qu'il venait de passer par le ministère des affaires étrangères. Ses discours, appris d'avance et travaillés extrêmement, sont de petits chefs-d'œuvre à l'usage des ambitions ministérielles. Il fait sentir à l'opposition dynastique, avec une bienveillance caressante, le prix de sa nouvelle amitié. Il assure, en passant, M. Molé qu'il peut à demi compter sur sa dédaigneuse protection, et il accable M. Guizot sous la moquerie de sa défaite, mais tout cela à pas de loup, à mots couverts. Aux bons entendeurs, cela signifiait que chacun des deux partis serait trop heureux d'en revenir à lui. Mais, allié trop incertain de l'un, allié trop récent de l'autre, M. Thiers n'est pas assez révolutionnaire pour l'opposition, et pas assez royaliste pour les doctrinaires."

But M. Cormenin is not always disposed to bestow so much trouble upon his pictures. He sometimes dismisses them in profile, and sometimes merely gives a rapid outline; even these, however, are expressive, and touched by the hand of a master. Lafitte, Charles Dupin, and Jaubert, are briefly described; and a variety of likenesses — including even such men as De La Borde, Humann, Dufaure, Bignon, Bertrand, and Martin (du Nord) — are crowded into an appendix under the title of "Orateurs en buste." In-

dependently of the vivacity and life-like truth of these inimitable sketches, which cannot fail to fascinate the attention of the reader, they are invaluable for the reflections they suggest upon the fate of nations. If any thing can explode the fallacy of "measures, not men," and convince the world of the importance of scrutinising the characters of the individuals to whom the destinies of countries are for the time confided, it is such a work as this of the sagacious Cormenin.

The writer who assumes the title of "Mask," undertakes a similar series of sketches of the leading men in both houses of the English parliament. He evidently thinks himself well qualified for the task, since he tells us that he has prepared these characters for the use of history, to save her the trouble of raking in old chests, and dusting her fingers in old magazines and newspapers; and he observes also, that it is highly probable that nine tenths of the parties who figure in his pages would be unknown to the world some hundred years hence, were it not for his timely aid. When it is stated that Wellington, Grey, Brougham, Peel, and Lord John Russell are amongst the individuals rescued from oblivion by Mask, the modesty of his pretensions will be duly appreciated.

But modesty is not a characteristic of satire, and Mask is a satirist. He leaps upon the stage with the vigorous agility of the clown, and begins by making ugly faces at the audience he is about to entertain. Unlike M. Cormenin, he is incapable of rendering justice to an opponent, and has such a genius for mockery and sarcasm, that he cannot let off even his friends, without maliciously exposing some of their defects. He is most successful when he is most abusive; he fails in panegyric, because he has none of the generous qualities that inspire applause with a tone of earnestness and sincerity. His praises are scanty, artificial, and precise; his censures vehement, tumultuous, unmeasured, and overwhelming. He appears to think it less necessary to be accurate than severe, and is always ready to sacrifice the fidelity of the likeness to the rampant malignity of the caricature. Such writers are not remarkable generally for the profundity or consistency of their views. They take up a set of opinions merely as a piece of machinery for working off their surplus humours, and are usually more engrossed by the process than the result. As far as the political opinions of Mask can be ascertained in the whirlwind of rhetorical passion, he may be set down as a reformer; but the exact extent of his creed seems to depend upon circumstances, and, like the elastic cravat in the fairy tale, to shrink or dilate according to the action of immediate influences. His zeal goes by contraries, breaking out into enthusiasm when he comes to examine the characters of such men as Burdett and Lyndhurst, and cooling down into caution and doubt when Grey and Russell are under consideration. He is not so much a believer in the doctrines of the Reformers, as a protester against the doctrines of the Conservatives; and, without having any affirmative proof of the fact, you infer that he must be a genuine Liberal, because he repudiates Toryism, just as you would pronounce a man to be a good Protestant, because he hated Catholicity.

But Mask is a clever fellow, notwithstanding that we cannot give him much credit for the integrity of his convictions. The truth is, he does not *feel* strongly—he only *writes* strongly. There is a great vigour of language, variety of expression, and originality of manner in his book; but the power of generalisation is wanted. Mask is a taker of individual portraits, which he heightens with draperies, and costume, and pillars, and windows, and flower-pots, and a hundred other artistical devices; but he cannot paint a great picture. He has not enough of philosophy or sympathy; his vision is

too limited, and his hands are too full of trifles for the attainment of excellence on a large scale.

The sketches are divided into two books; the first dedicated to first-class politicians, and the second to a trio of turncoats — Burdett, Graham, Stanley. In this division, Mask commits an egregious blunder with his eyes open, assigning three fourths of the volume to politicians of the first class, while he assures us at the same time that there is not a name in the list entitled to be admitted to that rank. His selection of persons is still worse. Amongst first-class politicians he includes the Marquess of Londonderry, Sir Charles Wetherell, Dr. Philpotts (who ought to be amongst the turncoats), and Dr. Whately, whose failure in the House of Lords he does not forget to commemorate with the usual asperity which, Whig-fashion, he incidentally deals out to his friends. The sins of omission are equally flagrant. Mask, indeed, seems to have opened his gallery to the men he knows, rather than the men who are worth knowing, and to have gathered for history not the most historical physiognomies, but the most familiar faces.

The character of Lord Lyndhurst is a good specimen of Mask's powers of coarse painting. All the points about the individual are salient; and Mask has caught them, not as they catch angels on the points of fine needles, but as they catch whales — he has fairly harpooned them.

"Talent he has in abundance — given him, as Lord Melbourne very properly conjectures, by God; industry he also has, exerted, as the same nobleman asserts with equal confidence, under the patronage of the devil. Principle — that is political principle, for as to private principle it is out of my province — political principle then he either never had, or turned it adrift very early, as too expensive for an adventurer. For foolish notions of Utopian morality he ever professed a very proper contempt; consistency in his idea was that sheer thick-headedness which could not understand the only argument by which a politician ought ever to be convinced. Patriotism was — but no, he never could give a definition of that.

"Imagine such a man tossed up and down, and thoroughly shaken among the elements of the last two dozen administrations — imagine him now chopping thoroughly round, now sideling gently a little back, now bolting like a singed rat from a burning house, now crawling gently back again when the fire was put out; imagine his shifts, his contrivances, his private laughs over his public speeches, and say whether you can help laughing with him. Imagine, moreover, a man who knew him in his youth, and who, retaining their then common Radicalism, has arisen no higher in estimation than to be thought a clever old scribbler, sitting down to remember how Copley started off, pitching out a bag of ballast whenever he got into a cloud, until, at last, he and the gas were clean out of sight, and nothing but the sand remained in the region he had started from. Imagine that, and you will feel why I laugh, and why I should be a fool if I fell to grave talk about abuse of talents, political inconsistency, and such like crudities."

The moral of this is the best of it. During the French revolution Lord Lyndhurst was a Jacobin. His reputation rose rapidly by the energy and talents he exhibited in the defence of Watson. But patriotism at that time was not a lucrative speculation, and the only way to make any thing of it was to sell it. His lordship watched the market, floated into parliament, and became one of the most devoted worshippers of mother church, and one of the most furious partisans of the government. The Rolls and the Court of Chancery rewarded his apostacy. But it became necessary to turn round again, and emancipate the Catholics. This was no great difficulty to a genius so ductile and accommodating. When the Catholics were liberated, it was next considered desirable to render their liberty insupportable by a harassing succession of parliamentary tactics; and in this service Lord Lyndhurst has outstripped all competition. Should his party — that is to say, the party to which he belongs at this moment — ever come into power again they cannot do less than restore him to the Woolsack; nor would it in the

least surprise us if they made him Archbishop of Canterbury. He would surely make as good a bishop as Dr. Philpotts, of whom Mask says,—

"If I were a painter, and would study nature for a face that might serve for that of a grand inquisitor, I should fix with enthusiasm upon that of Henry Philpotts, Lord Bishop of Exeter. * * * He has crawled through the usual narrow portals of servility: he has served that usual apprenticeship of degradation which the majority of our bishops have always undergone; and from being about the great in the capacity of private tutor — a person who, with the rank and education of a gentleman, is looked upon by our haughty aristocracy something in the light of a nondescript menial, and is especially despised by every rotund butler — he became a furious pamphleteering parson, with a good steady breeze in his favour, and a right good will to try its power."

But let us turn to a more attractive head. Joseph Surface himself is a more agreeable figure to contemplate than our Protestant Loyola. The sketch from which we take the following passage gives a just estimate of Peel. The writer despises his intellect, and arrives at the conclusion that as a politician he is contemptible. His "respectability," however, is undeniable.

"Sir Robert lavishes no *soins* upon agile opera girls, and figures in no amorous confessions of frail Harriets. He has ever been a man of unquestioned propriety; he throws away no auxiliary to ambition; and he well knows how much 'respectability' is worth in England. He was a good boy at college, and fagged hard. He took a double first-class — no very great thing to do, as examinations then went, and what half-a-dozen very mediocre men upon an average do every year, now that the difficulty is trebled; but still a very 'respectable' achievement for a gentleman commoner of Christ Church, in days when champagne and scarlet coats were the order of the day, and Latin and Greek were voted vulgar. Perhaps it was this early performance which first inspired him with that extraordinary estimation of his own powers, that religious awe of himself, which seems always to absorb him. He appears sometimes quite wrapped in self-contemplation, and, doubtless,

'The more he thinks, the more his wonder grows
That one small head can carry all he knows.'

Brougham, in one of his pamphlets, sneers cruelly at this 'his deep and devout veneration for himself, testified, among other things, by reverently dropping the voice upon naming the object of his adoration.' No one who has ever heard the right hon. baronet pronounce the pronoun 'I' in one of his speeches, can fail to feel the full force of this sarcasm."

No man in England understands the vulgar English character better than Peel; and no man plays up to it with more consummate skill. Every "respectable" individual who "keeps a gig" must entertain the most implicit admiration for him. He is the head of the class. The Irish have a phrase which they apply to upstarts — "Sheil in a gig," but which might hereafter be advantageously changed to "Peel in a gig."

O'Connell furnishes an amusing sketch. The amount of his influence in Ireland, and of the way he sustains it — his powers of controlling and carrying with him a popular assembly — his great capacity for business — and his indomitable energy will, at least, interest those at a distance who do not possess the means of judging for themselves. But the character of O'Connell remains to be written. It is as much above the reach of Mask's penetration as it lies out of the way of his inquiries. O'Connell is a worse and a greater man than he has described him to be. He is the man of the age who has accomplished the most extraordinary results with the most extraordinary indifference to the choice and use of means. The political problem that lies folded up in O'Connell's career must be solved by some more profound thinker than Mask.

What Mask is as a politician may be briefly seen from a part of his character of Lord John Russell, in which he vibrates between two opinions like a pendulum.

"To advance with the spirit of the age has always been his avowed creed. He has always advanced when he felt that the popular sentiment was with him, and, if he continues to be a politician, he will again; for he is the dupe of no stupid prejudice—he is neither passionate nor spiteful. I have hope of him, also, because he cannot be unconscious of his own individual insignificance; because he cannot imagine he is anything but what his followers have made him; because he cannot look around without seeing a hundred liberal men, each more able than himself, who might supply his defection. I have hopes of Lord John, because I believe him honest, and because I know that dishonesty would be, to him, political extinction.

"I do not mean that Lord John Russell is ever at all likely to fawn to and flatter every knot of impudent mechanics who meet in a pot-house, and constitute themselves the representatives of the working classes. I have no hope that he will take every idle cotton-coated brawler by the hand, and do his command. Even when he was bidding his utmost for popularity he did not do this. Admirably conceived, and in true tact, was his answer to two or three compositors upon the unstamped trash, who, upon the accession of the Queen, wanted to make her a holiday show, and to sport their ragged kickseys in the presence chamber. These men should remember that, though political rights are common to all, political importance is only due to education or to wealth. Both require toil and perseverance, and the latter is always open to men with a little talent and a little industry. Lord John told these indignant operatives that there could be no possible objection to their paying a visit to the Queen, they being previously clad in court costume — and the silver spoons locked up, he would have added, had he dared."

The "impudent mechanics," the "cotton-coated brawlers," the "kickseys," and the "court-dresses," betray that mental finesse which has been all along the bane of the Whigs. The attempt to legislate for the people in the spirit of fine gentlemen—the aristocratic lisp of liberty—the coming into the crowd with scented handkerchiefs to their noses—have invariably marked the whole course and bearing of the Whigs, who, as a party, cannot by their property, their hereditary habits, their traditions, and their prejudices, ever enter heartily into the popular cause. They approach it with an air of timidity, as if they were afraid of contagion; and, like the fop who lifts the soiled glove with a pair of tongs, they always contrive to keep a non-conductor between them and the people. Mask certainly advises Lord John Russell to give the ballot and a liberal suffrage to the constituencies; but observe how he stultifies himself, a few pages afterwards, speaking of Lord Howick.

"I look upon Lord Howick as a man of great promise; and, if I properly rate his energy and determination, probably destined to head a mighty movement, and a great peaceable revolution, even greater than that over which his father presided. His want of showy talents has prevented his being so well known to the million as he deserves to be; as he becomes better known he will become better appreciated. I believe the time is not far distant when he will be the only one in the cabinet in whom the nation will place its highest confidence."

The reader will no doubt smile at the prospect of the nation placing its highest confidence in Lord Howick. But this is not all.

"He approaches, also, nearer than any other member of the aristocracy to those great questions which have yet to be decided before England can be said to be in the possession of a wholesome government. I say Lord Howick approaches nearer than any other—where he stops I know not; I am inclined to hope that he has drawn no formal demarcation between himself and the people, and that he is ready, without looking to the sophistries of expediency-mongers, to advance wherever justice and sound reason may guide."

He does not know where Lord Howick stops; and he hopes his lordship will draw no formal demarcation between him and the people; and this, too, after his lordship has stopped, point-blank, at the ballot, and drawn a line of demarcation which, whatever his lordship and Mask may think to the contrary, never can be passed by the people. Lord Howick has taken his stand upon a so-help-me-God resistance to the ballot; and Mask, who is convinced in one page that the ballot ought to be granted, and

that any policy short of that measure would be fatal to the popularity of the government, thinks in another page that Lord Howick is destined to be the chosen minister, in whom the hopes and affections of the people of England are to be concentrated in the last extremity.

This is as bad as the conduct of Lord Howick himself, who agreed to throw open the ballot, under the pretence that it would hasten its success, and then turned round and declared that he did so because he really believed it would retard its progress.

Mask is in the same predicament as the Cabinet — he is divided against himself. An able weekly paper * gave a humorous description the other day of the difficulties of the ministerial journals, in trying to conform to the antagonist desires of the two sections of the Cabinet — trying to answer two bells in the servants' hall at the same moment. Mask gets into a similar dilemma. He holds the banner of the ballot in one hand, and claps Lord Howick on the back with the other. Now he throws up his cap for the rights of the democracy, and anon he moves away with an air of offended elegance from the greasy crowd. He looks very like a recruit enlisted in two belligerent services, whose valour is excited by turns at the sight of his alternate cockades.

From whatever point of view, however, we examine the characters of living politicians, we apprehend we must arrive at the same conclusion, that none of them will bear comparison with the men who preceded them, either in integrity of purpose or comprehensiveness of mind. The race has degenerated. Canning was the last of that lofty order on which Henry Grattan conferred so great a lustre by his virtues and his talents. The labours of Grattan cannot be properly estimated without a careful perusal of the history of the period in which he lived in connection with the narrative of his life. The volumes published by his son carry down his biography only to the year 1782, the date of the greatest achievement of his career — the free trade; but from these materials a sufficient image of the patriot and orator may be formed to satisfy the curiosity of those to whom his name is little more than a tradition.

Grattan had an original capacity for greatness — promptitude in availing himself of the fitting occasions for prosecuting his objects — lofty courage in the face of the worst dangers — remarkable skill in the strategy of parliamentary debate — enlarged views of the national good — sincere devotion to the real interests of the people — firmness — knowledge — and eloquence. The honour of having procured a free trade for Ireland belongs almost wholly to Grattan; it was the grand act of his life. Indeed, his fame may be said to subsist exclusively upon that single measure; for, although his struggles for Irish freedom and independence were continuous and consistent, entitling his memory to be held sacred for ever in the regards of his country, the free trade was the most important, prominent, and memorable of all the triumphs he gained over the administration of the day, — the question that occupies the largest space in the records of the Irish parliament.

The history of that great national measure is given at considerable length in the volumes containing the biography by his son, together with a variety of personal details, which we believe are now submitted to the public for the first time. The work is otherwise rich in documents of historical as well as personal interest. The correspondence of Mr. Grattan from his youth upwards, with some of the most distinguished men of the age, has

* The *Spectator*.

been collected from a variety of sources, and confers a permanent charm on the publication, developing not merely the growth of his mind, and the progress to maturity of his strong private attachments, but exhibiting a complete view of the spirit of the age, and the social institutions of Ireland. The production is, altogether, one of the most valuable and authentic illustrations of Irish history that has ever appeared.

It is to be remarked of Grattan that, from the earliest period of his studious life, he cultivated a peculiar style — terse, epigrammatic, and antithetical — by which even his speeches became ultimately more distinguished than his writings. He brought this manner to the highest state of perfection, polishing his abrupt and figurative sentences with an amount of care that seems to be almost inconsistent with the vigour and elevation of his intellect. The use of the antithesis, in public speaking, striking effectively upon the ear, and rendering the sense more perspicuous and impressive by the force of contrast, must be occasionally admitted as an artful expedient; but frequent recurrence to it is monotonous and unendurable. This was the prevailing fault of Grattan's speeches: they were not only highly electrical in particular passages, but were charged with electricity throughout, and came upon the audience like a rapid succession of minute explosions. Very often, too, these explosions went off in smoke. Such a panegyric, for example, as that a certain person had exhibited "seriousness without austerity, earnestness without extravagance, good sense without the trickeries of art, good language without the trappiness of rhetoric *," &c. really means nothing. It startles the ear, perhaps, to be smitten by the sound of something without another thing, each seeming, from the juxtaposition in which both are placed, to be necessary to the other; but the fact that this something does exist without the other thing shows that the other thing is not at all essential to its existence, and that, therefore, its existence without it is no more a matter of wonder than if we were to say, that such a man was "profound without whiskers — ambitious without being fat — and melancholy without a white waistcoat." Such petty artifices were beneath the genius of Grattan; yet he appears to have bestowed as much pains upon these verbal points as if they actually involved the most grave considerations. His letters are full of little starry passages about indifferent matters, which betray the sense of importance he attached to mere forms of expression. Thus in a letter from the country, he says, "I know nothing of the town at present: when I write to you, I write the language of my heart, *not the style of a newspaper.*" Nothing but the sheer bigotry of his devotion to the antithesis could seduce him into so preposterous a sentence. Again, he says, he is "tired of Dublin, with all its hospitality, *and all its claret;*" in another place, that he "lodges in the house of an old seaman, whose wife has all the arrogance of a gentlewoman, and all the coarse vulgarity of a dame;" that his friend Mr. Macauley married a Miss Murphy, "of a Jamaica extraction as well as of an estate;" and he complains, in another confidential epistle, that, on one occasion, he was for three days "left to the headach and himself." In an inferior man trifles like these would be unworthy of a moment's reflection; but in such a man as Grattan they present a curious subject for rumination. One can hardly understand how he bowed down his intellect to the production of such filigree sentences, which at best exhibit no higher degree of ingenuity than the exploit of cutting out a watchpaper, or writing the Lord's Prayer in the size of a sixpence.

* These lines are not Grattan's; they are from Dr. Parr's celebrated Spital Sermon. But all specimens of any given set of qualities without another set of qualities are precisely the same.

COLONISATION OF NEW ZEALAND.

New Zealand in 1839; *or Four Letters to the Rt. Hon. Earl Durham, Governor of the New Zealand Land Company, &c., on the Colonization of that Island, and on the Present Condition and Prospects of its Native Inhabitants.* By JOHN DUNMORE LANG, D.D. London: Smith, Elder, & Co. 1839.

Extracts from the Papers and Proceedings of the Aborigines' Protection Society. Nos. 1 and 2. May, June. London: William Ball; Arnold & Co. 1839.

LYING in the Southern Pacific, between the thirty-fourth and forty-eighth parallels of S. latitude, and 166th and 180th degrees of E. longitude, there is an island, or, more correctly, there are two islands, separated by a strait four or five leagues broad, upon which nature has bestowed a delicious climate, a fertile soil, and such bounteous resources of the earth and waters as indicate almost inexhaustible means of prosperity and happiness. This island, or double island, was discovered in 1642 by a Dutchman, Captain Abel Jansen Tasman, who was appointed to the command of an expedition for determining the extent of the continent then called Terra Australis, supposed by some people to stretch to the pole. Tasman had not been many days upon his course, after leaving the Mauritius, when he discovered a great quantity of duckweed floating on the sea, which raised his expectations of shortly making land; and, in order to encourage the zeal of his crew, he declared that whoever should first descry a ridge of land, or even a break of shoals, should receive as a reward three reals and a pot of arrack. A month elapsed, however, before the reward was earned, the weeds still fast accumulating upon the path of the ships. At last high mountains were seen; and as the adventurers approached they discerned a variety of trees scattered over the surface, but planted so thinly as to offer no obstruction to a view of the country. Some of Tasman's followers went ashore, but were disappointed to find no inhabitants in this strange region, although there were evident traces of human beings in some ingenious steps cut in the trees, to assist the ascent of people in search of birds' nests. They had no sooner returned on board, however, than they saw the clear outlines of living men moving rapidly between the trees, and the smoke of watch-fires, or encampments, wreathing up from the distant woods. The curiosity of Tasman was strongly excited by these circumstances, and he prosecuted his voyage until he cleared the southernmost point of the land, setting at rest the tradition that it extended to the pole. Soon afterwards he steered to the east, and lost sight of this newly-discovered but unexplored land, which, in honour of the governor-general who had prepared the expedition, he called Van Dieman's Land — the name by which it continues to be known.

Nine days afterwards — on the 14th of December, 1642 — land was again discerned in the direction of the east. The clouds hung so low as to bury the heads of the mountains, which were invisible to the navigators when they had even arrived so close that they could distinctly hear the breaking of the waves against the shore. Towards evening they came to anchor in a tranquil sheltered bay. Throughout the day they could not discover any movements of life on the land, which appeared to be barren and uninhabited; but the sun had no sooner set than a display of lights, hurrying to and fro, inspired the whole scene with sudden animation; and four vessels, crowded with islanders, blowing an instrument that resembled

a Moorish trumpet, and calling to the strangers in coarse vigorous tones, put out to the ships. The Dutch returned the salutation of trumpets, but could not comprehend the language of the natives, which was wholly unlike any vocabulary with which they had been previously acquainted. That night no further approaches towards a friendly intercourse were established, the natives returning to the shore when it became dark; but the next morning they reappeared in greater numbers: seven canoes hovered near the ships; and, observing a boat full of Dutch sailors in constant employment conveying orders from one to another, the canoes surrounded it, nearly upset it with their beaks, and assailed the crew so ferociously with clubs and paddles that they killed three of them and mortally wounded one, escaping back to land with one of the dead bodies. This incident — discovering too plainly the savage character of the islanders — determined Tasman to stand out to sea; but his vessels were scarcely under weigh when twenty-two canoes rapidly followed, and persisted in keeping close in their wake, until the Dutch, opening a brisk cannonade, compelled them to make a precipitate retreat. In commemoration of this inhospitable reception, Tasman named the bay *Moordenaare's* or Murderer's Bay, and, in honour of the States-general, called the country Staten Land.

From that period until 1770, when Captain Cook sailed through the groups of the Pacific, nothing further was ascertained concerning Staten Land, and the general impression was that it formed part of a great undefined southern continent. Captain Cook, however, circumnavigated it, and found it to consist of two large islands, divided by a strait, to which he gave his own name, changing the name of the islands from Staten Land to that by which they have ever since been known in Europe — New Zealand.

The extent of country embraced by these islands — which, although distinctly separated by the waters of the strait, are yet in such close proximity to each other as to form of necessity one common nation — considerably exceeds the entire surface of Great Britain and Ireland. The accounts of the actual length and average breadth of New Zealand vary in a very remarkable degree in different publications, especially in those which affect to favour the public with clear summaries of popular miscellaneous information, crowding an inconvenient diversity of topics into a surprisingly narrow compass — a class of books which, of all cheap ducts of knowledge going, are the last to be relied upon for correctness in the most accessible matters of fact. In one of them we find New Zealand stated to be no less than 2100 miles in length — a startling exaggeration, which the compiler appears to have duly balanced by representing Hindoostan to be 1000 miles long, and to contain one presidency, Bombay, which alone, he informs us, is 65,000 *square miles in length!* * Indeed, so profound is the ignorance which prevails concerning New Zealand, that in many of our school geographies its name is altogether omitted, except in the dwarf map of the world which sometimes accompanies such books, and where the curious explorer may perchance detect it occupying an obscure place southwards in the Pacific. This desideratum will no doubt be speedily supplied by the results of the inquiries which recent circumstances have brought to bear upon the islands, and which must ultimately lead to a complete survey of them; but in the mean time it is of the utmost importance that all the information that can be depended upon, in reference to their climate, productions, natural resources, and population, should be fully, honestly, and clearly laid before the English public.

There is a striking difference between the northern and southern islands

* Popular Statistics. London, 1835.

of New Zealand. The former is agreeably diversified by hills and valleys, richly clothed with foliage, and watered by numerous navigable rivers: the latter is mountainous and barren in the interior (although capable of being brought into extensive cultivation), but luxuriantly wooded towards the sea, almost to the water's edge. In consequence of this material difference in the immediate agricultural characteristics of the islands, the northern portion has naturally attracted the largest share of attention; and it is to that side that the rush of settlers, missionaries, and traders has hitherto been almost exclusively directed. A chain of mountains runs north and south through both islands. The finest timber grows in abundance nearly in all parts, but especially in the north; pines of five or six varieties, including the Koudi pine, which resembles the timber of the Baltic, and is considered by competent judges to be superior to it; several hard kinds of wood adapted for ships, and ferns of almost every description; all of which are found in great luxuriance, and in forests of vast extent. The soil is generally light and fertile, and, according to Dr. Lang, would be most advantageously employed, for the greater part, in pasturage. But this opinion must be taken with some reservation, and must be acted upon only in reference to the local influence of circumstances. Pasturage has been carried on with extraordinary success in New South Wales; but that seems to suggest the very strongest reason why agriculture would be likely to afford the best return to the emigrant in New Zealand, especially as the soil is so favourable for cultivation. In 1773 Captain Cook tried the experiment of planting several spots of ground with European garden seeds; and, when he returned to the island four years afterwards, he found, in many of the places where he had deposited the seed, extensive crops of onions, radishes, leeks, mustard, cabbages, and fine potatoes, nearly over-run by weeds, but considerably improved in quality by the change of soil. The country produces spontaneously wild celery and cresses, which spring out of the fissures of the rocks and are to be found in every cave; yams and cocoas are also plentifully grown; and the potatoes of New Zealand are, perhaps, the finest in the world. It is worthy of observation that, while the Irish potato is brought to such perfection in these islands, the *phormium tenax*, or New Zealand flax, is capable of being brought into higher cultivation in the bogs of Ireland than in its native soil; a fact fully established by the experiments of Sir Humphrey Davy.*

The grand productions of New Zealand are timber and flax. With these alone a large and remunerating commerce might be secured; but every species of grain, roots, and fruits, corn, maize, tobacco, olives, potatoes, some of the most delicate products of the east, and the entire vegetable kingdom of Europe, might be reared with success in the rich alluvial tracts that stretch along the banks of the rivers. Mr. Busby, the British resident, introduced the vine with complete success. The climate of the country is favourable to almost every description of garden luxury. It does not fortunately belong to that class of exquisite climates that are to be found only in Paradise or in poetry: it is more equable than the climate of England, milder in the winter, and not so hot in the summer. All travellers agree in representing it to be remarkably fine and genial, resembling Italy or the south of France, improved by the breezes from the sea; yet, notwithstanding this combination of advantages, New Zealand is said to furnish no quad-

* A company was projected in London five or six years ago for the purpose of introducing the *phormium tenax* into Ireland, thus rendering a double service to the country, by turning the waste lands to a profitable account, and producing one of the essential materials for the navy at a cheaper rate, and with a more constant supply, than it can be had now. But the company, after a few indications of life, suddenly abandoned the design, and nothing has been heard of it since.

rupeds but dogs and rats, and no game of any kind. Captain Cook, perceiving this want, introduced some European poultry into the islands, and, on a subsequent visit, was gratified by finding that they had increased, both in their wild and domestic states, with unparalleled rapidity, and to an extent that rendered their extinction extremely unlikely.

The bays and roadsteads abound with a variety of excellent fish. The shellfish is described to be of a superior quality, better flavoured, and more delicate than any found in Europe. The whale fishery on the coast is also so prolific, as to point out New Zealand as the most desirable point for establishing the head quarters of a whale fishery for the whole of the Southern Pacific.*

The aborigines of New Zealand are amongst the most interesting of the primitive races that have escaped the desolating progress of the white man. In stature they resemble the inhabitants of the Three Kings' Island, as described by Tasman, who tells us that they are very tall, and in walking take great strides. The New Zealanders are generally between six and seven feet in height, sometimes more, and rarely less, of great strength and activity, muscular and large, but unlike the people of Otaheite or the Society Islands, having no tendency to obesity. One traveller observes that, if they were properly fed, he has no doubt they would be the largest and best made men in the world.† The women are finely formed, and graceful in their persons, and both sexes mark their bodies with black stains, called *amoco*, which is similar to the process of tattooing. This fashion is general, but by no means arbitrary in its regulations, as every person tattoos himself agreeably to his taste, sometimes commemorating particular events by particular dots or incisions, until at length each individual may be identified by his own special marks.‡ The costume of the sexes does not present any very prominent points of difference. It consists chiefly of the skins of dogs, cut lengthwise in divers colours, attached to a strong matting called *pui*, and tied over the shoulders from two corners, and then girded loosely with matting round the waist. In addition to these articles, the New Zealanders exceed all other nations in the display of trinkets, shells, feathers, &c.; and they carry this love of finery to such a height, that their canoes are held to be the most picturesque vessels of any savage tribe afloat. The Roman Catholic missionaries appear to be quite aware of this frailty of the natives, and turn it zealously to account for the benefit of Christianity, by loading them with presents of pretty little brass crucifixes, and images of the Virgin Mary, which the New Zealanders exhibit to the best advantage, suspended from their ears, or glittering round their necks, amongst sharks' teeth, birds' wings, bits of coloured glass, bright stones, tin-foil, and buckles. Sometimes they decorate the collars of their dogs with these emblems of redemption.

A race with such a happy turn for embellishments may be expected to betray a little touch of poetry in their habits and customs, especially as nature has capriciously denied to them the pleasures of the hunt, and even the meaner enjoyment of birds'-nesting; accordingly we find them in possession of some usages which are not only peculiar to themselves, but which are specially calculated to provoke European curiosity. Perhaps one of

* Dr. Lang mentions an important fact, illustrative of the productiveness of the whale fishery on the New Zealand coast, namely, that, during 1838, a single mercantile house in Sydney imported from New Zealand no less than seventy-one tons of whalebone, which usually sells for 145*l.* per ton in London. As each whale yields about 500 pounds' weight of bone, there must consequently have been not fewer than 284 whales killed to produce this quantity.

† See Holman's Voyage Round the World, vol. iv.—a work of singular and peculiar interest.

‡ Polack's New Zealand.

the most singular of these is the practice of eating each other upon the slightest pretext, and of even getting up broils and feuds, hoping in the scramble to kill a few heads of human beings for their festivals. Their favourite modes of cooking are roasting and baking, which generally satisfy all their desires, as they are certainly not epicures, and the varieties of food to which they are restricted are not numerous. We do not know whether they use vegetables with their dishes of contemporary meat, but the luxury of a first course of fish is undoubtedly known to them. They are fishers of fish as well as of men — they kill birds and dogs for domestic consumption; and, instead of bread, they eat the root of a sort of fern, which they scorch over the fire, and then beat with a stick until the dry bark falls off. It is usual with them to celebrate a victory over some neighbouring chief by a great banquet; and on these occasions the amusements generally open with a war-dance, the most spirited movement in which consists of jumping as high into the air as they can; and this is followed by a sham fight, after which they sit down to eat the bodies of their vanquished enemies. In the winter of 1830, Echo, one of the most distinguished of the New Zealand chiefs, gave a feast of this description, which consisted of one hundred baskets of potatoes, cumoras, and greens, about four hundred weight of whale oil, some pieces of blubber, and several baskets of human flesh. The appearance and character of Echo may be received as a fair exemplar of the whole society. "Echo's personal appearance," says one who knew these people well, "is very prepossessing: he is tall and well made, of a graceful carriage; has the finest face I think I ever saw; and his hair, which curls gracefully over his shoulders, is ornamented with a single feather which proclaims his rank. His mind, however, is of another complexion, cowardice, cunning, cruelty, and treachery being its principal characteristics. He visits every strange vessel that arrives, for the purpose of stealing whatever he can lay his hands on, in which object he is so ably assisted, that a vessel has scarcely been an hour at anchor before she is stripped of almost every moveable article. The language of the eyes is, with much adroitness, made an auxiliary in their nefarious proceedings." *

It is worthy of remark, that the penal code of the New Zealanders includes such a minute catalogue of crimes as to lead a stranger to suppose, at first sight, that the people were the most fastidiously moral people on the face of the earth. But the severity of the laws, which visit with death a variety of minor offences that are elsewhere punished by fine, imprisonment, or expatriation, is susceptible of this solution — that the New Zealanders eat the criminals they execute. It is not very surprising that they should exact so rigorous a measure of legal responsibility, since it contributes so usefully to supply the desiderata of beef and mutton.

The houses of the islanders are irregular and poorly provided. Mats and baskets are the principal pieces of furniture, and in the formation of these articles the natives exhibit as much skill as in their cannibal legislation. Their settlements are in scattered villages, containing from 200 to 1000 persons each, recognising, but hardly governed, by the authority of a chief. The constant employment of these numerous parties is that of making war upon each other. Any one who has examined a drop of water through a powerful microscope, and watched the perpetual activity with which the work of destruction proceeds amongst its myriad inhabitants, has seen a fac-simile of the state of society in New Zealand. The natives

* Communicated to Lieut. Holman by the commander of a vessel trading amongst the natives of New Zealand. See Holman's Voyage Round the World, &c.

carry on the same sort of warfare, and for exactly the same purpose, — they fight for their dinners, and dine upon the dead bodies.

The New Zealanders are not wanting in a religious belief, adapted to these traditions of a life of wolves. They are not encumbered with temples or physical representations of the Divinity; there is no palpable idolatry in the way of their vigorous habits; there is not a single trace on tree or stone, throughout their whole territory, of any form of faith, for they refer all things to an invisible and pervading agency, the Great Spirit that speaks to them in the thunder and the winds. They believe in a God *, a Devil, and a Ghost. The particular functions of these three spiritual natures are, perhaps, not very clearly defined; but the devil and the ghost may be regarded as superstitions that have grown up in the course of time upon their original simple notion of the Eternal. Perhaps in their God they acknowledge the Creator and Preserver, and in the Devil, the minister of vengeance and retribution. As for the Ghost, it is not much to be marvelled at that some belief of that kind should exist amongst a people who feed so extensively upon their fellow-creatures.

In common with most other enlightened nations of the earth, the New Zealanders have a priesthood. The principal duties of these individuals is to frighten the weak and superstitious — a sanctified labour, which is not confined to the ecclesiastical functionaries of the Pacific Islands. They are said to have the power of charming, cursing, and prophesying, which they exercise exclusively for their own benefit. By the process of the *tabu* they can make things sacred: thus a woman, after her marriage, is tabooed and made sacred; and a man can get his house and grounds, or his fishing-tackle, or any thing else made sacred, the object of which is to justify him in taking the life of a trespasser. The priests, therefore, may be presumed to have their hands full of business, because, the greater surface covered by the *tabu*, the greater the chance of catching trespassers. While the *tabu*, applied to property, carries something of the respectable air of our insurance offices, it operates, in reality, like a man-trap or a spring-gun.

These ingenious people are as fond of dancing as of fighting, and frequently mingle both entertainments in an agreeable medley. When a marriage is about to be celebrated, it is generally preceded by a pitched battle between two candidates for the hand of the bride, greatly to the delight of the bystanders, and the especial admiration of the lady herself, who is prepared to bestow her tenderness on the victor. This amusement s considered to be quite baulked, unless both parties are severely beaten. The disappointed pride of the vanquished rival is usually soothed by a present of fishhooks, and then the entire company join in an hilarious dance, and a frantic chorus, that may be heard at a distance of some miles. One of their dances, called the *háká*, consists in a curious uniform undulatory motion of the hands and feet, which is rendered still more striking by being performed, at the same moment, by several hundred persons, with the utmost regularity. Their principal musical instrument is a flute, made of the thigh-bone of some devoured enemy, pierced with holes, and covered at one end. According to the most scientific criticisms that have reached us in reference to this instrument, it would appear that the sounds produced from it closely resemble the shrieks of a carpenter's saw, when it meets some unexpected resistance in the grain of a log.

* On one occasion, about ten years ago, they were terribly alarmed about their god, whom they call Tananana, and who was said to have been seen flying over Caffara towards Cape Egremont, at which place it is now supposed he has permanently taken up his residence. He formerly resided at North Cape.

It is rather remarkable that, while the New Zealanders are so fond of human flesh at their repasts, they should also observe great reverence for the dead. This sentiment of veneration for the departed appears, however, to be confined to their own tribes or villages, and to be exhibited with greater or lesser parade according to the rank of the deceased. In conformity with this classification of their piety, the slaves (when they are not sent to the oven) are thrown to the dogs; the poor are burned; children are put in a trough, and covered with mats, and the trough is fixed on the top of a post, about six feet high, near the tent, where it remains until its contents moulder away; but the bodies of chiefs are placed in a piece of timber hollowed to receive them, painted red, and fixed upright in the ground close to their residence, which is tabooed, and never entered again. The women of the village or clan perform periodical horrors at the tomb of the dead hero, inflicting hideous wounds on their bodies with bits of broken shell, glass, and fishes' teeth.* But the feast of the Haihunga, instituted by the various tribes to commemorate the actions of the illustrious dead, is the most elaborate of all their ceremonial offices. On these important festivals, the bones of the defunct warriors, says Mr. Polack, are scraped clean with muscle-shells, washed in a tabooed stream, and placed in the cemetery. The clergy of the district then form a procession, and, carrying forth the bones, join in an antistrophal chant, reciting the glorious actions of the departed, whose spirits are thus apotheosised. Formerly it was the custom to sacrifice a slave at this feast, which is regarded with peculiar awe by the natives; but slaves have become scarce — their services instead of their carcases having risen to a premium — and the New Zealanders, priests as well as laity, much to their mortification, are obliged to put up with pork.

Such are the people of New Zealand — such the land they inhabit — such their occupations, amusements, and characteristics. That such a race should have been permitted to keep possession of two islands so tempting to the cupidity of Europeans — that they should have escaped the common doom of the red man — and that *civilisation* should not have *extirpated* them long since, may possibly be attributed to the ferocity with which they have treated many parties who have from time to time attempted to establish a trade amongst them; to the desperate warfare they wage amongst themselves; and to their general reputation as cannibals, which is certainly not calculated to fascinate strange adventurers to their shores. But, although no regular movement, extensive in scope and design, has been directed towards the colonisation of New Zealand by any of the countries of Europe, a vast deal of bit-by-bit emigration has gradually taken place, and drawn by degrees a considerable European population to the islands, especially to the more favoured tract to the north of Cook's strait. This population, as might be expected, is not of the class likely to benefit the aborigines, consisting of missionaries, who have availed themselves of the opportunities thus opened to them to acquire property at the expense of the natives, and the neglect of the solemn responsibility confided to their hands †; land-jobbers and adventurers, who take advantage of the fantastic attachment of the people for articles of European manufacture, and who, in some instances, have purchased large tracts of land for an old musket and an iron pot; and

* See Holman's Voyage, &c. The same writer observes that these women frequently exchange their children, and nurse those which they adopt with great care. He also tells us, on the authority of the captain already referred to, that they frequently suckle puppies and young seals!

† From this censure Dr. Lang excepts the Wesleyan Mission, the members of which are strictly prohibited by the fundamental laws and constitution of their society from acquiring property of any kind, whether in land or stock, at the missionary stations.

a numerous herd of runaway or discharged convicts from New South Wales and Van Dieman's Land,—the scum and refuse of the worst portions of our home population. Of course there are and must be individual exceptions; but, as no settled system of emigration and colonisation has hitherto been acted upon in reference to New Zealand, nobody can be surprised to learn that the component elements of the European stock, thus attempted to be grafted upon the islands, should be of so deleterious and demoralising a character.

In consequence of all these circumstances combined — the internal feuds and cruel practices of the natives — the introduction of the vices of Sydney and Hobart town — and the close neighbourhood of the penal settlements that poured in their tide of depravity, disease, and death into the healthy region, New Zealand was fairly an unclaimed spot of earth — a waif of the waters, possessing no rights or government of its own, and being literally exposed to the first speculator who had courage enough to seize upon it. In this state of things miles of estates were bought up from the gulled aborigines for a few buttons or blankets; and one daring adventurer, taking the title of the Baron de Thierry, actually tried the experiment of assuming the sovereignty of the whole country. It was not until these proceedings became matter of general notoriety that the attention of the English public was directed to the subject. The inquiry that ensued ultimately resolved itself into the question, whether the British government ought to take possession of New Zealand? But while the government, with that drowsy procrastination which has for so long a period somniferously distinguished its colonial administration, was revolving this knotty point in its lethargic mind, a company of capitalists stepped in, and buying up a large surface of land, at a small rate of purchase-money, from the natives, have, in an incredibly short space of time, succeeded in disposing of it at a handsome profit to a considerable body of emigrants from this country, who are announced to take their departure for the El Dorado of the Southern Pacific on the 15th of the present month.

We assume at once that it is sheer waste of time to argue the right of our government to take possession of New Zealand. We possess the same description of right to take possession of New Zealand as that which we acted upon in taking possession of Van Dieman's Land, New South Wales, the West Indies the Canadas, and Hindostan; and, perhaps, our title is rendered a little clearer and more conclusive by the fact that, although we did not discover New Zealand, (for the honour of the discovery cannot be taken from Tasman,) we were the first to explore and circumnavigate it. But the right which most countries have hitherto stood upon is not so simple and definite as the priority of their telescopes or their charts — it is obviously the right of the strong hand; and, reluctant as we may be to acknowledge so disagreeable a truth, this is the kind of right by which we have secured and held the great majority of our dependencies. In the case of New Zealand, it would be a very ridiculous piece of international etiquette which would make our government hesitate about appropriating a remote island for the national advantage, while they suffer a company of gentlemen to appropriate it for themselves. The real question is not as to the right of the government to colonise New Zealand — a right which cannot be called into dispute except by the New Zealanders themselves — but as to the policy of adopting such a step, and the manner in which it ought to be carried into effect. This latter consideration is, in our opinion, of immeasurably greater importance to the true interests of humanity, christianity, and the stability of the British empire, than any other point involved in the investigation.

It will be in the memory of the reader that a bill was introduced last session into parliament for the establishment of a British colony in New Zealand, and that it was thrown out on several grounds, amongst the rest, because it was feared that the formation of a chartered company for such a purpose would probably lead to the extermination — certainly to the oppression — of the aborigines; and to judge by our past exploits in the way of colonisation, there is no doubt that this fear was well grounded. But since that time the New Zealand Land Company has been formed without troubling parliament, has purchased an extensive line of territory, marked out the boundaries of its first colony — its first town — its land and river course — and planned its entire field operations; and government, pressed for a decision as to their *intentions*, have dimly intimated the probability of their interposition at some future period to take the colony under their protection. But in the mean time what guarantee do we possess that the New Zealand Land Company may not produce the same calamities amongst the unfortunate natives that have been almost invariably produced wherever we have penetrated in the name of colonisation? And what guarantee do the emigrants possess that the lands they are to derive under the company shall be secured to them? The title of the company must be first established before the company can confer a title upon others.

The abuses that have been committed in the early settlements of all European colonies are familiar to every reader. At this age of the world, when knowledge has gone forth amongst men, enlightening and humanising the earth, and when the peaceful triumphs of the pen have superseded the bloody victories of the sword, the time has surely arrived when the white races ought to address the black for higher and nobler purposes than that of cheating them out of their inheritance, hunting them to the frontiers and confines of their possessions, slaughtering them to make way for the increasing numbers of their own body, and committing in detail the grossest and most revolting criminalities, to clear the scene for the extension of their own unholy traffic.* In the formation of new colonies, after all the experience we have had, it ought to form a preliminary condition that the rights of the aborigines be held sacred, and that, in all purchases of land and adjustment of locations, the interests and security of the aborigines should be strictly respected. We do not entertain any romantic notions about the primitiveness of the New Zealanders. We know that they will sell a hundred acres of arable land for a tin kettle or a ramrod, and that they will make what they suppose to be a good bargain, and cheat if they can. We know that they are ignorant, cunning, and cruel; but we say that we — educated, humane, and powerful — ought not to oppose fraud and force to the childish chicanery of the untaught savages; and that we are bound, by the spirit of our religion, by the genius of our national institutions, and by the honour of the national name, to civilise and shelter them from injury, instead of practising on their credulity and crushing them under our ploughshares. What we complain of in this instance is that her Majesty's government has permitted the New Zealand Land Company to be formed; to purchase land from speculators who originally purchased it for trumpery trinkets from the natives: to sell it out at a profit, and make preparations for an extensive settlement, without obliging the company to enter into a

* Some of the atrocities committed by white men are incredible. Dr. Lang mentions the case of a convict bushranger in Van Diemen's Land, who was hanged a few years ago for crimes against the European inhabitants of the country, and who confessed, when under sentence of death, that he had actually been in the habit of shooting the black natives *to feed his dogs!* This is appalling; but there are worse cases on record, to which we might easily refer, if we thought the subject really required further illustration.

solemn compact, in the first instance, to protect the miserable natives from inroads and oppression in the progress and issue of their proceedings. For all her Majesty's government seem to know — or, perhaps, to care — about the matter, the aborigines of New Zealand may be driven, before many years shall have elapsed, from their rich alluvial plains and irrigated valleys into the barren mountains of the southern island, where there is neither game nor vegetation, and where they must expire of famine, or, contrary even to the instinct of cannibals, feed upon their own tribes. This result is by no means unlikely — yet government has taken no precaution to avert such a catastrophe.

An admirable institution has been called into existence in this country by the desire to prevent, for the future, such scenes of inhumanity and violence: we allude to the British and Foreign Aborigines' Protection Society. It has not yet acquired sufficient maturity to enable it to create the requisite machinery of protection contemplated in the principle of christian justice upon which it is based; but it already forms the natural centre of all such operations: and to that institution we look for an energetic appeal on behalf of the aborigines of New Zealand. The subject has occupied the serious consideration of the society; and we find amongst its transactions (referred to at the head of this paper) a document of great interest, which may be recommended to the perusal of every person concerned in the affairs of the new colony. We allude to a letter from Dr. Hodgkin, one of the most distinguished members of the Aborigines' Society, to Mr. Hawes, in which the thoughtful and benevolent writer points out several objections to the plan of the company, and suggests a mode of proceeding by which all the objections might be obviated, and the colony planted in happiness and security. Dr. Hodgkin allows that the first proposition of purchasing land, or obtaining it otherwise by amicable means, is just and honourable; but he points out the difficulty of amalgamating widely different races, and the dangerous jealousies that are likely to be generated in the attempt. The suggestion of forming a colony complete in this country, and then transplanting it to New Zealand, like a full-grown tree, with its own soil about its roots, he considers liable to two objections: — 1st, That it would have the effect of rendering the colonists independent of the natives, and thus preventing the cultivation of social intercourse between them; 2d, That the prosperity of the undertaking would lead to the rapid extension of colonial enterprise in the same direction, to the common injury both of the natives and the first settlers. Alluding to the well-known aptitude of the New Zealanders in the imitation of European arts, Dr. Hodgkin thinks (very wisely in our opinion) that the acuteness of this uncivilised race, instead of affording a hope that they will readily submit to the government of the company, suggests rather the apprehension that they will resist all improvements as innovations and revolutions; and that their chiefs, so far from quietly surrendering their authority for a compensation, will exercise it with all the power they possess in defence of their ancient rights and privileges. In the whole of this temperate and philosophical view of the question we cordially agree; and we submit the proposition that follows to the grave consideration of every person who has contemplated emigration to the Pacific. Perhaps it is not yet too late to reap some practical advantages from this valuable suggestion: —

"To prevent such results attending your well-intentioned efforts, I would suggest that you should rather attempt to found a commercial metropolis for the natives of New Zealand than seek to colonise the country, and open the door for emigration from this and other civilised countries. *Let emigration be encouraged to those regions which are either*

wholly without inhabitants or very thinly peopled, but not to a country like New Zealand, which is already tolerably well peopled by a race possessing strong mental and bodily powers. I would ask whether every really desirable purpose which you have at heart might be more easily, speedily, and economically effected by founding a well-placed city, having a certain limited territory belonging to it. With this little territory, the various petty states into which the country may now be divided by its native possessors and rulers might, by skilful management and address, be induced to form such a league or confederation as would not only secure your safety, but maintain peace and tranquillity amongst the neighbouring chiefs, whose hostility to each other has been exhibited in warlike expeditions, which their acquaintance with European arts have made more frequent and bloody. The peace which you will thus promote would favour the introduction and cultivation of all the arts necessary for the production of those commodities which it is your object to import from your settlement."

We have marked one sentence in italics for the special benefit of emigrants, who ought to be instructed to draw a sensible distinction in their calculations of future success between a land thinly populated or wholly uninhabited, and a country already possessing a population, hardy, powerful, and vigilant. But, reserving this point for a moment, let us follow out Dr. Hodgkin's proposal. From the establishment of this commercial metropolis, he derives, as irresistible corollaries, the increasing popularity and influence of its founders; the gradual introduction of all the reforms which christian philanthropy demands; the power of preventing injurious speculations in the form of other settlements; the adaptation of native industry to the labours of the dockyards, the plantations, and the manufactories; and, finally, the institution of schools and courts of justice, the protection of the missionaries in the discharge of their duties, and (which is still more necessary and important) the salutary correction of those disgraceful practices by which they have brought so much dishonour upon their high profession. Throughout all these suggestions, it will be perceived that Dr. Hodgkin bears in view that strict respect for the rights of the aborigines which can alone insure security to the proceedings of the colonists; and that his entire plan is gradual in its operations, comprehensive in its scope, eminently practical in its development, and, above all, just and philanthropical. He begins by addressing the agency of civilisation to the actual wants of the aborigines, and appealing to their intelligence and their sympathies through the most direct and accessible channels. The work of a more expanded illumination, the diffusion of all the blessings of peace, order, and religion, the establishment in full activity of the humanising and useful arts, and the ultimate reception of these benighted and neglected islanders into the one great christian family — these great and glorious results are the natural and inevitable issues of his benevolent and judicious plan. While we accord to these principles our hearty concurrence, we cannot sufficiently condemn the impracticable theories that have been launched by other writers, for the attainment of the ends of colonisation amongst savage populations. We hold it to be purely visionary to attempt the absorption and reduction of such races through the single experiment of preaching in the first instance, postponing secular affairs to a subsequent period; and we are surprised to find Dr. Lang advocating a system which has never yet been known to succeed, and which his own experience might have shown him to be in the last degree hazardous and ineffective. Speaking of the missions in New Zealand, that gentleman observes,

"Reversing the apostolic plan, the missionary carpenter, the missionary boat-builder, the missionary blacksmith, the missionary ploughman, the missionary rope-spinner, &c., were all set to work at their various occupations, and the natives were expected forthwith to imitate their example. In fact, the mission settlement in New Zealand was for a long time a complete lumber-yard; a factory, in which all sorts of labour were going on but the proper labour of a missionary, — the very clergyman, for there was only one on the island,

being in no respect different from a common agricultural labourer, except that he mounted a pulpit and read prayers in a surplice every Sunday."

The failure of the New Zealand mission must be ascribed to other causes than that of the attention devoted to the cultivation of native industry; and Dr. Lang himself attributes it elsewhere to the cupidity of the missionaries, who appear to have consulted in all cases their own personal aggrandisement, at the expense of the people they were paid for teaching. How far the "apostolic plan" could be acted upon at this advanced age of the world, in such a place as New Zealand, may be reasonably questioned, especially the "apostolic plan" according to Dr. Lang's interpretation, which we give in his own words: —

"Indeed, as a general maxim, I would say that it is by no means particularly desirable that the New Zealanders should acquire a knowledge of European arts till they have embraced the religion of Europeans, when they will acquire them as a matter of course."

We never find a moral consequence set down as *a matter of course* that we do not instinctively doubt whether it really enters into the contemplation of him who expounds it; and in this case we believe the *matter of course* is about one of the most remote contingencies that would ever be likely to be realised. When Dr. Lang speaks of the New Zealanders embracing the religion of Europeans, he speaks wide of his own meaning, and, indeed, wide of all possibility, for in Europe there are so many religions that it would involve the poor islanders in a sad perplexity to embrace the divine chaos. Dr. Lang clearly does not mean the Roman Catholic religion, because he denounces it, as having already produced the most baneful effects in the southern hemisphere; and we can arrive at no other conclusion, after a careful examination of his *brochure*, than that he means by the religion of Europeans the special forms and doctrines of the church of Scotland, of which he is the zealous representative in New South Wales. Now this is the education question, cast as an apple of discord amongst the aborigines of New Zealand; and, to judge of the effects which its discussion has produced in educated christian England, it is hardly to be expected that it would have a very soothing influence in a heathen country. The reduction of the sacerdotal despotism of the gorgeous state church to Dr. Lang's small scale of religious tyranny is infinitely diverting. He says to the New Zealanders, "You shall be taught the arts of Europe if you embrace the church of Scotland; but unless you accept this condition you shall learn nothing." This miniature proscription is a ludicrous imitation of the Thatched House manifesto after all, considering the people to whom it is addressed and the circumstances under which it is issued. He would be more likely to succeed by the offer of a handsome cargo of glass beads and pinchbeck trinkets.

But there remains still a large field of speculation for the emigrants who are about to encounter, under the auspices of the New Zealand Land Company, the risks of an adventure of settlement, before the probabilities of the future condition and government of the islands have yet been determined upon. It is by no means certain that the contracts of the company are safe or permanent. They have purchased land from persons who are charged with having obtained it from the natives by taking a civilised advantage of their simplicity; and it can hardly be anticipated that the British government, when they come to claim their right of pre-emption, will confirm any privileges of property acquired by such means. Dr. Lang, who enters very minutely into this branch of the subject, and whose observations upon it ought to be consulted by every person who proposes to join the colony, is so

strongly impressed with the necessity of revising all those purchases and grants, that he even recommends the government to assert its authority in the investigation of every individual case; so that honest men may be enabled to retain their possessions, and persons of a different description be compelled to restore to the natives, or to the government on their behalf, the land they have fraudulently acquired. For this proceeding there is already a very satisfactory precedent, to which Dr. Lang refers. A few years ago, some adventurers from Van Dieman's land discovered a splendid country on the south coast of New Holland, and negotiated for the purchase of vast tracts of land, for a mere trifle, from the natives.

"The deeds were drawn up in due form, the natives having appended their respective marks, with all the customary formalities of English law; and certain lawyers in Van Diemen's land, who, it was alleged, were concerned in the speculation, pronounced them valid. But the imperial government, insisting on his late majesty's right of pre-emption, or, in other words, of treating exclusively with the natives for their land, very properly disallowed the whole transaction, and the native deeds were consequently null and void."

Here is a case bearing strongly upon the purchases that are now taking place in New Zealand; and should the government — as they have intimated their intention — establish the British authority in that colony, we know not how they can become parties to any proved acts of corrupt dealing, or, rather, how they can refuse to render justice to the appeals of the natives, awakened to a sense of their wrongs by the contentions that must take place in such an event.

But, even if such a measure should never be adopted, it does not appear that any real advantages can be gained by the emigrant who purchases land from the company at one pound per acre, when it is notorious that he may purchase it from the natives, as Dr. Lang observes, at probably not more than five farthings an acre, payable, moreover, in British goods, on which he can realise a profit of at least fifty per cent. To the company's offer of three fourths of the purchase money to be paid back to the emigrant in the conveyance of valuable labour to the colony, Dr. Lang opposes the cogent argument that for one fourth of that amount the same quantity of labour can be imported from New South Wales and Van Dieman's Land; so that the inducements offered by the company are really no inducements at all to a capitalist. Any man who has money to expend in a venture of this description could expend it to much greater advantage by speculating on his own account.

We cannot conclude the subject in a more salutary spirit than by extracting the recommendation which Dr. Lang submits to the consideration of the gentlemen who have embarked in this project for conveying English emigrants to a distance of 10,000 miles from their native land, on a trip of experimental colonisation.

"Let the company," he observes, "make a voluntary and entire surrender of their native titles to her majesty's government, to be adjudicated upon individually by a temporary board, like the Court of Claims in New South Wales, to be appointed for the purpose by the government, at the minimum price of crown land, to be established in the island, deducting the full amount the company may have already paid for their lands, either to the natives or to individual Europeans. The usual influence of such an example would be salutary in the highest degree in New Zealand, as far as the actual European population of the island are concerned, and would strengthen the hands of the government exceedingly, at the outset of the colony, in carrying out the simple but most important principle of her majesty's right of pre-emption in all cases, as regards the aborigines."

It is essential for emigrants to bear in mind that, whether the government should hereafter assert this right or not, they are equally involved in a dilemma: in the former case, by the risk attending the confirmation of

their purchases; in the latter, by the risk of being placed in the midst of a hostile, and, as we have shown, a crafty and sanguinary population, without having the protection of any established rule or authority to support them in their difficulties. And here the suggestion thrown out by Dr. Hodgkin is entitled to attentive reflection. New Zealand is a populated country. Unlike other places that have been chosen for the labours of a settlement, it is already held by numerous and powerful tribes. To act in such a scene with success, great means, moral and physical, are absolutely necessary. Are the emigrants prepared with such means? With this question — the importance of which need not be insisted upon — we take our leave of the subject for the present.

LETTERS ON THE STATE AND PROSPECTS OF ITALY.

No. III.

In 1831 — with respect to that which represents the nation in its vitality, the people and the youth — progress, in the sense which I have indicated from the commencement of my first letter, is distinctly visible. No royal prince is now at the head of the movement.*

No necessity is now recognised to commence the insurrection by the higher ranks; it shows itself in the bowels of the country; it is effected by a national feeling; it is the work of all; it has no need of names in order to succeed. "After the three days," it is here M. Orioli, an unsuspected authority, whom I willingly cite, "the crowd at Bologna besieged the chief post-office. In the coffee-houses a kind of pulpit was erected, from which the journals were read aloud. The papal government trembled. The people kept repeating, 'When shall we ourselves give the signal for rising? to remain thus inactive is shameful.' The young men manufactured arms; they formed themselves into companies: they chose their captains. There were in the city only a thousand soldiers, and almost all were very indisposed to fight against the people: the secret societies were henceforth useless." Subsequently, indeed, the two commanders of the troop declared before the prolegate of the pope that they would not have ordered their men to fire on the people: thus the youth, the soldiers, the people *en masse* were for the insurrection; and that which we here state of Bologna holds true of all the states of Central Italy. None refused to answer to the summons as soon as the summons was heard. It was a splendid sight, was this insurrectional

* The singular idea, to call it nothing more, of placing the Duke of Modena at the head of the Italian movement, had, it is true, been entertained before 1830, in the conspiracy hatched at Modena; but it was a secret between the chiefs and the duke; the youth who under them laboured in the cause knew nothing of it. Suggested, for an unknown object, by a person who still lives, and who has not thought proper to explain his intentions, in spite of the just requisitions of his countrymen, it was accepted as a sort of guarantee given to the revolution, by Menotti, a young man of a noble and generous nature, full of activity and devotion, but whose political capacity, perhaps, was not equal to the grandeur of the cause he had undertaken, and who did not foresee the false and almost untenable position in which he placed himself. After 1830 the idea was abandoned. For this the duke avenged himself by the death of Menotti. His large fortune was confiscated, and his house was plundered. His aged parents, and all his family — models of suffering virtue and of resignation — are exiles at Paris.

movement spreading from place to place like a train of powder — like the cross of fire which your ancestors carried from village to village. The signal was given in the night of the 2d of February, at Modena, from the house of Menotti. The thirty-one young conspirators, surprised by the soldiers of the duke, and summoned to surrender, answered by vollies of balls, and withstood, during a great part of the night, the onset of the numerous troops who surrounded the house. Cannon was brought and levelled against this extemporaneous fortress of new-born liberty; and it was the sound of this cannon which raised Bologna. She rose in the night of the 4th. When the next sun set, Imola, Faenza, Forli, Cesena, Ravenna, the whole of the Romagna, effected their movement. Modena, recovered from the stupor into which the unexpected affair of the 3d had thrown her, had already forced the duke to fly, on the night of the 5th, towards Mantua, dragging with him his victim Menotti, who was wounded and destined to destruction. On the 7th, it was the town of Ferrara; she rose under the eyes of the Austrian garrison, which withdrew from the city. On the 8th, Pesaro, Fossombrone, Fano, and Urbino drove out their governors. On the 13th, the insurrection triumphed at Parma. Subsequently, Macerata, Camerino, Ascoli, Perugia, Terni, Narni, and a host of other cities emancipated themselves. Ancona, where at first Colonel Sutterman made preparations for defending himself, was compelled to yield to some companies of soldiers, and of the national guards, commanded by General Sercognani. All this, as we have said, was done by the people, from an impulse which had no need of known chiefs, with an enthusiasm which it would be difficult to describe. The women and the aged all joined hand in the holy cause. It was the women who made the cockades and the flags. There were veterans of the Italian army, who seeing a certain mistrust evident amongst the youth, showed them their ancient wounds, and said to them, "We have received these only in the defence of our country." By the 24th or 25th of February, the Italian cause had been embraced by 2,310,913 inhabitants, who, free and emancipated, were ready to use every effort to aid their brethren to follow them in their career.

I have said the *Italian* cause, and I beg the reader to note this; for here, in fact, we have the refutation of the fears of which I have already spoken; here we have the vital law of the movement, and the condemnation of the provisional governments which were not able to comprehend it, or did not dare to follow it.

The standard which was raised was the *Italian* standard. The cockade which was worn, and which M. Orioli demanded should be laid aside on the first day of the Bolognese insurrection, was national. "Italy," was the general cry. From the first day, the youth of Bologna sought to invade Tuscany; those of Modena and Reggio to deliver Massa. Subsequently, the national guards, commanded by Zucchi, asked to be led by way of Furlo into the kingdom of Naples. In these first days of confidence and spontaneous action, every youthful patriot would have been astonished by the question, whether it was for the emancipation of the central provinces of Italy, or for the whole of Italy, that he had risen.

Hence may be deduced the duties of the men who came after the movement had been effected, and made themselves its chiefs and directors.

In every revolution, I conceive that the men to whom the prosperity or misfortunes of their country are matters of indifference, hold themselves aloof. I conceive — without justifying them whenever the revolution is the expression of the national will — that those who cherish in their hearts opposite convictions, will oppose the movement frankly and honourably; but

I cannot understand those who place themselves at the head of the revolution itself, and who act in a sense diametrically opposed to its first aspiration. If the name of traitor is anywhere applicable, it is, I think, in such a case as this.

When a people rises, the men who come to put themselves at its head, accept implicitly the idea for which, and by which, that people has risen. There is concluded between them and the mass, of which no one forced them to take the lead, a tacit, bilateral contract, in which the people says to them, "I have risen for this; this is what I will: I have courage and hands; you have heads and science: show us the way in which we can obtain our object:" and in which they answer, "Good; we will show you it: follow us, and support us." It is a solemn, sacred contract, — the most sacred with which I am acquainted, — in which actions take the place of provisions, and in which the salvation of the people is at the end of each act. If this is not so, I no longer know what political morality is; for then all deception is justifiable, and all treason legitimate.

And if this contract is violated — if the direction taken by the chiefs is in direct opposition to that which the nature and real object of the revolution enjoined to be followed — the revolution will fail: it will perish like a plant suddenly transported to a foreign soil and climate — like every thing which is attempted to be developed in a manner contrary to the law of its being; and in this case, ought the plant or the being to be accused, or not rather the imprudent hand which has perverted its growth?

Now let us examine from this point of view that which the provisional governments did which placed themselves at the head of the movement.

The movement, in its origin and object, was Italian; — they changed it to a provincial one. Its natural law tended to enlarge its basis as much as possible: they narrowed it as much as possible; they treated propagandism as criminal: they laboured to erect obstacles to the revolution, instead of seeking to overthrow those which existed. Nationality was the soul of the enterprise: they belied it, and sought their main support for the insurrection abroad. War with the Austrian was inevitable; it was necessary, therefore, to prepare for victory; but they laid it down as a principle, that the success of the revolution depended on the maintenance of peace; that this peace was not only possible but probable, and almost certain; and that consequently, all demonstrations, all organisation tending to disturb it ought to be proscribed. The revolution tended necessarily, from the nature of its elements, to terminate in a republic, to which the foreign governments could not be expected to be favourable; its allies then ought to have been sought amongst homogeneous elements in the people: now the sole pledge of alliance between nations is a proclamation of principles; and they made none whatever: they calculated on the aid of kings: they forced a popular movement to kneel before diplomacy. Activity was necessary to excite a spirit of action, energy to inspire energy, and faith to create faith. They were weak, undecided; and all their actions betrayed fear: hence the natural consequences, — distrust at home, discouragement and inaction in the other states of Italy, diplomatic deceptions, and the ruin of the revolution. Subjected altogether to the principle proclaimed abroad of non-intervention, it necessarily fell with this.

The principle of non-intervention had been, it is true, so explicitly, so solemnly proclaimed by the French government, that it could legitimately be supposed to have weight in the calculations of all those who were called to direct a revolution: already, considerably before the movement, a memoir drawn up by some influential Italians had been transmitted to the French ambas-

sador at Naples, M. Latour-Maubourg, which put to him the question, what France would do in case the Austrians should attempt to suppress a revolution which might break out in Italy. The ambassador wrote at the end of it a few lines, signed with his name, which "pledged France to support Bologna, under the conditions alone, that the government to be hereafter established should not assume an anarchical form, and that it should recognise the principles which had been declared in the face of Europe." This memoir, with the note, was handed about at Bologna during the first days of the revolution; and it was submitted to the provisional government, according to the evidence of M. Orioli. I know that M. Latour-Maubourg afterwards denied the fact; but I believe that there are sufficient reasons for asserting it to be true. This document, however, is of little importance, for the parliamentary debates are sufficiently decisive on the subject: "France," said M. Lafitte, president of the council in the Chamber of Deputies, Dec. 1. 1830—"France will not allow the principle of non-intervention to be violated; but she will labour also to prevent the peace from being compromised, if it can possibly be preserved; and if war becomes inevitable, it must be proved that we have had no choice between it and the abandonment of our principles. The holy alliance had for its object to stifle, by common efforts, the liberty of the people wherever its standard might be raised: the new principle proclaimed by France is that of allowing liberty to have free course, wherever it may naturally rise." Subsequently, the principle had been twenty times repeated and explained before the Chamber of Deputies. On the 15th of January we have M. Guizot exclaiming, "The principle of non-intervention is identical with the principle of the liberty of the people." Jan. 22, the minister for foreign affairs declared that "the holy alliance was based on the principle of intervention, which was destructive of the independence of all secondary states: the contrary principle which we have consecrated, and which we shall cause to be respected, ensures the independence and the liberty of all." On the 28th, the same was asserted by the Duke of Dalmatia. On the 29th we have it from the lips of M. Sebastiani. This was certainly sufficient to give the chiefs of foreign revolutions the right of taking into consideration, amongst the chances in their favour, the consequences of this principle.*

But other calculations ought to have been taken into account. It ought to have been foreseen by men of the least discernment and common sense in political affairs, that in 1831 a war between France and Austria must inevitably terminate in a general struggle, in a European contest between

* The treason of the French government was complete. For, let me detail it here, in order that I may not have to return to the subject: at the same time with these parliamentary proclamations, other proceedings were on foot which were still more abominable, because they affected individuals, and were the cause of particular measures. France played the part of a provocative agent towards the Italian, as well as towards the Spanish, patriots. "Did not Louis Philippe," says M. Cabet, a French deputy, in his work on the revolution of 1830, "transmit to the King of Naples a plan of a constitution drawn up by General Pepe? Did not he encourage the idea of a marriage between one of his daughters and the Duke of Modena, when the latter should have become King of Italy? Had not he several conferences on this subject with the brave Felix Lepelletier?" I have nothing to say with respect to these questions, but I can testify, as an ocular witness, the conniving tolerance of the French government in February, with regard to the preparations made by the Italian exiles at Lyons for marching on Savoy, and seconding the movement of Central Italy. These preparations were publicly made. The point of union for the association was the Café of the Phœnix. Arms were publicly bought and collected; volunteers were enrolled, who appeared in uniform. The Committee of Direction was in communication with the prefect of Lyon, and with the government. It was only a few hours before the departure of the force that a proclamation from the provincial authorities denounced the exiles as inciters of revolt and breakers of the peace. The force set out, nevertheless, but was followed by a body of cavalry, which surrounded and dispersed it. A great number of the exiles were arrested; all were driven back.

the two principles of the *status quo*, and of progress by national sovereignties. Now, in such a war, if France had every thing to gain, Louis Philippe had every thing to lose. The movement would have now overwhelmed him. The revolutionary impulse which, in order to succeed, it would have been necessary to give to France, would have overthrown the new royalty in the whirlpool of a war, which from the nature of its elements would have been converted into a sort of republican crusade; for the royalty in question was feeble, without root or sympathy in the nation. The sole, the grand guarantee of existence for Louis Philippe was then, as it still is, peace: here is the secret of his power and of his party. Hence, the only means of forcing him to overcome his repugnance, and in descending into the arena to keep the engagement which he had contracted with the nation, was that of organizing resistance, so as to be able to prolong the struggle for a long time; of generalizing it as much as possible, in endeavouring to facilitate the movement in those countries of Italy in which it had most obstacles to encounter; to take care that, above all, it should be effected in Piedmont, for the footing of the Austrian in Piedmont, as of the Prussian in Belgium, is irreconcileable with the dynastic interest and political tradition of France. But it was altogether a mistake to believe that Louis Philippe would hasten to rush into a war, when those whose ally he was expected to be showed themselves so feeble: it was stupid to see in the principle of non-intervention an obstacle to the Austrian invasion. Austria must have invaded, even at the hazard of a war with France: for the preservation of her Lombardo-Venetian possessions she is compelled to intervene against every Italian movement in whatever state it may take place. Hence, not to prepare for the struggle, was to furnish to Austria the means of destroying the subject of litigation, without giving any time for remonstrance. Louis Philippe understood so well the value of time at this conjuncture that, hoping to see the insurrection suppressed before there should be time to demand of him the fulfilment of his promises, he concealed for five days from M. Lafitte, president of the council — the only man, perhaps, who acted with good faith in this affair — the despatch of the French ambassador at Vienna, announcing the invasion by the Austrians of Central Italy.

Nevertheless, the provisional governments of the insurgent provinces acted on the hypothesis that Austria would not invade — that she would allow the revolution to establish itself in the heart of Italy; and that the only thing to be done was to furnish no legitimate motive for invasion. They thought of nothing else. Amongst all their acts there is not a single one which proclaims the national sovereignty; not one which summons the people to arm; not one which organizes the principle of election; not one which was calculated to encourage the other Italian states, and to make them believe that the hour of liberation was come. Fear was betrayed by their earliest measures. The revolution was rather accepted and tolerated than proclaimed: it would seem as if excuses were sought for it. The provisional governments of Parma and Modena declare, that the princes having abandoned their states, without leaving a government, the people is reduced to the necessity of forming one itself. That of Bologna declares itself installed, because "the act of declaration of Monsignore Clarelli, prolegate, announces the definitive intention to abandon completely the political administration of the province, and considering that a country cannot remain without some government, to preserve it from the evils of anarchy."* Shortly afterwards when the revolution, strengthened and extended, compelled it to adopt a bolder style, it is not still by virtue of the

* February 5. 1831.

imprescriptible right of every people to be free, that it proclaims the liberty of Bologna: it is to tradition that it appeals — to local tradition, — to the rights resulting from the convention passed in 1447, between Bologna and Pope Nicholas V. "In demanding liberty," it says in its declaration of February 11. 1831, "Bologna has done no more than reconquer that which for some time it had virtually lost," &c.; and its president, John Vicini, undertakes to expound historically this phrase in an address to his fellow-citizens, of the 25th of February, which is the diffuse, pedantic, and mean-spirited production of a jurist.*

At Parma, a certain M. Fedeli, elected general of the national guard, refused to accept the appointment, unless under the approval of the duchess, who was about to leave the city; this the government allowed him to request. A few days afterwards he entered into a conspiracy to effect a counter-revolution; and it was left to the youth of the city to disarm the soldiers whom he had gained over to this enterprise. The same government, although its finances were exhausted, ordered that all the *employés* of the court which had been expelled, should be paid from the public treasure. There was so little sense of Italian revolutionary right in these provisional governments, that one of them, in recalling home some citizens banished in the cause of liberty, entitled this decree an amnesty.

The news of the rise of Central Italy had spread rapidly to the extremities of the country, and had produced in all quarters a secret fermentation, which threatened sooner or later to break out into action. Nevertheless, there was scarcely any knowledge of men or things, or of the moral state of the people throughout the Peninsula. The governments used every effort to prevent communication. Wanting such data to go upon, and persuaded besides that the men composing the provisional governments ought to furnish the most energetic expression of the revolutionary ideas, those who were engaged at Naples, in Piedmont, or elsewhere, in preparing the public mind to follow the movement, waited for an act or a command from the centre of affairs, which might inform them what they ought to do, and point out the moment which they ought to seize. In a revolution, it is always from the initiatory point, — from that which is regarded as the focus of the insurrectional project, that men look for inspiration. In the mean time the decree of the 11th of February came to damp all ardour in the cause. By this decree, "Bologna hastened to notify to the European powers that she did not seek to interrupt the ancient relations of friendship with other countries, and that she would never permit the violation of their territories under any pretext. She hoped, in return, that no foreign state would take upon itself to interfere in domestic differences, which regarded her alone. Her tri-coloured flag would not be unfolded on the field of battle, except

* As the whole direction of the movement came to be concentrated in the Bolognese government, I think it may be advisable to give here the names of the members. From the fourth of February these were: the Marquis Francis Bevilacqua, the Count Charles Pepoli, the Count Alexander Agucchi, the Count Cæsar Bianchetti, Professor Francis Orioli, the Advocate John Vicini, the Professor Anthony Silvani, and the Advocate Anthony Zanolini. But at the end of the revolution, at the epoch of the capitulation, the government of the United Provinces, in consequence of some modifications which had been effected in the interval, was organised in the following manner: Vicini was president of the council of ministers, Silvani was minister of justice, Count Ludovico Sturani of finance, Count Terence Mammiani della Rovere of the interior, Orioli was minister of public instruction, Doctor Pio Sarti of police, General Armandi of war, Bianchetti of foreign affairs. Zanolini was member of the council. In passing a general sentence on the conduct of this government, and on the political capacity of its members, an exception can only be made in favour of Count Charles Pepoli. As he was almost always absent on different missions, it would be unjust to make him share the responsibility of the fatal errors committed by his colleagues; and the more so, because I believe that he alone instinctively recognised the true situation of affairs, and his subsequent conduct proves that his ideas are those of the young generation, and do not belong to the old routine, by which his colleagues were regulated.

when she was called on to defend her own territories." By this decree the centre renounced all initiative; it separated entirely its cause from the Italian cause, — country with it was Bologna — its system was peace, its hope non-intervention. It appeared to invoke repose and inaction: in no way had the states which might hereafter revolt any thing to expect from those which had preceded them; they could look for neither direct succour, nor for a diversion. The men of pure reaction, so numerous in Italy, renounced in their indignation every attempt at action; the diplomatic conspirators of the old school saw in this a great mystery, of which they thought it imprudent to hasten the *denouement*. "They are certain," they said, "of France joining them; for they are taking a direction which, unless she does, will terminate in their ruin, — let us continue to wait." And they waited.

Here we have one of the chief errors of Italy — a too implicit confidence in every thing wearing the appearance of calculation or of tactics, and too little confidence in enthusiasm, action, and simultaneousness — three things which comprise within themselves almost the whole of revolutionary tactics. We follow, await, or study events, instead of creating or dominating them. That which is in reality only meanness of conception is too often adorned with the name of prudence. Hence the vital importance which attaches itself to the first steps of those who undertake the task of initiation in Italy; it is on the degree of energy and talent which they manifest, that the general march depends. But this habit of renouncing spontaneous impulse, and awaiting inspiration from that which transpires abroad, is fatal. The discouragement which, in 1821, the deputies from the Lombard and other cities found in the chiefs at Turin, caused them to put off the movement; now it is precisely the *general* movement which calls forth the energy of *all*, and which produces men capable of directing it. This, however, rises rather from a defect of political knowledge and education than from a want of courage.

Nothing occurred to change the march of events in Central Italy. The youth demanded permission to rouse Tuscany to arms, and thus perhaps, by means of its eastern "riviera," to bring about an insurrection at Genoa; but it was refused. At Modena it was wished to form a column to march upon La Garfagnana, La Lunigiana, and on Massa, which was still in the hands of the soldiers of the duke: envoys from Genoa demanded this operation; it had also the object of opening, by the sea, a route to the exiles in France and Corsica: the government answered, "that if non-intervention was respected, liberty would sooner or later be established at Massa; but that if not, of what good could either be Massa or the sea?" From Corsica, the exiles themselves formed into a body, and having organised a certain number of Corsicans, sent to Bologna to demand some pecuniary aid, in order to fit out some ships, and also instructions respecting the disembarkment on some part of the coast: succour was refused them, and they were requested to abstain from their enterprise. So scrupulous were the authorities at Bologna, that, as M. Orioli informs, being in want of a certain number of muskets, and being compelled to borrow them from the provisional government of Modena, they took care to express, in writing, that they only received them as a simple loan, under security, and under the express obligation to return them the instant they should be required.*

* This strict and literal compliance with ordinary rules still did not save Bologna from the accusation of non-intervention. On the 15th of August, 1831, the French minister for foreign affairs said to the chamber, "On the 6th of February Bologna effected its revolution. That of Modena had taken place some time before. It is necessary to set right a point which has hitherto been ill explained. The first insurrection at Modena had not succeeded. A movement took place at

With respect to every thing which regarded the interior of the states of the Pope, matters were still worse. The sole act which can be called revolutionary, and which M. Orioli describes as tremendously energetical, is that of the 8th of February, which pronounced the abolition of the temporal authority of the Pope over Bologna and its province: this was to recognise a deed which had been accomplished, and it was a measure which could not have been omitted. This solitary exploit was the only sign which the government gave of *positive* life; all the rest was mere negation. The son of the Count de St. Leu proposed to organise a militia; but he was prevented. The fortifications of Ancona had need of repairs; they were left untouched. When General Zucchi subsequently arrived at Bologna, he commanded six regiments of infantry and two of cavalry to be formed; the project was opposed. Rome might have been taken without any great difficulty: already on the 12th, symptoms of an insurrection had been evident there; and although a first attempt, ill-organised, had been suppressed, it had still left the public mind in a state of unquiet expectation which facilitates the success of a *coup de main*. This General Sercognani never ceased to recommend, and he showed its possibility: the government declined the step, and did not even send to Foligno, although the matter had been arranged since the 20th of February, the necessary ammunition and artillery. Could these men comprehend the importance to all Italy of a flag of liberty planted on the capitol? The minister of war, Armandi, was the most active in this system of obstruction.*

The youth murmured, and threatened; it was appeased by promises. The press was indignant; it sought to place the question again on its right footing, on an *Italian* foundation. The answer to this was a restrictive decree, which punished, by fine or imprisonment, persons selling journals, "which were of a nature to compromise the relations of peace and amity existing with foreign governments." (Decree of February 12th.) All this was known in the rest of Italy.

The results of these facts were such as were to be expected. Count Bianchetti had been sent to Florence to interrogate the French and Austrian ambassadors: the French government did not even deign to answer the demands which were transmitted to it; it was keeping up, at the same time, an amicable correspondence with the Pope, and offering him aid. M. de St. Aulaire, who was sent to Rome, arrived there on the 20th of March, having avoided passing through Bologna, and refused all communication with the provisional government: the Austrian declared that he should intervene at Parma and Modena, but merely from the law of reversion; that Bologna had only to remain tranquil in order to be respected. The intervention took place, at first at Parma, Reggio, and Modena; and here

---

Bologna in favour of the Modenese insurgents, who by this means were enabled to triumph. Now I demand whether this is not a veritable intervention; and, if you refuse to recognise the right of governments to interfere, you must do the same in the case of insurgents." All this is impudently false. The affair of Menotti took place on the night of the 2d; Bologna rose on that of the 4th; the Romagna on the 5th. The Duke quitted Modena on the night of the 5th. On the evening of the 5th, some Modenese went to demand succour at Bologna, but it was refused.

* It appears that a certain Baron de Stoelting, a Westphalian, belonging to the house of the Prince of Montfort (Jerome Buonaparte), was sent to General Armandi, to prevail upon him, in pursuance of a promise made by the Prince of Montfort to Cardinal Bernetti, to prevent the expedition to Rome. The interview took place at Ancona; and, after that, Armandi took a decided part. Stoelting was the bearer to Armandi of a communication from Count Lutzow, the Austrian ambassador at Rome. General Armandi himself contradicts (p. 39.) the assertion that there was a want of ammunition, which has been somewhere made. A quantity was manufactured in the parishes, the women taking part in the labour.

the conduct of the government of the insurrection begins to be disgraceful as well as inept: but I shall disguise or conceal nothing, for in displaying the cowardice of individuals, I justify the nation. On the 6th of March, the provisional government said, in speaking of the occupation of Modena, "The affairs of the Modenese are not our own; the sacred principle of non-intervention imposes laws on us as well as on our own neighbours: none of us ought to take part in the quarrels of neighbouring states." It decreed that *all foreigners* who should present themselves at the frontiers should be disarmed, and sent into the interior. The *foreigners*, in this case, were Italians of Modena, to the number of 700, who presented themselves, with the old General Zucchi at their head*: they were actually disarmed, and were marched through Bologna like prisoners. The occupation of Ferrara soon followed: Ferrara was part of the United Provinces; she had seven deputies at Bologna: the provisional government announced this event in its proclamation of the 8th of March, without any remark: two of its envoys, of the names of Brunetti and Conti, brought back from Ferrara the verbal assurance of Bentheim that he should advance no further. The *Precursor*, the organ of the government, maintained, in its number of the 12th of March, that the principle of non-intervention had not been violated, that the treaty of Vienna gave to the Austrians the right of garrisoning the place, and that General Frimont had the power of increasing the garrison. A regency of the government was established at Ferrara in the name of the Pope: a proclamation was made, in which there was mention of Austrian aid: the Bolognese government maintained, on the 11th of March, that this proved nothing; that the affirmation of a papal junta and the intentions of Austria had nothing in common. The Austrians marched upon Bologna; they were at her gates upon the 20th of March, and still on the 20th of March not an order was given — only the citizens were required to keep quiet at home: it was recommended to the national guard to remember, that it had only been instituted for the maintenance of good order; fathers were advised to take especial care of their children; children were ordered not to quit their homes to assemble anywhere else: then the government quitted the city, met at Ancona; and on the 25th of March — two days after having elected a triumvirate, consisting of Zucchi, Borgia, and another honest and decided man, after having consequently abdicated all power — the members of the government, the men whose names I have given above in a note, placed the insurrection at the mercy of Cardinal Benvenuti, and capitulated, in demanding an amnesty: it was accorded, and was signed by parties on both sides, on the 26th. All the ministers affixed their signatures, with the exception of Pepoli alone, who was absent. I say of Pepoli alone, although I know that the name of M. Mammiani does not appear amongst the rest; but I have had in my hands the *procès verbal* of the sitting of the 25th, decreeing the capitulation, which the treaty of the 26th does no more than accept, and to it his name was attached.†

* The old general, Zucchi, a soldier of the empire, full of honour, of wounds, and of devotion to his country, had quitted Milan in disguise, in order to rejoin the standard of liberty. He was elected, on the 15th of March, commander-in-chief of the armed force. The appointment was almost a mockery. The youth proposed to him to overthrow the government, and to centralize the power: he refused, and did wrong. Captured at sea, in spite of the capitulation, he is now expiating his devotion to the cause in Bohemia.

† As is well known, the articles of the capitulation were violated; they were sent to Rome on the 26th of March, and annulled on the 5th of April by the Pope, as soon as the occupation was complete, and all the fortresses delivered up. The edicts of the 14th and 30th of April condemned, indiscriminately, chiefs, accomplices, aiders and abettors — the men of poetry or of prose — all

With men like these at the head of the movement, is it to be wondered at that all Italy did not rise in 1831? Is it astonishing that the insurrection did not triumph?

Now — and this objection has been made — whence came these men? How is it that we find them so often at the head of Italian movements? Do they not represent, by the simple fact of their power, the mean of the Italian revolutionary force? They do not. These men in no way represent the elements of regeneration existing in Italy: to judge of the one by the other would be to judge of France by its present government. In Italy, those who have effected the insurrections have never chosen their chiefs. From a feeling of legality carried to an extreme — from a fear, exaggerated, though honourable in its origin, of the accusation of being ambitious or anarchical—also from a traditional habit of confidence in men of great age and some reputation — and from a too real inexperience of the nature and march of revolutions, the artisans of insurrections, the people and the youth, have always ceded the right of organisation to the first who, with a shadow of legality, aspired to exercise it. The conspiracy and the revolution have always been represented by two different classes of men; — the one falling aloof after having overthrown the obstacles; the other suddenly undertaking the development of an idea, which it had never had, of a plan which did not belong to it, of an enterprise of which it had meditated neither the difficulties nor the resources, and with which it had never identified itself by enthusiasm or sacrifice. Hence the transformation which it has always undergone under their hands. Thus, in Piedmont, in 1821, the realisation of the revolutionary conception was confided to such ministers as Dal Pozzo, Villamarina, Gubernatis—all strangers to the conspiracy; and to a junta, of which the members, chosen by hazard from amongst the public characters, were completely ignorant of the powers, the tendencies, and the individuals of the party which they claimed to represent. Thus, at Bologna, the members of the provisional government were chosen by the government which had been overthrown; their title was their installation on the very day of the insurrection by Monsignore Paracciani Clarelli. Thus, generally, the councils of communal administration of the capitals assumed in addition the name of civic congress (*consessi*), declared themselves the legal representatives of the people, and appointed, without having the right, provisional governments. Now in these assemblages old age predominated; and with it ancient routine, old ideas, antipathy to the youth, and the fear, now without foundation, of the excesses which defaced the French Revolution. There was certainly a degree of liberalism present, for this is nowhere absent in Italy; but this liberalism was merely skirmishing,—it was faint and formal, — it was that which is termed *moderatism*, which is in reality nothing but a liberalism of detail, and not at all of principles; such, in a word, as is capable of being tolerated under suspicious, timid, and despotic governments. Hence the nature of their choice. They naturally chose men of their own tendencies, descendants of ancient families, distinguished professors, advocates in large practice; and never those who, by their political intelligence, enthusiasm, or energy, were made to ensure the success of revolutions; for that which they sought before every thing was not guarantees

who had contributed to the insurrection, and all who had approved of it: but this did not prevent Louis Philippe from declaring, in his speech to the chambers of the 23d June, 1831, that he had obtained for the insurgents a real, full, and entire amnesty. On the 9th of July, a circular published by France, Prussia, Sardinia, and, unfortunately also, England, in common, branded as criminal, and as very criminal, the insurgents and the members of the government.

of success, but of order and moderation. The youth, confident and inexperienced, in the intoxication of their first triumph eagerly accepted names which were not new to them — men, whose lectures they had attended, or whose speeches they had heard in courts of justice: why should they quarrel about names? Their standard — their colours — their hopes — stood them in stead of every thing, and rendered them confident of the future! They forgot that there is an immense difference between the necessities of a people in slavery and of a people in liberty, and that it is very rare that those who have represented the individual or municipal interests of the former, are calculated to represent the political and national interests of the latter. And for this error they have severely suffered.

The insurrection having been suppressed, the governments pursued their work with a fury unequalled, — except by their cowardice on the day of danger, or by our clemency whenever we have been the masters. A new layer of proscriptions was now superadded to that of 1821. Men emigrated *en masse:* there were no less than 600 exiles from the little duchy of Modena alone. The initiator of the movement — Menotti, died on the gallows, March 23d, 1831; with him perished the notary Borelli, a victim of the personal resentment of the Count Guidelli, one of the ministers, though his only crime was having, as a legist, assisted in drawing up certain acts of the provisional government: the duke sent the bill of the expenses of the execution, — the rope, the scaffold, and execution, — to the father of the victim. But it is not the scope of these letters to speak of our sufferings. They have been long known; and a single article of a law, for instance, the third of the decree published by the duke, April 8. 1832, which is as follows, paints more forcibly the situation of Italy than the hundred facts which I might be able to add to those already published: — "In cases where by the aid of *denunciations* or of *secret evidence* (of which the authors shall never be compromised, either by being confronted or otherwise,) we shall arrive at *moral* certitude of crime committed, instead of exposing the individual who has made useful disclosures, we shall content ourselves, as a measure of police, with condemning the criminal to extraordinary punishment, — milder, however, than the ordinary one, but to which *will almost always be added the penalty of exile.*"

1831 was a rude lesson for us; but our youth have profited by it. The deception of 1821 had taught them that every attempt at regeneration by means of the higher classes was a chimera; that of 1831 taught them that an insurrection seeking support abroad was equally vain. This eclectical work, the incorporation of the Italian *juste milieu*, making one step forwards and another backwards, prating of the people and holding the people in no account, laying down as a principle the republican idea and seeking to make it triumph by monarchical and diplomatic means, has led them to serious reflections, and caused them to feel the want of a definite revolutionary theory. In this want, and in these reflections, had its origin *La Giovine Italia*, — an association of which many have spoken, but without giving themselves the trouble to inquire into its object, its belief, and the means of realization which it proposes. These correspond to the ideas I have expressed in my first letter, and they will form the subject of my fourth.

JOSEPH MAZZINI.

ELEGIAC ODE.

Sing on, thou lonely thrush, in deep-leav'd bower
Of silent evening grey: the mute fields listen,
While closed is every dreamy flower,
Whose beauty gay
Laid its sweet head in twilight's lap,
Though still its odours pant and stray.
The air is fresh with fall of finest dew,
Which on the grass and clover-heads doth glisten
In fitful rays, and through the dark hedge gap
I see the broad field rise in mist!
Now sings the thrush with vigour new,
While that hoar mist ascends the blue
Of night's steep dome; and still my soul
Lingers on earth, and feels the goal
She would attain,
Beset with many a warring pain,
Which yet she cannot conquer, or resist.

Why should sorrow meet such tones,
Turning joyance into moans?
What is there in the human breast
That fills sweet peace with sad unrest?
Can we not with the bird-songs blend,
Singing blithe and soaring high;
With them be happy and ascend,
Opening our heart's wings to the sky?
Such may be ours; but when the leaden weight
Of griefs oppress,
All things absorb and mingle in the night
Of our distress.

Sing on, thou joyous thrush, in deep-leav'd bower:
Thy notes awake the chords of treasur'd grief
That in the soul lie deepest: no mean hour
Of common moving life can feel their power,
And fly not for relief
To nearest coils and glosses brief:
But oh! such song,
When my life's wheels are old in rust;
Broken — earth'd — over-grass'd — forgotten long —
Perchance by its too searching strains,
May waken to remember'd pains,
The cold oblivion of my dust.

Dim twilight now is on the lowlands hush'd:
The dusk leaves move not: every creeping thing
Hath sought its nook of rest; and sounds that gush'd
O'er moor and fallow, now beneath the wing
Of silence swoon away. The faintest echoing
Of distant watch-dog, or of sheep-bell dull,
Breaks not the pause. The sad hues wane
From eve's lorn cheek, while solitude doth cull
The moon-cold primrose, wet with love's last tears,
And glides a vacant Presence o'er the plain,
Where beauty dies, o'ercome by shadowy fears,
And hollowness and melancholy reign.

Sing on, blithe bird — my heart is all awake!
Emotions throng, and heavy sigh on sigh
Preludes their birth, e'en as their scenic change.
Fain would my spirit shake
Their pangs away, retaining sorrow's sweet;
But oh! her too magnetic eye,
O'er all the past sensations quick doth range:
The heart hath no retreat.
Sing on, blithe bird! thy voice is as a bell,
That rings in memory's vast and ruin'd hall!
The silver peal dead silence over-coils,
And thrills amidst her vacant shell:
Like showers that fall
From May's clear eyes through day-break's dome,
And with a trill of pearly music come.
The will that toils
For hope, who hires for bliss and pays with tears,
When thy clear tones it hears,
Breathes o'er the past a deep lament,
The more because it cannot e'en repent,
Far less recall.

We are not as we would be: mind and sense
At war, like stars that flaw their mirror'd spheres,
With action and re-action's fire intense,
Wane to the sullen years,
Where hope is purblind, and its best blood drain'd
By many a cause it never gain'd.
So do we sigh, and heavily wend along,
Lost to ourselves, save when some floating song
From hidden bird, or voice, or instrument, —
Some passing face, or form, chance word, or flower, —
Recall our feelings to their primal bent,
And wake the ashes up from the heart's wither'd bower.

Then, while thy warbling voice, O, unseen Bird!
Poureth swift varied cadence on the night,
Wake, memory, from thy bed of bliss deferr'd,
Deck'd in a bridal garland, grey with blight!

Yet from thy crowded shores
Cull thy most cherish'd stores,
And with a tender hand, O strew!
Soft as falls the evening dew,
Some healing balm upon each thought
That flits before my passive brain,
Yet presses on my heart with pain,
And old familiar sign:
Sad images the past hath wrought
From pure ore, mix'd with fatal earth;
Condition of their human birth;
Ah me! they seem'd divine.

Beneath yon moveless tree, where shadows broad
Blot out the antique stem, the flowers and sward,
Might not Endymion grey be sleeping still?
Love — sleep — or placid death, were well placed there
My thoughts now wander at impression's will,
To one who sang the tale,
And brimm'd the poet's shell with beauty o'er,
Finding therein his own sure wreck and bale,
Whence ignorant clowns made pastime of his wounds;
With mad glee trampling the free bird,
Caught straying thro' their formal ward;
Hoof-headed critics, in their cattle bounds!
I wander on through ruin's core, —
Whose black-weed banners are unfurl'd,
Midst landmarks high on wastes that sweep the world,—
To one, late dead, whose memory o'er all moan
Towers safe and sacred: but my soul must wail
For passion's funeral pyre — its ashes live alone!

The patriot sage lies cold — his words are shrin'd,
Though living he was baited by all fangs:
Evil's poor webs unwind,
And destiny o'er death her pinion clangs,
While steady triumph down the humble future strides!
For straiten'd circumstance and press
Of galling years, each rife with countless pains;
Ill health and houseless age — the consciousness
Of that which burns within, is all he, living, gains.

Where man needs man,
Forth springs the worst, as harvest of the best;
Success is single-handed. This Promethean span
Wherein our cased intelligence abides,
Is fretted to the bone by meanest things,
Till like the sun, absolv'd from twilight's vest,
The uncased mind burns on — revolves o'er time and life,
And sheds fix'd light on yesterday's poor dust.
We move 'neath Pan's reflective wings,
And follow Proteus, looking wise,

Through sickly calm or heady strife,
Passion, monotony, and rust;
And glancing up our eyes,
We see how like the world is from the first!
How full of temporal names and glosses fine,
With the same flinty heart — the same dull eye
To all but individual vanity;
And yet we hope! — not that hope's glittering dust
Still cheats our wisdom, but because its wine,
Though with all vain intoxication rife,
Is needful to the health of working life.

But he is now beneath the mould
Whose spirit without blur or stain,
In coffin'd night unchanged from dawn —
Uncompromised, great, integral and just —
Is left like Joshua's sun, a monument of morn!
The wolves now slink along the wold,
Or huddle into crannies old:
With him a pulse of truth and power is gone,
And the world feels it not; because its brain,
To all except self's proper gain,
Like gold upon dead eyes, is folly cold.

Sing on, thou joyous thrush in deep-leav'd bower!
My heart is all awake: why art thou dumb?
Can shades of night thy bosom's joy deflower,
And each warm pulse with death's reflections numb?
No blight upon thy fairy life can come,
Though autumn blains through beauty's trellice creep,
And howling winter ravisheth the flower;
For thee no thoughtful brow should tear-drops steep,
E'en when in grassy grave thou liest in stiffen'd sleep.

Thy voice is mute, sweet bird; thou wilt not sing,
And wake melodious sorrow any more;
But, Oh! enough thy briefest strain to bring
Quick to my bosom its most grievous store,
And brim it with the keenest memories o'er.
Thy notes, at close of eve, when sad-eyed twilight glides
From throne of dimmest molten ore and stain,
Down to the realm where night abides,
Were fit to pour above Arcadian graves,
While beauty is intense on mount and plain,
In grotto, mossy grove, or weltering waves;
But here, one spirit moaning its unrest,
On wide and hollow mead,—with nought above,
Save leaden clouds and gloom, while at the verge,
In black and matted vest,

The stock-still trees, in dense mis-shapen mass,
Stand round like Druid wrecks; — thy soul to move
Unto sweet song, were vain to hope or urge.
Yet shall not such pure melody o'erpass,
Like cloud or perfume through the deserts wild,
Into oblivion's mightier world of void;
But like the voice of some angelic child,
Heard in elysian dream to chorded harp
Or dim and sonorous quire, my heart shall guide
O'er Time's unfathomably troublous sea,
Beyond the flaw of evil's warp,
Fixing a lesson of humanity.

Our souls are not of wind — our hearts not clay;
We veer not with the hour
By pain or pleasure's power,
Nor lose the images of truth
Stamp'd in the purity of youth,
Until our dying day.
The fount of inborn feeling ne'er is drain'd,
Although its goal be never gain'd;
The bosom that hath chords for others' bale,
That glories in a friend's high fame,
Or sighs at close of melancholy tale;
To life's last page
Of greyest age,
Whatever wrongs have strewn the stage,
Will vibrate still the same.
Our feelings deep, the stress of evil fate,
Grief, barb'd adversity, and absence fraught
With all the yearnings of fond fancy's brood,
And time estrange not;
Nor e'en though love's reward be found in hate,
Or cold indifference withering up the heart,
Slow tears may scald the cheek in solitude,
And yet we change not.

R. H. H. 1830.

THE WAR IN THE EAST.

The East has always been fertile in great men, in those grand and colossal figures whose energy appears superhuman. In our own time, if we are to seek a celebrity approaching to that of the genius who re-united, after a lapse of nine centuries, the scattered elements of the empire of Charlemagne, it must be confessed that it is towards the East we must turn, — to Egypt, where the diadem of the Pharaohs and Ptolemies encircles the brows of the octogenarian Mehemet Ali, who is to Napoleon what the vulture is to the eagle. Guizot, that great reflecter upon the revolutions of empires, is inclined to attribute to each state a period of decay proportionate to the term of its construction. M. Lamartine, on the contrary, having been an eyewitness of the state of the East, conjectures that the race of the Turkish empire is run, and that the hour of its dissolution is impending. The reasons for this opinion, which he gave in his luminous speech in the French Chamber of Deputies, correspond with those hazarded by us in a former disquisition, and may be summed up in the fact, that fanaticism formed the bond of union and the element of conquest of the Turks, and that fanaticism is weakened or no longer exists among them. The idea of an Arabian empire, founded on the ruins of the Ottoman, is also visionary, for the same reasons as are applicable to the society of the Turks. Neither can amalgamate with European communities or habits; and in both countries precocious civilization depends upon the accident of the lives of two men — Mahmoud and Mehemet Ali. — Anarchy must succeed their decease.

The singularity of the present position of the Egyptian satrap is this, that although innumerable pachas have attempted, at various periods of Turkish history, and with more or less prospects of success, to establish an independent kingdom, they have all hitherto succumbed in their ambitious projects, after a time, before the fortunes of the house of Othman. Even Mehemet Ali, notwithstanding he has succeeded through civilization in rendering himself physically more powerful than his sovereign, might finally have fallen before that moral or religious force which, in the opinion of the Faithful, assigns to the Sultan a sacred supremacy over every Mussulman; but the victory of Koniah, by laying open to the victorious Ibrahim the path to Constantinople, exacted, at the cost of Russian intervention and the cession of Syria, a sort of tacit admission of Egyptian independence which the relief from momentary difficulties, it was to be supposed, would instantly cancel.

Since the date of the French Egyptian expedition, however, a new element has intervened in the wars between Sultan and Pacha, and that element is European influence. It is the complication of Western with Eastern interests which has enabled Mehemet Ali to stand against his sovereign so long in virtual independence, and which now gives such important features to the present declaration of hostilities.

The attitude which the parties have assumed towards each other, though caused by events of a less recent date than the convention abolishing monopolies throughout the empire, is mainly to be attributed to it. The governor of Egypt, in fact, feels that its literal adoption would destroy the source of his revenue and strike the sword from his grasp; he is therefore urged to make a death struggle for supremacy or independence; whilst the Sultan, persuaded that the assistance of England and France will be accorded to the side of their commercial interests, anxiously seizes the opportunity to

wreak his long-cherished revenge upon his rebellious satrap. The commercial convention was a secret means of avenging the humiliation of the convention of Kutayah; for so long as the Sultan's authority was recognised over every province of his dominions, the European powers could not object to its being carried into effect in Egypt, where Mehemet Ali's monopoly was thus pierced to the vitals. So true it is that it is the opposite of material interests of nations that bring them into collision, although minor causes are generally assigned for it. It would be vain to speculate upon the consequences of a battle between Ibrahim Pacha and Mahmoud both to western and eastern politics.

Of all the actions which mankind can commit, the most considerable are battles. They exceed all others as much by their peculiar greatness as by their results. No acts are more decisive, or introduce into the politics of the world more surprising novelties. They require but the space of a day, and their consequences are perpetual. Whether it be necessary to settle a question of interest between two nations, that one should extend itself or disappear by conquest, or lastly, that an end should be put to civil dissensions, the judgments which are there pronounced are supreme. It is true that very often the arms that were prostrated arise again, and appeal to another field of battle; but eminent battles possess this quality above all others, that their decrees are generally omnipotent, and there is no refuge for the vanquished from the laws which they impose. In all cases, notwithstanding the death and devastation caused, battles are facts which God holds in his own hand, and which deserve to be praised, since they tend to put an end to war and to recall the normal and ideal state of the human race, which is peace.

Another conflict like that of Koniah might dissolve the empire of Mahomet; but the difficulty still remains, what is to succeed to it? "*Mais que diable de faire de Constantinople?*" was the difficulty which the Emperor Joseph II. expressed when consulting with Catherine and her confederates on the partition of the Turkish empire. "Constantinople," said the Emperor Alexander, "is the key to my house." There is no longer any difficulty in disposing of that bone of contention according to the conference at Erfurth, and England must resign herself to behold the key of the Eastern and Western worlds, the trident of the ocean, transferred to the hands of Russia; while Egypt, the highway to Indian commerce by land, and the mistress of the Mediterranean, falls to the share of France, who eagerly covets its possession, and secretly proclaims the price at which she is willing to lend her co-operation. The interests of all parties being such, it is natural to suppose that France and Russia must view with feelings of pleasure the collision between Ibrahim and Hafiz Pacha, which will accelerate the desired consummation. England and Austria alone have a sincere interest in preserving the *status quo*. For what can Russia lose by the defeat of the Sultan, and what can France lose by the overthrow of Mehemet Ali? Evidently nothing. Russia acquires the right by the treaty of Unkiar Skelessi to occupy Constantinople and Asia Minor with troops from Sebastopol, and to protect the Sultan from the victorious Egyptians. France gains the opportunity to annex Egypt, with its vast resources, to her Algerine dependencies.

Casting our eye farther eastward we perceive a complication of difficulties still more grave and imminent. Our armies are entangled in the jungles and wilds of Affghanistan, surrounded by a hostile population, like the army of Crassus amid the Parthians—the Shah of Persia is reported to be advancing a second time upon Herat with 40,000 men—the Prince Kamran by no

means grateful to his allies the English for their assistance—Dost Mahommed organizing by his influence conspiracies in Madras itself against our power, and the Muscovite eagle flapping his wings in the distance and scenting the coming prey. Let us consider for a moment the obstacles, moral and physical, which interpose in the path of Russia, and the contingencies which, by possibility, might prove favourable to her designs.

Since the report has reached us that Count Simonitch has been appointed to a command in the Persian army at the recommendation of Russia, it cannot be surprising that we are disbelievers in the sincerity of the cabinet of St. Petersburgh, and in the assertion that her Eastern envoys intrigued against British power in India of their own accord and without the knowledge of their superiors.* It is not in a formal disavowal by Count Nesselrode, vague and void of meaning as it is, that a refutation of facts can be found, and of the prosecution of a course of policy which the history of a century confirms. We arise with this conviction from a perusal of a diligent summary of the heads of this great political problem, which is to be found in the third volume of the instructive and entertaining History of Russia, in Dr. Lardner's Cyclopædia, in which the author's research has left little of importance to be gleaned by other writers. It was only in December, 1832, that the Moscow Gazette, the *official* organ of the Russian government, declared aloud to all civilized Europe its haughty defiance of England. "The Russian nation," says the official writer, "is indignant at the clandestine proceedings of England, or rather of her perfidious ministry, in regard to the troubles of Poland: but our turn is coming. We will tear off her mask. We will show the world how a people is really reduced to slavery. You shall soon have an opportunity of judging whether Lord Ponsonby spoke truth when he repeated to every body who would listen to him, 'Russia is no longer of any account, henceforward Poland will prevent her from interfering in the affairs of Europe — her government is quite Asiatic,' &c. How does this Albion, loaded with debt, and now imbued with the most perfidious principles, dare to rouse the bear (for so they call us) who devoured Napoleon, with the first army that ever invaded her territories, and marched to Paris to revenge their rashness. No: our turn must come; *and we shall soon have no need to make any treaty with this people but at Calcutta.* Her false policy has done its best. Let her go and make alliances with the African negroes, whom she wishes so well, and for whom she has made Europe her dupe. The barbarians and slaves, as her papers call us, will teach her a lesson. Meanwhile let her go on. — It is all we want."

As the progress of our internal politics has not, however, verified the Calmuck's insinuation in the last paragraph, and as England still survives in spite of predicted anarchy and downfall, it may be possible for her to take courage and consider whether the Russian bear have the power of reaching Calcutta, and whether there be any *Ursa Major* born among their Cimmerian deserts with a genius capable of leading his brethren successfully to the conclusion of such an enterprise. The consideration of these

* If any proof were wanted that the intrigues in Persia were carried on under the cognizance of the Cabinet, and that the Cabinet, finding their schemes exposed by the vigilance of our intrepid agent, Sir Alexander Burnes, were determined to disavow their own dark plot, we have such a proof in the fate of the unfortunate Vickovitch, who played so conspicuous a part in the Persian conspiracy. Vickovitch had returned to St. Petersburg, and had an interview with Nesselrode, the purport of which has not transpired, but there is no great difficulty in divining it from the issue. The wretched man went home, and on the following day shot himself, *after destroying all his papers.* His crime was failure. The minister found it convenient to disown his agent, and sacrifice him to a violent state necessity. The agent, in despair, anticipated the executioner. Such is a brief epitome of the perjuries and sanguinary atrocities of Russian diplomacy.

chances will embrace that of the neutrality, hostility, or friendship of France under Louis Philippe or a future republican government, should the contest between England and Russia be delayed or prolonged until that event arrive, and, finally, the genius of the Muscovite military commanders.

It must be remembered that the prestige of Russian military force has fatally declined ever since the date of her Turkish, Polish, and Circassian campaigns. In fact, all her victories have been won at an enormous waste of human life, without any exhibition of military science. Russia *never won an important battle* during the whole course of her long wars with France in spite of her boastings, and we defy her advocates to point out one. The battle of Novi was doubtful, and in those days she had a Suwarrow. It is a different order of talent from his, and a different kind of feeling from that which obliged the Russian officers placed in the rear to urge onward against the Polish legions at Ostrolenka their poor inanimate serfs at the point of their swords, which must lead to a prosperous end a descent upon India.

From the time that we have ceased to delude ourselves as to the danger with which our Indian empire is threatened from the quarter of Russia, we have imagined that it would tend to retard the fatal moment to represent this danger as chimerical, and the press has laboured to demonstrate that the fear of England's resentment would always suffice to prevent the designs of Russia, and her power to arrest her progress. But Russia has sufficiently shown how much these considerations prevail with her by her conduct in the East, where, for the last ten years, she has never ceased to pursue her projects, delaying, or, at the most, disguising their execution, according to circumstances. England has arrived at that period in the existence of nations, when the idea which they have created of their power is an arm of which it is easier for them to avail themselves than of that power itself. England, by reason of the very height of her renown, cannot, as the Duke of Wellington said, afford to make a little war; and to exert her whole power, the greatest considerations and the most vital risks would need to be self-evident. The science of political calculation, of which our former cabinets have made good use, has at length taught us, that we have been so miraculously favoured by fortune and skill throughout those long struggles when the French revolution placed our existence at stake, that we might have reason to count upon contrary results if we lighted up a war, which, by embracing the whole universe, would again put in jeopardy all that the past has solved in our favour. It seems, nevertheless, that we cannot prevent Russia from daily approaching the object of her ambition, the path towards which seems to be prepared by the march of time itself.

What keeps Russia immovable in the path to India is neither respect for the abilities of our foreign secretary, the indirect menaces of our diplomacy, the wrath of the press, nor even the fear of our fleets and armies — it is circumstances which are wanting to Russia. We believe that she could, if necessary, send into the field simultaneously ten armies like that which would be necessary to invade British India, if she were not wanting in all the elements of that moral force without which so vast an enterprise could not be attempted.

The three most celebrated conquerors who have accomplished in former times the projects which Russia meditates at the present day, were, with the differences appertaining to the time and country in which they lived, and in degrees which we cannot compare to each other, men of rare genius in war. Preceded by the fame of their exploits, which filled all Asia, they

had already vanquished the lively imagination of its people and bound it to their ascendency, which was regarded by them as miraculous when they advanced towards Hindostan. Without that influence which their name and presence exercised, who can say that they would have triumphed by the mere force of arms over the resistance they encountered? Another less famous conqueror, Mahmoud of Ghizneh, who founded the first Mahommedan dynasty in India, was unavoidably borne to the summit of his hopes by the irresistible energy of that religious fanaticism which inspired the Arabs during the first centuries of the Hegira.

Whether it emanate from a single man or from an entire people, it is always the action of an exceptional genius which has assured the success of these great designs. Russia is in a condition wholly opposite to that which these different examples present. No national passion urges her towards India. The religious prejudices of the people of Asia, although much weakened, repel her by the force of their inertia. Since Peter the Great, not a single man of genius has arisen either upon the throne of the Czars or in the midst of their armies or councils. In order to send an army from the borders of the Caspian Sea to the mouths of the Ganges, to triumph over the resistance of the populations by repeated, rapid, and decisive victories, or to disarm them by the skilfulness and tact of negotiations which shall obtain their assistance or neutrality, something more is wanting than the ordinary merit of a general or field-marshal competent to chastise the rebellion of a few nomadic tribes, or to despoil Turkey or Persia of some additional province. The capricious preference of an autocrat could not justify itself by the example of Potemkin, in confiding to the first officer who happened to be a court favourite the mission of going to attempt a *coup de main* upon an empire of a hundred millions of men at the distance of a thousand leagues. Russia, since she has entered upon her career of aggrandisement, has used no other system to arrive at her ends than a crafty and obstinate pursuit. After having employed for a century the violence of war and the perfidy of politics to mine the Ottoman empire, she was forced during the last campaign to endure the loss of two years under the eyes of Europe, before passing the chain of the Balkan, beyond which Constantinople yet remained to be conquered. Provoked and endangered by the Polish insurrection, she saw the German Diebitch, her boasted conqueror of the Turks, condemned to await the attack of the mysterious malady which cut him off without having been able to lead his soldiers across the open plains to the city of Warsaw. Alone, divided, and betrayed, obtaining, instead of succour from the kings of Europe, only secret or declared vows for her ruin, Poland was enabled with a few thousand troops, animated by love of their country, to make head for more than a year against that Colossus with a hundred arms, which seemed able by a scornful gesture to crush it to atoms. How different is the slowness with which success generally declares itself for Russia from that thundering rapidity which a march upon the Indies would require! And nothing can be discovered in her capable of giving this enthusiasm. The race of its sovereigns has preserved the cunning of the Greeks of the Lower Empire, with the ferocity of the Tartar; but not his adventurous intrepidity.

The conqueror who shall mount his horse to point out to his soldiers the road to Calcutta, has not yet appeared in the family of Romanoff. We English may assure ourselves that it is not the prudent monarch Nicholas, who awaited at a respectful distance on board one of his vessels the result of the siege of Varna, who will renounce the glory of his reviews in the sure shelter of palaces, where his politics perform their exploits, to go and pre-

sent to the people of Asia the spectacle of another Macedonian Alexander. If the cruel disposition of the Czar, whose frown can move European diplomacy, causes his sleep to be troubled at times with the trophies of Timour, he may console himself for his inability to imitate those famous bloody pyramids invented by the Tartar conqueror, by his own reminiscences of the deserts of Siberia, and of the Polish women and orphans dragged at the tails of horses to his military colonies. Russian politics are, besides, charged with too many difficult and pressing affairs to dwell upon the gigantic project of an invasion of India otherwise than very remotely. Her present wish is for another portion of Europe. There is no human power which could lay hands at the same time upon Constantinople and Calcutta. This is the reason why Russia remains so long suspended between these two banquets which summon her — the one to the Bosphorus, the other to the Ganges. So long as the question of the destiny of Constantinople shall not be definitively solved, British India will be safe. War is neither our wish nor our interest. If the Russians triumphed, Constantinople, in their hands, would be too great a blow against our commerce and power for us to see in that event a fortunate diversion from India, the invasion of which would, in fact, only become easier thereby. In the contrary supposition that Russia, lowered by English ascendency, beheld the hope of inheriting the Ottoman empire in Europe vanish from her sight, her energy and activity turned, but not destroyed, would find no other vent but Asia, and thenceforth, directed to one single end, would be irresistibly forced to seek upon the Ganges amends for the cause lost upon the shores of the Bosphorus.

Assuredly Great Britain has no want of provocations if we had made up our minds to chastise Russian insolence and aggression. It needed not the recent events before Herat, and the formidable coalition organising against her sway in India, to be added to the indignity of the Vixen's capture, or the contemptuous rejection of our mediation for Poland and Cracow, to justify, acording to the *ancient* policy of England, a loftier tone towards the northern cabinets; — but other considerations intervene. *Could we but count on the neutrality* of France (to let alone counting upon her assistance either under the shuffling Louis Philippe, since his evasion of the Quadruple Alliance, or under an Anti-British republican government, should such succeed him), we might force the Dardanelles, paralyse, by the presence of a dozen fleets in the Black Sea, the operations of the Russians on its northern shore, and acting at the same time in the Baltic, frighten Cronstadt and Sebastopol with the chastisement formerly inflicted upon Copenhagen. But whilst the bombardment of Copenhagen left England only the powerless resentment of Denmark, the destruction of the Russian marine would awaken the formidable envy of a nation to whom would be afforded an opportunity of revenge. The antagonism of Russia and England arises at present only from the foresight of the moment when the interests of the two powers, become irreconcileable, shall appeal to arms. The two nations who have long been united to each other by a commerce mutually advantageous have not yet encountered each other as enemies on the field of battle, and have no humiliations to revenge upon each other. They have no Novi, no Zurich, no Marengo, no Borodino, no Moscow. This position is favourable for England: common sense may teach our statesmen that they ought to avoid increasing the forces of an enemy by bringing his passions into play. Every effort made by the British arms against the power of Russia by wounding the nation in its savage pride would make it a question of honour in its eyes to make an attempt upon India. It is then that the peril,

having become pressing, could no longer be conjured away but by the doubtful success of a battle upon the Ganges; for the patriotic sentiment has always created among nations unlooked-for instruments of attack as well as of defence; and in default of a great warlike genius Russia might find in this feeling the enthusiastic resolution which is necessary for her to go and combat England at the extremity of Asia.* We may threaten, but it is more prudent at present not to turn those menaces into declared hostilities: to erect a barrier power in Afghanistan is better; afterwards our fleets may concentrate themselves in the seas of Malta, or the Archipelago; and having so far subdued our chivalrous sympathy as to lose the admirable opportunity afforded for a moment by the victorious insurrection at Warsaw, we may perhaps give the signal to Europe of a crusade against this barbarous and inhuman power, at a less favourable moment than we otherwise should have done; but for the result we should have no fear, for Poland, Austria, Hungary, and Germany, with their armed myriads, would cordially join in stemming the deluge of barbarians, and driving back into their congenial deserts the hordes that now threaten to overwhelm Western civilisation.

Ritter, in his "Comparative Geography," has expressed in a word the interest with which Afghanistan inspires both England and Russia. It is, says he, the country of transition between eastern and western Asia, between India and Persia. It is there that we find all the passages that lead to the Indies; and an Indian proverb says, that no one can be King of India who is not King of Caboul—a proverb which expresses the importance attached by England and Russia to the events in Afghanistan. On a former occasion we have traced the route of the various conquerors who have made themselves masters of Hindostan proceeding from this great chain of mountains in Upper Asia, that divides Persia from India, where nature seems to have placed the keys of the Asiatic empire. Shah Shoojah is the son of Tymour Shah, the last Emperor of Afghanistan of the tribe of the Sadukzies; his nephew, Kam Ram, the Prince of Herat, is of the same tribe. The greater part of the principalities of Afghanistan have fallen under the power of the chiefs of the Barukzie tribe, and are Caboul, Ghiznez, Candahar, and Peshawer. The cities of Herat, Candahar, Ghizneh, Caboul, and Peshawer, form, as it were, a triangle on the map, which has its apex on the north-west, and its base on the south-east. At the apex of the triangle is Herat; at the base from west to east lie Candahar, Ghizneh, Caboul, and Peshawer. It is within this triangle that the destinies of Asia are deciding, and these are the cities which have beheld passing from their walls so many of the great conquerors of the earth.

The cause of the change in Dost Mahomed's politics may be easily explained. This chief of Caboul, according to the accounts of our travellers, is very favourable to commerce, which is, indeed, but natural; for Caboul serves as a passage to the caravans in their way to and from India, and the custom-house of Caboul pays a considerable revenue to Dost Mahomed. Hence his liking for commerce, and his desire to see the Russians take part in the traffic of central Asia, and pay tribute to his treasury. The principles of free trade which Russia preaches against England have, therefore, found in him a warm partisan and are undoubtedly the cause of his recent friendship for that power.

Sir Alexander Burnes doubted much if ever the ancient family could

* It is impossible to appreciate too highly, in a political point of view, the magnificent scheme of Indian steam communication across the Isthmus of Panama, which, we have every reason to believe, will, ere long, be effected by the unwearied energy and patriotism of our greatest capitalists.

reascend the throne without foreign assistance. Whatever be the intestine divisions of the Barukzies, they are always ready to unite against a common enemy. During Sir Alexander's stay at Caboul, Dost Mahomed received advice from his brother at Candahar that a Persian ambassador had threatened him. "When the Persian shall have armed against you," replied the chief of Caboul, "send to me, and the same as I am now your foe, I shall then be your friend." If ever the different principalities of Afghanistan are to be reunited under one chief, it is under Dost Mahomed only that this union could be properly effected; for the hatred of tribe against tribe prevails over the private dissensions that divide the tribe within itself. They ally themselves with those whom they hate the least against those whom they hate the most — a sort of alliance which is quite common in politics. It would seem, therefore, considering the ascendancy of Dost Mahomed over his other brothers, that it was a doubtful choice on the part of our government to have selected Shah Shoojah as the regenerator of the Afghan empire. It was to Dost Mahomed Khan that many people think this part ought to have been assigned. But as a cause for marching an army towards the head of the Indus, for the purpose of opening the navigation of that river, Shah Shoojah serves the purposes of England far better than any other pretender. In fact, the river Indus is the basis of the Indian army's operations, and the indispensable preliminary of the Afghan expedition; for without it the English army would be cut off from its communications with India, and commit a strategical fault. Hyderabad, Bakkar, and the strong places of the lower and middle Indus, have already fallen into our hands. Assured of the course of the Indus as the basis of its operations, our army may then defer, if necessary, the remainder of its operations until the following year.

Let us briefly sum up the share which Afghanistan will take in the struggle between Russia and England. Afghanistan is not a possession which Russia and England dispute. It is a political and commercial position, which neither of the two powers wishes to abandon to the other. When Russia, under the name of Persia, tries to lay hands upon Herat, England is irritated and uneasy, for Herat is the road to India. If England succeed in the attempt to restore Shah Shoojah, and to maintain him by aid of the English army, Russia, in her turn, becomes chafed, for if England reign at Caboul, Russia is henceforth excluded from central Asia. The two powers might consent for a moment to leave Afghanistan in the power of the Barukzies, who dispute it between themselves, but they will each seek from his own quarter to fortify their base of operations in central Asia—Russia to extend and consolidate its influence in Persia which will serve it as an advanced station against British India; and England, to avail herself of the course of the Indus, to the end that she may always be in a state of attack and defence upon her north-western frontiers. Once fortified in their bases in this manner, they will commence their struggle in Afghanistan, for Afghanistan is the country whose possession decides the balance of Asia; and in order to be King of Hindostan, according to the Indian proverb, one must be King of Caboul.

We now pass to the examination of the eastern question in Turkey and Egypt. It is there that we perceive the struggle between Russia and England approaching to Europe, where, for a time, the death of the Sultan Mahmoud appears to have referred to the decisions of diplomacy what we were on the point of seeing decided by the *ultima ratio*. The Sultan Mahmoud, whose name will occupy a prominent figure in the annals of his country, was assuredly one of those remarkable men to whom it is impos-

sible to refuse the homage due to a great character. His life was a perpetual struggle, and he rose greater from every defeat, so admirable was his perseverance, so deep was the faith he had in himself, and in his cause: — a noble Mussulman figure — devout and resigned — enlightened by a ray of the genius of civilisation. The history of the Ottoman empire does not record a period of thirty years marked by so many immense reforms and great catastrophes as that of his reign. He has the credit of originating whatever good was done within that period, and of opposing whatever evil resulted from circumstances over which no human power had any control. His death is an immense misfortune for the Ottoman empire. The great man who had introduced into it the true principles of civilisation is no more; but, on the other part, it has removed an obstacle to the reconciliation of the Turkish and Egyptian empires. The sultan neither could nor would pardon Mehemet Ali his rebellion, sometimes open — sometimes hidden under the appearance of submission, or disguised by the forms of diplomacy, but constant, permanent, ever active, ever encroaching. After the insurrection of Greece, the destruction of the Janissaries, and, above all, after those attempts at reform which were in Turkey a sort of compensation for the dismemberment which weakened its power, Mehemet Ali thought always of ruining the power of the sultan. Between a sovereign thus wounded in his honour as well as his interests, and the powerful vassal who aspired to sovereignty, there might be moments of truce, but never peace. The first cause of the inferiority of Turkey to the nations of Europe was the absence of military institutions, and the absolute want of regular armies. The Sultan Selim, comprehending the necessity for a reform, had founded the *Nizzam Djeddi*, or new militia. That institution struck at the roots of the Janissaries' power, and Selim succumbed; but Mustapha IV., the Sultan created by them after the reign of a year, fell himself before Mustapha Baraictar, the devoted servant of Selim, who opened the throne to Mahmoud, then twenty-three years of age. The Sultan received into his hands an authority nearly annihilated. All the provinces of the empire had become feudal sovereignties in the hands of pachas. Ali Pacha ruled in Epirus, and Mehemet Ali had commenced to raise himself in Egypt. Mahmoud himself allowed the terrible subject who had made him Sultan to govern in the divan; but the vengeance of the Janissaries soon relieved him from that control. It required all the strength of Mahmoud's mind to stand up against such omens, but he had been raised to the throne with the hatred of the Janissaries, and in the month of June, 1826, he executed the daring act which has no equal in history except the destruction of the Templars.

The massacre of the Janissaries lasted two months. The Sultan immediately commenced his reforms, organised a real conscription and formed regiments after the European fashion. But these projects could only be accomplished with the aid of peace and the same year in which he had destroyed his only military force, he had to combat the insurrection in Greece. That war was fatal to him, not only because it dismembered his empire, but because it placed him at variance with the powers most naturally summoned to second and protect his plans of reform. Scarcely recovered from the disaster of Navarino, he had to make war in 1828, against Russia, and sign at Adrianople the surrender of his northern provinces.

During this period of defeats arose, at the other end of his empire, the powerful vassal, who, in 1832 and 1833, forced the Sultan to place himself at the mercy of his most dangerous enemy, and sign with Russia the famous treaty of Unkiar Skelessi. Death arrested Mahmond at the moment

when his passion, more powerful than the injunctions of diplomacy, and excited perhaps by the feeling of his approaching end, was about to cast him into the chances of a war, of which he seemed to cling to the idea. A few days before his death he had beheld his vessels leave the Bosphorus, and saluted them with his last looks. Sultan Mahmoud only needed to have been born amidst that civilisation to which he so nobly aspired, to have been a great man. But educated himself in the manners of the seraglio, he never possessed the advantage of that cultivation, which would have elevated his ingence to the height of his will. He only executed incomplete reforms; he attacked customs more than institutions, and exercised immense energy in trifling affairs. He wished to impose at a stated hour, and with all the Oriental fatalism, the civilisation which is born with time. It was also his misfortune to have effected his internal revolutions in the midst of foreign wars, and to have been obliged to war against the nations whose manners and institutions he sought to imitate. It is therefore the duty of the West to protect an empire which falls because it wished to resemble the West, and it is our civilisation which ought to watch over the tutelage of his son, a youth of seventeen years, and gather together his weak and divided power, which the loss of the great battle with Ibrahim must have nearly annihilated.

SONNET.

In hopeless love, let lover never pine;
For Beauty is not marble, but is moved
By prayers and constancy; and may incline
At last to love where most she is beloved.
But he who loves, and, loving, is repaid
By love as deep and tender as his own,
And who, in the sweet course of love, is stayed
By a repelling knowledge that the zone
Which binds the elements shall fly, and land,
And sea, and cloud, and sunshine, blend in air,
And be as One, ere he shall clasp that hand,
And call it his — let him, Lost Heart, despair;
For upon him hath fallen the end of time,
Ev'n while his life is in the freshness of its prime.

ILLUSTRATIONS OF ANTIQUITY.

"Diis Manibus!"

We have always thought that antique art would be best illustrated by those poetical fragments of antiquity scattered through the works and remains of various classics which give us, like the ruins of Pompeii, an insight into their familiar and internal life. The materials for this design are not so scanty or insignificant as might be supposed, nor the light which art and poetry reciprocally reflect so unimportant. Our sculptors cannot carve, nor our painters design, in the spirit and taste of Grecian art, without a competent knowledge of its form of thought, and a correct and scholar-like idea of its literature. Fuseli, that learned enthusiast of Grecian antiquity, knew this truth well; nor was our own Flaxman behind-hand in perception of its necessity. Above all others, it is to artists a most material point that the form be correctly imparted, and the mode of thinking and expression, of which Greek art is only the visible emblem or embodyment, be rightly understood. It will be seen from the inscriptions and fragmentary poems illustrative of classical art and customs which follow immediately, that classicism is not, as it is erroneously deemed to be by shallow critics, a peculiar school or shape of literature, having no intrinsic merits or superiority over what is called the Romantic (including under that denomination all written literatures, European and Oriental); but that it is a form, having its basis in the eternal relations of truth, simplicity, and nature, the harmony of the world of thought with the world of matter, the highest expression of good taste,—taste which is neither relative nor changeable, but arbitrary and eternal as the eternal fitness of things. We are weary of hearing a code of false taste and anarchy proclaimed in literature in the name of romanticism, Christianity, and Teutonic mysticism. Let us tread underfoot these ridiculous chimeras, and return to nature and the models of antiquity as the only legitimate paths in which the human intellect can march in the cultivation of the beautiful and the good, the Καλον και το αγαθον. May we be permitted also to retain the technical forms of the original verse, so far as we can approach in English to hexameters and pentameters.

ONE DEATH.

Wherefore fearest thou rest, the rest, O father, of peaceful
Death, which sorrow and care, anguish and tears too, stills?
Once only comes it to mortals — none of them e'er could lament
That he, more times than once, was doomed to look upon death —
But sorrow and pain, and the troubles of life, how much of them rise,
Daily increasing more, and daily in newer form!

CUPID DRAWN IN A CAR BY BUTTERFLIES.

Love, thou art borne in a car by two swift butterflies drawn,
And thou guidest them softly playing thy lyre meanwhile.
Gentle God, let never, let never thy fetters be felt;
Under melodious song fly they willing and free!

LEUCOTHEA'S GIRDLE.

Learn thou the lore of the schools — yet, like Leucothea's girdle,
Let thou be once on the shore — back to the waves it is cast.

THE BATH OF THE GODS.

The Nymphs, Apollo and Bacchus, the Graces, Cupid and Cypris,
Swore together "This bath henceforth for ever is ours!"

ON A PANTOMIMIC DANCER, WHO DANCED IN THE CHARACTER OF BACCHUS.

O Dionysus, wert thou once in Olympus to show
How with what magical art Pylades danced thee to-day,
Juno's self had encored, her hate to love had changed:
"I am his mother — not thou, Semele! — Bacchus is mine!"

THE EXIT AND ENTRANCE OF LIFE.

Naked came I, and naked go I once under the earth;
Naked from hence to go, needs it both sorrow and pain?

HELLAS.

As the flowers the earth, and as the stars the heavens
Adorn, so Athens adorns Hellas, and Hellas the world!

SAPPHO.

Sappho is my name: I have all women vanquished
In song, as Homer once vanquished you, O men.

ALEXANDER.

O Calliope, see a new Achilles on earth!
Send, O goddess, to him another Homer down.

KALLISTIUM.

Whether in raven hair, or whether in blond thou walkest,
Fairest Kallistium, still walkest thou forth like a queen;
All is becoming to thee, and thou, when the years with silver
Sprinkle thee o'er, wilt be peerless in silver hair!

THE LYING MIRROR.

Trust to thy mirror no more, thou painted Chloe: what shows it
Unto thee is not thyself, that is an image of lies;
But go to the fountain, and there wash in its waters thy forehead:
What in it then thou seest, sorceress, that is thyself!

LAIS' MIRROR.

She whose anteroom once was full of languishing lovers;
She who with Grecian hearts as if with balls has played,
Lais devotes to Paphia now this mirror. It shows her
Not what she was — what she is, never in it may she see!

PYRRHO.

Art thou dead then, O Pyrrho? — "I doubt!" thou doubtest in death,
Though dead? "Silence! Death ends the sophistical knot."

HATE AND LOVE.

Hate makes grief, and love makes grief, so shall I of the twain,
Since I of one must choose, now choose the sweeter pain.

THE BRAGGART.

"Show to me, shepherd," exclaimed a boasting effeminate huntsman,
"Show me the lion's footsteps — show me the tracks of his claws!"
"They are close by," answered he; "yonder the den of the lion
Will I point out." "Now good!" said he, "show me some other sign.

WORD AND DEED.

Idle is every word that never in deeds is accomplished:
But where is also the deed that does not the speech require?

FOOLISH PIETY.

Foolish mankind! when the gifts of the gods they freely enjoy
Godless are they; and pious when the Dæmon does harm.

SLOW BENEFITS.

Every favour must still be light; when draggeth it slowly
Heavy-like steps along it is a grace no more.

TWO KINDS OF EPIGRAMS.

With thee is the epigram like the little busy-like bee,
That from the flowers forth flies, and buzzes, and stings.
With me is the epigram like the little young budding rose,
That from the thorny bush nectar-refreshment breathes.
Let us both of them gather within one garden then:
Here are flowers, O friend; add thou the bee thereto.

THE STATUE OF VENUS BY PRAXITELES.

As fair Paphia's self upon her statue at Cnidus
Gazed enchanted, "How?" said she to herself, and blushed;
"Three among mortals saw me naked — Adonis, and Paris,
And Anchises: yet where saw Praxiteles me?"

DIOGENES.

As the wise Diogenes, now in the region of shadows
Landed, upon the shore met King Crœsus the first —
He who the gold had drawn so amply from Pactolus' stream —
"Fool!" cried he, flourishing boldly before him his ragged staff,
"Here am I come the first: see I have brought all my store
With me: but, pauper, thou — thou hast brought nothing of thine."

THE LIGHT GRAVE.

Little shared I in life, yet also no evil committed;
Kept from injustice my ways; kept me from envy free.
Therefore press lightly on me, O blessed mother! and have I
Ever a wicked one praised, earth then weigh on me hard!

THE IMMORTAL HOMER.

Evermore sounds in mine ears Andromache's sorrows. In flames
Rises Troy before us, shrouded in ruins and horror:
Ajax rages still wild near Ilion's sacred walls;
Hector still see we there sinking in blood-stained dust.
One, the Mæonides, gave to all everlasting life,
And his father-land is every inhabited world!

THE ELEPHANT IN THE TRIUMPHS OF PEACE.

No more bears he upon his back the tower with the phalanx —
No more rushes with madness into the ranks of the fight.
Low down bends he his neck, obeying the reins of his guider,
That the car of his lord he may draw with triumphant pride:
See the elephant knows also the trappings of peace,
Feels that more worthily now he serves the states-orderer thus!

HIGHER NATURE.

Shall, in afflicting hunger, the lion refresh him with grass?
So will a lofty mind never sink under itself.

THE LION ON THE GRAVE.

"Lion, what dost thou here with thy huge wide-spreading claws
Upon the grave? thou heavest thy terrible mane with pride."
"What I among beasts am deemed such was Teleutias living
Among men, and like me was bravest of the brave!"

THE THRICE FORTUNATE.

Mother of love, unto thee devotes Kallirrhoe this crown; here
Pallas these locks to thee; to thee, O Diana, this girdle!
For ye gave all unto her: — the husband she wished, ripe years,
Clear-eyed reason, and then of children a manly race.

THE ORACLE.

As Alexander once to Ammon's seat had arrived,
And Jupiter's self had named him his godlike son divine,
Naught of his father he asked, but that at the founts of the Nile stream
Fortune and destiny both he might hold in his proper hands;
Also we of the Gods would ask as a secret only,
That virtue, and faith, and luck, they should inscribe on our hearts.

FLYING TIME.

"Nothing constant exists in the changing affairs of men,"
Is one of the wisest words of the Chian sage — one day.
As the leaves of the trees, so are generations of men;
But the mortal gives ear seldom to words he hears,
Proved in his bosom in vain. The deceiving hope
Each one approaches, and steals into each youthful heart
In joyous thoughts, so long as the lovely flower of youth
Blooms, and roams the man enveloped in dreams around —
In oblivious dreams. They think not of age or death —
Think not so long as they bloom of the withering autumn's fall:
But, like young children, presume; — like them, they know not all
How in the flow of time youth and life wane away.
Learn it, boy! for thou therewith in joyful mind this life
Throughout shalt pass, and calmly then thou shalt draw near to thine end!

THE MORNING'S DAWN.

Friend! what mean the tears which over thy countenance flow?
What means this silent despair here 'mid the goblets of joy?
Art thou the only one then deceitful love has sickened?
Art thou the only one whom Cupid with sorrow rewards?
Drink, and forget thy grief! Look! yonder rises Aurora
Out of the waters! Who knows if we on Hesperus gaze!

THE DOUBLE DART.

Cupid, a god art thou when thou with the twofold arrow;
Woundest twice; but a rogue when thou with one only strikest.

THE STILL WITNESSES.

Sacred night! and thou, thou trusty watch of our loves,
Still lamp! I call you both to witness the oaths we swore —
He ever true to me, I to be true to him.
Ah! and he broke his word, O sacred night! and thou shinest,
Lamp! thou lightest him now into my rival's arms!

THE VANQUISHED HERCULES.

Hercules, speak! Where hast thou the hide of the Nemean lion?
Where thy golden wand? where thy death-dealing arrows?
Where is thy might? thou sittest sad and dejected, forlorn:
Sorrow and pain appear together mixed in thine eyes.
Say, who hath vanquished thee thus — thy weapons stolen away?
Who could accomplish the deed? "Paphia's craftier son!"

THEMISTOCLES' GRAVE.

Place near my monument Hellas, and spears, too, over my tombstone:
Draw the immortal fight which thee, O Hellas, did free;
And the Persian Mars and Xerxes should mine ensigns
Bear: upon them alone resteth Themistocles' grave;
Let Salamis be hard by the pillars; then say the inscription,
"This did I, O Grecians, bury me meanly now!"

THE TWO PICTURES.

Askest thou me, Menestratus, what thy Deucalion's worth,
And thy Phaethon there, whom thou hast painted in flames?
Both are worthy the fate to which the gods condemned them,
This of the burning flames, and that of the drowning flood.

THE ILL DREAM.

Heavy expenses incurred once the covetous Hermon in dream,
Anxiously sprang he from bed, shivered, and then hung himself.

CUPID AND BACCHUS.

Well against Amor am I within my bosom defended
Through my reason: I stand single to single to fight; —
I, a mortal, against the immortal: — but there is Bacchus
Now by his side. Who may against two deities stand?

ALEXANDER'S STATUE BY LYSIPPUS.

Alexander's noble form, his spirit heroic, live
Here in Lysippus' statue, — mighty majestic bronze!
Aloft towards Heaven he looks; then spoke to the God of Heaven
"Mine is the earth, O Jove! thou thine Olympus keep!"

THE SOLITARY TOMB.

Deep buried lie the dead's ashes; the wind, too, hither and thither
Moves the sighing leaves in eddying rounds as they fall:
Let us read the inscription; let us question the pillars
Who slumbers here? unto whom place they this withering crown?
"Wanderer! I was Arete, of Euphron the fortunate love,
Unto whom, fruits of our love, in life twin sons I bore:
One left I with him to dwell who comforts him in his age;
As a memorial, then, took I the other one here."

THE NIGHTINGALE.

Fleeing the furious north, that robbed my voice of its song,
Flew I over the sea: Boreas stormed at my back;
And then sank I, when, lo! a pious dolphin received me
Next on his back, and bore me without a rudder away.
Noble sailor! thou borest Philomela, and Philomela
Sings to thee back from the shore now thine Arion's song!

THE CROWN.

Heliodora, the flowers wherewith I crowned thee have withered:
Heliodora, thou bloomest, of the crown's flowers the flower!

THE FETTER.

From her head drew Doris
A single golden hair;
And bound me by the hands
To her a prisoner.
I mocked the beauteous fetter,
And said, "I'll break it soon," —
Yet when I tried to rend it,
No steel was e'er so strong.
Now have I given over
All thoughts to burst it through:
And, hapless me! I follow
Where'er the hair me draws.

MILK AND HONEY.

Goddess Suada and Paphia, take, O take of my thanks,
The purest, sweetest gifts which I, a bridegroom, can bring,
Milk and honey; — the honey for him, with flowers of love
Garlanded round; — the milk for her, the innocent bride.

JUPITER AND CUPID.

Jupiter scolded Cupid, — "I shall thine arrows destroy."
"Thunderer," said he, "and I shall turn thee again to a swan."

DEATH.

Saon, Dikon's son, the Akanthian, slumbers in sacred
Sleep here: — Never more call death the sleep of the brave!

THE HOUSEHOLD ALTAR.

Not the goddess of crowds; thou seest the heavenly Venus
Here in this bust that to her grateful Chrysogone rears
In Amphicles' house, with whom she in life and in love
Numberless years did pass, and daily with sweeter joy;
Then began she with thee, the Celestial! Blessings of heaven
Dwell evermore with those who on the immortal think!

ARISTODICE.

All mankind praised thee once, Aristodice, blessed so with fortune;
Because thou barest six blooming sons to the world;
But unto thee was the earth — unto thee was the ocean hostile:
Three of them sickened; three lie within the depths of the sea.
Mourn, O mother! with thee Philomela mourns at the grave,
And in the caves of the sea mourns Halcyone with thee.

WISHES.

Mortal are we, and mortal also are all of our wishes;
Sorrow and joy they go, or else it is we go by.

THE YOUNG SAILOR.

Also have I sailed over the waters of Life: Aganar
Is my name, yet I sailed upon their bosom not long;
Raging tempests arose; — I would have trusted the storm:
Hapless! hither the waves bore me in fury away.

THE NARROW GRAVE.

Man, thou seest me now in narrow grave here entombed;
Wide enough is it for me. Crœsus himself has no more!

THE HAVEN.

False goddess of Luck, and thou, O sweet deceitful Hope!
Farewell, and betray how long and whomsoever you will!
I in the haven rest now, a poor man, but there dwell
Freedom and courage with me all rich tyrants to flee.

THE PLAY.

A play is our life and a drama: foolish murmurer, learn
To act, or thou wilt bear sorrows and shadows away.

THE LITTLE SONG.

Little saidst thou, Erinna, and yet are thy delicate songs
Immortal — never are they covered with wings of night!
Meanwhile myriads countless of vain and counterfeit strains
Fashion gnaws, and already darkest oblivion hides:
Oh a little song is the swan's, yet sounds above every
Wild crane's shriek that on high amid the clouds had soared!

THE GRAVE OF THE BROTHERS.

Two brothers, Paulus and Letous, lived both only one life,
Also covers them now only one brotherly grave!
Sorrow and joy alike they bore — together alike they went
Into the Bosphorus sea down to Proserpina's realms:
Farewell, sweet harmonious souls — farewell, rest happy; the best
Emblem upon your grave were Concord's altar to place.

FATHERLAND AND ITS SONS.

Ilion sank with Hector — with him, the hero, lay low
Priam's lofty realm and the beleaguered's fate;
So is Pella with thee, O Alexander! sunk.
States ennoble the men — but no men the states.

THE DRIED UP FOUNTAIN BY THE SIDE OF THE TOMB.

Nymphs! whither fly ye, and where are now the bubbling waters
Which flowed whilome, and which ne'er drank the hot beams of the day?
Hence to the tomb of the noble Agricola have we fled
There weeping, to cool the urn that his ashes retains.

THE NEW STAR.

Amidst the heavens dwells my beloved. O that I the whole
Heavens were! on thee to gaze — to gaze with million eyes!

ON THE TOMB OF HIPPONAX, A SATIRICAL POET.

This is the tomb of Hipponax — away!
If thou be wicked; yet if thou be good,
And son of parents good — then seat thyself
In trust thereon, and if thou wilt too sleep!

HERACLITUS AND DEMOCRITUS.

Heraclitus! how wouldest thou now this mournful life bemoan,
Camest thou back again to the afflicted world;
And Democritus, thou, how wouldest thou heartily laugh,
Camest thou back again to the ridiculous world!
I stand between you both, and muse how, with wisdom, I
Now may lament, and now may properly laugh.

DIMOS.

Thine eyes, my Dimos! those beautiful eyes
They have won my love;
My heart is faint, and I fain would die
All alone, my love.
My beloved! thy sword bury far within
This tempestuous breast,
Then at length will the wanderer find repose,
And the weary rest.

In a golden veil then receive the blood
Of thy paramour;
Through the forest, the field, and the mountain, go
By the sounding shore,
And if, perchance, from whose veins it flowed,
One should ask thy pride,
O say, 'tis the blood that beat round the heart
Of thy love — thy bride!

HYMN OF ANTEROS.*

From shining regions where the blissful choir
View the Promethean conqueror reclined,
The soul transporting with his silver lyre
Towards the good from all alloy refined;
And Heaven's immortal spirits listening, lie
Unto the magic of his melody.

Borne on my purple wings, a welcome guest
I come, and fill your orb with fire divine.
Fond mortals with a deity invest
Each grove or fount or lovely haunt of mine;
The adorned earth and sky my spirits share,
Commingled with the world-surrounding air.

I am the fire whose bright etherial ray
Cinctures with immortality the soul
Which the gross cumber of its earthly clay
Divesting, soars beyond the world's controul
Great spirit, deepest love, whose essence fills
The ocean, air, and everlasting hills.

All arts the culture of the Ausonian shore,
To me and to my heavenly light belong
All harmony, all elegance, all lore,
The sanctified, the sacred soul of song,
All gifted mortals, on whose chosen head
The Eternal Melodies their influence shed.

I to the couch of the Egyptian queen,
Sad Cleopatra called with dying breath,
Invoked from Paphian bowers and skies serene
The gentle spirits of voluptuous death;
I, by my tears, wrung from relenting Heaven
That hour to pale Laodamia given.

* The ancients worshipped two deities of love, "Eros and Anteros of old"—the one the god of terrestrial, the other of celestial, desire.

To hallowed breasts my spirit still imparts
The flame whilome divine, ere Cupid's guile
Drove me from earth, and mingled with his darts
The generous affection and the vile,
Such love as revelled in the golden age,
Ere sad Astrea left this earthly stage.

In twilight's calm I linger near each scene
Of beauty which my spirit still enthralls,
And to the night then yield I up unseen
Aërial melody, whose dying falls
By mortal heard, some lonely temple nigh,
Uplift his soul with mournful ecstasy.

LOVE'S WITNESSES.

Ὁ Ερωτας Φανερωμενος.

Love! when we last night embracing,
Sighed — Farewell, who saw us part?
Was it night, or sly Aurora,
Or the stars, or moon that heard?

A star shot down! and told the ocean,
Ocean told a mariner;
Then the sailor told his mistress,
She — she told it everywhere!

THE WAY OF LOVE.

Where behind Pisa the Alphean stream into the ocean pours,
Hurrying towards Arethusa, he carries her branches of olives,
Beautiful flowers and leaves, and sacred dust from the race-course,
As his tributes, and darts them swiftly under the waves
Diving deep underneath, but mingling not with the waters
Of the salt sea, through the sea tracing a shining path:
Thus hath the boy, who deep wounds and manifold wretchedness sends,
Also the might of love taught the impetuous river.

MOSCHUS.

TO THE EVENING STAR.

Evening star! thou golden light of loveliest Cypris!
Evening star! of night the sacred ornament bright,
Which as the moon outshines, so outshinest all stars;
Hail to thee, lovely one! since now to the feast of the shepherds
I go — do thou light me on instead of the friendly moon,
Who will not rise betimes, for I to a theft do steal
Furtively; yet not that I the nightly traveller rob,
But that I love, and with lovers to mingle love is sweet.

MOSCHUS.

LOVE AND BE LOVED.

Longing Pan, he loved the neighbouring Echo; the Echo,
She loved the dancing Satyr; the Satyr he pined for Lyda;
But even as little as Echo for Pan so little did burn
For the Echo the Satyr, and for the Satyr young Lyda;
Every one loved the other; so much as the loved one hated,
Was he hated, and felt the pains of retaliation.
This an example teach I to loving spirits, to love
Those who love you, thus ye will loving, be loved again.

MOSCHUS.

LAND AND SEA LIFE.

When the cerulean sea by softest winds is dimpled,
Boldly my timid mind up rises; the upland Muse
Charms me no more; but the stillness of ocean ravishes me;
But when thunders again the frightful deep, the sea rears
Hollow waves and foams, on billows piling up billows.
Quick turn I then mine eyes towards earth and trees, and fly
Far from that dangerous ground: the footing of land only seems
Sure to me then — only pleasant the depths of the shadowy forest:
Where, also, during the storm, the pines sing in melody sweet.

Truly a fisherman lives a sorrowful life; a skiff
Is his house; the ocean he ploughs; he hunts in midst of the waves
Deceitful — the whilst I under the leaves of the wide-spreading beech
Slumber in sweetest sleep, and hear the murmuring fountains,
Which from the uplands to us flow softly, alarming us never.

MOSCHUS.

OLD AGE.

As the leaves of the spring that in the flowering season
Quickly burst forth as soon as warmth from the sun they feel,
So bloom, for a little time, mankind in the bloom of youth
Gaily; and yet, then, never evil from good discern:
But there stand the Fates dark at our side; the one
Sends to us old age; soon, soon sends us another one death.
One day youth's sweet flower flourishes only; the sun
Rises and sinks; with him, too, sank the flowers away;
And whene'er that is past, the time of our capable years,
Ah! then wishes our man, sooner than life, for death:
Then, too, suffers the soul many anxieties: — one
Household sorrows, or feels poverty's dismal gripe;
This one wishes for children, and when his wishes are blest,
Must he then from the world hie to the realms of shades;
That one gnaws and devours spirit-consuming sickness:
To every mortal allots Jupiter evil enough.

MIMNERMUS.

A few words now in conclusion.

In Greek poetry we have remarked, that analysis invades, anatomises, and exhausts every impression, every secondary idea, every manifestation, however incidental, of life. Nothing of uncertainty, nothing of mysticism, nothing of that indefinite, which with us moderns gives promise of heaven, and which our spirits long for, because we find in it a reminiscence or a presentiment of a country and a life different from those of this world. In the Greek all is defined, determined, materialised. The expression — and by expression we mean not only the language and style, but all that gives light and effect to the conception and imagination of the poet — is rapid, picturesque and concise, a worship of sensation, a religion of matter. "*Un solo è il punto onde movono la religione e la poesia,*" says an acute Italian writer. The religious intention predominates in all schools of poetry: the point of departure of religion, according to Victor Hugo in the preface to his *Cromwell*, is always the point of departure of poetry. Existing literature, the expression of the religious society of Christianity, has, according to certain critics, led back poetry to truth. Like it the Modern Muse has seen things from a higher and more comprehensive point of view than the Pagan. It has felt that all in the creation is not *humanly* beautiful, that the ugly exists at the side of the beautiful, the deformed at the side of the graceful, the grotesque near the sublime, evil with good, shade with light. From these reflections critics have been led to inquire if the narrow and relative reason of the artist ought to obtain the preference over the infinite and absolute reason of the Creator; if it belongs to man to rectify God; if a mutilated nature is the more beautiful; if Art has the right to cut into two, as it were, man, life, the creation; and if, in short, to be incomplete is the way to be harmonious? This is termed the theory of the romantic school as opposed to the classic. Poetry, with the appearance of Dante, made a great and decisive step—a step which, like the shock of an earthquake, changed the whole intellectual world. Art began to fashion after nature; and this new feature or type introduced into poetry is the grotesque, the characteristic trait, or fundamental difference, that separates modern art from ancient, the existing form from the dead, the romantic literature from the classic.

Shakspeare has said that there is a soul of good in things evil. The aim of modern art seems to be to show that there is a soul of beauty in things deformed and incomplete. We confess that the criticism of Aristotle is in our eyes superior to that of these Aristarchs. We have no sympathy for every day life, or for ignoble Nature, either in itself or in its copy.

"Rien n'est beau que le Vrai; le Vrai seul est aimable."

The beautiful alone ought to be the legitimate object of Art.

"High actions and high passions best describing."

We adore the soul above us more than the soul beneath us, as says the German Novalis; and in poetry as in life, our prayer to the gods is like that of the Grecian sage, — "Grant me what is beautiful and what is good!" Kant defines the beautiful, an infinite that manifests itself in the finite. In Greek poetry we have a pantheistic unity, and a polytheism evincing itself in materialism, — unity in the thought, multiplicity in matter. Placed between the Oriental world and Greece, — between Europe and Asia — it reflects the sanguinary strife and varied fortunes of the two principles which for twenty centuries have divided the world; and glorifies itself in the noble cause and sacrifices which fate had imposed upon its country — the canceller of so many ages of slavery to nations. Its religious thought is war between freewill and necessity, between man and the universe which enchains him. Greek intellect made the first steps towards a solution of that problem, but in its philosophy. The *life* of the Greek world is wholly in its poetry; the Greek mythological origins are all Oriental; and when writers had exhausted that spring, poetry was silent. The poetical period of Greece did nothing but state the problem. Hence its predominant narrative character and the conscience of the poet so seldom apparent, a sphere of images wholly objective, and a quiet and repose over all its creation, which, as we have elsewhere said, one is unable to attribute to the security of victory, or to the spirit of resignation. The Powers of Nature, sanctified and removed from analysis, subjugate it. Mysteries inclose every path to the exploring intellect, and throw a veil over the universe. Freedom agitates at the base of the pyramid — Fatality is enthroned immovable and tyrannical at the top, working without scope, as if for the mere exercise of its power — not the instrument of universal decrees, fulfilling themselves in despite of individuals — not laws which constitute man perforce the minister of a vast design, stamped by an Intelligent Cause upon the universe, but a brief and tremendous struggle between anguish and impassive cruelty, between the sacrificer and his victim, between man and destiny.

The prominent characteristics of Greek literature, subjective and objective, spiritual and material, mingled with the affections of the human heart, which are every where the same, gloomy and hideous, gentle and amiable, according to the nature of the superstition or mythology of the age and clime, are reflected in these slight tributes to the Manes of the dead. Some readers may esteem them insignificant and puerile, their forms uncouth, and their thoughts the reverse of profound; but whilst a relish for truth and nature abides, the scholar must always be enamoured of whatever traces a remembrance of his youthful love for that beautiful and poetical antiquity, "the island in the ocean of the world;" of which we conjure him, like the departing Augustus to his Livia, to live always mindful, if he would wish to sacrifice to the Graces, — *Memor vive et vale!*

THE CYNICAL MOROSENESS.

Καὶ οὐ πολλῆς τῆς πραγματείας δεῖ τριβώνιον περιβαλέσθαι, καὶ πήραν ἐξαρτήσασθαι, καὶ ξύλον ἐν τῇ χειρὶ ἔχειν, καὶ βοᾶν, μᾶλλον δὲ ὀγκᾶσθαι, ἢ ὑλακτεῖν, καὶ λοιδορεῖσθαι ἅπασι.

"It is no very great affair to put on a thread-bare cloak, to hang a wallet about the neck, to hold a stick in one's hand, and to bawl, or rather to bray, or bark at, and to abuse every body."

Which is the way to happiness? The question surely is not an inconsiderable one. Which is the short, straight, sure road, that leads at once to pure and perfect felicity — to consummate happiness — together with undying, unfading, imperishable glory? — which is the way? To lead the life of a Dog. Either there is no path at all, or it lies altogether, and only, in that direction,—To lead the life of a Dog! The sporting dog of a gentleman residing in the country passes his hours in ease and pleasure: being closely connected with the higher orders of society, he shares largely in the abundance, security, deference, and amusement, which are reserved for the favoured few. His diversions and employments and those of his master are the same; and, inasmuch as the quadruped is drawn towards them by a still stronger instinct, and bound and restricted to them by habits yet more exclusive, he probably enjoys and engages in them with even a keener relish than the lord of himself and of the rest of the creation. As to liberty, which is a sweet thing, the dog is subjected to no laws or restraints, except such as are indispensable to the right prosecution of the great end and object of his existence — the sports of the field; and as to honour and worship, things scarcely less sweet than liberty, he commonly finds about as much respect as his owner, or only a little more, or a little less, as it may happen. If, then, the life prescribed and propounded as a model be that of a fox-hound or greyhound, of a pointer or setter, it is, indeed, an excellent and an admirable one, of conspicuous celebrity for utility, dignity, and happiness; it being, in truth, the life of an English country gentleman. But to lead the life of a dog is not to live thus; still less is it to live after the gentler fashions of a lady's lap-dog, whose slavery should be sweeter than liberty, and his disgrace more honourable than honour itself. It is to be as a houseless, homeless, disowned cur in the streets of a large city; starved and snarling, ill-favoured and ill-conditioned, seeking to snatch a perilous shelter, or a precarious morsel; and to repay, by barking and biting, the frequent assaults of sticks and stones. Such is human happiness — such superhuman glory! For proof there is high authority, unexceptionable, and of universal acceptation and acknowledgment amongst the wise, even the sublimated extract and quintessence of ethical philosophy — the moral manual of Epictetus himself, of which the twenty-first chapter enjoins, "Remember, that you ought to conduct yourself in life as at an entertainment. Does one of the dishes, that are carried round, happen to be near you? put out your hand, and help yourself modestly and moderately. Does it go past you? do not offer to detain it. It has not come to you yet? do not extend your desires towards it, but wait patiently until it shall arrive. Thus with respect to children, thus with respect to a wife, thus with respect to offices, thus with respect to riches: behave thus, and you will some day be worthy to sit as a guest even at the entertainment of the immortal gods. If, however, when these good things shall be brought and offered to you, you do not accept them, but decline to partake of them, then indeed you will not merely be worthy to be entertained at the table of the gods, but

you will deserve to be their colleague, and to share with them in the government of the world. For it was by acting thus that Diogenes and Heraclitus, and others like to them, became, and most justly were esteemed, divine." How exquisite a passage! But it is not that we may give utterance to a suitable degree of admiration, which would be long and difficult, at the beauty and sublimity of the sentiment, or the strange felicity of thought and expression, but simply to show that a man who led the life, and received the appellation, of a Dog, was accounted not only the best of men, but of more than human goodness. He was recognised as being, indeed, absolutely godlike; as fit to participate in the supreme direction of the universe; and worthy also, probably, to receive divine honours and worship. The recognition was made some four centuries after the decease of the subject of it, and it is more complete and remarkable, because the author of it, by reason of the eminent and extraordinary propriety and purity of his life and doctrines, has sometimes been reputed a Christian philosopher. All men are familiar with Diogenes — the surly and the proud: very few of the celebrated personages of antiquity are more generally known than the Dog, at least under one aspect and phase of his character, but under that only; that is, as a morose Cynic, and appearing moreover most commonly in a ludicrous point of view, as the inhabitant of a tub, and as doing many odd things tending to the amusement of children. He is reckoned rather to resemble a mastiff, a bull, or a bear, which being confined in a public, but secure place, deserves well of the commonwealth of boys, because it may readily be provoked at any time to bark, roar, or growl, for their diversion, than to present the goodly image and impress of heavenly wisdom and virtue. How then is the mind to be divested of its bias towards jocularity? how is the farcical notion to be banished, and a serious and more equitable valuation of the renowned Cynic to be substituted?

The ancient Egyptians were so strong in their piety, or superstition, that they could worship a dog; but, by the dog itself, μὰ τὸν κύνα, (the oath is Socratic,) it is hard to arrive at a full apprehension of the divinity of the philosophic Anubis! So entirely is the fancy prejudiced, prevented, and preoccupied by the comic effigy of the sullen humourist, that a strong effort of the intellect can alone repel it, and bring us to contemplate the assertion of his surpassing excellence otherwise than as a self-denying affirmation — a fine irony — a subtle Socratic subsannation.

Nevertheless it is unquestionable, and not to be doubted, that of scarcely any of the famous men of antiquity was the glory more entire, ample, and solid. Yet, although the fact is stated, as being an acknowledged historical truth, yet astonishing, and almost incredible as it is, it is one of several surprising, paradoxical, and ill-understood passages in the story of old times, which have escaped the searching ingenuity of sharp and erudite wits, who love with a pleasing, artless, unpretending pedantry to hunt out the curiosities of the former world. Consequently the observation, that it is difficult of imagination, and hard to comprehend, how by such a course of life such celebrity was attained, has something of the freshness of originality. Diogenes was the son of Hicesius, a banker, in the remote but famous city of Sinope, whose bank stopped payment in consequence of some pecuniary operations. Concerning these operations there is some diversity of opinion and of testimony, as to what extent they were fraudulent, and as to what share the son had in them. It seems that he admitted that they were improper, and that he had been himself culpable: the confession was made, however, at a period when his notions of morality had become very strict. Modern philosophers assure us, that anciently the true prin-

ciples of the science of banking were very imperfectly understood; accordingly the failure of Hicesius and Son was ruinous, not merely to their innocent customers, but, contrary to the modern, and more scientific practice, to the guilty partners also. The young banker was the victim of this pristine ignorance; he found in the bankruptcy of his house, not a mine of wealth, but a heavy load of insurmountable poverty: disgrace, exile, and misery; not an augmentation of credit, ease, and opulence. He fled to Athens, where, in spite of denials, of blows, and the utmost hardness of sticks, he forced himself upon Antisthenes, the founder of two illustrious sects; for the Cynics and the Stoics had a common ancestor, a common origin, one common father. He also attended the schools of other famous teachers, and adopted through necessity, being a poor man and an exile, a plain, simple, economical mode of life,—καὶ, ἅτε φυγὰς ὤν, ὥρμησεν ἐπὶ τὸν τριβῶνα βίον. He soon embraced, and publicly professed and practised, in their utmost severity, the Cynical principles and methods of his great master, Antisthenes; and afterwards aggravated, exasperated, and outraged, by incredible extravagances, the austerity of Cynicism itself. His diet was not only moderate and temperate, but it became coarse and gross, and indeed filthy and horribly disgusting. Two of the various accounts which describe the cause of his death, illustrate the opinion and belief of his countrymen, as to the kind of nourishment with which he chose to support his happy and glorious existence. Some writers relate that he died of an attack of cholera, or cholic, occasioned by devouring a neat's foot raw: others say that a bite in the leg proved fatal, which he got in attempting to take away for his supper a portion of a marine animal, called a polypus, from some hungry dogs, that were greedily eating it. He went bare-headed and bare-foot, his only covering by day, or by night, being a coarse threadbare cloak. In this respect he did not go beyond his master; for Antisthenes, fascinated with the loveliness of an utilitarian life, had previously discovered, that a tunic, or shirt, is a superfluity; and that the final cause of dress — warmth, might be attained at least as well by doubling the ample cloak, or mantle, of the Grecian costume, as by wearing a tunic beneath the cloak; accordingly that garment, their sole integument, was worn double by the Cynics. The tunic or shirt, therefore, became the specific difference, that separated the sturdy members of the Cynical persuasion from the stern gentlemen, who followed the rules of a kindred and not dissimilar sect — the Stoics: —

> *Et qui nec Cynicos, nec Stoica dogmata legit,*
> *A Cynicis tunicâ distantia.*

Thus a vestment, sacred or profane, of service or of ceremony, has sometimes afforded means to discriminate and to classify the whims of more modern sectaries. The full Grecian mantle, being made scanty, by being doubled, was wrapped closely round the bare body of the Cynic, the right arm being uncovered as far as the shoulder, that the free use of an instrument, which was the inseparable companion and indispensable adjunct of the philosopher of utility, might have no let or hindrance; and the heavy blow of a thick, knotty stick might at once clench an argument, silence by a sharp stroke, in aid of his candour, an obstinate opponent, and give resistless strength to reason, additional poignancy to reproof, and a fresh grace to persuasion. The folded cloak was confined at the waist, and secured by a yard of rope, a leathern strap, or some other homely cincture; but the sage within was not over solicitous respecting the concealment of his person. Certain pious advocates for nudity have preached, that it is not for man to be ashamed of what God has made, and that every part of the human body

is alike beautiful, and equally and exceedingly honourable. The Cynics, on the contrary, arrived at the same conclusion by the opposite road: they maintained, that far from not being ashamed of any of our members, we have a sufficient, but uniform, cause to be ashamed of and to abhor all of them indifferently; the intellectual man being most noble and all glorious, and the corporeal man utterly despicable and abject. The lordly soul weening in its pride, that it promotes its own exaltation to contemn its servant and slave, and beast of burthen, the body, does well and wisely, they teach, in showing how scurvy a brute the animal man is. Inasmuch as the whole fleshly fabric is altogether and indiscriminately infamous, and the hands and face are not one whit less disreputable than the rest, the conscientious Cynic was bound to display any other portion of his hateful self without more repugnance, and as readily as these. Consequently the four-footed dogs of both sexes are not more exact and impartial in permitting themselves to be freely viewed from the tip of the nose to the tip of the tail by all persons, at all seasons, and in all places, than the two-footed dogs of both sexes were in making a total, uncompromising, gratuitous exhibition of their vile and detested bodies.

Moreover, in favour of moroseness, and on behalf of the sacred interests of utility and truth, it was deemed proper, if there was reason to believe, that any person would be especially shocked, annoyed, or offended by the exposure, studiously to insult such weakness to the utmost; and a female Cynic was peculiarly obliged, for the credit of her sex and the dignity of philosophy, to set forth in a most conspicuous light her contempt of antiquated prejudices, because the revelation, being less looked for, would be more startling, more instructive, and more improving. The mansion of the great Diogenes was a tub, a large jar, or cask; a kind of residence in which a four-footed dog is sometimes still induced, by means of a chain and collar, to dwell; for, like the porters in Naples, he was content to abide in the streets and public places, without the poor shelter of his rolling home. It seems to have been esteemed by him an object of primary importance to harden himself, and by wallowing in the snow, basking in the fiercest sun, and submitting to each various inclemency and rigour, to acquire, as being something preeminently noble and conducive to happiness, the power of enduring cold and heat, and every privation and hardship, and a certain Spartan manliness. Many instances attest his extreme aversion to any softness, delicacy, or effeminacy; he constantly and with much vehemence upbraided the Athenians and his other contemporaries on account of their defects in this respect; and bitterly complained that they were not men; that he wanted, and looked in vain for, a man. He perambulated the streets at noonday with a lighted lantern; but the object of his search was not according to the popular version of the story, an honest man, but simply a man,—λύχνον μεθ' ἡμέραν ἅψας, Ἄνθρωπον, φησὶ, ζητῶ. There is more point in the joke of hunting a crowded street in vain for a mere man, than in asking in a great commercial city for an honest man, where it is acknowledged that, in the strictest sense of the term, such a commodity is not to be had. Besides, it is related, that on other occasions he required to have a man; and a crowd of men being immediately pointed out to him, he replied, there is not a single man there; that is only a rascally rabble of poor, weak, effeminate wretches. He did not want an honest man; a person not dishonourable, or dishonest, in any the smallest degree; one, who had never taken the least advantage of another in trade, or other transaction—such an individual is probably rare, as he is certainly most estimable. But such an one the banker did not want; he asked not for honesty, but for manliness and

hardihood. I want a man; a fine, bold, roaring, foul-mouthed fellow, ready to say and to hear any thing, and to give and take thwacks with a cudgel; to scorn shirt and shoes; to go half-naked; to sleep in the kennel; to eat raw beef, and raw fish; and last, but not least, I want one who will not scruple to do coolly in public whatever those, who are not wholly lost to shame, blush to name in private! In what terms can the utter unreservedness of the Cynics be described? It formed the key-stone of the arch; it was the pole-star in their heaven; their leading feature; the grand fundamental principle; the *sine quâ non:* it may not therefore be passed over in silence; it was to them what silence was to the Pythagoreans, irony to the Socratics, constancy to the Stoics, hilarity to the Platonists, doubt to the Sceptics: to the Cynics this form of moroseness was the rule and touchstone of the order; yet it is difficult to speak of it. Diogenes, as his namesake and biographer writes, used to perform in public all the rites both of Ceres and of Venus, ἐδόκει δὲ πάντα ποιεῖν ἐν τῷ μέσῳ, καὶ τὰ Δήμητρος καὶ τὰ Ἀφροδίτης. Concerning the rites of Ceres he argued thus:—if to dine is not an improper thing in itself, it is not improper to dine in the public streets; but to dine is not an improper thing in itself, therefore it is not an improper thing to dine publicly in the streets. It is probable, that the philosopher was the more disposed to take his meals in public, that it might be generally known, that his practice was in strict accordance with his professions, and that his fare was really coarse, gross, and distasteful. The Cynical usage of devouring openly in the market-place an unsocial and unpalatable morsel, at irregular periods, like a dog, seemed exceedingly shocking to the Greeks, a wise nation, to which the solemn and comfortable refection of a well-ordered, well-spread table at canonical hours was ever acceptable and truly dear. Besides, to the pious and jolly Greek the banquet was a matter of conscience, as well as of delight; to him supper was supper, and on that account alone an affair of no small moment: but it was also a sacrifice, a religious rite, a holy ceremony of family worship, and of household domestic devotion; a divine service to be observed seriously, and to be consecrated in its commencement, progress, and conclusion, by prayers, thanksgiving, and libations. A poor man could eat his dry crust, or his cold apple, in a corner, meekly praying and earnestly desiring that his next repast might be less unsatisfactory; but a man of competent fortune was guilty of black ingratitude towards the celestial givers of all good things, and of rashly tempting and provoking the forfeiture of blessings, by demonstrating that he was plainly unworthy of them, if he omitted to regale himself and his house in modest luxury, commensurate with his worldly substance; even the austere entertainments of the Spartans were regular and decorous, sociable and conversable, although, on account of their peculiar institutions, the fare was hard and scanty. The social table and the cheerful hearth were the proper altars of the household gods; the feasts of the immortals were celebrated in poesy and fable, not less than their loves; and the genial board was equally sacred with the genial bed. Accordingly the unwholesome, disgusting, ill-timed diet, at once lonesome and public, of the dogged sect, was nearly as odious and indecent in the eyes of the merry, companionable, festive Greeks, especially of the polite inhabitants of Athens and Corinth, in which cities Diogenes commonly resided, as certain astounding and horrible violations of decency; and the former improprieties are ordinarily related at the same time, and often in the same sentence, and with the same degree of censure, as the latter. In these days the gratifications that attend a copious, well-arranged, hospitable repast, are the only obligations which bind the opulent to observe a liberal economy of enjoyment; the richest man might now feed habitually on the vilest offals without incur-

ring any other reproach, than the imputation of bad taste, and possibly of niggardliness. With respect to the other peculiarities of the Cynics, it is quite otherwise.

The admirable Lactantius indignantly asks, "*Nam quid ego de Cynicis loquar? quibus in propatulo coire cum conjugibus mos fuit. Quid mirum, si a canibus, quorum vitam imitantur, etiam vocabulum nomenque traxerant?*" Every philosopher, who was ambitious to lead the life of a dog, sought by an exact conformity with canine usages, particularly with that which mainly served to impose the name of dogs upon the sect, to arrive at a perfect imitation of the life of the animal, of which they borrowed the appellation. History has handed down the names of many famous men, together with ample testimony of their close compliance with the rigid rule; and also the name of Hipparchia, the sister of one Cynic and the wife of another; together with a full and correct report of this lady's nice observance of each doglike act. Is a degenerate posterity to infer from the narrative of by-gone greatness, that the conformity of the learned and admired female was ordinary and habitual, or merely occasional and rare? The charity, or the weakness, of a faint-hearted modern would fain believe, that this ancient heroine, as well as other wisdom-loving dames of more zeal than delicacy, thought fit to cynize thus, once or twice only, in order, by a great example, to read a great moral lesson to their age and sex. It will be readily imagined, that the adherents of the shirtless sect, since they did not hesitate to perpetrate openly what less enlightened persons account the greatest act of indecency, did not scruple to commit every minor indecorum with freedom and frequency. The philosophic moroseness was constantly paraded by a conscientious preceptor, or a promising disciple, in a steady course and perpetual succession of insults to the senses and feelings of modest and well-conditioned auditors and spectators; and forasmuch as such behaviour was less likely to be anticipated by worldlings, the brutish deportment of a female sage was encouraged and applauded in an eminent degree by the elect, as being more exemplary, more effective, more truly morose, and more exquisitely philosophic, than the uttermost vulgarity of a whole army of men. The strange story of the distasteful but most illustrious school presents a long, and surely a discreditable, catalogue of disgusting, abominable, and revolting outrages. Such as their actions were, such also were their words. If there was no deed, not in itself criminal, which the good Cynic should decline to perform at all times and in all places; if there was no act, of which he might ever allow himself to be ashamed; it is plain that he could not but esteem all words alike harmless and equally fit for every occasion: of what word could one, who reasoned and lived thus, ever be ashamed? To let fly from the bulwark of the teeth whatever expression might first occur, indifferently and indiscriminately, without choice, reflection, or consciousness, whether it would seem to the laity modest or immodest, was the common mitigated course of the lukewarm brethren: the Cynic, the zealot, and the entire sisterhood,—for the sisters are uniformly zealous,—were sternly addicted to the pious use of ribaldry of the most obscene filthiness. For to adopt a decent phrase when an indecent one could be found, or carelessly to neglect the more gross for the less startling, so long as a single unconverted individual still retained weakness enough to be shocked at any thing, was to throw away, through a culpable remissness, an opportunity of doing good. The predominant and perpetual obligations of moroseness likewise demanded the immediate employment of language likely to prove an annoyance to any body; not only by reason of its obscenity, but to scurrility also there was its favour with the dogged tribe. To lead

the life of a dog was the fundamental canon of Cynicism; to snarl, to bark, to bite, to rail, were some of the golden fruits of submission to the golden rule; to cast slanderous and odious imputations, to hurl bitter, biting, angry reproaches and invectives, and to reap a rich harvest of heavy blows, were other fruits. The strokes, which the rabid insolence of the unshod critics provoked, were often received with as much patience, as if the doctrine, common to both Stoics and Cynics, were undeniably true, that kicks, cuffs, and stripes, and all such external and indifferent things, are of no concernment whatever to the recipient; and they were often returned by the bare right arm, and the ponderous gnarled cudgel, with as much ingenuous earnestness, and as hearty a good will, as if the same common doctrine were utterly false and unfounded. Such was the personage to whom one of the most staid and sober of the philosophers — a grave, and wise, and justly admired moralist,—would intrust the dominion of the world, an empire over all things co-ordinate with the Supreme Intelligence; such was the man who has been commended by authorities still more austere and venerable, who has been mentioned with honour by Origen, Basil, John Chrysostom, Jerome, Augustine, and by other saints and doctors — fathers of the church: it would be long to repeat, but it would be agreeable to refer to their praises of the dog Diogenes. He covered himself with glory, although he sought it not; he acquired fame, which he did not value; for he taught that, for the sake of reputation alone, apart from utility, a man ought not to take the trouble even to hold out his finger. "*De bonâ autem famâ Chrysippus quidem, et Diogenes, detractâ utilitate, ne digitum quidem, ejus causâ, porrigendum esse dicebant.*" Thus said the proud utilitarian; and the vain Cicero, in recording the saying, records also his dissent, and his own opinion, that a good renown is valuable for its own sake, without reference to its usefulness,—"*propter rem ipsam, non propter usum.*"

The Cynics were accounted admirable, because they led the life of the gods; and the life of a dog, when duly estimated and measured by the proper standard, is more like the life of a god, in the apprehension of philosophers, than it appears to be to an ordinary apprehension. To conquer the nature of man was the object of Stoicism; the aim of Cynicism was to go beyond it. "*Hominis naturam cum Stoicis vincere, cum Cynicis excedere.*" To quit the common path is an uncertain and ambiguous direction; to become like to a being superior to humanity, or to grow similar to one inferior to it, would seem to be two different and opposite things; yet the wise teach that they are the same: it is the same thing, or very nearly so, to be a god, or a grasshopper. "Old age does not oppress thee, thou wise, earth-born songster; but being exempt from sickness and suffering, bloodless, fleshless, thou art almost like unto the gods!" With a poetic jocularity a festive poet thus addresses the grasshopper, or some such insect: —

> Τὸ δὲ γῆρας οὔ σε τείρει,
> σοφὲ, γηγενὴς, φίλυμνε,
> ἀπαθὴς, ἀναιμόσαρκε·
> σχεδόν εἶ θεοῖς ὅμοιος.

With earnest seriousness many a moralist inculcates in didactic prose, that the canine existence, for nearly the same reasons, is equal to the divine. "If any one doubts about the happiness of Diogenes, he will doubt also concerning the state of the immortal gods; whether they live happily because they have no lands, no gardens, no valuable farms, no large capital at interest. Are you not ashamed, if you admire riches, to look upon the universe, for you will see the gods destitute of every thing, — giving all,

retaining nothing? Do you account him poor then, or like to the immortal gods, who has stript himself of whatever is in the power of fortune?" "*Si quis de felicitate Diogenis dubitat, potest idem dubitare et de Deorum immortalium statu, an parum beaté degant: quod illis non prædia, nec horti sint, nec alieno colono rura pretiosa, nec grande in foro fœnus. Non te pudet, quisquis divitiis adstupes, respice, agedum, mundum: nudos videbis Deos, omnia dantes, nihil habentes. Hunc tu pauperem putas, an diis immortalibus similem, qui se fortuitis omnibus exuit?*" It was a profane and an impious thing, therefore, to harbour any doubts as to the supreme felicity of Diogenes. The pre-eminence of the divine, or cynical, life consisted in this, that being in want of every thing, it wanted nothing; and having nothing, it had nothing to lose. When this mode of existence was first presented, the novelty was probably very striking. The first time the lion sees a naked man, or woman, he runs away in the utmost terror, however hungry; the next time he is less alarmed; and the king of beasts soon grows familiar with the forms of the lord and lady of the creation, so that he shortly learns, it is asserted, to devour them, although quite bare, just as readily as if they were muffled up to the chin. When any pretty pleasant device is new, it is fresh and fashionable, and it captivates the fancy of all, who are wise enough to give their attention to such matters; but through use it grows stale, and common, and vulgar; and good taste again demands something new. The world was long able to contemplate with awe, with veneration, and amazement, a limited and select establishment of four vestal virgins; and, indeed, reverence might be carried with perfect safety somewhat further; but if every plain poor girl, whose face, or pocket, will not purchase a husband, is to consecrate her virginity to heaven, the pale-eyed sisters will wax tiresome at last. And so is it with the divine life: the monastic orders adopted it, and pursued it often no doubt with edification and unction; but they wore out the cloak of the Cynics, which was threadbare in the beginning; and the abstinent, the austere, the ascetic, the eremitical, in short all the ingredients of Cynicism, have been brought into bad odour by the frowzy monks. But how striking soever the divine life might be whilst it was still a novelty, and unquestionably it made a very deep impression upon the lively fancy of the sensitive people of the south, it is not sufficient in itself to explain the causes of the success of the sect of Cynics. In order to form a just notion of the depth and strength of the impression, we must not forget to take into the account the warm and kindly temperament of the audience, to whom the representation of a new drama of existence was addressed. Should some ill-advised sage profess under less genial skies to reject all the superfluities, all the comforts, and nearly all the necessaries of life, the churlish humour of the north would take him at his word: without sympathy for sufferings voluntarily undergone, or compassion for errors springing from a laudable motive, the rigid rule of self-imposed abstinence would be literally enforced, without any mitigation, and the unpitied, despised ascetic would be deemed a fool for his pains. Where the rights of hospitality were generally acknowledged, and the hospitable rites duly and religiously observed, — where innumerable obliging and neighbourly offices tended continually to endear the stranger to his friendly entertainers, the constant refusal of the offered favours, or the acceptance of so much only as would fall to the share of a little regarded dog, would at once stimulate both the curiosity and the kindness of tender-hearted inquirers. But where the stranger's sole recognised claim to attention is the prospect of being more readily defrauded, of being cheated aptly and promptly in a sale, or a purchase; where the frigid indifference of constitution is confirmed by the

inborn and impenetrable self-conceit of the untaught savage, — there no novelty, unless it be utterly frivolous upon the face of it, can engage; no sacrifice, except a pecuniary one pretended for deceit, can move; no speculation, save such as promise a considerable premium, or usurious interest, will ever attract. Yet granting the full force of contrast,—conceding every thing that can be asked for climate, institutions, race, education, dispositions —allowing each postulate, accepting every suggestion, and thankfully assisting and co-operating with an expositor, who would read a riddle; still, still we feel that the mystery has not yet been explained. The strangeness of the new life alone was not adequate to the effect produced by the sect, that invented, or adopted it. The Spartan scheme of polity had long ago circumscribed man's physical wants by a very narrow circle; the free choice of coarse fare, and homely apparel and lodging, and the wilful endurance of cold and heat, hunger and thirst, and other hardships, together with similar moral phenomena, had been exhibited already on a grand scale by the zealous disciples of a practical philosopher, Lycurgus.

The Lacedæmonians had learned to strip themselves of the fortuitous and the extrinsic, and thus to prepare for mental and martial struggles, as coolly and as quickly, as the expert pugilist casts aside, for the advancement of science, his coat and waistcoat. So completely had they denuded themselves, indeed, of every thing that is in the power of chance, that Fortune, according to the felicitous comparison of Bernard de Mandeville, could do no more mischief to them, than a blind mare in an empty barn: but the Spartans, although naked, were still decorous, decent, orderly, and even formal, as were the Stoics also; consequently, in this respect, they were quite different from, and diametrically opposed to, the Cynics; and besides, together with military institutions, a warlike nation exactly observed the military politeness. That glorious moroseness which was the peculiar attribute and characteristic of the dogged sect, and, as it were, the charter of their liberties, immunities, and privileges, and the foundation of their mighty and abiding renown, was as little in use at Lacedæmon, as it is understood by yourselves at the present day. What was this famous quality? How did it endear those who professed and practised it to their contemporaries, and render them illustrious in their own age, and in succeeding generations with all posterity? These are questions of difficult solution: perhaps it is no light matter even to apprehend rightly the difficulty of answering them. Why were a body of men so generally and so long revered, whose very appellation was a title of reproach, and their description opprobrious? The Cynical, or dog-like philosophers are so called, on account of their unsociable and intractable wilfulness and self-conceit, and their boldness and shameless impudence, — for such are dogs, and such are they, — οἱ Κυνικοὶ φιλόσοφοι, διὰ τὸ αὐθαδές, καὶ θρασὺ, καὶ ἀναιδές, τοιοῦτοι γὰρ καὶ οἱ κύνες. It may be, that by reason of its remoteness we are unable to discern, through the misty distance, the foregone excellence which captivated our forefathers; but is it quite certain that we should be sensible of it, if it were still present with us? If we had teachers of equal merit, should we be duly impressed by the moment and value of their instructions? Alexander the Great was attracted by a noble curiosity to visit the admired inhabitant of the tub. He made large and unlimited offers to the Cynic; and skilful and experienced interpreters affirm, that the question was sincere and of literal acceptation, — "Is there anything that I can do for you?" "Only to stand aside a little;" for at that season of the year, or of the day, the sunshine was agreeable. "If I were not Alexander, I would be Diogenes." — "If I had not been placed by my destiny in a station to which I was born, and which I cannot quit; if I

were at liberty to choose a course of life for myself," — the full purport of the monarch's obesrvation is seldom seized, — "I would certainly dwell in a cask, naked, homeless, penniless; I would feed on the vilest offals; and, in one word, I would lead the life of a dog!" What was it that at once caught the king? He was a man of no ordinary genius, of much learning and perspicacity, the companion of philosophers, and the friend and pupil of Aristotle: the attraction was not futile, or trifling; but whatever it was, would it have prevailed equally with a conqueror of modern times? A certain worthy man, Onesicritus by name, being one of the Myrmidons, — that is to say, a native of Ægina, — sent Androsthenes, the younger of his two sons, on some business to Athens. The youth casually fell in with the Dog, who seized him by the ears, and held him fast; so that he wholly forgot his errand, his own people, and his father's house. After some time, as he failed to return, the old man sent Philiscus, his other and his eldest son, to look after the business and his brother: but on his arrival this young man also tasted of the suavity of the Cynic's discourses; and being spell-bound by the mighty wizard, he, too, presently forgot his old father and his home. At last Onesicritus, growing impatient and uneasy at the unaccountable delay, came himself to Athens; and for a long time afterwards the father was seen following, with both his sons, the half-naked philosopher,—the three earnest, eager listeners, always seeking equally to soothe their love by catching the accents of truth, and beauty, and wisdom, as they fell from lips coarsely and filthily nourished. What did he say to them? what words did "the Dog" address to these good people from Ægina? If we could hear them, would they arrest our attention now as powerfully? should we also be rivetted to the earth, and inevitably coerced to pursue the rotatory peregrinations of the wooden house? what charmed speech would be strong enough to bind and to loosen us and them? The difficulties are so numerous and so perplexing wherewith the history of the olden times is thickly beset on every side, and the matters depending upon these difficulties so momentous, that it is not easy to determine with what welcome the harbinger ought to be received of him, who shall clear up, and expound even partially, a few of them. The eloquence of Diogenes was persuasive and powerful, as we learn not merely from the record of its effects, but likewise from express testimony concerning himself and other members of his sect; and the style of some Cynics, we are told, even resembled the lovely diction of Plato. The citizens of Athens and of Corinth were acute and impassioned critics; they were well qualified to form the nicest and most delicate judgment respecting the merits of oratory; and they were ever ready also to be enraptured and borne away by speakers, whose discourses fulfilled all the difficult conditions and the hard exigency of their criticism. They were, in truth, epicures in speech; and a refined, fastidious, difficult taste, which taught them to reject with disgust whatever fell below the standard of perfection, gave a sharper edge to their appetite for the exquisite: they could not endure to be fed with ordinary fare, and they laid hold of any occasion that set before them the rare, the extraordinary, and the delicious, with the rapacity of famished guests. The orators — the great masters of the whole art and practical science of rhetoric — were commonly politicians, political adventurers, and empirics. Their hearers had listened to them with intense delight; but sometimes to their shame, to their bane, to their lasting injury and utter destruction. The entertainment was sumptuous — every plate savoury — the whole consummate; but was it wholesome? Some meats were poisonous, many medicated, nothing absolutely safe.

The Cynics, on the contrary, sought not place, power, or profit; they had

left all, renounced all, and were civilly dead: they hunted after nothing, except perhaps praise; save only a harmless vanity and a certain self-punishing pride, they had extirpated every passion. At their feasts all was what it seemed; there was no guile, no cause for apprehension, for confidence many; whatever was delightful to the palate was assuredly salutary to the stomach; every viand was ingenuous, or if perchance any drug was present, it must be something that would corroborate and infuse a marvellous health into the entire system. The very peculiarities themselves, which constituted the characteristic moroseness, were additional securities; each of the horrors, to which some allusion has been made, was a distinct pledge that the bridge of self-interest had been broken down, and the world and worldliness cut off for ever. Not only was the eloquence of Diogenes remarkable, but his wit also was universally celebrated; many brilliant repartees still display its poignancy and originality. The divine gift of apt, sudden, irrepressible, irresistible facetiousness, was duly honoured by an age eminent for felicity of genius: he is surely a favourite of the gods, in whom resides the brightness of a quick fancy, together with a rich vein of genuine native humour; and if it ever happen that such an one is not the favourite of men likewise, it is only during some sad period of obscuration, when mundane dulness for a while offuscates the celestial light. As the stars shine brightest when other luminaries are withdrawn, so the radiance of his pleasantry was more effulgent by reason of the dark night of a repulsive and odious life, in which he thought proper to envelope it. The temper of the Cynic wit was caustic; plain-spoken, bold, and biting quips were freely thrown in; hard heavy hits and home thrusts were exchanged unsparingly, and without reserve; the mordacity of the dog, a constant attribute of the sect, was found not in the teeth, but in the tongue, —

——— *Namque*
Mordacem Cynicum sic eludebat.

The sect of Cynics were endeared to the free citizens of the ancient world by an ardent love of liberty of speech and action, — by an unconquerable spirit of full and absolute independence; because their doctrines and discourses were powerful provocatives to the appetite for freedom, public and private, perpetually exciting their disciples to hunger and thirst after it, as the supreme good. On this ground principally is Diogenes strenuously and heartily commended by the philosopher Arrian, in his excellent commentaries upon the Manual of Epictetus, and by others of the same school; and not by stern Stoics alone, but by the graceful, festive, indulgent Platonist. Maximus Tyrius, a Platonic philosopher, extols " the Dog" for his entire and lofty immunity, and wise, virtuous, and sublime self-sufficiency, in strains of speech, and with a force of conception and of diction, that astonish and stun the reader. And, indeed, it is always very difficult, when fresh from reading, or even from referring to the compositions of the more profound and eloquent of the ancients, to speak or to write at all ourselves; for their beauty is so transcendent, that it paralyses the trembling tongue, and benumbs the hand with amazement; and being bowed to the earth by heaviness at our utter incapacity to speak, or write, not in truth, as they spoke, or wrote, but in phrases that can be tolerated by the only competent critics, by those who are familiar with antiquity, we are often constrained to guard a diffident silence, distrustful of ourselves, notwithstanding any impression of the value, or importance, of what we should otherwise be disposed to communicate. The distaste of the republicans of Greece for whatever bore the aspect of dependance was excessive, and their inge-

nuous and liberal fastidiousness shrunk with abhorrence from any contact with subserviency. But their institutions, although comprehensive in practice, were select in theory; they loved an oligarchy, in which the few were many, yet still comparatively few; an aristocracy, in which the best were numerous, and not uniformly as good as they ought to be, but were yet, upon some principle of choice, the best. In their democracy they had no notion of universality, whereby, as has been ignorantly supposed, or dishonestly pretended, every filthy fellow, with no other qualification than his impurity, was a lay presbyter of the commonwealth, and might exercise executive, legislative, and judicial functions, purely in right of his dirty shirt; each scheme of polity was something exclusive, which shut out much, even when it embraced the most. Liberty and equality, — these famous words being understood in a generous acceptation, and as they would be welcome to a scholar and a gentleman, — were fondly cherished by Antisthenes, the founder, and Diogenes, the prince of the Cynics, and by their successors and liegemen. Their love of knowledge was not less conspicuous than their love of liberty. Pythagoras was the first philosopher, the first to style himself a lover of wisdom, and his love of it was doubtless great; but greater was the love of the Cynic, who loving wisdom and wisdom alone, for its own sake, contemned and rejected every thing besides. The man of a vast soul, *vir ingentis animi*, as Diogenes has been called, was esteemed an able and acute dialectitian; and by him and his disciples logic, the instrumental art, which directs the mind in the just knowledge of things, was carefully and successfully cultivated. But the canine confraternity have been accused of undervaluing the other liberal arts, under the vain pretence that they are useless, and of condemning a liberal education through some foolish and futile profession of naked utility. It would probably be found, on a patient and judicious examination, that the sages rather censured the mode in which the education at that time in fashion, and termed τὰ ἐγκύκλια μαθήματα, was conveyed, and the purposes to which it was applied, than laboured to deter students from the acquisition of any branch of learning. But the inquiry would lead into a wide field of criticism, of citations and disquisitions.

The Cynics, as a sect, were pious and religiously disposed. The most illustrious of their family has been accused of Atheism; but the accusation in the case of Diogenes, as in almost every instance of the like hateful charge, was altogether unfounded, and has been made in ignorance and error. He spoke freely on all subjects, and also concerning the gods and of divine things. Such of his remarks as remain display a certain keen and vigorous license of speech, and an outward show of levity, at least to those who cannot see beyond the shell, or discern the profound import couched within; but they are never disfigured by any real impiety, when rightly understood and fairly interpreted. In extenuation of the Cynical moroseness, and to assist us in comprehending the motives of those who bore with it, or even approved of it, and indeed admired, as did sundry worthy persons who are far above reproach, and almost above praise, the prudent choice of men content to lead the life of a dog, it is meet and fit to consider well the character of the times in which they practised a strange and astounding self-denial, inconceivable humiliations, and mortifications monstrous, inordinate, and incredible; to ponder and weigh scrupulously in the equal scales of an unbiassed judgment, not only the great and grand and glorious examples, not only the splendid virtues and the splendid vices of the heathen world, but the mean, sordid, selfish infamy, the abominations and corruptions, wherewith the majesty of the antique splendour was defiled and

polluted; to regard the prodigious luxury, the excessive and unnatural effeminacy, the devouring insatiable rapacity, the profuse insensate prodigality, all the frightful and desolating sins, and guilt unutterable and intolerable, that the strait rule of the severe order of the most holy Cynical fathers would subvert from the foundations, and would render thenceforth and for evermore ineligible, impracticable, and impossible. The objects sought, the final cause, the end and aim, were precious and inestimable; and worthy to be purchased, if they were not to be procured on easier terms, at a very heavy and burthensome price. The friend and votary of simplicity might prefer to be received, in the Cynic fashion, on a hard homely bench, rather than upon a soft and decent couch:—

Potius in subsellio
Cynicè accipiemur, quam in lectis.

And if luxury and its incident and inherent extravagance and rapine were altogether abhorrent from his nature, he would dread a coarse and revolting diet less than these more alarming and most pernicious evils. The name of the sect became, as it were, the name of temperance, being interwoven with, and not to be parted from, frugality. That there could possibly exist any similarity between the honest Cynic and the mean parasite was a ludicrous idea, a notion broadly farcical, and apt to provoke bursts of loud laughter. Accordingly, the grand master of comic power, in whose graceful compositions, as in a boundless bottomless ocean of scenic excellence, every beauty and every virtue of the drama luxuriates in exuberant plenty,—the consummate Plautus proposes, as something rarely jocular, that all parasites should belong to the family of Cynics:—

Cynicâ esse e gente oportet parasitum probe!

A column, with the statue of a dog in Parian marble upon the top, adorned the tomb of the most illustrious of this family. Pausanias, some four or five hundred years after his death, describes the spot like one who had visited it. "As you go up to Corinth," he says, in his description of the environs of that city, "there are other monuments by the road side; and Diogenes of Sinope is buried near the gate, whom by way of addition the Greeks call—the Dog." Ανιοῦσι δὲ ἐς Κόρινθον, καὶ ἄλλα ἐστι κατὰ τὴν ὁδὸν μνήματα, καὶ πρὸς τῇ πύλῃ Διογένης τέθαπται ὁ Σινωπεὺς, ὃν κύνα ἐπίκλησιν καλοῦσιν Ἕλληνες. Other works of art were consecrated to the memory of this remarkable man; but the most lasting and the most honourable memorials of his greatness are to be found in the writings of the wise of former days: one of his eulogists must not be forgotten. The admirable Lucian has fastened with the sharp lash of unsparing satire the indelible scar of a flaying jest upon every conspicuous absurdity; he has not spared the errors and follies of the Cynics, yet he treats Diogenes with reverential regard. His suffrage is important; and one short extract from his incomparable "Dialogues of the Dead" may serve, in some measure at least, to explain why toleration was extended to the canine life and the Cynical moroseness. "But we had no such thoughts about each other, when we were alive," Diogenes observes, to whom his disciple, Crates, had been relating the history of two enormously rich men, each of whom earnestly desired the death of the other, that he might be his heir; "we had no such thoughts. I never once wished Antisthenes to die, that I might inherit his staff, although he had a very stout one made out of a wild olive tree. Nor do I think, Crates, that you ever desired to inherit my property, when I died; my tub, and my wallet, with two quarts of broad beans in it."—"No; I had no need of an inherit-

ance; nor had you, Diogenes; for you inherited of Antisthenes whatever was necessary for you, and I from you, an inheritance much greater and more dignified than the Persian empire."—"What inheritance do you mean, Crates?"—"Wisdom, and frugality, and truth, and freedom of speech, and liberty."—"Yes, by Jove, I remember receiving all this vast wealth from Antisthenes, and leaving it, with large additions, to you, my successor. But others cared little for such property; and nobody paid court to us in the hope of being our heir: they set their eyes on gold alone. And very properly so; for they had no place in which they might receive such things from us. Being utterly corrupted by a delicate and effeminate life, they were like rotten purses; so that if any one ever happened to throw into them wisdom, or freedom of speech, or truth, it fell out immediately, and ran away like water, the bottom not being able to contain it: just as those poor damsels, the daughters of Danaus, keep pumping into a leaky tub. But gold they kept fast hold of with their teeth and nails, and in every possible way. Consequently we shall have our wealth even here; but they will bring with them no more than a single halfpenny, and that only as far as to the ferryman."

THE SOCIAL CONDITION OF JAMAICA.

A LETTER FROM A RESIDENT PROPRIETOR TO A NOBLEMAN CONNECTED WITH THE ADMINISTRATION.

Jamaica, June 1839.

My Lord,

As your lordship has been so good as to give me permission to communicate my impressions of this country, I shall not apologise for doing so freely and at some length, begging your lordship to view my opinions with indulgence; but assuring your lordship, that, whatever reception they may be otherwise entitled to, they are at all events genuine, and, I believe, unbiassed. Within the last three months, I have traversed nearly the whole extent of the island by three different routes, visiting the greater number of parishes, and making every practicable inquiry during my progress. In the following remarks, I beg to submit the result to your lordship's consideration.

The present state, both of property and of the labouring population in this island, is clearly any thing but satisfactory. This your lordship will no doubt have learnt both from public and private sources; and I can, from personal observation, state, that the representations contained in the two accompanying reports from Manchester and St. James, which I beg to enclose *,

* The following are the principal heads and paragraphs of the Reports referred to, omitting the preliminary details of the names and organisation of the Committees, where the same facts are unnecessarily repeated:—

Report of the Parish of St. James.

During the apprenticeship, it has been estimated, that about 4341 labourers were usually at work; since that period their numbers have decreased to 2031 — in the former period *three fifths* were females, in the latter only *one third* are females. These are the aggregate numbers of 56 estates.

1st, Labour.—An analysis of Labour gives the following results:— On 24 estates a resumption of work took place about the 15th of August — the labourers having thus taken two complete weeks of holidays. On 17 estates nothing was done till the 31st of the same month, thereby sacrificing a whole month in idleness: on 7 estates no labour was resumed till the 15th of September: on one not till the 10th of October; but on one property no resumption of labour has as yet taken place. Down to the period of receiving the returns the number of labourers have increased on 22 estates; on 20 the numbers have decreased; on 12 they were nearly the same.

Task work has been general in this as in the neighbouring parishes; 32 estates, according to the returns received, have worked wholly by the job. On 49 estates, the average number of hours, per

are generally correct, and that the condition of property is in few parishes better, and in many worse than there described. Your lordship will by

---

day have been limited to seven. On all only four days, per week, previous to the commencement of crop.

3d, WAGES AND RENT. — The rate of wages, where day labour has been adopted, is 1*s.* 8*d.* per day, with, in most instances, medical attendance and medicines gratis. Where job work has been resorted to, the following rates have been paid; *viz.* cleaning canes per acre, 15*s.*; if foul, 20*s.*; cleaning pastures per acre, 10*s.* 10*d.*; holing, 3*s.* 4*d.* to 4*s.* 2*d.* per 100 holes. Many of the returns state, that the labourers, where they have been diligent and industrious, have earned 4*s.* 2*d.* to 5*s.* per day, and, in holing, as high as 6*s.* 8*d.*

On 37 estates, no rents have been demanded; on 19, rents have been demanded, varying from 3*s.* 4*d.* to 8*s.* 4*d.* per week for house and grounds; but almost all these demands have been made in consequence of the labourers refusing to work for the estate. On 49 estates, no rents have been received; on seven, the total amount received has been *seven pounds two shillings and sixpence!*

The refusal to do work is attributed by 25 estates to one or more of the following causes: — 1st, Bad advice by the Baptist preachers and stipendiary magistrates. 2dly, The mal-administration of the law by the stipendiary magistrates. 3dly, A belief which has been industriously instilled into the labourers that the proprietor could not dispossess them of their houses and grounds; and, 4thly, That the British government was about to pass a law to give them legal possession of the said houses and grounds.

AGRICULTURE. — On the question of the state of agriculture, several of the returns describe it as "very backward" — "very bad" — "very melancholy" — "truly deplorable." Most of them report cases of cane lands dug, but not planted — lands planted, but choked with weeds — canes not trashed — ripe canes rotting — pastures very foul, and all these evils arising from the want of labour.

With regard to the prospects for the present and future crop, one estate only reports better than the apprenticeship, but worse than during the three years previous; 5, equal to the apprenticeship. On 48 estates, the general prospects are stated to be much worse than either of the foregoing periods. Of that number, 37 state their probable diminution at ⅓d. as compared with the apprenticeship, and ½ nearly as compared with the three preceding years. The prospect for next crop is represented as very deplorable.

The state of the FALL PLANT is deplorably short of whatever might have presented itself to the judgment of the most correct statist. On 42 estates not less than 745 acres (about one third of the whole usually put in) is at present deficient; but much of that planted, besides, is not established for *want of labour*. From three estates being ratooning properties, no answer is given; on five the plant is nearly as usual.

There are on 44 estates, 700 hogsheads of sugar short; the remaining 11 have not commenced crop at this period, and from them there are, of course, no results.

Of the destruction of property. — On 47 estates, the labourers have cut and wasted canes to a great extent, and great damage has been done to the cane-fields by the trespass of hogs, and of the estates' cattle, in consequence of the idleness and inattention of the cattle minders. On 14 estates there have occurred combined strikes to raise the wages.

It was the anxious wish of the committee that no bias should be expressed contrary to what appears on the face of the returns; and, in accordance with that desire, a faithful report has been drawn up, exhibiting on the face of it (from the combined statements of 56 practical and experienced planters) the condition of that society upon whom so much expense had been lavished, — so much time and actual property sacrificed, and also the state of agriculture at the present moment, which could never have been contemplated by the most unqualified friend of freedom and humanity.

REPORT OF THE PARISH OF MANCHESTER.

Question 1. The average attendance of field labourers since the 1st of August?

Answer. On many properties about one fourth, some few one fifth, and on some large extensive ones not one tenth, and most of work done on them by strangers.

Q. 2. Amount of wages per day paid to each class of labourers, and time they work?

A. From 1*s.* 8*d.* to 2*s.* 6*d.* per day, there being only one class, all cleaning alike, weak as well as strong, the time in the field at work scarcely averaging six hours.

Q. 3. Where job work is performed, the rate paid, and quantity done?

A. Cleaning coffee previous to crop was from 6*s.* 8*d.* to 13*s.* 4*d.* per acre, and 10*d.* to 1*s.* 3*d.* per 100 trees; at present they demand from 1*s.* 3*d.* to 1*s.* 8*d.* per 100 trees, planted at 5 feet square, which contains 1742 trees the acre; earning from 3*s.* 4*d.* to 5*s.* per day on some plantations; they weed by the acre at 10*s.* to 30*s.*; at coffee full picking 3*s.* 4*d.* per barrel was given, and often one and a half barrel picked by each negro; pruning 2*s.* 1*d.* to 2*s.* 6*d.* per day; doing little more than 100 trees each.

Q. Whether labour has been continuous or not?

A. Decidedly not: no planter could reckon for it more than for a day's work, as they pleased; some one day, others two, three or four in a week: very few do anything Friday and Saturday, so uncertain has it been that fifty have been at work, — next day not more than five. Labour ceased pretty generally early in the month of December, and was only partially resumed in the middle of January; in consequence great quantities of coffee dropped on the ground, and was lost to the proprietors. It is computed one fourth of the coffee and on many properties, even much

these reports observe, that cultivation is uncertain and difficult, while the expense is usually almost ruinous. The great evil is, beyond all doubt, the scarcity and uncertainty of the supply of labour, and the consequently high price of such as can be obtained, rendering it questionable, in the first place, whether the cultivation of the staples of the country can be carried on at all; and (if this be possible) secondly, whether it can be carried on at a fair profit. The disinclination to work for wages arises, in the first place, from the anomalous condition of the labouring classes in this country, for while elsewhere the labourer is compelled to work for his employer or starve, here he subsists on the produce of his grounds by a few hours' labour a week, and works for hire for the purpose only of procuring his indulgences and luxuries; whenever, therefore, it proves a greater indulgence to be idle than to earn money, he ceases from labour. Even if compelled to pay rent, which is as yet far from being the case generally, a day's labour will almost invariably raise a sufficient sum to meet the average charge, namely, a shilling sterling a week to each adult maintained by the cultivation of grounds on the estate; and a shilling sterling in addition to the head of each house for rent of house and garden. Several attempts have been made to remedy this evil: First, by charging a high rent with the view of enforcing labour. This measure has exposed its advocates to much and very unmerited abuse, it being regarded, whenever adopted, as if the end proposed were the exaction of high rent, and not the enforcement of labour. It has consequently failed of the desired result; for the tenant either quits the property, or remains and eludes all payment whatever. Secondly, the ejectment of the most refractory has been attempted; this, however, is a slow, expensive, and uncertain remedy, and frequently, even if successful, has no other effect on the negro than to make him desert the property, or secrete himself upon it in some friend's or relation's house. Thirdly, in a few instances the grounds have been taken away and the growing provisions destroyed; this harsh and unjustifiable procedure greatly exasperates the negroes, and usually ends in driving them entirely from the property.

A second reason for the want of continuous labour is the course adopted by the negroes of either purchasing land at a low price to cultivate for themselves; or of squatting on the outlying lands of some large estate, as trespassers. Every inducement is in many places given to them to purchase in this way; bellmen have even been sent about, ringing and announcing land to be sold at ten shillings an acre. In these contracts the negroes, as you may imagine, are frequently grossly defrauded, and I much doubt whether any one of them has an available title to his land.

The last reason I shall allude to is the want of motive on the part of the negroes, in many districts of the island, to earn money, they actually have more funds in their hands than they know what to do with. By the sale of provisions, fruit, corn, &c., with an occasional short spell of labour, they realise a considerable income; and for want of better objects upon which to expend their resources, the women bedizen themselves in the most extra-

---

more has been lost; this can only be attributed and accounted for in a great measure to the secret undue interference which has been resorted to, and caused all differences between employers and employed.

Resolved, — That this committee is of firm opinion and belief, grounded upon long practical knowledge and experience, that this parish is in a most deplorable state, many fertile properties being completely overrun with weeds and grass; that if even continuous labour could be resumed and calculated, it is next to impossible to bring back the coffee fields to their former state of cultivation. If the laws are not administered in a more equitable manner, and the duties between master and servant defined by some regular system, the destruction and fate of this once beautifully productive parish is sealed. At Alligator Pond wharf as many as ten thousand casks have been shipped in one year; the ensuing cannot be estimated as much more than three thousand.

ordinary manner, and the men adorn their black fingers with paste diamond and mosaic gold rings. Umbrellas and parasols are in great request; and I have seen a negro breaking stones on the road with one hand, while he held an umbrella over his head with the other.

Wages are for these reasons ruinously high, 2*s.* 6*d.* currency (1*s.* 6*d.* sterling) being the usual rate for twelve hours' nominal labour during crop time, while by job work an able man can earn from five to six and even up to nine or ten shillings a day; four shillings is now commonly given for digging 100 cane holes, and a man has been known to dig 300 in a day.

These, in my humble opinion, are the principal causes of the present difficulties arising out of the existing nature of things; and I am convinced that they are sufficient to destroy the prosperity of this country as a colony of Great Britain, unless some remedy can be speedily found. The temporary difficulties with which we have to contend are the great ignorance that still prevails among the negroes, as to the relative rights of master and servant and of landlord and tenant; every claim of our rights they resent as an injury, and are prepared to resist to the uttermost. Nor is it unnatural that the tenants on one estate should conceive themselves injured by the enforcement of rent, when on the very next property, perhaps, no demand whatever of that kind is made. The want of a uniformity of system among the managers of properties is productive of much mischief. A clear and explicit declaration of these relative rights from the local government would be attended with the most beneficial results.

To observe these difficulties is far more easy than to suggest the remedies. The whole system of provision grounds appears to me to be vicious; but as it would be impossible at present to effect their entire abolition, the following strike my mind as the best palliatives that could be adopted under the circumstances.

1. A general, temperate, and moderate demand of a weekly money rent, fairly proportioned to the advantages derived by the tenant from his house, garden and grounds, universally and firmly insisted upon. This would be of itself no trifling resource, would prove an incentive to earn by weekly labour the sum required, and would familiarize the mind of the negro with the rights both of owner and tenant. The only remedy for those altogether refractory is to eject them, and, if possible, supply their places by others better disposed to labour for their subsistence.

2. The unlimited cultivation of grounds should be checked, and gradually discouraged by prohibiting new land from being opened without an additional rent, and by furnishing the negroes with every facility of purchasing, instead of growing provisions, by having a good supply either on the estate, or at a contiguous store. The importation of a cheap supply of provisions from Cuba or elsewhere would have the best effect. Once render the negroes dependent on money for their daily subsistence, and we shall have labour enough in the market.

3. The negro ought to be encouraged to earn money by affording him much greater facility than he enjoys at present for disposing of his earnings to his own solid advantage. Every large property, or two or three smaller ones, should maintain a store, supplied with the necessaries and comforts suited to the condition of the negro. Independently of profit, the supply of small change, and the stimulus given to labour, would be a sufficient inducement to incur a moderate outlay, and trifling risk.

4. The enactment of laws bestowing a certain summary and inexpensive method for enforcing the payment of rent, the fulfilment of contracts for labour, and the ejectment of refractory tenants. To this topic I shall again have occasion to allude.

5. The only radical cure is indisputably a great increase of population. There are thousands of acres of unemployed mountain land perfectly salubrious, and admirably adapted to colonisation by Europeans. On the prospects of effecting this object, I do not at present purpose making any remarks.

These, my lord, are the general observations I have been enabled to make during my, as yet, short residence in this island; but I cannot conclude without offering a few remarks on the particular questions now affecting this country, although I am perfectly conscious of the great difficulty of forming a perfect acquaintance with their respective merits.

On the subject of the Baptists I cannot say much from personal experience, and am unwilling to form my opinion from any other source. Their great influence is undeniable; and I cannot conceive that it is always exercised with propriety, when I find members of a large armed body of that persuasion assembled on behalf of their minister convicted of riot and assault of a very aggravated nature, and find many among their ministers who admit that they have advised the negroes to refuse all labour, rather than work for less than 2*s.* 6*d.* per day. One of their ministers now in this country has been pronounced, by the Vice-Chancellor of England, an unfit person to exercise his functions, — one in whom it was immoral to remain pastor of a charity school.

With respect to the stipendiary magistrates, however conscientious and able some of them may be, it is clear that others do discredit to their station. They are undeniably treated with great animosity by the planters, and it is but natural that their feelings should be affected in return by such conduct. Independently of every other consideration, the odium in which the class is held prevails to such an extent that I can scarcely convince myself that the value of their services can now compensate for the evils necessarily arising from such a state of opinion; for, whatever may have been the case formerly, it is indisputably the fact now that the proprietor is the party who chiefly requires protection, and who is most at the mercy of the labouring class, many of whom keep possession of their houses and grounds without either paying rent, or performing labour; while their worst resource is to quit, and by a few weeks' labour earn money sufficient (if they do not already possess it) to buy land and cultivate for themselves. I certainly do not conceive that we have any right to prevent them from adopting this course; but as an excessive recourse to it would be attended with ruinous consequences, I think it ought to be checked, which might be easily done by the imposition of a tax in the form of a stamp of a certain amount on every conveyance of land.

The political dissensions in this country are productive of many detrimental results; and the unhappy differences existing between the house of assembly and the governor, and the home government, are not only followed by great temporary inconveniences in the expiration of some of our most useful and necessary acts, but will, if not soon adjusted, result in incalculable evils to the island. The whole of the property and influence of this country is decidedly opposed to the present state of things; and the report of the suspension of our constitution has raised a feeling in all classes of white and browns, and even among the most intelligent blacks, that is perfectly indescribable. My lord, should such a project be in contemplation, the consciousness of being right makes me bold enough to warn your lordship not to countenance any such measure. I have personal knowledge of a dogged determination among the most enlightened and influential resident proprietors to oppose and impede to the utmost, not by violence,

but by much more efficacious means, by refusal to pay taxes, by all the delays and sinuosities of the laws, and by all available measures whatever, at the risk of property, or even of life, all and every the acts of any but a representative government. Every free man of this country, who has a notion of his rights—and there are not now many ignorant of them—will respond to this appeal. The cause is ably advocated by the most temperate and argumentative paper here, "The Morning Journal," edited by two gentlemen of colour, members of the House of Assembly, Messrs. Jordan and Osborn, who are powerful supporters of the same views in their places in the house. A universal feeling of this kind will at last become irresistible; and, should further troubles arise, the interests of absent proprietors, now very precarious, must fall a sacrifice.

On the other hand, my lord, I am convinced that by a milder influence this country and the House of Assembly may easily be induced to pay every due regard to the wishes and recommendations of the home government, and effects may be brought about, which direct interference with the internal legislation of this country would fail to produce. The want of patronage of the governors of this island in all local appointments is, I believe, one of the chief reasons of the little influence which they have generally possessed with the country in the House of Assembly. The members of the house consider themselves to be scarcely treated with due courtesy; and I am convinced that a slight degree of conciliation would produce a surprising result. The members of the bar here are generally, and now in particular, men of property and influence in the country, as well as powerful members in the house, and would be greatly conciliated by having a seat on the bench here to look to as an object of ambition; the proposed and very necessary appointments of a legal chancellor and of legal assistant judges offer a favourable occasion, and would be an inducement to men of talent to come and practise at the bar of this country, It is also to be considered, that the advocates of the old system of things, born and educated in the times of slavery, are rapidly disappearing, while an enlarged constituency is gradually tending to a more popular representation. I have already trespassed far too long on your lordship's indulgence, and I must defer several other topics of interest and importance, which your lordship's knowledge of the subject will immediately suggest, for the present, and conclude by again begging your lordship's indulgence for taking up so much of your valuable time. I have the honour, &c.

A Resident Proprietor.

*** In such a state of society as at present prevails in Jamaica, under the anomalous circumstances into which the whole population has been plunged by the conduct of the House of Assembly, it is, perhaps, exceedingly difficult to judge dispassionately of the real sources of the evil, and to apply such remedies as shall be at once just to all parties and effective in their operation. With a view to the formation of the necessary correctives, it is of the highest importance to procure the best evidence of the actual condition of the island; and as implicit reliance may be placed upon the integrity, respectability, and independent sentiments of the writer of this statement, we have great pleasure in submitting it to the consideration of the public. We believe the picture it conveys of the relative situation of the proprietors and the labouring population to be accurate, and upon all points correct: and if we dissent from the general impression it is calculated to make, we do so not because the *facts* are in the least degree questionable, but because the writer has not traced them to their *original causes*. Legislation must be applied to the root of the disease, and not to its symptoms. But we are sure that the suggestions of the intelligent writer will be read with universal interest; and that whatever differences of opinion may prevail as to the choice of remedies, none can exist as to the excellent spirit in which this communication is conceived.—Ed.

REVIEW OF LITERATURE.

To do any thing well, it is necessary to do it completely; and although in our notices of current English literature we do not contemplate the extravagant feat of recording every book that happens to be published, we always desire to furnish such an epitome of the principal works of the day, and such a general view of the character and tendencies of the different classes of production, as may put the reader fairly in possession of the Intellectual Spirit of the times in which he lives. It would require the hands of Briareus, and a head similarly furnished with a century of faculties, to accomplish any greater aim in the space and time within which we are limited. Nor would the utility of so minute a catalogue bear any reasonable proportion to the quantity of room it would absorb; for it may be ordinarily assumed, that the publications we omit may be safely spared without much injury to the general interest of our outlines of criticism. The value of these summaries will probably be more apparent some time hence than at the moment of their appearance, while most of the volumes to which they refer are yet fresh, and some of them, perchance, uncut on drawing-room tables; at least we hope so, for, light and trivial as they must seem to contemporary eyes, they involve a more laborious process of inspection, reflection, and arrangement than can be justly estimated from a cursory perusal, such as To-day bestows upon the labours of Yesterday.

In our retrospect last month of the Books of the Season we were obliged, by the pressure of numerous demands, to postpone a few volumes that came within the period it embraced. We propose now to include them under their proper heads, beginning with the department of TRAVELS.

Mr. Laing's "Tour in Sweden [1]" aspires to a higher region of observation than is usually attempted by travellers. The peculiar circumstances of the country, and the fact that the author's attention had been already strongly directed to the general condition of the Scandinavian peninsula, sufficiently account for the great pains he has taken in expounding the startling problem which the social and moral aspect of Sweden presents. There certainly is no other nation in the civilised world which exhibits such strange anomalies — such perverse domestic contradictions — such blended antipathies — such smooth waters rippling tranquilly over such perilous rocks and quicksands; and every reader to whom these facts are now made known for the first time must consider himself largely indebted to Mr. Laing for their development. The relation in which Sweden stands to the rest of Europe is, in itself, a curiosity in international statistics. She is cut off from the Continent, like an amputated limb, by the severance of her ancient provinces of Finland and Pomerania. This isolation of her state is rendered complete by the expatriation of the royal and heroic race of Vasa, that line which in earlier ages conferred such lustre upon her name, and filled her palaces with such proud pageants of a glorious chivalry. The banners of her historical fame are rent and cast away; her greatness has melted into a tradition; her throne is filled by a stranger, an alien to her blood and her language, a soldier in the armies of Napoleon. She lives within herself, and feeds upon her own heart. The reign of Bernadotte has contributed to keep her in this situation. He has failed to extend her frontiers — to elevate her in

[1] *A Tour in Sweden in* 1838; *comprising Observations on the Moral, Political, and Economical State of the Swedish Nation.* By SAMUEL LAING, Esq., Author of a "Journal of a Residence in Norway." London: Longman & Co. 1839.

the rank of kingdoms — to revive her former importance; and, devoting all his energies to the one object of enclosing her securely in the confines within which he found her, he has preserved her at peace with the universe, but at war with herself.

From the external quietude which breathes over this segregated land, of which strangers hear so little, and have naturally fallen into the habit of thinking less, it has been generally inferred, that, under Bernadotte, Sweden has enjoyed an age of gold; but Mr. Laing's researches effectually expose this agreeable fallacy. The ordinary arts of peace are cultivated in the ordinary way by this home-bound people; but having no more exciting or extended aims to occupy them, a perpetual struggle is carried on in a sort of under-current of discontent between the government and the governed. The population enjoy a large measure of nominal liberty, but the king is really as absolute as a satrap in his seraglio. Rights of a most enlarged nature are inherited by every man in the country; but they are exercised under a surveillance that extracts from them the very essence of free will. Thus the freedom of the press is recognised in the fullest sense — any man may publish a newspaper; but the executive is armed with a summary power of suppression that literally nullifies the privilege. The consequence is a daily and hourly contest between the theory of free opinion and the practice of arbitrary control. The journal prohibited at twelve o'clock under one title re-appears at three o'clock under another; and the wrestle is likely to go on until one party or the other is wearied of a succession of falls. The king cannot give way, lest his retreat might be mistaken for fear or weakness: the people will not, and they are right. The illustrations of this state of things furnished by Mr. Laing are amongst the most remarkable instances extant of authority baffled by popular subterfuges, and of the guaranteed rights of a whole people smothered under the portfolios of justice.

The moral condition of Sweden is equally extraordinary, with this additional stimulant to curiosity, that it is altogether inexplicable. It would puzzle the profoundest philosopher to explain the causes of the unprecedented contrast which she displays in this respect between profession and performance. Nothing even remotely resembling it ever existed, we believe, before; nothing similar to it, even upon a small scale, can be discovered in the diversified annals of mankind. There is a powerful church establishment in Sweden, co-equal with the state, united to the state by indissoluble ties, yet independent of the state; possessing a distinct department of government, through which it wields great and salutary influence; richly endowed; reckoning amongst its pastors some of the most enlightened, pious, and liberal churchmen in Europe; having no sects beneath its wing to disturb the universality of its control; drawing the entire population, with scarcely a solitary voice of dissent, into its fold; crowned with almost hyperbolical popularity, and reigning literally in the enthusiastic affections of the people. On the other hand, there is a nation of willing communicants, united in their adherence to this church, contributing munificently to the wealth of its temples and its ministers; a nation regular in their obedience to its prescribed offices, feasts, festivals, and fasts; a nation uniformly religious in the common acceptation; a thorough church-going people. It might be expected from this amiable agreement between the church and the population — from this exquisite harmony of faith — this devotion to all the forms and requisitions of religion — that the people of Sweden were amongst the most moral races of the earth, especially as the means of education they possess are almost unlimited, and are encouraged with a zeal that cannot be said with truth to be manifested with equal perseverance any

where else. The expectation is reasonable, and is justified by the experience of all time. Where there is so large a volume of smoke we have a right to look for a brilliant fire; but this fire smoulders in ashes notwithstanding. The beautiful apple that turns to dust at the touch is not more deceitful than all this show of morality and religion. The people of Sweden are the most demoralised people in Europe! The paradox is appalling, but there it is beyond all question. The population amounts altogether to 3,000,000; only 15,000 are engaged in manufactures, and even these are not closely congregated as that class of labour is in England, but scattered wide apart throughout the kingdom. The rest of the people are employed in pastoral pursuits. There is only one city; there are no nests of vice; no resorts for idleness and profligacy; they have only a scanty navy, and a trifling standing army, and very little commerce. Yet this people, so favourably circumstanced, put the calendars of crime of all other civilised countries to the blush, so completely do they transcend in the iniquity and ratio of their offences. We cannot enter into the details; but some notion of the extent of crime may be formed from the fact, that the official returns, on an average of five years, from 1830 to 1834, show that 1 person in every 49 of the inhabitants of towns, and 1 in every 176 of the rural population, were punished for criminal offences; that in 1835 the proportion was 1 in every 140 of the whole nation; and in 1836, 1 in 46 of the towns, and 1 in 176 of the rural districts; and the crimes included in these estimates were of the very worst and most debasing kinds. It is impossible to account for this extraordinary fact by any known circumstances:—there are no excise laws, no game laws, no resistance to tithes, no conspiracies, no rebellions open or disguised — none, in short, of any of those causes in existence which might be suspected to be conducive to such general and lamentable results. Mr. Laing refers the spring of these vices to the construction of society, and enters into some elaborate expositions of his reasons. But he has not satisfied us on this point, nor do we think that it is within the reach of investigation to penetrate the mystery. The work in which this blotted map of civilisation is unrolled to the public is one of the most valuable contributions to moral and political geography that has appeared for many years, and we commend it to the reader as we would the first lines of some new and surprising science.

A residence, not a tour, in such a country as Peru, is absolutely necessary to any observer who undertakes to present a picture of its interior life, its physical resources, climate, and customs. Dr. Smith must be allowed to have fulfilled this condition scrupulously, for his work[2] on that country is the result of ten years' patient drudgery in his profession amongst the people of Lima, and indeed all over the Peruvian republic. It is generally found that physicians are admitted to the most favourable opportunities of examining the in-door habitudes of foreign countries, through the infirmities that yield them a ready access to the household, and that frequently give them a direct claim on the confidence of those whom they assist or benefit by their skill. Such is the case nearly all throughout the East, where medical science is often held synonymous with knowledge of a higher and more sacred order. But in Peru, it appears, a different theory prevails. The physician is exposed to a kind of contempt peculiar to ignorance and obstinacy. The Peruvians consult him as other people do, but, unlike other people, they expect that he will prescribe according to their own

[2] *Peru as it is; a Residence in Lima, and other Parts of the Peruvian Republic, comprising an Account of the Social and Physical Features of that Country.* By Archibald Smith, M.D. Two Vols. London: Richard Bentley. 1839.

notions of dietetics, diseases, and remedies. He must, therefore, either abandon his practice, or smuggle his advice upon them in the disguise of some of their familiar nostrums. Under such circumstances, should they recover, they are grateful to the saints, but should they die, the physician alone is to blame. This little trait lets us into the whole character of the people: they are superstitious about trifles, and want energy for great things. The Limenians are extravagant in matters of external display, fond of frippery, and tinsel, and embroidery, and perfumes, and flowers, and fantastic entertainments, and every description of indolent licentiousness.

Thus vice creeps into their showy and shallow society; and the women, possessing more intelligence, a higher tone of mind (but by no means of morals), and remarkable graces of person, obtain a complete ascendancy in the management of affairs. They even intrigue to corrupt the fountains of justice, and exercise a species of influence in the boudoir of the government that is felt to be irresistible. They are assisted, perhaps, in carrying on this machinery of power by the luxurious climate and the picturesque associations in the midst of which they live, and of which they are the visible spirits. The combined fascination seems to overpower the judgment as well as the passions of the other sex. Dr. Smith gives some interesting glimpses of the gorgeous manner of living that prevails amongst these people, and, conducting us into the interior, touches lightly upon the productions of the country, the scenery, and modes of education. There is some novelty, but not much attraction, in the volumes. They contain a mass of small details, which, in other hands, might have been easily expanded into a more imposing shape; but Dr. Smith confines himself to simple statements of facts, which will be very useful to people who have any intention of settling in Peru, but which are not likely to make a sensation amongst people who prefer staying at home.

Mr. Leigh, a gentleman who acted as surgeon to the Australian company's ship "South Australian," has published a very unpretending, but singularly useful book[3], to prove that hills which look green at a distance may turn out to be miserably barren when you come close to them. He declares that he has no party to serve, and it is evident he has not, since he devotes his volume to the relation of disagreeable truths. His immediate purpose is to show that the flattering accounts which reach us in this country of the land of kangaroos are for the greater part pure fictions, or extravagant exaggerations; that the emigrant, instead of finding a place overflowing with milk and honey, will have enough to do to catch the bees and feed the cows, and that no settler can hope to achieve even a moderate degree of comfort (for prosperity seems to be nearly out of the question) unless he be prepared to labour like an iron machine, and to bear all sorts of privations and disappointments with nerves of whipcord. The book is a practical lesson on voluntary banishment, and is agreeably interspersed throughout with a variety of personal adventures illustrative not only of the country but of the farcical misfortunes of the unlucky speculators in Australian miracles.

The waters of the Pacific ocean wash the western shores of a region which, throughout all the revolutions that have shaken the dynasty of Spain in those pleasant regions of "barbaric pearl and gold," has, by some strange combination of circumstances, been suffered to fall into almost total oblivion. We constantly receive information about South America and the feuds of her spasmodic republics — the newspapers are crowded with scraps of intelligence about broken spars drifted into contemptible villages on the coast of Mexico, the wrecks of cock boats, and the penny whistles of Valparaiso;

[3] *Reconnoitering Voyages and Travels, with the Adventures in the New Colonies of South Australia, &c.* By W. H. Leigh, Esq., late Surgeon, &c. London: Smith, Elder, & Co. 1839.

but nobody ever hears of the Californias, two tracts of country whose history is a romance full of strong human interest, and whose position in the conflict of thrones and provinces cannot be regarded without universal sympathy. To supply this want, Mr. Forbes, who appears to have enjoyed considerable advantages for the undertaking, has written a full but succinct history of the country [4], tracing its varied fortunes from the earliest period to the present time, and bringing before the reader a very complete view of the domestic and political circumstances in which the progress of events has contributed to place her. It is on account of the latter feature, that we class the work under this head; for, although it is ostensibly a history of Upper and Lower California, yet the historical matter is brought to bear so directly upon existing interests that it is more likely to attract attention to the consideration of impending policy than to the monuments and memorials of the past. In the composition of this work, Mr. Forbes has thought less about the mere decorations of style than the choice and arrangement of matter; but the matter is so varied and curious that it may be said to create its own style. The narrative is from the beginning to the end like a chronicle of dazzling fables, at one moment crowded with dramatic incidents, at another opening scenes of the most picturesque beauty; sometimes developing a single character of lofty virtue, and sometimes discovering to us the fathers of the savage wilderness, planting the cross in the inhospitable lairs of the Indians. Amongst the more striking details will be found an account of the origin and progress of the pearl fishery, and an exposition of the advantages of the projected plan of steam navigation in the Pacific, for the attainment of a more speedy communication between England and the western shores of America. The work on the whole is highly creditable to the author, and cannot fail to be productive of an improved acquaintance on the part of his countrymen with the neglected provinces it delineates.

We have before us no less than three works upon Russia, embracing travels into the interior, close views of the domestic life of the people, and very full accounts of the social institutions of the empire. Of these, perhaps, the work of the Rev. Mr. Venables [5] is entitled to the first consideration, because the information it communicates was acquired under peculiar circumstances, and is, for the greater part, new. Mr. Venables is connected by marriage with several Russian families; and the object of his visit to the country appears to have been principally to spend the summer of 1837 with the relatives of his wife, who accompanied him. Received as a friend, he was located at once in the household, and was thus admitted, on the most intimate terms, to a participation in the daily round of visits, parties, and entertainments. His description of society in Russia presents on the whole, a more agreeable picture than could have been anticipated. There is of course much luxury and expense, magnificence of style, and straining for effect. These are the ordinary characteristics of a nation on the borders of civilisation, with the elements of political greatness infused into the circumstances by which they are surrounded; but there are better attributes amongst them than these. The social intercourse of Russia—we confine ourselves, it must be understood, to the upper and educated classes—has a soul of cordiality in it which no one would every dream of looking for in such a climate, and especially in a race through whom despotism descends in varying intensity from the autocrat to the serf, each class obtaining re-

muneration in kind from the class below for the wrongs and opprobrium it has suffered from the class above. The Russians, with all their passion for high living, are not fond of the starched ceremonials by which it is generally accompanied. Their country life is especially free from artificial forms. They visit each other at all hours throughout the day; friends are always welcome in their houses — a relic of the old hospitality of the Slavi. Such is their sense of social enjoyment, that it is common amongst them to drive twenty or thirty miles to a dinner, and it is customary when one family chooses to spend a day or two with another, to announce their intention previously, and to carry it into effect as a matter of course: and visits of this kind, instead of being regarded as an intrusion, are esteemed as a compliment. The actual amount of inconvenience which is sometimes occasioned by these volunteer parties, may be estimated from the fact, that even a single man seldom moves in Russia with less than two servants and four horses, and that as there are no contiguous inns, such as we have in this country, where the crowd of menials and horses can be accommodated, the doomed host is obliged to provide house room and stable room for them all. Mr. Venables mentions one instance in which the cortége — not to speak of the guests — reached the formidable number of ten servants and sixteen carriage horses. This occurred in the middle rank of life — what must it be amongst the Dolgouroukis and modern Potemkins? French is the general language of the educated classes; which would not be at all surprising, considering the barbarous jargon of the native Russ, were it not for the cause to which the use of it is ascribed. It appears that they never close their drawing-room or parlour doors, and that, as there are no such luxuries as bells in Russia, the servants consequently wait in the ante-rooms to be within call: the ladies and gentlemen speak French to evade the inquisitive ears of their domestics! Mr. Venables' book is crowded with curious small items of this description, and affords in a brief compass a very impartial and graphic view of real life in the regions of the Northern Bear.

Next in interest, although, we believe, something earlier in date, is Mr. Bremner's "Excursions in Russia."[6] During a residence of five years on the continent, Mr. Bremner, who disavows all prejudices and antipathies, cultivated every opportunity that lay in his way of acquiring a knowledge of the Russian character. Whenever he met a Russian, he seems to have taken him by the button, and extracted from him all the information he possessed, or had the courage to disclose; and in the course of these experiments he arrived at the conclusion, that it is only *out* of Russia a traveller can ascertain the true state of opinion amongst the higher classes. *In* Russia they are spell-bound by terror; elsewhere, whenever they can be induced to speak, there is no end to their communicativeness; like children escaped from a pedagogue, and out of sight of the rod, they chatter away as long as you will listen to them. There is a melancholy truth in this condition of a human being that cannot be contemplated without painful emotions. That a man should speak freely of his own country only when he is far away from it, may be accepted as a terrible evidence of how little share he has in its happiness — how small his stake is in its government — how little his own country is his own! Mr. Bremner's account of St. Petersburgh is lively, sketchy, and amusing; and his pictures of the lives of the Russian nobility — their gorgeous habits side by side with cruelty and selfishness — their external elegance and inward coarseness — their mask of finery hiding

[6] *Excursions in the Interior of Russia; including Sketches of the Character and Policy of the Emperor Nicholas, Scenes in St. Petersburgh, &c.* By Robert Bremner, Esq. Two Vols. London: Henry Colburn. 1839.

squalid minds and stony hearts — convey a moral to all nations that have any interest in substituting true civilisation for that mockery of it which flourishes so rankly under the brooding shadow of despotism. The most agreeable spectacle in Russia (and upon this point all travellers agree) is the fine macadamised road from Petersburgh to Moscow, and the commodious diligence that flies at a spanking pace from one capital to the other. But you must not venture further if you have any care for your bones. From Moscow to Vladimir, and on to Nishnei-Novgorod, the roads are not even so good as the corduroy roads of America. This is the more marvellous, as breaking stones is one of the most general accomplishments of the poor, ragged, whipped, and half-starved peasantry — the land-slaves of the aristocracy — who work day and night that their lords may drink champagne, and lull themselves with perfumes in the costly hotels on the Neva.

Captain Mignan's travels[7] cover a wider surface than either of the preceding works, carrying us from St. Peterburgh over the Caucasian Alps into Koordistaun, in the middle of the winter. This journey is at least a novelty, and would, no doubt, have been productive of some curious notes, but that Captain Mignan was fortunate enough to travel in the train of the envoy extraordinary of the Shah of Persia, who was so munificently provided for by the Czar, that he flew along at a rate of speed which rendered observation nearly impossible. Sometimes the prince stopped long enough to enable the captain to see the draperies of the windows, or to catch an outline of some dreary village mantled over with ice; sometimes an accident kept them in a place, not of entertainment, but of refuge; sometimes the roads (such as they are) were choked with snow, and the whole train was stopped; and sometimes the Shah's envoy accepted an invitation to a ball or a pageant, *en route*, and then there was a little rest, and a little gazing and talking, and a flash of sights dancing before the eyes, from which an impressionable imagination might conjure up a tracery of national customs about as distinct as a spider's web in the sunshine. Notwithstanding these discouragements, however, Captain Mignan has contrived to write two volumes of very amusing details, wanting, perhaps, in solidity (except when he discusses Indian affairs), but sprightly, exciting, and characteristic. The narrative is light and graceful throughout, dotted all over with personal peculiarities, and will be especially attractive to those readers who are interested in the affairs of Persia *quoad* our eastern possessions.

Literature, in all its classes, is certainly more zealously cultivated by the officers in the East India Company's service than by those who have the honour to belong to her Majesty. Perhaps one reason for this is, the resource it affords them against *ennui* — another, the novelty of the scenes into which they are thrown — and a third, the certainty of promotion which follows the development of talent. Captain Mignan, whose work we have just dismissed, belongs to the Bombay army; and Captain Harris, whose expedition into Southern Africa we are about to notice, belongs to the engineer corps. Similar publications constantly flow from similar sources, reflecting high credit upon the intelligence, abilities, and industry of our countrymen in that quarter of the world. These are the best agents of acquisition and civilisation. The pens of educated and reflecting soldiers are much more likely to achieve permanent triumphs than all the bayonets that were ever forged: and to do something wiser than the accomplishment of victories in the field, to accomplish victories over the allegiance and affec-

[7] *A Winter Journey through Russia, the Caucasian Alps, and Georgia; thence across Mount Zagros, by the Pass of Xenophon and the Ten Thousand Greeks, into Koordistaun.* By Captain R. Mignan, of the Bombay Army, &c. Two Vols. London: Richard Bentley. 1839.

tions of dusky tribes subjugated by our arms, and not always treated with justice in their misfortunes. Captain Harris's Expedition into Southern Africa[8] is one of the most agreeable and original narratives of travels that has issued from the press for a long time. Its interest is not a little enhanced by the circumstance of its being printed at the American Mission Press of Bombay, where new works of so much importance have rarely made their appearance. A love of field sports on a grand scale appears to have been the author's inducement for visiting Africa. He was tired of tigers and elephants, and had visions of giraffes and antelopes, and the giant behemoth: and so, obtaining leave of absence for two years, he sailed for the Cape. Arrived there, he determined to penetrate the interior. Stress of weather compelled him to abandon his voyage to Algoa Bay, and to put into Port Elizabeth; and after encountering and vanquishing a variety of difficulties, he found himself at last in the country of the Abaka Zooloos, governed by one of the most acute and despotic savages upon record. Captain Harris's object was to make the tropic of Capricorn; to ascend to the great lake which is supposed to spread beyond it; and to return by the unexplored waste of the Vaal river, hitherto interdicted to Europeans by his haughty and inexorable majesty of the desert. This dangerous enterprise was successfully performed; the savage was propitiated, in spite of his awful shield and pard-headed body guard; and Captain Harris had the pleasure of exploring a vast tract of country, upon which speculation has hitherto wasted itself in vain. The work is full of perilous adventures, picturesque scenes, and curious facts in natural history; and is written in a most modest and unaffected tone. It is enriched with an accurate map of that part of Africa which lies to the north-east of the Cape colony; and, in addition to its account of the places visited by the author, contains a circumstantial history of the strange elopement from the British territory of a large body of Dutch farmers, who located themselves in the wilderness in 1836—exchanging comfort and security for a succession of the most direful calamities.

Lady Chatterton has written a well-intentioned book upon Ire land[9], full of amiable sentiments and lady-like descriptions of scenery; just such a publication as one may read without having either one's patience or curiosity very heavily taxed. The view which Lady Chatterton takes of the condition of the Irish peasantry is generally correct; she describes them exactly as she saw them — gay in the midst of wretchedness; she sympathises with their wants, laughs at their wit, wonders how they can be so poor and so happy, thinks there is nothing so perfectly delightful as the odd way they have of reconciling themselves to their misfortunes, and is sorry to find that they have no notion of those honey-suckled cottages, trim little gardens, and pretty beehives, which enter into the rural life of England. It is impossible to dispute the accuracy of Lady Chatterton's statements; nor can it be denied for a moment that the work is written in the kindest spirit and with the most philanthropic views. But it is chargeable with this fundamental defect, which, indeed, is common to most of the commentaries upon Ireland written by English travellers, or even English residents (under which latter denomination, we believe, Lady Chatterton must be classed), namely, that in describing the actual state of the people, she either refers it to immediate and secondary causes, or does not attempt to trace out the cause at all.

[8] *Narrative of an Expedition into Southern Africa, during the Years* 1836 *and* 1837, *from the Cape of Good Hope, through the Territories of the Chief Moselekatse, to the Tropic of Capricorn. With a Sketch of the recent Emigration of the Border Colonists, and a Zoological Appendix.* By Captain W. C. Harris, H. E. I. C.'s Engineers. Bombay. 1839.

[9] *Rambles in the South of Ireland during the Year* 1838. By Lady Chatterton. Two Vols. London: Saunders & Otley. 1839.

The original springs of all these calamities — the roots of all these flowers of fantastic humour that blossom in so sterile a soil — wholly escape her ladyship's penetration. We do not expect philosophical or political dissertations from so graceful and lively a writer; but it is necessary to point out a desideratum, which unquestionably leaves the picture imperfect in a very essential feature. The despairing fun of the Irish, without the "provocation," is Hamlet with the grand excision, by "particular desire." The volumes, however, are very agreeably executed — running lightly over the surface — and a great deal more sensible and just than nine-tenths of the conversation we hear in general society on the subjects to which they are dedicated.

We have two works before us on America — both recent — both touching on the leading points of national character — and both written by Englishmen. Captain Marryat's is more important, in so far as the domestic institutions of the United States are involved. The Honourable Mr. Murray's is more attractive, as a narrative of personal adventures. We will take the former[10] first.

When a popular author makes his appearance in America, it is immediately assumed by the people that he intends to write a book about them, and they at once resolve upon misleading and annoying him. The love of wild reckless mischief that pervades the Americans renders this sort of sport perfectly congenial to their tastes; and it would be difficult to point out a country where such a freak could be successfully carried on with such unanimity of intention, and such perfect harmony of proceeding, as in the eccentric dominions of Uncle Sam. Captain Marryat happened, unintentionally, to be placed exactly in this situation. He could not pass through America like an innocent private gentleman. Every body seemed to know him, and every body hoped he would not put down such and such things in his "book." Even a little boy at a store where he was making a purchase in New York, asked him whether Mr. Easy had left the king of England's service, and when the Captain had last seen Mr. Japhet. This was provoking enough in all conscience; and, although Captain Marryat tried to sink the Captain and the Marryat, and to be a mere common-place person, it was all in vain. They seemed to know him by instinct, and to look at him and talk at him through his silence and his cloak. How far the natural re-action of this state of things may have increased the repulsion on both sides is not recorded; but it can hardly be doubted that a gentleman travelling under such circumstances is not in the most favourable position to form a calm and dispassionate opinion of the character of a country. It must be observed, however, greatly to Captain Marryat's honour, that his work, making a reasonable allowance for impressions of a strictly personal kind, is apparently written with the severest honesty of purpose; that, exhibiting occasionally some small resentments, and not unfrequently taking a humorous advantage of the peculiarities of brother Jonathan, it is on the main impartial, scrupulous, and accurate; and that, less entertaining than Mrs. Trollope's sketches, and less philosophical than Miss Martineau's, it is, in many essential particulars, more close to life than either. Captain Marryat grants to America the full measure of panegyric to which she is entitled for the wonderful progress she has made in the employment of the useful arts for the most useful purposes; and he is even disposed to acknowledge merits that have been denied to her by others. But it cannot be concealed that he entertains a sentiment of general aversion or, per-

[10] *A Diary in America, with Remarks on its Institutions.* By Captain Marryat, C. B. Three Vols. London: Longman & Co. 1839.

haps, dissatisfaction, in reference to the entire frame-work of society, the government, the institutions, the morals, and the habitudes of the people. He looks at them through English eyes, and arrives at the only conclusion at which an Englishman, with all his insulated prejudices fresh upon him, can fairly be expected to arrive. He is as just as he can be; and since all sublunary justice is relative and conditional, he deserves credit for the integrity of his intentions. The absolute impossibility of depicting the Americans as an historian or a traveller might depict the Spaniards or the English, is clearly stated in the introduction. The Americans have hitherto been represented as a nation, and the same set of characteristics have been attributed to them in common. This is a grand mistake. They form a mass of people as various as the cities, districts, and states they inhabit, presenting not only an endless diversity of contrasts, but a constant succession of transitions, cemented by one general government, but identical in no other solitary point of view. It is extraordinary that this important truth should never have been put into print before, because no man can travel through the United States without having it forcibly pressed upon his attention. And in this truth we discover the key to all the errors that have been committed about American society — errors which Captain Marryat himself falls into, after having exposed them in his predecessors.

To represent America with fidelity, a work should be written on each state, and then a composite tract upon the thread of federal compact that binds them all. But is America worth a labour of this kind? Before the volumes could be completed she would have entered another sign in her eternal zodiac, and so baffle her commentators. She is like Mawworm in the comedy, who, referring to the expectations of the pious who hope to get into heaven by clinging to his skirts, hints that he will wear a spencer and disappoint them.

Mr. Murray's volumes[11] introduce us to the usual lions — the towns and table d'hôtes — the prying stage-coach and steam-packet people — the talkers and speculators; and, upon the whole, afford a fair reflection of the flying characteristics of the Union. But the most novel and important feature in the work is an account of the Pawnee Indians, an original race, seated beyond the western outposts, and presenting more traits of the picturesque in their habits and localities, than perhaps any other tribe in that remote region. The first glimpse of these people seems to have fascinated the visitor; and he was tempted to go into the wilderness with some of their chiefs, that he might satisfy his curiosity about their manner of life. And a strange manner of life it is. Their encampments are like villages in a state of constant preparation for warfare. Their hunting usages give them an air of romantic marauders; and were it not for their true hospitality and generous disposition, one would be disposed, at first sight, to feel for his pistols whenever any of them approached too closely. The description of these Pawnees, and of the adventures that occurred during Mr. Murray's residence amongst them, form the most valuable and interesting part of the work. For the rest, it is recommended rather by the florid spirits of the author, than by any great reach of sagacity. Mr. Murray has much more imagination than judgment, and succeeds best when he is out of the track of civilisation. He cannot penetrate the veil of artificial society, and is too apt to lay a false stress upon mere externals. The youthfulness of his mind is apparent in a variety of *jejune* criticisms upon trifles, and in a cer-

[11] *Travels in North America, during the Years* 1834, 1835, *and* 1836; *including a Summer Residence with the Pawnee Tribe of Indians, in the remote Prairies of the Missouri, and a Visit to Cuba and the Azore Islands.* By the Hon. C. A. Murray. Two Vols. London: Richard Bentley. 1839.

tain glow of style that is rather out of place in a book that professes to treat of habits and manners. He betrays also some very unworthy prejudices about the Irish emigrants; and, indeed, the whole Irish nation. He affects to despise national bigotry, and all the while it peeps out in a variety of ludicrous ways. These are, perhaps, nothing more than youthful excesses, which may be safely committed to the corrective influence of time; and, making a liberal and lenient deduction for them, the agreeable vivacity of his style, and the breadth and vividness of his delineations of the outlying denizen of the wilds, will abundantly compensate the hours engrossed in the perusal of his volumes.

Connected with travels and travelling is a charming little volume on the "Roman Antiquities of the City of Treves."[12] It pretends to no higher aim than that of guiding the stranger through the remarkable monuments of this ancient city which, although it stands on the vine stream of the Moselle, close in the neighbourhood of the Rhine, is rarely visited by tourists. Professor Wyttenback, the author of this book, resides at Treves, where he conducts the gymnasium; and was probably induced to draw up this account of the place, from a feeling of mortification at the neglect with which it is treated by foreigners, who skirring past the walls of Coblentz, make a *détour* to the *brünnens*, without casting even a longing look across the vineyards towards this noble memorial of the greatest nation of the antique world. The volume is not alone remarkable for erudition in the descriptive and historical letter-press, but for much fidelity and skill in the plates and vignettes with which it is embellished. Any idler who proposes to visit the Drackenfels and Ehrenbreitstein at the approaching season of the vintage, could not better employ the intervals of his journey than by dipping into the pages of the professor's picturesque lore; and if by the time he finds himself on the bridge of boats, looking up at the commodious hostelrie of *Le Cheval Blanc* in the little town of Thal, he does not determine to turn off to the Moselle, we miscalculate upon the influence of the guide book.

There are two other guide books to places nearer at hand, that must not be overlooked:—Roscoe's books on the Grand Junction Railway[13], and the London and Birmingham Railway.[14] These works are designed to supply the traveller with all the information necessary to illustrate the scenery contiguous to the lines, and to furnish at the same time a complete account of the origin and history of these costly undertakings. The volume on the Grand Junction Railway is full of descriptions, and almost as amusing as a pictorial hand-book of English seats, villages, and traditions, as it is valuable for practical details connected with the establishment of the road. The volume on the London and Birmingham Railway is more distinguished by its scientific character, and by the minuteness of its statements in reference to the progress and utility of that great artery of communication. Like the former, also, it presents a complete panorama of the country on each side; and both volumes are richly embellished with a splendid series of engravings.

In Medical Literature there are a few volumes which demand a passing notice.

[12] *The Stranger's Guide to the Roman Antiquities of the City of Treves.* From the German of Professor John Hugh Wyttenback, Director of the Gymnasium at Treves, &c. Edited under the direction of Dawson Turner, Esq. London: J. W. Parker. 1839.

[13] *The Book of the Grand Junction Railway; being a History and Description of the Line from Birmingham to Liverpool and Manchester.* With Sixteen Engravings and Four Maps. By Thomas Roscoe, Esq. Assisted by the Resident Engineers of the Line. London: Orr & Co. 1839.

[14] *The London and Birmingham Railway, with the Home and Country Scenes on each Side of the Line, &c.* By Thomas Roscoe, Esq. Assisted in the Historical Details by Peter Lecount, Esq., Civil Engineer, &c. London: Charles Tilt. 1839.

Of these Dr. Billing's "First Principles of Medicine" [15] is the most comprehensive and important. If the approbation of the medical profession and the public may be admitted as a collateral evidence of the value of a publication of this nature, there can be no doubt of the merits of Dr. Billing's treatise, which has passed through three editions in a shorter space of time than such works usually occupy in exhausting one. The popularity of the volume, however, may be easily accounted for. It is a perfect manual of the whole science of medicine, developing clearly, fully, and practically, every thing that is known of pathology and physiology. Previously to the appearance of this work, the student was left to his own resources; there was no authority to which he could apply for instruction: all the books on medicine and surgery were repetitions of the same common-places, and none of them exhibited the *rationale* of treatment; in fact, he was compelled to acquire knowledge by a painful and tedious process of inquiry, without direction, and without arrangement. Dr. Billing's work supplies this want: it contains a complete review of the whole subject, written in a way that must be intelligible to every reader: there is nothing omitted from its pages that is necessary to the unity of the design; and it presents a combination, as valuable as it is rare, of practical knowledge and scientific principles. In this publication Dr. Billing has conferred upon the profession as great a service as he did in originating clinical lectures in our hospitals, the honour of the introduction of which belongs exclusively to him. Two such incidents in the life of a medical man are sufficient to secure to his name a lasting reputation.

Dr. Little's "Treatise on Club Foot and Analagous Distortions," [16] is a novelty in this particular class of deformities that will be received as a valuable contribution to a department of investigation hitherto singularly neglected in England. Dr. Little was led to the prosecution of an earnest inquiry into the subject, in consequence of having been afflicted with Talipes in the left foot, and failing to procure any relief, although he consulted the first authorities in London. At length the operation of the division of the tendo Achilles, successfully performed by Dr. Stromeyer of Hanover, attracted his attention, and he resolved to place himself under that gentleman's care. The result was the restoration of the foot, a studious inquiry into the anatomy and pathology of distortions, and this very able work, in which the subject is carefully analysed and illustrated. Dr. Little's book must be regarded as a great advance towards the removal of the scepticism and ignorance that prevailed in reference to a species of physical calamity, which has long been doomed in this country either to rash experiments or utter neglect. Had Lord Byron lived in this day, the diseased temperament of the poet (which is attributed by many of his personal friends to the secret mortification he felt from the distortion of his foot) might have yielded to the treatment laid down by Dr. Little.

A volume on the "Diseases of Women," by Mr. Jones [17], professes for its object to point out the necessity on the part of the medical profession, to resort more frequently to physical investigation, in forming the diagnoses of the diseases of women. He seems to be influenced by an amiable spirit of benevolence, which, we trust, for the sake of those to whose interests his

[15] *First Principles of Medicine.* By Archibald Billing, M.D., A.M., Member of the Senate of the University of London, F.R.C.P., &c. Third Edition, considerably enlarged and improved. London: S. Highley. 1839.

[16] *A Treatise on Club Foot and Analagous Distortions, including their Treatment both with and without Surgical Operation, illustrated by a Series of Cases and numerous Practical Instructions.* By W. J. Little, M.D. London: W. Jeffs. 1830.

[17] *Practical Observations on Diseases of Women.* By William Jones, M.R.C.S. London: H. Balliere. 1839.

work is addressed, will be effectually responded to by the profession and the public. The treatise displays research and ability, and will be valuable to the junior practitioner.

Dr. Dickson has published a book, called "The Unity of Disease[18], the intention of which, in his own language, is "to subvert the entire fabric of British medicine." We know not that we can render a better service to the author and the public, than to announce the fact, and leave it to make its own impression.

A gossiping, rantipoling, rigmarole description of medical, or medico-anecdotical work on physicians, past and present[19], may be briefly dismissed as a pleasant collection of scraps from all quarters, having no pretensions to the weight of authority, even on the traditions of the profession, and filling no loftier niche than Dr. Millingen's laborious trifling, under the quaint title of "Curiosities of Medical Experience." The volumes may fill up an idle hour quite as well as any other idle production — but, once put aside, they are not likely ever to be resumed by the medical reader. They have as much claim to be considered a record of physic and physicians, as the Military Sketch Book has to be considered a history of the army.

We must postpone for future notice several works that have reached us— some of them too late to receive the requisite consideration for our present Number, and others which demand more space than we can now afford to bestow upon them. Amongst these are Mr. Caunter's beautiful piece of criticism and learning, "The Poetry of the Pentateuch," Sir G. C. Haughton's "Prodromus," "The Philosophy of Mohammedanism," "The Works of Sydney Smith," a few volumes on historical subjects, and some half dozen novels and poems. The remainder of our space must be assigned to a miscellaneous variety of productions that belong more strictly to the current literature, and that cannot with so much propriety be postponed.

Amongst the numerous pictorial publications which perplex the choice of bookfanciers, "The Illustrated Shakspeare"[20], beyond all comparison, holds the first place. It is entitled to this distinction — a proud one in this age of munificent competition — by a rare combination of attractions, in every one of which excellence has been attained. The typography is clear and beautiful — the embellishments, cast into the pages like "a shower of shadowing roses," are profuse in number and exquisite in design — the text is carefully revised — the introductions to the plays brief and full of the spirit of the poetry — the notes few, and all to the purpose — the size adapted to the dimensions of a noble library — and the whole crowned with the merit of being so cheap, that it assumes the name of "The People's Shakspeare." The undertaking, as far as it has proceeded, appears to be conducted with great care in all its departments, and in none are the taste and feeling that pervade it more truly drawn out, than in the marvellous vignettes that seem to float through its pages. The work is honourable to the enterprise of its projectors, and cannot fail to obtain an extensive circulation wherever the name of Shakspeare is loved; and where it is not loved is, we believe, as yet a *terra incognita*.

A new edition of the works of Sir Humphrey Davy, edited by his brother, Dr. Davy[21], is in course of publication. The first volume, con-

[18] *The Unity of Disease, analytically and sympathetically proved.* By Samuel Dickson, M. D. London: Simpkin and Marshall. 1839.

[19] *Physic and Physicians. A Medical Sketch Book, exhibiting the Public and Private Life of the most celebrated Medical Men, &c.* Two Vols. London: Longman and Co.

[20] *The Illustrated Shakspeare, revised from the best Authorities, with Annotations and Introductory Remarks on the Plays by many distinguished Writers.* Illustrated with nearly One Thousand Engravings on Wood. London: Robert Tyas. 1839.

[21] *Memoirs of the Life of Sir Humphrey Davy, Bart.* By his Brother, John Davy, M. D. London: Smith, Elder, and Co. 1839.

taining the biography, which is already known to our readers, has appeared. The edition promises to be a complete collection of Sir Humphrey's labours, and is got up in a style worthy of his fame.

The fifth part of the History of Napoleon[22], by Mr. Horne, is now before the public, and the expectations excited by its announcement have been fully and ably fulfilled. The narrative is written in a spirit of perfect impartiality. The author seems to have thrown himself into the future, and to have looked back upon a past world, far removed from the reach of its influences and prejudices, describing and deciding with a dispassionate seriousness that is seldom exhibited in works of this description. He exposes many popular fallacies as he proceeds, clears off much of the ill-will and verbiage of Scott and his imitator Lockhart, and fairly rescues Napoleon from the ridiculous enthusiasm of his panegyrists on the one hand, and the slanders of his enemies on the other. In addition to the merits of the work as an historical memoir, it has high claims on the public from the lavish richness of its embellishments, which are chiefly from the designs of Horace Vernet, Raffet, Jacque, and others, who, whatever may be their general merits as artists, possess this peculiar distinction, that, in the portraiture of Frenchmen and French scenes, they are *unique* and unrivalled.

In the "Life Book of a Labourer,"[23] by a Working Clergyman, we are presented with an odd book — full of practical knowledge — inspired by a sincere piety — and exhibiting such a freak of fancy as clergymen of such a stamp seldom venture to indulge in. The work details the experiences of a minister contending with the difficulties of the position in which working ministers in this country are placed; and although it is written after an eccentric fashion, it is yet so truthful, so wise, and so entertaining, that even those who fail to catch the point at which it drives, will be amused and unconsciously instructed by its *brusque* revelations.

Lady Blessington ventures, we believe for the first time, on a very small book[24]; which, accustomed as we are to see her ladyship associated with magnificent octavos and grand quartos, has the same sort of effect as if we saw Cleopatra navigating the Nile in a fairy skiff. But the book, although small, is weighty and substantial. It is apparently a gathering of the thoughts of years — axiomatic in form, and for the most part profound and just. The subjects to which these brief reflections are principally addressed, are subjects connected with society — characters, manners, fame, sentiment, passion; a few of them are trivial and hardly worth preservation; others are fallacious; but the majority of them contain the essence of a close observation of life under a great variety of circumstances.

The lovers of tea[25] ought to read Dr. Sigmond's exposition of its virtues, its history, and its geography. The subject is more curious than it appears on the surface, and, like the celebrated ode on tobacco, draws out quantities of entertainment and speculation from a weed, which we are in the habit of treating with a very superficial familiarity.

"The Heads of the People,"[26] a series of irresistible wit, which has just attained its ninth number, may be described as one of the most original works of the day. The idea was unquestionably an admirable one, and whoever conceived it, must have an extraordinary talent for hitting off the

[22] *History of Napoleon.* By R. H. Horne, Esq. Part V. London: Robert Tyas. 1839.

[23] *The Life Book of a Labourer.* By a Working Clergyman. London: Smith, Elder, and Co. 1839.

[24] *Desultory Thoughts and Reflections.* By the Countess of Blessington. London: Longman and Co. 1839.

[25] *Tea; its Effects, Medicinal and Moral.* By G. G. Sigmond, M.D. London: Longman & Co. 1839.

[26] *Heads of the People, taken off by* Henry Meadows, *the Artist to the Illustrated Shakspeare.* Part IX. London: Robert Tyas. 1839.

popular weakness. Perhaps there is no country in the world, except England, which could bear to see itself thus drawn in classes, depicted faithfully with a little spice of sarcasm, and exhibited at so much a head to the wondering gaze of the whole world. But in England no man believes that he belongs to the class that happens to come under the lash of ridicule. He has a saving clause through which he escapes, and which enables him to look on and enjoy the joke against others. It is not so much pride as selfishness that produces this confidence of security, and enables an Englishman to laugh at every one's faults except his own, and to be ready to join in the hue and cry set up against all foibles and follies, under a thorough conviction that he has none himself, or that, if he have, they cannot be detected. Like the ostrich that buries its head in the sand, and believes that nobody can see it, an Englishman muffles himself up in his self-love, and thinks he is safe from assault. The experiment of "The Heads of the People" has succeeded as it ought to do, for it is one of the most complete gallery of portraits — literary and pictorial — that England has produced. A high order of talent is engaged upon it, and a very accurate judgment is exercised in assigning to each writer a character upon which his previous habits of thinking may be presumed to give him peculiar advantages. The work is as cheap as it is clever, and has already found its way into some of the languages of the Continent.

The number of whole libraries of reprints now in course of publication is so great, that we cannot even enumerate them; but they may be generally alluded to as a striking evidence of the general tendency to recur to the sterling literature of the past, and as a proof that the reading spirit of the age is rapidly extending its domain. Of these series, "Smith's Standard Library" is one of the cheapest and most comprehensive. It embraces some of the poems of Scott and Crabbe, the works of Goldsmith and Burns, Kirk White and Thomson, "Anson's Voyage," Coleridge's exquisite translation of Schiller's tragedy of the "Piccolomini" and the "Death of Wallenstein," the poems of Gray and Collins, and other works, all printed with remarkable beauty and precision.[27] "Chambers's Educational Course of School and Text Books," and "People's Edition of Standard and Original Works" may be allowed to divide popularity with this excellent series. Paley, Butler, Franklin, Goldsmith, Defoe, Smollett, Ramsay, Tennent, Bacon, and Burns, furnish the principal materials of the numbers, which are very carefully printed, and possess the further advantage of being edited with considerable ability, new notes and prefaces being frequently introduced to clear up the obscurities of the text, or, as in the case of "Clarke's Travels in Russia," to enlarge the information by references to the latest authorities.[28] "Ward's Library of Standard Divinity" includes, without abridgment, some of the distinguished theological treatises of Hall, Howe, Mayhew, Leighton, Brooks, Porter, and Bellamy; and, like the other cheap libraries, is brought out with equal care and elegance.[29] In addition to these, there are the pictorial histories, and popular encyclopedias, and cheap issues of the "Old English Poets,"[30] the series commencing with the works of Spenser, illustrated and re-edited, and presenting such treasures of knowledge and delight at so low a rate, that there is not a cottage in the country which may not now make up a bookcase of choice volumes at a less cost than Hume or Shirley, Johnson or Gibbon, could have been procured a few years ago.

[27] *Smith's Standard Library.* London: 1839.

THE

MONTHLY CHRONICLE.

COLONIES AND EMIGRATION.—SOUTH AUSTRALIA.

The British public in general have but a vague idea of the real extent of the British colonial empire. It has often been said, indeed, that the well-known Spanish boast, that "the sun never set upon the dominions of Charles and Philip," has been more than verified by the development of British greatness; but until Mr. Montgomery Martin applied himself to the task, no work of any lasting value was ever published, from which a comprehensive view of the statistics and resources of our colonies could be obtained, and that gentleman's writings, we fear, are very far from having obtained a circulation at all commensurate to their real value. Trashy tales, that to another generation will be as vapid as the comedies of Murphy are to this, have counted their circulation by tens of thousands; while the "Statistics of the Colonies of the British Empire," a book which no library ought to be without, has been for nearly a year before the public, and is as yet known only to a very limited circle even by name.

Mr. Martin calculates the area of the British colonial empire at 2,119,708 square miles,—an extent equal to twenty times that of Great Britain and Ireland; to nearly double that of European Russia, including Poland; and to more than double that of the United States of America, including the territories of Michigan, Arkansas, and Florida. In this calculation, moreover, the Polar regions of North America, generally marked in our maps as British territory, are not included; and of the vast island of New Holland, only the three colonies of New South Wales, South Australia, and Swan River are considered as colonial possessions, though there cannot be a doubt that the whole of that leviathan of islands will, at no very remote period, be occupied by the descendants of Englishmen. In Southern Africa too, the spirit of enterprise inherent in the European race will eventually force the mother country to extend her sway beyond the present limits of the Cape colony; and even while we are writing, the British government is preparing to take formal possession of the valuable islands of New Zealand, which, for several years past, without any interposition on the part of the mother country, have displayed many of the most important characteristics of a British colony. Nor must we neglect to mention the British settlement about to be formed at Port Essington, on the northern coast of New Holland, which, with judicious management, may be made to develope itself with a rapidity fully equal to that which has marked the advancement of the flourishing colony of South Australia. In the next edition of his valuable work, Mr. Martin will have to make some important additions to his already astounding calculations.

The Russian empire, indeed, as usually marked out upon our maps, has an extent of more than 7,000,000 of square miles, being three times that of the British possessions; but of this vast territory by far the larger

frontier is disqualified by the severity of its climate from ever attaining a high degree of cultivation, while of the very limited extent of sea-shore there is not one point that is not cut off for many months of every year from all maritime communication with the rest of the globe. The British colonies, on the other hand, have almost an incalculable extent of sea-coast accessible at every season of the year; several of them are situated within the tropics, others in the most favoured regions of the temperate zone; and it may safely be assumed that there is no one article of commerce which may not be reared in one or other of our colonies, to an extent sufficient to supply the demand of all the markets in the world. Nevertheless it cannot be denied that the most remarkable fact connected with our colonial empire, is the very limited amount of benefit which it has conferred upon the mother country, and the slow rate at which the resources and capabilities of those distant possessions have generally been developed.

We have seen, and the world has seen with wonder, the astonishing rapidity with which the ancient British colonies in North America have advanced in their career of prosperity, since the day on which they renounced allegiance to England. No one believes that, had they remained in subjection to the mother country, the same magnificent results would have been obtained; nor have we seen in any of our other possessions, though many enjoy local advantages fully equal, indeed superior, to those of North America, that those advantages have been turned to account to an extent that can, in the most distant manner, be compared with the unparalleled development of the United States. Some enthusiasts may attribute these effects to the magic influence of democratic institutions; but highly as we esteem the advantages of popular government, we are not prepared to look to it as a panacea for every social evil. The history of the Spanish colonies affords a striking proof that independence alone does not secure prosperity; while the improvement that has taken place in the still dependent island of Cuba, shows that even a very imperfect system of government at home does not preclude the possibility of an enlightened system of administration in a distant colony. It ought to be our study then to trace the causes that have led to the advancement of the United States since the period of their independence, and to study whether the same causes cannot be put into operation in our remaining colonies, without awaiting their separation from the mother country.

The causes to which we are disposed to attribute the chief share in the prosperity of the United States are the total absence of restraint upon domestic industry, and an admirably arranged system of emigration to the waste lands of the interior, — a system that could scarcely be improved, as far as the interest of the whites is concerned. But are these causes of a nature not to admit their application to British colonies? Is there a rational ground that can be adduced why the trade of Jamaica with foreign countries should be placed on a less liberal footing than that of Ireland? or why the sugar of the former island should not be admitted into the markets of England with as little restraint as the oats and butter of the latter? If Jamaica is, as we maintain it to be, an integral portion of the British empire, there can be no reason why the produce of Jamaica should not be admitted into Middlesex and Surrey upon the same terms as the produce of Yorkshire or Munster; and if it is just that the merchant of Hull or Dublin be allowed to import his wines from Bordeaux, and export his fabrics to Hamburg, without being compelled to the circuitous route of London, there can be no rational ground for refusing the same facility to the merchant of Kingston. Instead of such a system, however, we have

established one founded on principles diametrically opposed to those of a free intercourse. From a selfish dread lest foreign nations should in any way participate in the commerce of our distant possessions, we have almost wholly excluded foreigners from an intercourse with our colonies; and we have compelled those colonies not only to bring their produce exclusively into the home market, but also to purchase from the mother country alone whatever European commodities may be necessary to the supply of their real or imaginary wants. To confine them thus to one market, both as sellers and purchasers, is to set artificial limits to their powers of production, and to force them, in many instances, to buy their supplies at a higher price and of a worse quality than if placed on the same footing as Ireland and Scotland. In the last-named country would manufacturing industry ever have attained its present importance, if the same principle had been put in force by which we have been guided in the administration of the more distant portions of our empire? If we wish the prosperity of our colonies to equal that of the United States, we must study to imitate the system of America; and we may rely upon it that when the same causes are brought into play, the same effects will not be slow in manifesting themselves.

If we consent to place the colonial trade on the same footing as the coasting trade, a new system of taxation, we are aware, must be adopted; for if the sugar, coffee, cotton, and wines of our colonies are admitted freely into the mother country, a substitute must be found for the revenue now raised on those articles. A large proportion of the deficiency, however, which would arise, would be cheerfully borne by the colonies themselves; and by throwing open the colonial trade to foreign nations, a new source of revenue, and one of no insignificant amount, would be created in the duties paid on foreign goods imported into the colonies. In the mother country also, it may fairly be expected, the stimulus that would be given to the shipping and manufacturing interests would render every other branch of the revenue much more productive than it now is; while the low price at which all descriptions of colonial produce would be sold to the consumer would not only stimulate trade, by an almost incalculable increase in the consumption, but reconcile the people, at the same time, to the imposition of such taxes as might be found necessary for the maintenance of public faith.

Speculations of so vast a compass may seem visionary to many, but there is no part of them of which the execution is not practicable; and if once realized, far from leading to financial embarrassment, they would insure a development of national greatness, and an increase of revenue, immeasurably beyond any thing that the most sanguine can anticipate from a perseverance in the present system.

The plan of commercial reform, which we have here hastily sketched, would necessitate many other changes. As we should have to look to the colonies for no inconsiderable portion of the national revenue, it would follow that a system of internal government, likely to possess the confidence of the inhabitants, would have to be established in each colony; for no race of men, with English blood in their veins, would long submit to taxation imposed upon them, either directly or indirectly, by the Colonial Office in Downing Street. A system of domestic legislation, consequently, wholly independent, *as long as it acted upon certain fixed constitutional principles*, would become the inalienable right of each British colony, as soon as it contained a population sufficiently large to enter on the exercise of self-government. Each colony, then, in the administration of all interests of a purely domestic

character, would become as independent of the mother country as the several states of America are of the federal congress sitting at Washington; and the imperial parliament would cease to be cognizant of all matters except such as concerned the general welfare of the whole British nation, in and out of Europe.

Whether a system so simple and just will ever be adopted by Great Britain towards her colonies, may fairly be doubted; but of this we are well assured, that without some great modification of the present oppressive, impolitic, and restrictive plan of government, there is not one of our colonies which, when it feels itself sufficiently strong to do so, will not hasten to sever the bond that unites it to the mother country.

The second great cause which we have mentioned as having mainly contributed to the rapid advance of the United States, in their astonishing career of national prosperity, is an admirably organised system of emigration to the waste lands of the interior; so far, at least, it is admirably organised as the interest of the white population is concerned, but to the Indian race it has proved to be cruelly destructive. A little forethought on the part of the American government might have obviated this great moral drawback; and at all events it is to be hoped that any plan adopted by the British, in imitation of the American government, may be honourably distinguished by a considerate regard for the welfare of the aborigines whom we deprive of the wastes over which they have been wont to range uncontrouled.

The American system for the encouragement of emigration is extremely simple. As soon as a fresh tract of land has been acquired by the government, by what is called "the extinction of the Indian title," (a proceeding the humanity of which we will not attempt to vindicate,) the land is surveyed, and divided into counties, townships, and sections; and from time to time public auctions are held, at which the sections are put up for sale at the minimum price of a dollar and a quarter (about five shillings) per acre. If any higher price is offered, the land immediately becomes the property of the highest bidder; and locations which, on account of their vicinity to a navigable river, to a projected road or canal, or from any other cause, present peculiar advantages, lead at times to spirited competition. In general, however, no advance on the upset price is offered; and the land from that moment is for sale at the above-mentioned minimum price, at which it may be purchased by the first stranger that presents himself. The revenue which the United States have derived from this sale of the public lands has been sufficient to liquidate the whole public debt of the republic; and the fund which has accumulated, since the extinction of the debt, has even become a subject of embarrassment to the federal government. The facility which this system offers for the acquisition of land at a low price, and with a secure title, annually tempts many thousands of enterprising individuals to leave the more densely peopled Atlantic states, and to plunge into the wilderness, where with industry and frugality they seldom fail to become comparatively wealthy, by the increased value which a growing population is constantly giving to their land.

The manner in which, till a very recent period, the waste lands have been disposed of in our own colonies, forms a singular contrast to that which we have been describing. The government at home, and the governors in the colony, were in the habit of granting away these lands with indiscriminate profusion to those whom they happened at the time to feel disposed to favour. These grants were guided by no plan or principle. Hundreds of thousands of acres have frequently been given to individuals who wanted the means or the inclination to cultivate their newly acquired

domains, and these vast unoccupied tracts too often became a serious impediment to general improvement. What is obtained for nothing is usually valued at the cost price. The land prodigally given away to idle favourites was frequently disposed of again with the same reckless improvidence; and as a much larger portion of land was appropriated than could possibly be brought into cultivation, the natural consequence was that the market value of land was kept much below the point which, with a more prudent system, it would certainly have reached.

Several writers had at various times endeavoured to point out the impolicy of the British government in thus allowing to be squandered away what might with ease be made a source of national wealth. The wiser conduct of America was often, but in vain, appealed to: the Colonial Office, like every other department of government, was in those days prepared to do battle for every antiquated usage; and every proposed innovation was pertinaciously resisted, as though administrative improvement must be the precursor of revolution, as though the most indefensible abuses constituted the nerves and sinews of our political institutions. Mr. Edward Gibbon Wakefield was the first that succeeded in awakening the attention of the public to the American system for the disposal of public lands. His success was mainly promoted by the suggestion, which he offered at the same time, that the funds arising from the sale of colonial lands might be appropriated to the conveyance of poor emigrants to the colonies; thus furnishing a constant supply of labourers to the new settlement, at the same time that the mother country would be relieved of a portion of that surplus population for which she found it impossible to provide employment. The scheme proved attractive to almost all classes. To the speculator it held out promises of wealth; to the colonist the prospect of a new and rapidly peopled country; and to the philanthropist the hope that many thousands of human beings might be removed from the privations and sufferings of a highly taxed and densely populated land, to one where their only capital, their labour, would become an article of value, and where the fruits of their industry would not be snatched from them for the maintenance of an expensive and deeply indebted government. The plan obtained so warm a support from all classes, that it triumphed eventually over the inert resistance opposed to it by the Colonial Office; and at length, on the 15th of August, 1834, the royal assent was obtained to an act of parliament, by which the king was empowered to erect South Australia into a British province, and to provide for its colonisation and government. As this is the first act by which the principle of selling public lands, and investing the proceeds in a labour fund for the conveyance of poor emigrants to the colony, is recognised, we believe our readers will willingly excuse the insertion of a brief abstract of what has not inaptly been called the Charter of South Australia.

The act consists of twenty-six clauses. By the first, the limits of the colony are fixed; the Tropic of Capricorn forming the northern boundary, the 132d degree of longitude the western, the 141st degree the eastern, and the coast with the adjacent islands the southern boundary. The clause proceeds to say, that the new settlement shall not be subject to laws passed for the other parts of Australia.

By the third, fourth, and fifth clauses, the secretary for the colonies is authorised to appoint three or more commissioners for the purpose of carrying into execution those parts of the act which relate to the conveyance of poor emigrants to the colony.

The sixth clause declares the whole of the lands within the above limits

open to purchase by British subjects; that the purchase money shall be employed in conducting the emigration of poor persons from Great Britain and Ireland; that the lowest price at which land is to be sold shall be 12*s.* per acre; and that no land shall be sold except for ready money.

The eighth clause directs that one of the commissioners shall reside in the colony.

The seventeenth clause allows the commissioners to raise, on loan, a sum of 50,000*l.*, for the immediate removal of poor emigrants to the colony; so that the first body of emigrating capitalists might, from the first, be supplied with labour. By the two succeeding clauses, a further loan was authorised of 200,000*l.*, to pay the necessary expenses of the commission and the first establishment of the colony.

The twenty-second clause declares that no convicts shall ever be sent to the new province.

The twenty-third clause holds out the promise of a constitution for South Australia, as soon as the population shall amount to 50,000 inhabitants.

By the twenty-fourth clause, a sum of 20,000*l.*, part of the above-mentioned loans, is ordered to be invested in Exchequer bills, as a security that no part of the expense of the colony shall ever fall upon the mother country.

By the twenty-fifth clause, the right is reserved to the Crown of re-entering on possession of the whole of the lands that may remain unsold in August, 1844; if, in the meantime, the population should not have increased to at least 20,000 natural-born subjects.

Lastly, by the twenty-sixth clause, it is ordered, that the powers of the commissioners shall not commence until 20,000*l.* have been raised towards the proposed loan, nor until 35,000*l.* have been invested in the purchase of lands.

Thus it will be seen, that without any pecuniary assistance from the government, but by the mere dint of private enterprise, it was proposed to lay the foundation of a new empire at the antipodes. The preliminary difficulties which the authors of the plan had to contend with occupied upwards of two years. In March, 1836, however, a sum of no less than 36,377*l.* had already been paid for land to be allotted to the purchasers in the projected settlement; and on the 25th of May, 1837, Captain Hindmarsh issued a proclamation, by which the site of Adelaide, the capital of the new colony, was determined — a day from which the new province of South Australia may be said to have been constituted. Much unnecessary delay arose from a series of paltry squabbles between Captain Hindmarsh and Colonel Light, the chief of the surveying department; a subject on which we shall have occasion to speak more fully in the course of the present article.

We have now lying before us the "Third Annual Report of the Colonisation Commissioners for South Australia," from which we propose to extract a few facts, to show the splendid results that within so short a space of time have been obtained from the first attempt ever made by this country to establish a colony on a plan approximating to that of America; and, with these results before us, we think we shall be justified if we express our astonishment that no preparations have yet been made to call on the government to extend the same principles to all the other British possessions beyond the seas.

Including the preliminary sales of land, to which we have already alluded, 43,221*l.* had been received down to the end of December, 1837, in payment for 63,795 acres of land in South Australia. The first sales were

effected at the price of 12*s.* per acre; but one of the first acts of the commissioners was to raise the minimum price to 20*s.* — an act, the policy of which we are disposed strongly to condemn. The sales effected in 1837, therefore, were all at the uniform price of 1*l.* an acre, at which rate 3300 acres were disposed of in that year. In 1838 no less than 37,800 acres were sold by the commissioners; besides which, in July, 1838, the sale of lands in the colony itself commenced, and during the first two months of July and August (the latest date to which the commissioners were in possession of returns when making up their report), no less than 6160 acres had been sold in the colony. Since then the sale of lands has been going on merrily, as will be seen by an extract we are about to quote from the "*Southern Australian*," an opposition paper, published at Adelaide; but before we give the extract in question, it will perhaps be as well to say a few words in explanation.

People buying land and paying for it in England, or in South Australia, acquire the right of selecting their several portions from such lands as may have been surveyed by the colonial surveyors; but any person choosing to pay 4000*l.* down in one sum, acquires the right of having what is called a *special survey* of 4000 acres made for him in any part of the colony that he may point out. Now it happens that, since the site of Adelaide was chosen, many localities have been discovered which offer much greater advantages; but those who have already purchased land in and about Adelaide are exceedingly anxious to prevent the new settlers from flying farther away than necessary from the infant capital. This hint will be sufficient to make our readers understand the motives that induce the Adelaide editor to lament, in such moving strains, the investment of so much good money in the purchase of distant allotments.

(*From the Southern Australian, March*, 1839.)

"During the last ten days two more special surveys have been paid for, making in all ten, by which the labour fund is, or ought to be, increased 40,000*l.* Viewed in this light, it is a gratifying fact; it is also consolatory to have this evidence of the amount of the unemployed capital in the province, and satisfactory to find that the neighbourhood of Adelaide is so highly esteemed as to offer inducements to parties to pay 36,000*l.* (the cost of nine special surveys) for land immediately surrounding it; but at the same time we must express our decided opinion that the greater part of the sum above mentioned might have been employed more profitably for individuals, and more beneficially for the province. We fear that many of the special surveys lately claimed have been taken by parties as mere speculations, and will not add in any way to the wealth or advancement of the province; and although we do not presume to interfere with private enterprise, we confess we should have had much more pleasure in seeing the major part of the money expended in stock. We have always laid particular stress upon the importance of speedily getting an exportable commodity; and we cannot but view with regret the season for communication with the other colonies fast passing away, without seeing any energetic measures taken on the part of our capitalists for the introduction of that stock which must be our chief support.

"Land is being purchased in all directions to a great extent, while there is ten times a greater quantity adapted for tillage already given out by the surveyors than will be used for two or three years to come. Pasturage may be had (at present for nothing) to almost an unlimited extent, and yet, within the last eight weeks 40,000*l.* has been subscribed for fresh land; and during the present season for intercourse with our Van Diemen's Land, Sydney, and Port Phillip friends, we do not think more than 10,000 sheep have been imported. Surely this is unwise: if the land be bought as a speculation, where do the parties expect to find a market for it at a profit, especially as some of the recent special surveys have been divided amongst many individuals? If bought for tillage, we would ask whether the proprietors have got the capital to bring it into a good state of cultivation, and to live while the crops are growing; or if they would be able to bear up against a failure of the first year — a thing not at all improbable with land that has never been turned up? We stated in the outset that ten special surveys had been taken, and we said subsequently that nine were for land surrounding Adelaide, — the tenth has been paid for at Port Lincoln, and declared for at Boston Bay. It is said that this has been done by a body of subscribers, of whom very few, if any, have *seen* the spot, and consequently know nothing of its localities. If

such be the case, we cannot but designate it as one of the wildest speculations we ever heard of. There are not many parties in the colony who have been at Port Lincoln; and if we understand right, there are none who have landed in Boston Bay and made explorations in-land. If this be the case, we cannot understand upon what ground the subscribers have declared, or what advantage they expect to reap that cannot be found here. We understand they have been induced to do so because two parties have taken up vessels and gone down there to explore; and, if so, we hesitate not to pronounce the step the height of folly. That the parties referred to may find some spot or spots on the coast to the westward of Port Lincoln well worthy of a special survey, we can imagine; but it will be years before such location will be in requisition; and therefore no one person, or body of men, ought to expend 4000*l.*, unless they can afford to lie out of their money for ten or twelve years. Is this the condition of the subscribers to the Boston Bay survey?"

From the above extract some idea may be formed of the rate at which the sale of land must have been going on in the colony, since the date to which the last report of the commissioners extends.* In reply to the lamentations of the editor at the investment of so much money in land rather than in stock, all we can say is, that it may safely be left to individuals to decide upon what they think the most advantageous way of disposing of their money. Besides, it must be borne in mind, that 40,000*l.* paid for land will provide for the conveyance of 2000 British labourers to the colony; and we doubt whether there is any description of "stock" the importation of which is likely to be more to the general advantage of the settlement.

During the year 1838, it appears that twenty-three vessels sailed from London for South Australia, four from Liverpool, one from Dundee, one from Greenock, and one from Kirkaldy Roads. By these vessels 3154 emigrants were conveyed thither, who in the report are classified as follows:—

	Males.	Females.	Total.
Labouring class -	1388 -	1309 -	2697
Superior class - -	258 -	98 -	356
			3053
Superior class children - - - - - -			101
Grand total - - - - -			3154

Of these, 2361 were sent out wholly or partly at the expense of the emigration fund.

In 1836, the number of emigrants who went out amounted to 941 souls; in 1837 to 1227; and in 1838, as we have just seen, to 3154.

* Since this article has been in type, accounts have been received from South Australia to as late a date as the 13th of March; and, as the intercourse is daily becoming more active, even later intelligence will probably have arrived in England before our present number reaches the majority of its readers. The purchases of land, and more particularly the special surveys, appear to be increasing with geometrical progression. The *South Australian Gazette*, of the 2d of February, announces "another special survey of 15,000 acres" as having been just taken by Mr. C. Flaxman, for himself and others. "We *know* of another in immediate contemplation," the writer continues, "and we hear of several more. It is impossible to conceive the spirit which these surveys are infusing among all classes of colonists; and we trust they will demonstrate in England, beyond all doubt, that the soil, climate, and situation of South Australia are far superior to any other known portion of New Holland. Let it always be borne in mind, that several of these surveys have been demanded by some of the largest stock-proprietors of New South Wales — not merely alive to their own interests, but themselves the very best qualified to judge by comparison of the advantages of our more favoured land. His Excellency has, in the most considerate manner, allowed land-orders to be received to the extent of one half, or 2000*l.*, on each special survey; so that not merely all reasonable complaints, with regard to the want of surveyed land, are avoided, but a greatly increased amount of benefit is conferred upon those who have purchased land in England, in so far as a certain number of them can, by concerting among themselves, choose whatever district they consider the most advantageous." It is not, however, enough that only one half the amount of a special survey should be received in land-orders; and the Commissioners will do well to apply an immediate correction to a system, the effect of which is at present to make it more advantageous to the emigrant to carry out cash than to buy his land-order before starting.

The emigration to South Australia has not, however, been confined to this country. About 600 German Protestants, desirous of escaping from the religious persecution to which they were subjected in their native land, have been sent over to the colony by the assistance of Mr. George Fife Angas, the Chairman of the South Australian Company. A very considerable immigration has likewise taken place from the older colonies of Australia; and, upon the whole, it is calculated that when all the emigrants known to have embarked in England in 1838 shall have arrived at Adelaide, the population of the province will amount to between 7000 and 8000 souls.

The Commissioners, in the selection of emigrants, have been desirous to procure an industrious and moral population for the colony; with this view, the remuneration paid to the various agents throughout the country is so regulated, as to give to each of them a direct pecuniary interest in the good conduct of the labourers selected for a free passage. During the voyage also, to promote habits of temperance, all intoxicating liquors are excluded from the ordinary dietary of the emigrant labourers; and a library of moral, religious, and entertaining books is provided for them, as well as a schoolmaster for the instruction of the children. Habits of temperance, however, according to the accounts of most of the travellers who have visited South Australia, do not prevail among the labourers, owing to the low price of spirits, and to the high wages which the men are able to obtain. Perhaps the most effectual remedy for this evil might be found in encouraging the cultivation of the vine, which would soon correct the habits of the humbler classes, who are almost always found to incline to temperance in countries where wine is equally easy of access with spirits.

The following extract from the Report of the Commissioners shows the progress that has already been made in providing the means of education and religious instruction:—

"We have great satisfaction in stating, that our endeavours to plant in South Australia an industrious and educated population, have been zealously and effectually seconded by the spontaneous and voluntary exertions of enlightened and benevolent individuals, as well in this country as in the colony.

"The state of religious instruction, and the progress which is making amongst the various sects of Christians in planting the principles of the gospel in the country of their adoption, are satisfactory and auspicious. The temporary building which the South Australian Church Society sent out to the colony for the accommodation of the members of the Church of England having been found unsuitable, a stone church, capable of holding 500 persons, was, when the last accounts were received, in the course of erection, and was advancing rapidly towards completion: the whole of the sittings are said to have been taken in a single day. A Sunday school is connected with this church, and is under the superintendence of the colonial chaplain, the Rev. Mr. Howard.

"The Wesleyan Methodists have formed a society in the colony, and to their zeal and activity the colonists are indebted for a stone chapel capable of holding about 200 persons. This chapel has been opened for divine worship, and every sitting is said to be let. A Sunday school is also connected with this chapel, and the desire for instruction is such that the attendance has increased beyond the limits of the accommodation provided.

"The Colonial Missionary Society have sent out the Rev. Mr. Stowe, a very respectable minister of the Congregational denomination, and a numerous auditory attend upon his ministry.

"There is also a Baptist minister of high character officiating in Adelaide.

"The South Australian School Society, the object of which is to establish and conduct Infant British and Labour Schools, have commenced their operations in the colony, under the superintendence of Mr. Shepherdson. This gentleman is considered in every respect suitable for the office of head teacher and director of the schools. The school is under the management of a committee in this country, assisted by a committee and officers in the colony. The number of children under instruction is very considerable, and additional buildings are required for their accommodation.

"In compliance with the wishes of some of the leading colonists, the Rev. T. Q. Stowe has established a day-school, in which the classics are taught, and purposes, as soon as the

necessary buildings can be erected, the establishment of a boarding-school, in conjunction with a relation of his own, formerly the master of a grammar school in this country. A gentleman of known reputation as a scholar, and with a sufficient command of capital for the undertaking, has sailed for the colony, with the view of opening and conducting a classical school, upon a comprehensive plan. Besides these several establishments for the instruction of the youth of the province, a Mechanics' Institute has been founded in Adelaide, and is in full operation."

One of the most gratifying characteristics of South Australia, is the respect that has been paid to the rights of the aborigines; and the uniform kindness with which they have been treated has hitherto had the effect of preventing those unhappy collisions which disgrace the early history of all our other settlements. An officer has been appointed with the title of "Protector of the Aborigines," whose office it is to guard them against oppression; and though we are far from admitting that all has been done for them that strict justice required, on taking arbitrary possession of the lands over which it had been their privilege to roam, still we rejoice to see the recognition of the principle. We shall make no apology for occupying some space with an extract from the last Report which their Protector has addressed to the Colonial Office:—

"Adelaide, July 1. 1838.

"I have much pleasure in announcing that the aborigines' location is sufficiently advanced to admit of the occupation of the twelve huts, and the natives express great satisfaction in the possession of them. The interpreter is settled on the spot, a garden is in preparation, and rations of biscuit are twice a day distributed to whatever persons choose to apply for them. Sugar and rice are occasionally supplied; and old garments of every description are generally bestowed upon the natives by the colonists. The progress of the school has been retarded by the melancholy death of Captain Bromley, who was found drowned in the river on the 7th of May. I have not since met with any person fitted for the office, and who would accept of it at the present salary. In the meantime, however, many natives, especially children, are becoming acquainted with a great number of English words, and are very eager to learn the names of every thing which attracts their attention. But their general indifference to whatever is valued by civilised man, whether it be clothing, the luxuries of food, and comfortable habitations, or the more worthy gratifications of the intellect, makes it no easy matter to stimulate them to that degree of industry necessary for acquiring such advantages; and the salubrious climate of their native land predisposes very considerably to this indolent condition of mind and body.

"Viewing this as the grand obstacle to their civilisation, and making allowance for all others which oppose so desirable an end, I am impressed with the thorough conviction that the only means which can be permanently successful is, first to teach them the simple and sublime doctrines of Christianity; and that to begin by any other method is truly to commence at the wrong end.* The success of such an undertaking promises to be the more certain, in that the aborigines do not appear to be attached to any superstitions, of whose influence it would be previously necessary, and perhaps difficult, to divest them. Their minds rather seem to be in that unoccupied condition which capacitates them for receiving impressions of whatever may be presented to them in a sufficiently interesting form.

"Entertaining this opinion, I cannot but believe that the arrival of a special missionary for the aborigines would be the greatest benefit which can be bestowed upon them; and there can be little doubt that, aided, as he would be, by the co-operation of the Protector, and immediately put in possession of as much of the different dialects as is now known, without having to overcome the first difficulties of acquiring an unwritten, and therefore variable language, his progress would be commensurate with the wishes of those who look upon the aborigines of South Australia as fellow-members of the great human family.

"I have, &c.

(Signed) "William Wyatt,
"Protector of the Aborigines
(*ad interim*).

"To the Honourable the Colonial Secretary,
&c. &c. &c."

* We cannot coincide with this, while the facts of the present utterly wild and savage condition of the aborigines are so strongly placed before us. They cannot, at present, comprehend even the extent of their own physical requisitions: how, then, should their minds be in a state to receive abstract truth? The same discrepancy applies here as in the case of the New Zealanders (see the *Monthly Chronicle*, for August, p. 121.); and in both, the extreme difficulty of finding competent teachers of the simple and sublime doctrines of Christianity.—Ed.

We have already alluded to some paltry squabbles between the first governor, Captain Hindmarsh, and the surveyor-general, Colonel Light. We have frequently seen allusion to those differences in the South Australian papers; but until we had seen the particulars detailed in the Report of the Commissioners, we own we had but a vague notion of the causes of these dissensions. From the statements in the Report, we are tempted to attribute these differences, and the inconveniences thence arising to the colonists, chiefly to the arrogance of Colonel Light. We would fain use a milder expression if we could feel justified in doing so: but, assuming the Report to be correct — and the Commissioners are not likely to screen the governor at the expense of their own officer — we must say that Colonel Light appears totally to have misunderstood the nature of his mission.

The colony of South Australia, as at first projected, was to have been a chartered colony, founded on principles similar to those which had guided the establishment of the British settlements in North America in the seventeenth century. Such a plan would have placed the disposal of the public lands under the control of the governor. The Act of Parliament, however, went to establish a divided authority — leaving to the governor and council the executive and legislative powers, and the levying of taxes; but vesting in a Board of Commissioners the disposal of the public lands, and the application of the emigration fund arising from the sales. The Commissioners also were charged with the raising, the custody, and the application of the revenue loans necessary to defray the expenditure occasioned by the first establishment of the colony. This divided authority does not appear to have produced the happiest effects.

"The governor had scarcely landed," say the Commissioners, "when a governor's and a commissioners' party were formed. The partisans of the former imagined that they were upholding the royal prerogative, and maintaining the power of the crown, by forcing a departure from the regulations and instructions by which the commissioners gave the selection of the site of the capital to the surveyor-general, and left to private enterprise the laying out of all secondary towns; while, on the other hand, the partisans of the latter acted as if they thought that to limit and oppose the exercise of the executive authority was to vindicate the peculiar principles of colonisation embodied in the South Australian Act. The irritation of the contending parties became daily more intense. The despatches received from the several authorities in the colony were chiefly occupied by narratives of official contests upon subjects comparatively unimportant. This state of things was beginning to produce impressions unfavourable to the new settlement, as well in this country as in the neighbouring colonies, and must have impeded, if not altogether suspended, the prosperity of South Australia, had not prompt and effectual measures been adopted for removing the cause in which it had originated."

The measure adopted for removing this fertile cause of dissension has been simple enough — that of uniting in one and the same person the functions of governor and resident commissioner. The officer on whom this joint character has been conferred is Colonel Gawler. As yet we have no means of judging of the success of his mission; but the extraordinary progress which the colony has already made, in spite of all the inconveniences arising from the civil discord just alluded to, is calculated to leave an impression that even should the experiment not succeed to the full extent anticipated by the Commissioners, no serious impediment can now be thrown in the way of South Australian prosperity.

The surveyor-general, Colonel Light, left England on the 1st of May, 1836; and about eight months afterwards Captain Hindmarsh sailed to assume the government. Immediately on the governor's arrival the first difference arose, in consequence of the refusal of the latter to sanction the site selected by Colonel Light for the new city of Adelaide, the capital of

the colony. We cannot but think that in this refusal Captain Hindmarsh displayed a correctness of judgment, to which it would have been well for the colony if greater deference had been shown. The new capital has been established on a site eight or ten miles distant from the sea shore, on a small brook, which though it may afford the inhabitants a sufficient supply of fresh water, is altogether valueless for any purposes of navigation. The natural consequence is, that all merchandise sent from Europe costs almost as much in land-carriage as in freight, before it can be conveyed from the coast to Adelaide. The motive assigned for this preposterous selection is about as puerile as can well be conceived; neither more nor less than an apprehension that the morals of the young community might be corrupted by the evil example of the crews of the ships arriving from England. We are not surprised that the sailor was disgusted by so mawkish a piece of twaddle, and by the insult which it implied to his own profession. We could almost wish that Captain Hindmarsh had persisted in withholding his sanction altogether. Nevertheless, a compromise was brought about, on condition that a secondary town should be established at the harbour; and this first bone of contention having been disposed of, the preliminary purchasers were put into possession of their town sections at the two embryo cities of Adelaide and Port Adelaide.

Other subjects of contention speedily arose between the governor and the surveyor-general, and the natural consequence was, that the business of the surveying department was neglected. Complaints soon arrived from those who had bought land-orders in England, and who justly murmured at not being put into possession of the lands for which they had paid their money before their departure from Europe. In October, 1837, some unofficial communications were made to the Commissioners, attributing the delay in the preliminary surveys to the insufficiency of the surveying department. The Commissioners immediately applied for advice to an officer of acknowledged experience and ability, Captain Dawson, of the Royal Engineers, who gave it as his opinion, that the surveying department under the command of Colonel Light was amply sufficient for the survey of a district of 150 square miles (the extent required) within a period of from four to six months. This opinion, which was furnished in writing, and which is appended to the Report, was then sent out to the colonel, and certainly conveyed what appears to have been a well-merited rebuke, as a period much longer than that mentioned by Captain Dawson had already been allowed to elapse.

"In November, 1837, Mr. Kingston, the deputy-surveyor, arrived in England, bringing letters from the resident commissioners, and from the surveyor-general, representing that in the beginning of June, more than two months after the survey of the town had been completed, scarcely any progress had been made in the survey of the rural lands; that with the staff, then engaged, the completion of such surveys, to the extent required by the first purchasers, would occupy a period of three years; and that, in order to complete the survey of 100,000 acres in the period of six months, the surveyor-general required such an addition to the supply of assistant-surveyors, labourers, and instruments, as would, according to the estimate inserted in the Appendix, raise the expense of the surveying establishment to upwards of 14,000*l.* per annum."

"For this communication," say the Commissioners, "we were unprepared;" and we can readily believe the assurance: 14,000*l.* for the survey of 100,000 acres! — nearly half the price at which the American government sell their public lands! And this extravagant estimate, it must be borne in mind, was for the survey of a tract of level country, very thinly wooded, and offering no natural impediment whatever to the labours of the

engineer. In this emergency the Commissioners again applied to Captain Dawson, requesting him to reconsider his opinion, and referring him for local information to the deputy-surveyor, Mr. Kingston. Captain Dawson did reconsider his opinion, and was strengthened and confirmed in his first judgment — "that with the actual strength of the surveying department, the preliminary surveys ought to have been executed in a period not exceeding six months." The Commissioners then decided to send Mr. Kingston back to the colony, with fresh instructions to Colonel Light; and in the event of the latter declining to undertake the task of making the requisite survey within the stated time, the execution of it was to be confided to Mr. Kingston; in which case Colonel Light's authority was to be for the time suspended, though he was to retain his full salary, in order that he might be employed in surveying secondary sites, and in completing the examination of the coast and of Lake Alexandrina. At the same time, to be on the safe side, three additional assistant-surveyors were sent out.

On the arrival of these instructions, Colonel Light, under an impression that Mr. Kingston had acted unfairly towards him, resigned his office; and his resignation was followed by that of all the assistant-surveyors, with the exception of three, two of whom had just arrived from England. The Commissioners in their report declare the impression of Colonel Light to have been altogether unfounded, Mr. Kingston having throughout the whole affair "acted towards his superior with scrupulous honour."

On the resignation of Colonel Light, the direction of the surveys devolved on Mr. Kingston, who, according to the report before us, set about his work with zeal and energy; and although almost left alone, he appears in a very short time to have placed the holders of preliminary land-orders in possession of their sections in the district of Adelaide. Under these circumstances, it would have been only fair to have promoted so active an officer to the vacant appointment. The Commissioners seem to have thought otherwise; and inform us, with evident satisfaction, that they "have had the good fortune to secure the services of Lieutenant Frome, R. E.," who, with a corps "about equal in numerical strength to that which existed before the recent resignations, estimates that he shall be able to effect an accurate survey of upwards of 400,000 acres per annum.

We have dwelt at some length on the history of these delays in the surveys, chiefly on account of the frequent allusions that have been made to them by the daily press — allusions which we believe were often intended to raise unfair prejudices against the new colony. We trust that the inefficiency of this department will not furnish so important a topic to the next report which it may be our duty to examine.

Upon the whole, we look upon the report which we have been considering, as a document that fully justifies the expectations entertained by the original promoters of the colony of South Australia. Should this career of prosperity continue unchecked, we feel satisfied that it must lead, at no distant period, to a complete remodification of our whole system of colonial government. Of this we are assured, that if a similar plan is acted on in British Guiana, at the Cape of Good Hope, and in the new settlement about to be formed on the northern coast of Australia, those colonies may each look forward to results quite as brilliant as any that may fairly be anticipated for South Australia. British Guiana alone contains an area of 100,000 square miles, or sixty millions of acres, of which only a few pestilential swamps on the sea coast have hitherto been colonised. In the interior is a noble expanse of upland country, with a delightful climate, and, by the sale of those unoccupied lands, an abundant emigration fund

might be raised; moreover, owing to the greater proximity of the country to England, an equal number of labourers might be conveyed thither at a much less expense than to South Australia. Nor is England the only portion of the British empire to which the emigration of a part of its labouring population would afford a welcome relief. In India, it is but too well known, the poorer classes suffer yearly the most frightful privations. Why should not an emigration fund be raised by the sale of public lands in the new settlement now forming at Port Essington, on the northern coast of Now Holland, to be expended, in part at least, in the conveyance thither of poor emigrants from India? This is a question well deserving the consideration of those who have lately taken it upon themselves to inquire into the wrongs sustained by our Indian fellow-subjects.

Before closing this article, there are one or two points connected with South Australia, to which, though they may be familiar to many of our readers, we feel it our duty to refer. Since the establishment of the colony, a navigable inlet has been found to Lake Alexandrina, a large inland sea situated within the assigned limits of the province; and it has moreover been discovered that the Murray river, the only river of any magnitude which has yet been met with in New Holland, discharges its waters into this lake or inland sea. The prospect of a large extent of inland navigation is thus opened to the colonists; and so important are the advantages anticipated from this discovery, that many of the purchasers of land-orders have declined to select sections in the district of Adelaide, choosing rather to wait until some of the lands on the lake and along the river have been surveyed. We are disappointed to find that no allusion is made to this subject in the report of the Colonisation Commissioners. Great anxiety, we know, prevails among those who have already located themselves about Adelaide to discourage the establishment of distant settlements; but selfish motives of this kind, we trust, are not allowed to stand in the way of what we cannot but consider the true interest of the colony. The Adelaide gentry may rest assured that sooner or later towns will arise in South Australia, that will eclipse their seat of government as completely as New York and Baltimore have already left the city of Washington behind in the march of improvement. The site of Adelaide, away from the sea coast, and remote from any navigable river, can never become the commercial capital of the colony. To talk of remedying this inconvenience by the construction of a railroad or canal is mere childishness; it will be many, many years, before capital will be such a drug in South Australia as to allow of its being invested in such expensive undertakings. In the meantime thriving cities will be rising on the Murray river, and on different points of the coast; and the sooner the Commissioners direct the surveyors to extend their operations to the favourite points, the more rapid will be the improvement of this interesting colony.

We should blame ourselves if we were not to say a word or two about those enterprising gentlemen who have within the last year succeeded in effecting the overland journey from New South Wales to Adelaide, for the purpose of driving large flocks of cattle and sheep from the old to the new colony. Captain Sturt, Mr. Joseph Hawdon, Mr. Eyre, and perhaps some others whose names have escaped us, have repeatedly made this journey, and always without experiencing any annoyance from the native tribes through whose grounds they passed. In a recent number of the *Southern Australian*, we find the following report (addressed to the governor by Mr. Eyre) of the last of these trips of which any account has reached us: —

"My party is composed of thirteen individuals, exclusive of myself, and two boys aborigines of the Hume and Murrumbidgee rivers; and my stock consisting of about one thousand sheep, about six hundred head of cattle, and four teams.

"We left Limestone Plains (our point of departure) on the 5th December, 1838; and following the high road to Port Phillip as far as the crossing-place of the Murrumbidgee, we turned that river to the westward, instead of following further south, as all the parties coming to this colony had previously done; and by this means we avoided crossing the several rivers on that line of road, materially shortened the distance, and obtained a more abundant supply of feed and water for our stock. After passing my party twice across the Murrumbidgee, to avoid some ranges, I continued following its right or northern bank, and passing through the marshes of the Lachlan, I crossed the bed of that river without being aware of it, as its channel presented the appearance of nothing more than an ordinary creek, and had no water in it as far as I went up, beyond two hundred yards from its junction with the Murrumbidgee; my drays crossed about half a mile above this junction, and had no difficulty in effecting a passage. The marshes of the Lachlan (at least that portion of them which I crossed, and which lies contiguous to the Murrumbidgee) no longer exhibit that formidable appearance they did some years ago, and the many dry seasons we have had lately have so much changed their character, that they now only present the appearance of large and rich alluvial flats, more or less covered with reeds, but generally of a firm surface, and affording an easy and good road to travel over. After passing the Lachlan, we followed down the Murrumbidgee to its junction with the Hume, and on our arriving there on the 20th January, we became aware that another party (which I have since ascertained to be Captain Hart's, from Portland Bay) had arrived on the south side of the Murray about the same time we did on the north; and our two parties continued following opposite sides of the river to beyond the junction of the Darling, where Captain Hart crossed to the northern side with his party a day or two's stage in advance of mine. After crossing the Darling I felt anxious, while in that neighbourhood, to ascertain the nature and course of a junction laid down by Captain Sturt as the Lindesay, and falling into the Murray on its southern bank; and I was the more anxious to ascertain this point, as I had myself last year (when endeavouring to cross the interior of the country to the southward of the Murray on my route to Adelaide) met with many difficulties and much delay from my not being able to fall in with this (supposed) stream in the direction I expected to have found it. After seeing my party two days' stage beyond the Darling, I crossed to the south side of the Murray, accompanied by two of my party, and spent three days in a careful examination of the surrounding country, but was unable to discover any stream connected with the country to the south. I found the extent of land subject to flood much greater in this vicinity than I had done higher up the river; and its surface was intersected by very many creeks and lagoons, some of which were of considerable size and had a good deal of water in them, and one in particular, which I took to be the Lindesay of Captain Sturt, is both wide and deep, and has its whole course distinctly marked by lines of lofty gum trees. This creek appears to separate the flooded lands from the higher ground beyond, and continues for a course of about sixteen miles, taking first a south-westerly and then a north-westerly direction, and coming to the river at both its extremities; but it appears (as do also all the other creeks and lagoons) to be filled only by the surplus waters of the river in seasons of flood. Immediately beyond the low lands are extensive plains of red sand, covered with low bushes, but destitute of low grass; and these are again locked in by sandy ridges covered with scrub, which appeared to extend far into the interior to the southward. After crossing the Darling, my party continued to follow in the same route I kept last year; and as soon as I had seen them over the worst of the road, I left them a few days ago, leisurely advancing, and preceded them myself to Adelaide.

"It affords me much pleasure to have it in my power to state, that my intercourse with the aborigines has been generally of a very friendly nature, and that I have again conducted a party in safety and in peace through the various tribes that frequent the line of route; but at the same time I should strongly impress upon future travellers the necessity of the utmost care and vigilance on their part, and would caution them by no means to rely too much on the exhibition of a friendly disposition on the part of the natives, as they are both cunning and treacherous, and frequently refrain from acts of violence only from dread of a superior force. In the vicinity of the Lachlan river I had one of my party dangerously wounded with a spear by some natives, who, but a few minutes before, had shown themselves to us on the opposite side of the river waving green boughs, and making the usual demonstrations of amity; and with these natives we had no intercourse whatever, so that they could not possibly have received offence of any kind to induce them to commit so wanton and treacherous an outrage.

"Having been the first to bring sheep over-land from New South Wales, and having thereby proved its practicability, I may be expected to make a few remarks on the subject. From the nature of the country, and the great quantity of scrub we were obliged in many

places to pass through, we had much difficulty in getting the sheep along, and our trouble was not a little enhanced by the very hot weather we experienced during the greater part of the journey, the thermometer during the heat of the day generally ranging from 120° to 134° in the sun. In some parts of the route we had also much difficulty in procuring a sufficiency of feed, but this seldom occurred for more than a day or two's stage at a time, and we had always an abundant supply of water; so that our losses, on the whole, did not amount to one per cent. on the original number. I have therefore much pleasure in stating it as my opinion, that though far from being a good line of route for driving sheep; yet in ordinary seasons I consider it to be a perfectly practicable one, and have no doubt but that by careful and judicious management, and dividing the sheep into small flocks for driving, this most valuable description of stock may eventually be introduced into the colony in considerable numbers, by a safer and cheaper means than can be done by water, and the colonists thus have the prospect of obtaining, at no extraordinary risk, a property which is almost the only one they can look to for a sufficient and available export.

"I have the honour to be, Sir,

"Your most obedient humble servant,

"EDWARD JOHN EYRE."

We have not yet exhausted the topics on which it was our intention to have dilated, but the space already occupied warns us to beware lest we exhaust the patience of our readers. We have given a hasty sketch of the flattering results that have been obtained in one colony from the adoption of a system, far indeed from perfect, but based at least on correct principles: may it not fairly be calculated that the same policy, applied to our colonial empire generally, would produce similar effects? We confidently reply to this question in the affirmative; and should we live to see the experiment tried, we feel convinced that our anticipations will be fully justified by the consequences. Proud as the political eminence is to which Great Britain has already attained, it is trivial in comparison to that which would be secured by the adoption of a truly liberal and enlightened system of colonial government.

THE BRITISH QUEEN STEAM-VESSEL.

THE richest ship that ever sailed from land,
Was, in imagination, all a wreck:
What hopes were founder'd then, or running mad!
She rides in port!—and all is ten-fold joy,
Because the wealth hath not yet passed away.
O, Man! erroneous in realities,
When wilt thou know that deep-set inward things,—
Some heaven-ward principle of love and truth;
Justice and charity, the soul of friendship,
And general sense of innocent happiness,—
Are nobler and *more real*, as more lasting;
Producing more substantial good on earth;
Than the huge bulk of Mammon on the seas,
Whose wreck were small to losses such as these.

STUDIES OF UNDEVELOPED CHARACTERS IN SHAKSPEARE;

FROM SKETCHES AND SUGGESTIONS IN HIS PLAYS.

No. VII. — *Macbeth.*

Everybody believes in physiognomy according to the extent of his experience and the strength of his involuntary impressions. As a theory, few can admit its truth, "for sundry weighty reasons;" but all people tacitly acknowledge its validity by their practice, simply because they cannot avoid such practice. Of late years the study of phrenology (which has been rather prematurely termed a science) has found innumerable proselytes; and its developments, being perfectly definite, tangible, and fixed, whatever blunders or changes may have been made in the nomenclatures, present the substantial groundwork of a system, which, (after it has performed all its necessary lunations of absurdity, by the temptations it offers to mechanical extravagance,) will one day be the means of conferring immense advantages in individual and national education. But with the study of physiognomy the case is very different. The features, it is true, are definite and fixed, yet their outlines are rendered evanescent and changeable to the most confusing extent by the variations of expression; and, even when in repose, the variations of character in the outlines are generally so extremely fine and delicate, so liable to convey false impressions by a peculiarity of light and shade, that the attempt to reduce the principles of physiognomy to any system of regular fixed practice seems impossible, although it must be evident that such principles do exist in nature, find them who can. Now, when we add the imperfections of our sight, our experience, our knowledge, or our imagination and judgment, to the natural and circumstantial complexity of this most elaborate and hair-breadth study of that index which is, perhaps, simultaneously occupied in the same aim-dazzling speculation upon ourselves, there can be no manner of wonder at the disrepute into which all the theories of physiognomy have fallen, and the denial which even its few demonstrable and well-known verities experience. A Greek, Latin, or Dutch proverb is quoted by a gentleman against "all faith in the face," and the next moment he refuses to hire a servant because he "don't like the looks of him." If the worshipful bench of metropolitan magistrates, to say nothing of the elders of the civil force, were able to display their combined experience, the question would be wonderfully illustrated on the darker side of humanity, while for the rest we must go (not to the, generally-speaking, handsome nonentities of sculpture) to Raffaelle, Murillo, Guido, Correggio, &c. to the poets and romancists, and to Shakspeare in particular.

The opinion of the venerable Duncan on the question of physiognomy is very clearly expressed: —

> "There's no art
> To find the mind's construction in the face."
>
> Act I. Sc. IV.

We are to recollect, however, that Duncan does not say this till after the treason of the Thane of Cawdor has been discovered. Previous to this he

had always looked upon him with eyes of unbounded confidence, because he liked his face.

> " He was a gentleman on whom I built
> An absolute trust." — *Ibid.*

It would hence appear, whether there be or be not an art of physiognomy, that Duncan did not possess it, because he had made a woful blunder in his estimate of Cawdor. But, inasmuch as no single act of misconduct or depravity can cancel a previous life of worth and integrity, so we are disposed to think that Duncan was very probably right in the general opinion he had all along entertained of the thane; and that the act of treachery which led to his death was an exception to himself and his better nature, from which he was led astray by some powerful circumstances, even as was Macbeth, who, no doubt, had a noble-fronted physiognomy before his fall. Previous to his meeting the witches on the heath, who set his imagination diabolically at work, anybody would have trusted the open manly expression of Macbeth's countenance, and would have been right in so doing. The same may be said of the Thane of Cawdor. The deep penitence and high-sorrowed dignity in the expression of his feeling towards the king whom he had injured, and the proud abstraction with which he met his death, show that the spirit of nobleness in his nature had only been obscured or inveigled, not extinguished nor permanently perverted.

> " *Duncan.* Is execution done on Cawdor? Are not
> Those in commission yet returned?
> " *Malcolm.* My liege,
> They are not yet come back. But I have spoke
> With one that saw him die: who did report
> That very frankly he confessed his treasons;
> Implored your highness' pardon; and set forth
> A deep repentance: nothing in his life
> Became him, like the leaving it; he died
> As one that had been studied in his death,
> To throw away the dearest thing he owed
> As 'twere a careless trifle." — *Ibid.*

The arch-seducer of the faith and fealty of the Thane of Cawdor seems to have been Sweno, King of Norway. This Sweno, after certain " skipping kernes " had been beaten in the field, suddenly, " surveying vantage," made a furious assault, " with new supplies of men," upon the forces commanded by the two Scottish generals, Macbeth and Banquo. He was frustrated, however, in his attempt, after having engaged in single combat with Macbeth during the battle.

> " Norway himself, with terrible numbers,
> Assisted by that most disloyal traitor
> The Thane of Cawdor, 'gan a dismal conflict:
> Till that Bellona's bridegroom, lapped in proof,
> Confronted him with self-comparisons,
> Point against point rebellious, arm 'gainst arm,
> Curbing his lavish spirit."
>
> Act I. Sc. II.

By what circumstances of temptation and inveiglement Cawdor was seduced from his allegiance by Sweno, or whether, indeed, the act originated in himself, and, if so, from what circumstances and motives, no positive information can be obtained from those who knew him.

> " Whether he was
> Combined with Norway; or did line the rebel

With hidden help and vantage; or that with both
He laboured in his country's wreck, I know not;
But treasons capital, confessed, and proved,
Have overthrown him."

ACT I. SC. III.

An old Scottish ballad is, however, extant, which throws some strong though broken gleams of light upon the matter. It is entitled "The Last Wordis o' the Zane o' Cawdor." No date is affixed to it. We give it verbatim, with the exception of a trifling transposition of words where the measure required it, in consequence of our rendering the dialect more acceptable to present times.

"My Marion, loose your braid, your braid sae lang behind;
O! loose your yellow hair, — cast its gold upon the wind!
For your father now maun die, and yon grave a traitor hold,
And nane beside yoursel will bless his ashes cauld.

"O, nane but ye, my child, will pause beside yon grave:
They 'se pass wi' siccan shudder, as though the foul fiend drave;
They 'se pile their stony thoughts aboon thy father's bones,
An' curse the restless ghaist that ay maun bleat his moans.

"When I am hid, ye'se gang unto the Norway's king;
May be he'll hold his promise for a' this news may bring:
But for thee I'd hate him now, as I hate my treacherie;
Yet nane shall ken the secret cause why thus disgraced I die.

"Hie to the gude King Duncan, wi' a' thy winsome grace;
Tho' you love his mortal foeman, yet look up in his face:
The truth, my Marion, tell, that, allbe my acts were foul,
Yet did I love my gude king wi' a' my harte an' soul.

"I would na' he forgave me, — I could ne'er forgie mysel:
Deep, dark-down 'neath the cairn my shame doth hunger for to dwell.
Farewell, kind gentlemen! I pray ye dinna greete,
But take my head, and lay it at gude King Duncan's feet."

"These laste wordis o' my bleeding harte, I would sue toe have maist humblie made knowne unto the king by my dochter, for whom, in death, toegether with hys majestie, shall my restelesse spirit constantlie praye. Amen."

Concerning the character of Sweno, whatever might have been the nature of his connexion with the unfortunate Thane of Cawdor, nothing is developed in the text beyond such qualities as belong to the class of bold, fierce, iron-clad, sword-and-battle-axe-men of the olden time, and rude regalities who could scarcely write their own name. In his "correspondence" with Macbeth, he, however, got the worst of the argument; and we learn from Rosse, that,—

"Sweno, the Norway's king, craves composition;
Nor would we deign him burial of his men,
Till he disbursed, at St. Colmes' Inch,
Ten thousand dollars to our general use."

ACT I. SC. II.

The logic of Macbeth had also brought another equally ferocious and unprincipled reasoner to a transcendental pitch of conviction: we refer to Macdonwald, surnamed "The Merciless."

"The merciless Macdonwald
(Worthy to be a rebel; for, to that,
The multiplying villainies of nature
Do swarm upon him,) from the western isles
Of kernes and gallowglasses is supplied;
And fortune, on his damned quarrel smiling,
Show'd like a rebel's whore: but all 's too weak:
For brave Macbeth, (well he deserves that name,)

Disdaining fortune, with his brandished steel,
Which smoked with bloody execution,
Like valour's minion,
Carved out his passage, till he faced the slave;
And ne'er shook hands, nor bade farewell to him,
Till he unseamed him from the nave to the chaps,
And fixed his head upon our battlements."

ACT. I. SC. II.

After the acute reasoning of Macbeth had thus laid open the inward man, it is not without some scruples that we class Macdonwald among the undeveloped characters. The foregoing, however, may be regarded as instances of rough-drawn and non-apparent characters in Shakspeare, which tend to enhance and elucidate his main design. That such individuals have continually nothing whatever to do with his subject, is the excess and abuse of a principle which (however it may be erroneously considered as undramatic in *these* days) is often an important element of the true dramatic art. By means of Sweno and Macdonwald we are shown the grounds of Macbeth's pride in his soldiership and courage, which makes him open to the strongest influence when these qualities are called in question by his wife, and finally by Macduff. By means of the thanes of Cawdor and Glamis, the rapid fulfilment of the first part of the predictions of the weird sisters is brought about, which impels Macbeth to a belief in all the rest, and to assist in the accomplishment.

Of Sinel, thane of Glamis, we can ascertain nothing, except that by his death Macbeth succeeded to his title and lands. Macbeth, in reply to the witches, says, "By Sinel's death *I know* I am thane of Glamis." The king did not, therefore, confer the title upon him; consequently, his succession to the estates, as heir, shows that Sinel was a relative. It is most probable that Sinel was killed in the recent battles with Macdonwald and Sweno.

Several luckless individuals, besides Macbeth, have recently suffered, or are about to suffer, under the malignant spells of the witches. The first of whom we hear is the sailor's wife. This woman was "pretty well off" in the world; and having grown to a fat "ronyon," or scorbutic excrescence, by feeding upon constant rumps of beef, made indigestible with laps full of chesnuts, which she was always "mounching," her indolent proud flesh had brought her into a state of selfishness, which not only suffocated every generous feeling for others, but made the very application for sympathy an astonishment and a provocation. The insulting terms in which she couches her refusal to give the longing applicant a few chesnuts, stirs up the soul of our sister to revenge; but that the latter singles out the woman's husband, instead of the actual offender, for the exercise of her malignity, seems at first like a natural perversity in the moral constitution of weird sister aforesaid. On second thoughts, however, we should rather say that the witch was right; for, inasmuch as the woman's chief enjoyments of life were centered in her corporeal exuberances, the ruin of her husband would necessarily be the shortest cut to the best revenge. The sailor, her husband, was merchant-captain, or master, of the good ship "Tiger," and had gone to Aleppo. What the witch was to do, who had resolved to follow him in a sieve, we are left to conjecture, by the very significant hint, that the thing done should be worthy of the sharpened wisdom and malignity of a rat who has lost his tail. The actual extent of the poor man's black visitations are not known, but the promises of the visitant are sufficiently appalling to the imagination.

"I will drain him dry as hay:
Sleep shall, neither night nor day,

Hang upon his penthouse lid;
He shall live a man forbid:
Weary seven-nights nine times nine,
Shall he dwindle, peak, and pine:
Though his bark cannot be lost,
Yet it shall be tempest-tossed."

ACT I. SC. III.

Of the pilot, whose thumb was bitten off by the same witch, either before his vessel was wrecked, while he stood gazing over the uplifted waters in the direction of his home, or after his drowned body was cast upon the rattling slope of the oozy shingles, — nothing occurs to identify his character: he is only remembered by his misfortune.

There are many things in prose as well as poetry which we read and understand sufficiently well for the comprehension of the general scope and tendency of the given work, yet which we never *realise* to our imaginations as facts, or supposed facts, without the ingress of certain adventitious circumstances inducing a home-searching view of the literal truth. This is not only the case in reading books, but in our affairs of life and knowledge of actual things. We believe, know, and understand very well that a certain number of men are shipwrecked, murdered, and starved every year; but let us be suddenly called upon to imagine a drowned, murdered, or starved man lying before our feet, and we shall feel that our previous impressions were vague idealisms of the fact, and that we never were conscious that the thing was a reality. But, in proportion as people possess and exercise this power of calling the mental faculties onward to the imaginary realisation, or inward vision of the embodied truth, so is the depth and breadth of their comprehension and sympathy with men and books. Our dormancy in realising known or admitted facts will become apparent to every one who examines himself on the point. We will offer, however, a complicated instance and illustration of the question, in which the dreadful supposititious result of a self-evident antecedent fact has been realised, we are persuaded, by many who, notwithstanding, have never realised the very fact necessarily antecedent. We confess to having never, till almost the present moment, realised the fact to ourselves of Lady Macbeth's child — a little boy, of, probably, less than three years old — yet we had often shuddered at the horrid image of the child dashed on the blood-stained floor, with its gaping skull and distorted form.

There is considerable excuse, we think, for our not having ever believed in the reality of Lady Macbeth as a mother, and in her exercise of any of its tender offices. The unnatural horror of the picture she presents of the frightful predominance of her will over the strongest ties of affection, carries off the mind from all maternal associations. When she declares she has known what it was to suckle an infant, we have, hitherto, never believed her, nor her maternity, being led onward to consequences which made the illogical instinct of humanity admit no credence to the necessary antecedent fact. A child however — we are compelled to know it — she once had; apparently a boy, who probably died in infancy.

We should conjecture that Lady Macbeth lost her mother when she was very young, and that she was consequently left to pursue her own course, without any of the constant influence of authority or affection which a mother only can acquire over a daughter. We do not doubt her father's affection for his daughter, and his admiration of her soaring and unconquerable spirit, but we much doubt his influence and authority; partly because he was much abroad, and still more because she was naturally indomitable, while he possessed less strength of will, having, besides, been nearly

worn out in previous fruitless contentions with her mother. She was thus left almost entirely to the spontaneous development of nature; and, consequently, the strongest inherent qualities grew to an overwhelming preponderance, unchecked and unbalanced by any internal or external influence. On the whole, notwithstanding his affection and admiration, her father was very glad when Macbeth fell in love with her. The daring spirit which overpowered her father's energies was the chief cause (not forgetting the commanding beauty of her person) of attraction to Macbeth; while on her part, the high-famed valour, and strong, excursive, superstitious vastness of imagination in Macbeth, rendered him an object of sympathy, as the only man whom she could regard with any admiration, and upon whose neck she could not set her foot. How much feeling of a finer and deeper kind was subsequently developed in her, towards her husband, is palpable, but does not fall within the compass of our present plan to elaborate.

The father of Lady Macbeth had lived to a period of old age, but was dead at the time of the great and tragic events to which his daughter was a chief agent and a victim. It is worthy of observation that the unrestrained and otherwise injurious mode of Lady Macbeth's "bringing up," or, rather, the unchecked excesses of her spontaneous growth, had led her into a mistaken estimate of herself. Her will, in imagination (or her imaginative will, if we may use such an expression) was boundless, and restrained by no thought or feeling whatever: her animal or practical will was limited by both, and was also open to nervous affections and influences. She was not the monster of a fixed purpose, but the human agent; not the fate-wielder only, but the sufferer no less than the doer. We have no belief that she would have dashed her child's brains out while it smiled in her face, because she had "sworn" to do it. She would have found some high-minded excuse for evading it, or compromised that will by the promise of exercising a greater. She had evidently contemplated, in the first instance, to murder the king herself; but, even in the imagination of the act, she calls upon the aid of the spirits, who attend on mortal thoughts, to unsex her (because she felt as a woman), to fill her full of direst cruelty (which she felt was not natural to her), to stop up the passage to remorse (which looks like a presentiment of the dreadful remorse she afterwards experienced), and to let no compunctious visitings of nature (which she already felt by anticipation) shake her fixed purpose and destroy its accomplishment. Finally, in this working up of all her energies to a deed — which would have needed no such efforts, had she really possessed such an integral, unmitigable, meteoric, self-centric, and sheer-damnable will as she imagined — she invokes night and hell to blot out all vision, so that her knife shall not gleam upon its victim, "nor heaven peep through the blanket of the dark, to cry hold! hold!" Instead of this, however, something else occurs; and she fails in what she had contemplated, with the excuse that Duncan resembled her father as he slept. Now, most probably, the venerable victim did not resemble her father at all, in a literal sense. She saw a venerable, old, and "gracious figure," with a grey beard and thin grey locks, sleeping on a couch, and her revolting purpose conjured up the idea of her father, and forbade the deed. It was as though heaven, in the shape of her dead parent, *had* looked through the blanket of the dark, and cried "hold! hold!" Conscious that she was unequal to the dreadful deed about to be done, she drank deep to nerve her courage — so deep, that her excitement only prevented her from being as intoxicated as were all the grooms; but even in this preternatural state of boldness she is not proof against, nor preserved from, the influence of the horrible scene, which haunts her in her after-dreams —

makes her walk in the agony of her sleep — see the constant-pouring blood of the murdered king — wash her hands for ever, and in vain — become insane with "thick-coming fancies,"— and die, either by excess of crowding horrors, or the suicidal attempt to escape from their intolerable presence.

The foregoing considerations of the chief elements in the character of Lady Macbeth, as originating in the equally profound and subtle complexity of her allusion to her father, might readily lead us into psychological speculations, (which, however, we must not pursue,) on the involutions of the will with the imagination. It will be apparent to those readers who are conversant with such studies, that the characters of Lady Macbeth and of Hamlet, though dissimilar in so many respects, are extraordinary illustrations of a peculiar principle of self-deception in some of the strongest natures, to which we have previously alluded. And this makes us revert to certain difficulties in the theory and practice of phrenology, of which we spoke at the commencement, and to the confidence with which its disciples establish "a local habitation and a name" to qualities or faculties, all of which are so involved in each other, as to defy the separation even of the mental analyst, with his most profound synthetical summing up, to boot; since no one can say at what precise line of demarcation the will ends and the imagination takes up the "many-mingled" thread.

There must have been a mysterious sensitiveness in the natures, or a prophetic horror in the dreams, of the two attendants of the king, who slept together near his chamber. That they actually uttered broken ejaculations, such as "murder!" "God bless us!" and "amen!" is pretty certain; but the voice which cried "Sleep no more," &c., was evidently an hallucination of the over-wrought senses and imagination of Macbeth.

A passing remark is made concerning Duncan's wife — the queen, who is dead — from which we should gather that she was full of all motherly affection and tenderness, but of weak character, and unfit to bring up children, being sure to spoil them by constant indulgence, and a morbid feeling about religion. She did not live long enough to spoil Malcolm, who turned out a noble youth. Macduff, reminding him of his early infant years, says, —

> "———the queen, that bore thee,
> Oftener upon her knees than on her feet,
> Died every day she lived."
>
> ACT IV. SC. III.

We had once entertained a notion that the expression of the queen's bearing this child, does not allude to her always sitting with the child in her lap, but to her constant praying on her knees with the child in her arms: we have since been compelled to believe in a much less recondite reading of the passage. "Died every day she lived," that is, made up her account with this world every day, and was always prepared to die. Her confessor must have had a busy time of it, and perhaps he had taken advantage of her morbid tendency, and thus hastened her end by the over-excitement of her sensibilities.

Of the elder Lady Macduff — we mean the mother of Macduff — we regret to find no sort of clue to her history, which would probably be interesting. As the state of chirurgical science, both in theory and practice, was very imperfect at the period, there can be little doubt but that she died under the cæsarean process, whereby the future conqueror of Macbeth was ushered into the world. Nor can we doubt the equally summary fate of any tragedy by a modern author, in which the *denouement* should be assisted or announced by so horrifying a circumstance (to say nothing of

the quibble) so revoltingly expressed. Since Macbeth's head, stuck on a pole, is not brought upon the stage by Macduff, according to the text of Shakspeare, and considering the innumerable liberties taken with all his plays in representation, we certainly think, without one atom of respect for mere mawkish refinement, that some trifling change in the verbal expression of the above passage might have been adopted with advantage.

The eight kings, descendants of Banquo, are, of course, mere shadows; for, though it is true that they appear on the stage, they certainly were not born at the time. The grooms or attendants of Duncan, who were found smeared with blood upon their hands and *faces*, (a circumstance resulting from the wild excess of bewildering passion, and a most suspicious circumstance in their favour, had there been time for the spectators to come to their reason,) are simply vague tragic episodes. There are a great many nondescript creatures skipping and flapping round the heads and heels of the witches, such as Graymalkin, Harper, and Paddock. These three only, however, are named; the remainder (Puckle, Hoppo, Hellwain, Stradling, &c.) are interpolated from Middleton's "Witches." The use made of these interpolations, together with the fine music to which the words are set, give the scenes in which they occur the character of a tragic opera. We by no means object to this element as an assistance to the preternatural presentation of the witches; we cannot, however, admire the crowded herd of gipsies, which have been substituted, being precisely the same in scenery, dresses, and choruses, as in "Guy Mannering." Of all those connected with the stage, English singers have the least notion of any thing approaching the ideal: they are far worse in this respect than the dancers, especially in pantomime. A competent manager may make a dancer fly before him into some semblance of the aërial, but he has scarcely ever yet been able to storm the heavy substance out of an English singer.

There is only one scene in the progress of this great tragedy which disturbs the atmospheric "keeping" of its otherwise sustained and regular torrent. We refer to the entrance of the Porter directly after the murder, when the knocking at the gate alarms the conscience-stricken Macbeth and Lady Macbeth, who hurry away to their chamber. The porter comes in: he is a kind of moral-satirist wag, and drunk into the bargain, which makes him rather coarse in his sallies. *He* knows nothing of the murder which has just been committed under such appalling circumstances; but *we* do, and his excellent impertinence is felt accordingly. The occurrence is perfectly natural, and therefore, under such immediate circumstances, perfectly offensive. In the course, however, of his half-drunken, half-drowsy impertinence, he suggests three characters, two of which represent large classes. The first is that of a farmer "who hanged himself on the expectation of plenty." This man, probably, had a great quantity of corn on his hands, and wanted a famine to enable him to sell it at some enormous price; and as there had been violent rains just at the time when the wheat was in blossom — a blossom of most delicate structure, and easily destroyed — he had entertained sanguine hopes that there would be a miserable crop of corn in the country, and no foreign supplies. The next is "the equivocator;" one who "could swear in both the scales against either scale; who committed treason enough for God's sake, yet could not equivocate to heaven." This masterly accidental sketch needs no comment, for certainly, however a man may tamper with heaven upon earth, the subsequent call he receives is not likely to be equi-vocal. The third is an English tailor, who is said to have come to Macbeth's castle "for stealing out of a French hose!" Truly and inexplicably, a most extraordinary place to seek upon

such an occasion! He is welcomed in a strain befitting this very Shaksperean and much-to-be-forgiven speaker: —

"Come in, tailor; here you may roast your goose. [*Knocking.*] Knock, knock: never at quiet. What are you?—But this place is too cold for hell. I'll devil-porter it no further. I had thought to have let in some of all professions, that go *the primrose way* to the everlasting Bonfire."

Act II. Sc. III.

Our list of characters from the present tragedy comprises —

The Thane of Cawdor.
Sweno, King of Norway.
Macdonwald.
Sinel.
The Sailor's Wife.
The Sailor.
Macbeth's Son.
Lady Macbeth's Father.
Duncan's Wife.
Macduff's Mother.
The Farmer.
The Equivocator.

TWO SONNETS.

I.

When we behold the hair-suspended sword
O'er human joy for ever pendulous;
And see the earthy pitfalls 'waiting us
Thickly along life's way; of act or word
We grow incapable, and fain would wait
Stirless and speechless for the coming state,
Wherein the millions of the past abide —
Their dust, their deeds, and their recorded pride:
And our vow'd spirits (like the devotees
In attitudinal monotony
Transfix'd in Indian forests, till the trees
O'ergrow them, and the wild birds build thereon)
Seem stricken to their place eternally,
And no more vital than a stock or stone.

II.

The life continual, the fast flow of things,
That welters round about us; every year
Bearing the next upon its changing wings,
And disappearing but to reappear;
Like-visaged, tho' transfigured; rise and setting
Of sun and moon, planets, and starry crowds;
Coming and going of the solemn clouds;
Wild play of storms and streams, and billows, fretting
The ever-shifting girdle of the ocean;
The bursting of green buds, and fall of leaves;
The unfolding and decay of gracious flowers;
The music and the silence of the hours,
Still alternating: 'tis all this reprieves
Our spirits from their trance, to sweet commotion.

* W *.

MUSIC IN GERMANY.

We live in an age when attempts are made, not only to explain every thing by way of analysis, but also to lend to all the phenomena of intellectual life a general signification, a character bearing upon the general development of the human mind. Music, the most popular, attractive, and sublime of the fine arts, has, it can easily be imagined, not escaped the test of critical ordeal, and the results of the investigations it shall be our task to exhibit in the following pages.

Haydn, Mozart, and Beethoven may be considered the first who have impressed German music with a character, at once original, profound, and energetic. Their works are distinguished, not only for sublime harmony, but also for their obvious tendency to raise music into the sphere of science by the better development of its elements. Haydn, especially in his earlier productions, though he never loses sight of the ordinary rules and principles of the art, appears, nevertheless, to animate them with a new spirit, and often even to metamorphise them into new elements, by the brilliancy of his style, breathing a calm and innocent spirit imbued with all the grace and serenity of nature. Grief and melancholy assume in his compositions a soft and mild character, never giving utterance to bursts of violent and stormy passions. In Mozart, form and principle are blended with wonderful tact. The structure of his compositions is generally rounded into perfect symmetry by means of contrasts and repetitions, while the whole is characterised by sublime harmony, lofty melody, and graceful rhythm. His music expresses a divine or "melodious sorrow" on the one hand, and the most exalted joy on the other. But the title of the "Father of music" he chiefly owes to the skill with which he brought to perfection instrumental music, raising it on a level with the vocal part of the art, in the true spirit of the German style. "Don Juan," the grandest of his creations, will also always remain the grandest opera in German music. In Beethoven, science predominates over all the other elements. He contemplated nature in all her charms, struggles, and sorrows, from an elevated station, and disdaining form and symmetry as something too sober and physical, he obeyed, in his ethereal flight, the inspiration of his poetical imagination alone. Joining the cheerful simplicity and variety of Haydn with the deep fervour and richness of harmony of Mozart, Beethoven succeeded in establishing harmony between all the various instruments, and with it also the sovereign power of instrumental music; while vocal music, proving rather deficient to express the nuances of the violent emotions of his poetical fancy, he almost neglected altogether. These three maestros may be considered as the original founders of the various schools of music now extant in Germany.

The Rombergs, rather deficient in profoundness and original thought, are the disciples of Haydn, while Spohr, in creating in his symphonies a style of his own, characterised no less by harmony than passion, is easily known as the follower of Mozart, by the form of his style. Ries seems to work on neutral ground, without marked partiality for any school; his talents have produced charming melodies in all styles, while Kalliwoda, after having imparted to his earlier compositions the character of Spohr, pursued afterwards a new style, full of pleasant and fantas-

tical melody. Onslow is, we think, the only one of that period who well knew how to control his lively fancy by the principles of the art.

The *Concerto* was first brought to perfection by Mozart, by the change he wrought in the instrumental part. It was greatly cultivated after him by Beethoven and the later composers, such as Clementi, Dussex, Handel, and, lastly, Moschelles, all of whom united science with brilliancy of style and execution. In Ries and Kalkbrenner, we are more struck with graceful melody than scientific harmony.

The *Sonata*, of which the early masters were Bach, Haydn, and Handel, was perfected by Mozart and Beethoven, and afterwards greatly cultivated by Humel, Kalkbrenner, Schmit, &c. At present, it is partly neglected by the profession, and entirely abandoned by amateurs, though the spirit still lingers in the masterpieces of Moschelles, Pixis, Reissiger, and Schubert.

The *Variation* is, of all the species of music, the only one which has undergone a change for the worse in process of time. It formerly had, at least, the merit of scientific harmony and combination; while now it is destitute of all character and principle whatever, the whole consisting of random and superficial melodies and accompaniments. Mere mechanical execution, especially on the piano, seems to be the fashion of the day; while all the numerous compositions are more or less confined to the piano alone, the favourite instrument of the present time, among all classes and both sexes. The fashionable mania for brilliant mechanical execution has infected even the scientific Czerny, who relinquished his more serious and sterling compositions in favour of the existing folly; he is followed by Herz and Hünten, who, with more tact and elegance than profoundness, have become the spoiled children of the fair sex. Their whole power consists in turning, twisting, and repeating certain passages of favourite operas with taste and precision.*

Of the composers of simple music for other instruments beside the piano, we shall only mention Viotti, the father of our modern violinists. His style and ideas are clear and naïve. His pupil Rode was at first inclined towards simple, but noble and pathetic compositions, but was afterwards influenced by the progressive spirit of the age to give them a more complicated and scientific character. The concertos of Spohr for the violin are, in that respect, the best models for study, as even the parts which are chiefly characterised by the difficulty in execution partake of the most sublime lyric beauty. Of equal merit are his, as well as Weber's, concertos for the clarionet; nor ought we to omit noticing the charming pots-pourris of Spohr, as also the pieces composed for the violoncello by B. Romberg.

The number of composers for the wind instruments is comparatively very limited, owing to the imperfection of the instruments themselves, on which no great variety can be performed. There is no more such a thing as military music, the truly military marches of the former days having been superseded by dances and opera-airs; nor can we, indeed, withhold our admi-

* And a careful abstinence from all meaning in their legerdemain. This is precisely the case in England at present. Scarce a single concert takes place in which every solo performer does not play similar tricks. He gets through his morsel of original melody, or theme, as soon as he decently can, and the next instant off he goes, up and down the scale, in endless evolutions, and you hear no more of the melody. In this manner, and by the hour, do pianists, more especially, worry the ears of an exhausted flock of fashionables with the interminable repetitions of their mere manual exercises; and these exemplary auditors sit patiently, partly because they have paid their money — partly because they are afraid it would show a want of science and taste not to be delighted — and partly because, like the English at Waterloo, they will not go away, however worn out, while there remains any thing more to endure.—Ed.

ration for the dances of Strauss and Lanner: there is in them something piquant, varied, and cheerful, which render them altogether irresistible.

Let us now examine the state and progress of vocal music. We shall begin with the opera, which has obtained, in our age, a high degree of perfection, and nearly monopolised stage popularity, above even tragedy. The cause lies more in the increasing taste for music, than in the absence of good dramatic performers. The popular predilection for the real drama has of late so diminished in Germany, that the composers take care to select subjects for their music the least poetical, provided they express strong passions, and admit of stage effect. The million usually prefer seeing and hearing, to thinking.*

Mozart is, without doubt, the first creator of the German opera. Before him, the German composers, with only one or two exceptions, confined their talent to imitations, and especially of the Italians, but Mozart finally effected a perfect revolution in the musical world by the appearance of his two masterpieces, "Don Juan" and "Figaro" where he united to a great extent dramatic effect with the most original vocal harmony, blended with all the grace of Italian melody. Beethoven's "Fidelio" has, however, a better claim to scientific harmony, despite the comparative inferiority of the vocal part in it. Before Beethoven had published his "Fidelio," Cherubini and Mehul were the musical stars in France; the first was distinguished for original harmony, as the latter for great simplicity of expression; but their chief forte was the instrument: the orchestra was the sphere of operation, and dramatic situations were more delineated by the harmony of the instruments than expressed by the utterance of the voice; so much so, that when, in process of time, instrumental music became more and more developed, a sort of forced and unnatural modulation was introduced into the songs, utterly destitute of all melody, expression, and dramatic action. The malady found its way also to Germany, and affected the productions of all her composers, with the exception of Weigel and Winter, who had been reared in the Italian school.

About that time arose in Italy a maestro who wrought a reform in vocal music, and established, by the force of his genius, a school of his own, which soon spread all over the musical world; we mean Rossini, whose melodious airs resound throughout the civilised world. It was Rossini who gave life and spirit to the Italian opera, and elevated the vocal part to the utmost degree of melody and art. In his earlier compositions, it is true, we rather miss the pervading spirit and truth of the drama itself; but in his later productions, he proved that he was no stranger to them; nor could the Germans, with all their strict adherence to principle, withhold their admiration for a genius, even in his transgressions of the laws of the art. In Germany, vocal music was characterised by science and principle alone, never making allowance for melody or natural sentiment; while Rossini, with the boldness of a genius that defies pedantic restraint and authority, broke through the barriers of dry laws and discordant principles, and created such luxuriant melodies as to share his triumph with the performers themselves. All that time the German opera had been under the control of two rival composers, Spohr and Weber. The efforts of the latter evidently tended to give to music, both vocal and instrumental, the language of thought and sentiment; in short, to express, by musical sound, even the delicate various shadings of

* The million never did otherwise in any part of the world: the greater reason why there should be as little delay as possible in teaching them better, instead of pandering to their grossness.—Ed.

inward emotions, as conveyed in the words of the text, — a task that met with many obstacles in the practical part; it had, however, the advantage of preventing the German stage from copying the Italian style altogether.

It was reserved for the genius of Weber to introduce in France a taste for German music, and more especially by means of his wonderful opera of "Der Freischütz." It soon also led to the introduction of Beethoven's music, first in the concerts of sacred music, and then in the musical conservatories, with rapid progress and success. Ever since, the superiority of German instrumental music was duly appreciated in France, at the side of the Italian style of vocal music, which had been introduced in the opera-comique by Hérold and Auber, in opposition to the style of Dalayrac, Iscuard, and Boïeldieu. Hérold and Auber possess, indeed, to a wonderful extent, talent, and taste for graceful rhythm, which lends to their compositions a character not less distinguished for art than delectable harmony.

Airs and songs have taken in Germany a more artistical turn, with that of the instrumental accompaniment, in which Schultz, Hiller, Himmel, Reichardt, and, above all, Zelter, so much excelled. As to Beethoven's accompaniments, they surpass, in every point of view, the art, melody, and harmony of the songs themselves.

At the time when the lyric poems of Göethe, Schiller, Uhland, Rückert, Müller, Körner, Schneckendorf, &c. attained in Germany high popularity, they soon became a theme for musical composition; and in which Weber distinguished himself by his peculiar mode of expressing the words. The elegies of Spohr, the airs of Berger and Weidebein, belong as yet to the best specimens of that branch of vocal music, which was, however, soon superseded by the grand cavatinos of operas, introduced under such a heavy load of flourishes and other artificial ornaments, as to banish nature and expression altogether from the sphere of music. Some composers, such as Löwe and Schubert, it is true, did their best to arrest the rapid decay of natural music, by the composition of a great number of ballads; but they failed in their attempts, by a fault of their own, by rendering the accompaniments stupendously difficult in point of execution.

Church Music was originally confined to the voice alone, as religious worship does not require the éclat and effect of instruments. The masterpieces of that early period might as yet serve for models of sublime simplicity; even profane music had then partaken of the same character. But the perfection of instrumental music soon secularised the style of sacred music, and filled it with all the richness of imaginary art. Some are of opinion that this sort of worldly splendour in sacred music has entirely destroyed its true spirit, and that, in order to create it anew, we ought to re-adopt the style as prevalent in the sixteenth century. No one has, however, as yet, found any blemish in the taste of introducing an immense orchestra in the temple of Solomon: why then suppose that the Christian worship be averse to the sublime joy of the heart manifested through the imposing sound of buoyant instruments? The Credo surely contains, not only passus and sepultus, but also ressurrexit; and the words, "Gloria in excelsis Deo," — do they not claim the greatest display of pomp and splendour imaginable? Moreover, the advanced state of civilisation, and the peaceable times of our present age, do by no means correspond with the gloomy and sombre character of the ancient sacred music, risen, as it was, amidst the horrors and disasters of war and civil convulsions. But we digress: let us return to the history and progress of sacred music.

Church music, during the seventeenth century, bore the stamp of a spirit

not less narrow and pedantic than dogmatic and semi-savage, despite the noble efforts of a Bach and Handel towards its amelioration. Some will conclude, from the endeavours of Haydn to extend and enlarge the instrumental part of church music, that his religious sentiments had lost of their previous intensity. In looking, however, at his "Salva Regina," and the "Seven words," we only discover in the compositions a strain so sublime and divine as to disclose to us at once the sacred source from which they emanated, viz., religious enthusiasm and devout piety; though we must admit, on the other hand, that in his "Creation," Haydn seems more to preach the gospel of nature than Christianity. His brother, Michael Haydn, who devoted his time and talent solely to the composition of sacred music, proved by his productions the immense extent to which modern art may be rendered subservient to the exigencies of religion. The masses of Mozart were produced in his earlier days; his hymns belong to a later date; and his requiem he composed shortly before his death. Beethoven wrote but little of sacred music; circumstances, and the peculiar turn of his mind, rendered him unfit for the task; witness his oratorio of "Christ in the Olive Garden," and many more, which are decided failures, despite some fine parts in them.

Among our contemporaries, we must notice Eybler, the follower of Michael Haydn, and Schneider, who unites deep study with a fertile imagination, and has given quite a new character to the oratorio. His style partakes of the dignity of Handel, and the popularity of Haydn, and the talent he displayed in the total reform of the choral music, especially in his "Last Judgment," places him in the rank of the first-rate composers of Germany. Klein and Löwe followed his footsteps, the first (in his oratorio "Japhet and David") with characteristic simplicity, and the latter with a touch of stage effect. Both of them, as also Spohr, have composed the most excellent choruses.*

In the other countries beside Germany, we meet with but one great composer of sacred music; we mean Cherubini the elder, who after having quitted the stage, where his talent was not duly appreciated, turned his whole attention to church music. His requiem, masses, and hymns rank among the best compositions of the day. In all the temples of Italy, with the sole exception of the Vatican chapel, we hear nothing but the adapted airs from Rossini's operas.

Having given a brief sketch of the progress of the art in its different species with regard to composition, we shall now endeavour to examine the prosaïcal part of music, practical and mechanical execution.

Though it cannot be denied that the study of music has now become universal, the old national differences in the art, to which we have alluded in the foregoing pages, are still perceptible. Italy may, indeed, boast of a few individuals, such as Clementi and Paganini who excel in the skilful execution of one instrument or other; upon the whole, however, the force of her artists is exclusively confined to the vocal part; so much so, that even the orchestra plays in Italy but a secondary part, to accompany the voice. The reverse is in Germany; but few possess fine and flexible voices; while the study of the instrumental part is carried to a pitch equalled by no nation on earth. The smallest town in Germany possesses an orchestra whose members are capable of executing the most difficult compositions. Music is in Germany a recreation, an indispensable evening amusement,

* We do not know why our correspondent omits his highly-gifted countryman, Mendelsohn, and his grand oratorio of "Paul."— Ed.

after the toil of the ordinary pursuits of the day. Every place has its harmonic societies, where professors and amateurs assemble promiscuously, all animated with one feeling, the love of the art, ancient and modern, profane and sacred.

In the provinces along the Rhine, musical festivals are annually celebrated in one of the principal towns, such as Cologne, Düsseldorf, Coblentz, where amateurs make a pilgrimage from the remotest corners of Germany to participate in the instrumental part. Most of the great German composers have been reared in those nurseries of amateurs, though in some places, especially at Dresden and Prague, there are special establishments for the education of musical artists in the profession of their future career.

The influence of the aforenamed societies on popular songs is visible in the churches of Southern Germany, and more especially in Würtemburg, Bavaria, and Baden. At the university of Würzberg, professor Frölich, head of the musical seminary, instructs young schoolmasters or aspirants in the art of singing. The society of singing at Berlin has been established for the laudable purpose of studying and publishing the works of the art of the former ages, which have nearly been sunk into oblivion by the modern productions. The musical world in Italy is wholly given up to opera music, and public attention is absorbed in admiration for the vocal powers of the professional singers of both sexes. England manufactures excellent pianos, and even improves and perfects them; the public admires music, and pays dearly for the whistle of foreign virtuosos. In France, music has not become as yet general or national, and the want of musical festivals is chiefly the cause that the cultivation of the art is confined to a few individuals alone.

Good orchestras are there unusual. But France possesses an institution which eclipses in point of talent and skill all the establishments of a similar nature in Europe; we mean the famous conservatory at Paris, the most unique in the world with regard to the perfection of the instrumental music, and the taste and dexterity with which it is managed. Nowhere are the works of the great German composers executed with more spirit, effect, sentiment, and precision than in that celebrated conservatory. Haydn, Mozart, and Beethoven appear there in the full splendour of their genius. We must, however, not forget to mention, that the director of the establishment, Mr. Habeneck, is a German, who endeavours to render German music popular in France, by inculcating its spirit into the minds of the distinguished artists of whom he is the leader.

That Germany, where music is carried to such a high degree of culture and enthusiasm, has nothing to compare with such a magnificent establishment, is chiefly owing to the want of a central point, of one single capital town which would assume the character of a supreme tribunal in the arts, to decree tone, spirit, and fashion to the other places. Such has been once Vienna, the residence of the three aforenamed maestros of Germany, and where the muse found protection and encouragement by the brilliant imperial court, and full scope for development in the royal chapels, rich churches, and sumptuous monasteries. At present, however, all that splendour has passed away; and Vienna, instead of upholding the glory of the German composers, was the first which introduced the Italian opera in Germany, together with the whole style of Rossini's melodies. It is also at Vienna where Strauss, the modern Orpheus, reaps his laurels; and, despite the efforts of the musical society, and the complaints of amateurs of true music, this king of the waltzes is preferred at Vienna even to Mozart and Beethoven.

Some time back Berlin had the glory of having revived the national operas of Glück, which had been supplanted by those of Rossini and his disciples; but the strenuous efforts of the various and numerous societies of music proved abortive against the all-powerful influence of Spontini, the director of the opera of that place. His compositions, however, which oscillate between the styles of Mozart and Rossini, are on the decline in popular favour; and the glory of the stage is now divided between the school of Rossini, Auber, and the German composers. Considering the smallness of the place, and its slender resources, Leipsic exercises comparatively a far greater influence in the art, by means of its three celebrated institutions: the concert by subscription, the singing school of St. Thomas, and the music of the two Protestant churches. It has, moreover, an excellent theatre, which is frequently visited by the dramatic troop of Dresden, and the stage often displays the talents of foreign minstrels in their passage through that place; nor are there wanting societies and journals for the dissemination of musical taste among the people.

Dresden cultivates chiefly vocal music. Weber, who once directed the stage of that place, impressed upon it the spirit of German melody. Nor can we speak with less respect of the instrumental music as displayed in the orchestra of the great Parc. Münich, Stutgard, Carlsruhe, and Darmstadt have always possessed excellent musical chapels, where singing in particular is cultivated. The musical school of Münich, founded by Winter, has produced the best cantatrices in Germany. Of late, the compositions of Chelard, a Frenchman, have met upon the stage of Münich with unbounded applause. Cassel, the residence of Spohr, deserves to be noticed for its splendid theatre, and conservatory for singing. Nor ought we to omit mentioning Brunswick, where the four (brothers) Müllers are the leaders of an admirable orchestra; Hanover, the residence of Marschner, a talented opera-composer; Weimar, where the late Hummel has exercised a salutary musical influence on a population possessing a natural taste for the arts; and lastly, Francfort, ever famous for its orchestra; and Hamburg, the residence of Bernard Romberg.

The present spirit of German music is particularly characterised by a sort of wild delirium, most licentious modulation, confused passages of harmony, and precipitate discordant transitions from key to key. Instrumental music now presumes to be descriptive, to paint scenes, and to express, in short, every thing in animate and inanimate nature. Witness the symphonies of Berlioz and others, where attempts are made to describe, by the modulation of sound, a series of landscape scenes. This is, indeed, carrying music far beyond its natural bounds; and we do not hesitate to assert, that without the guide of the programme before them, but few, if any, would guess the true design of the composer by listening to the sound alone. Even Beethoven has failed in a similar attempt in his pastoral symphony. All we can expect from the most perfect harmony, is the expression of our inward emotions and sensations, but nothing beyond. Apel, author of "Metre based of Music," has, it is true, discovered a poem in one of Mozart's symphonies in E major; but we doubt of the intentional design of the plan; and the very tardiness of the discovery shows the futility of the attempt. We must not confound the resources of vocal and instrumental music. In the former, the word models the sense of the melody, while in the latter imagination alone developes the train of obscure ideas which have been called forth by the spell of music. Berlioz, a young composer of great talent and promise, oversteps in these theories the due boundaries, and loses himself in a wild sphere of confusion and extravagance. His efforts to give to instrumental music all

possible signification are laudable enough; but, be it remembered, that the plan can only be realised (if ever) at the expense of the dignity and independence of the noble art. Who, indeed, could be made to believe, or be able to hear, "the dream of the young Andalusian?" Also, the present compositions for the piano are beset with the same mania for extravagance. Attempts are made to unite the utmost flights, fits, and starts of fancy, with the extremest difficulties in point of execution: hence, the strangest turns, discords, broken harmonies, and unmelodious passages, all calculated to express the extreme agonies of despair and bewilderments of grief. We must, however, except Chopin, the only one of the modern school whose very defects assume a graceful appearance. He is one of the best pianists in point of mechanical dexterity; and the deep and intense feeling he unites with energy, calm melancholy, fertile imagination, original rhythm, and progressive harmonies, abundantly redeem the odd, harsh, and shocking passages of the new school to which he adheres. He has found numerous but unsuccessful imitators. A composer ought neither to adhere too scrupulously to the rules and principles of the art, nor defy them altogether. His task is to modify them by his views, and act up to them; but those who supply the place of sentiment and originality by disorder, *tours de force*, and far-fetched harmonies, can never pretend to lasting fame. There are, however, many young composers at present in Germany, who, by dint of severe study, have produced remarkable compositions, such as "The Midsummer Night's Dream," "The Hebrides," &c., by Mendelsohn, Bartholdy*, and many others.

Exaggeration is the characteristic malady of our present opera. Music is considered as a mere means to produce stage effect, to express more the history of the piece, than the sentiments of the actors. A striking instance of this defect is, "Robert le Diable," by Meyerbeer, an opera which, despite some beautiful parts and parcels in it, is, nevertheless, utterly destitute of style and character. It is a mistaken notion that music can and shall express all mental situations; there is a savage sentiment that will not ally itself with art, as there is a despair that can never be dissolved into harmony. We must, however, give due credit to the operas of Marschner, a composer of rare comic talent; and we shall conclude by saying, that since the musical defects of our epoch arise more from presumption and a sort of wanton liberty than lack of knowledge, we are fully justified to expect a pleasant spring after a stormy winter, even in music. Also, the Italian opera has undergone a change, and, we are glad to add, for the better. It assumes every day more and more the true character of the drama. Rossini was the first who introduced it, and his example was soon followed, with more or less success, by Bellini and the other young composers of his chools; while, on the other hand, the new tendency to the grave, dramatic, and serious, has proved the death-blow to the Opera Buffa, and laughing gaiety seems now for ever banished from the Italian stage, where the delicious "Barber of Seville" had led to quite different expectations.

* Our erudite friend does not appear so conversant with his contemporaries as with the great men of other days. Not merely by dint of severe study has Mendelsohn produced his works. We regard him in the musical world as what is commonly called the "rising genius" of the time; and this is scarcely ever said until the individual *has* risen, and done a great work.—Ed.

LETTERS ON THE STATE AND PROSPECTS OF ITALY.

No. IV.

It was in 1831, when all the illusions nourished by the incorrigibly credulous on the advantages to be derived from the accession to the throne of Charles Albert, vanished before the evident tenor of his way, that the "*Giovine Italia*," which had long been conceived, was realised in an association. The band of youths who took upon themselves to propagate and realise its programme had passed through the stage of carbonarism, and had become convinced of its impotence, from its want of unity of ideas, corresponding to the exigences of the age, and from the want of energy in its chiefs: they had examined with care the movements of 1831, and had deduced, from this examination, that there was in Italy no deficiency of revolutionary elements, but of a guiding spirit. Moreover, their hearts were tenanted by faith; they had not merely political calculations in their heads; they aspired to be not simply revolutionary, but also regenerative; they felt that, at bottom, the question was no other than the grand problem of *national education*, and arms and insurrection were for them only the means, without which, from the state of Italy, it was impossible to accomplish this; they appealed to bayonets, but only under the condition that they should have ideas at their points. They cared little to destroy, if they had not the hope of creating; they cared not to inscribe rights and obligations in a charter, if they could not succeed in engraving them on the hearts of the people. This was what their predecessors had almost entirely neglected, and what they sought to effect with all their soul and strength. To rouse the different Italian states to revolt was not their object; their sole endeavour was to create the nation. They believed religiously — and they found support for their belief in history, philosophically considered — that Italy had not performed its task in the world; that it had still something to add, some element to introduce in the progressive march of humanity; that it had yet to live a third life; and it was to initiate this life that they aimed. With these ideas, they found themselves, from the commencement, placed at an immense distance from all who had preceded them. They had to turn their backs at once on the theory of materialism, leading in politics to individualism, good at best to guarantee, but never without the exercise of force, some personal rights, but impotent to found nationality, or association, or the belief in a unity of origin, of law and tendency: they had to recur to the synthetic, spiritualistic Italian philosophy of the sixteenth and seventeenth centuries; to revive the faith which alone could implant in the minds of the Italians the conscience of the destinies of the nation, and restore to them, by means of this conscience, courage, devotion, constancy, and harmony: they had to combat the fractional spirit, and to pave the way for unity, by principles embracing all the manifestations of Italian life, applicable not only to politics but to philosophy, to the science of law, to literature, to the fine arts, to every thing. It was a wide task; but the men of whom we speak believed that it was sufficient to have caught a glimpse of it, to render it their duty to pursue it, whatever might be the time to elapse before the enterprise succeeded: they undertook it.

Hence the double phrase of the "*Giovine Italia.*" Pursuing a work of education, and all education requiring a principle for its basis, every principle being, by its nature, general, the association must, of necessity, live

a two-fold life, general and special, humanitarian and national. This it felt. The flag of the *Giovine Italia* (that which was borne at the head of the band which, in 1834, attempted to rouse Savoy to revolt) bears, on Italian colours (white, red and green), on the one side the inscription, *Liberty — Equality — Humanity;* on the other, *Unity — Independence* — GOD and HUMANITY: this was, from the commencement, its principle in all its foreign relations, as GOD and the PEOPLE was in all its labours for its country; and from these two principles — which in effect are one and the same, but with different applications — it deduced all its religious, social, political, and individual creeds. It does not enter into my task to follow it in its general applications.* I have here only to seek for signs of the revolutionary prospects of Italy, and I shall content myself with proving that *La Giovine Italia* has been perhaps the first amongst the political associations of our time to comprehend, in its conceptions, all the branches of national activity, and to seek, from a religious point of view, to cause them all to converge towards one object, according to the idea of a mission imposed upon man.

Convinced that every nationality to be real and durable must be founded by the nation itself, and must issue from its labours and its sacrifices, *La Giovine Italia* laid it down as a fundamental law, that the Italian revolution might profit by foreign elements, but ought not to choose them as its sole support; and that it ought to be effected by its own powers. Convinced that what is deficient in Italy is not force, but harmony, and conscience of force, *faith*, in one word, in its possible triumph, it concluded first, that it was above all, from the character of the initiative and of the direction, that the inspiration of this faith and energy must proceed and be communicated to the masses — an energy which triumphs because it wills it, and because it believes it powerful to triumph: then, that the grand study of this initiative should be to call to combat the most powerful force possible, that is to say, the people. Now, for the association which undertook to initiate the movement to be strong and to feel itself so, a good, clear, and precise object was necessary; and in order that the people should answer to the appeal and should descend into the arena, a fixed, known, and popular object was also necessary; for, on the one hand, true force consists not in uniting for a moment a crowd of discordant and heterogeneous agents, but in concentrating on a given point homogeneous elements, forces of the same nature; not in placing in juxtaposition, but in associating: on the other hand, we have neither the right nor the power to cause a people to rise without telling it exactly for what; no one will ever succeed in inspiring it with faith in those who summon it to action, or in their power, if it be ignorant of the price of victory: the people loves just and useful revolutions, but it does not wish them to be eternal, and it will remain cold and indifferent when it perceives that its chiefs seek, from fear or from bad faith, to hide from it the object in view, or when the object itself is vague and incomplete. Besides, morally speaking, every work of regeneration implies a belief in those who undertake it; every soldier of the revolution who has none is a fomenter of discord, a provoker of anarchy, without having a remedy to still it: practically, the means correspond to the object; the definition of the latter gives the law of operation, dictates the programme of

* The general idea, philosophical and social, of the *Giovine Italia*, afterwards, in 1834, gave birth to an association, or rather a federation of national associations, under a unity of belief, known by the name of *La Jeune Europe*. This association, of which the object is to organise the holy alliance of the people, in opposition to the alliance of Vienna, caused from its very commencement great alarm, and has met with no little persecution.

action, directs and maintains those who follow it, and also the choice of the elements which are required for its success. For all these reasons, and wishing to avoid the errors of 1821 and 1831, *La Giovine Italia* resolved to disguise nothing, and to sacrifice nothing. It presented itself as it was, as the tendencies and exigences of Italy required it to be — an association republican and indivisible.

The first step taken, it did not recoil before the difficulties, whatever they were, of its subsequent steps. A principle and its consequences — all its revolutionary logic was comprehended in these words.* It felt that the most powerful party was the most consistent party, and it was this. It was not satisfied with simple views of reaction, with vague professions of liberalism; it demanded his belief of every one who presented himself, and only accepted those as members who had a belief in conformity with its own. It did not speculate on the number, but on the unity, of its forces; it thus made a first experiment on the nation; it was content to run the risk of finding the results unfavourable to its desires and anticipation; but it was not content to allow divisions to break out in its bosom on the day after the revolution. Wishing to cut out new paths, and rearing a standard which had never yet been reared by any Italian political association, it felt the necessity of planting it in the midst of new and pure elements, not preoccupied by old theories, and free from all anterior engagements; it addressed itself, consequently, more particularly to the young, for amongst them was capacity for enthusiasm, zeal, devotion, and energy. To them it told the whole truth, without reserve or disguise. The grand error which had ruined all the previous revolutionary efforts had been the custom of confiding the destinies of the country rather to *men* than to *principles;* it was a violent reaction against this custom; it combated all traditional deference to great names; it preached thus — "Have no faith in names, but in yourselves, in the masses, in your right, and in God; if you require chiefs, choose them amongst those who do not belong to the past, but who have drawn their inspiration from the revolution itself: new things demand new men." It exposed the errors of 1831; it told the whole truth of the chiefs; it separated itself from the past, in as far as this past pretended to dominate the present and future. It repeated in every tone and under every possible form, that the salvation of Italy was in the people; that it was its flag which must float above the insurrection; that the grand lever of the people was action; that it was necessary to act — act — act — without ceasing, without discouragement, without being intimidated by reverses at first. It said to the people and to the young — "Rise and fear nothing, for it is sufficient for you to will, in order to conquer. Rise with the banner of your democratic nationality entirely unfolded. Let there be no evasion, no compromise; they are iniquitous, and, moreover, useless. Raise your standard, and advance; look neither to the right nor to the left, but to your object before you. Think not of avoiding or of deferring the struggle with Austria, for it is inevitable; whatever route you take, you cannot escape it; and because it is inevitable, provoke it: the offensive is the war of revolutions. Attack! and you will cause all the more alarm to your enemies; you will inspire those who follow you with all the more confidence and ardour. Wherever you rise, let it be in the name of Italy, and for the whole of Italy: let every city revolt as if it only sought the means of causing the next city to follow its example. The more you enlarge the basis of your operations, the more you will augment your chances of success. Hope nothing from any foreign government whatever: if any succour can come to you from

* I treat here of the spirit of the publications of *La Giovine Italia.*

abroad, it will not be until you have shown yourselves strong and able to conquer without it. Hope nothing from diplomacy; nothing but ill can come of it; discomfit it, in allowing it no hold upon you: your arms are action and publicity. But know that, provided you rise in the name of a general principle; provided you show yourselves ready to fight and die for all, your cause will become the cause of all; know that the people of other nations, your only natural auxiliaries, will follow into the arena the first who shall open it in the name of all; know that this war between particular states, which is shown to you from time to time as the favourable opportunity which cannot fail to arrive, and which you are bound to await — know that you have it in the skirt of your garment. It is possible that you will succumb, but even then you will, instead of falling basely and without effect, have educated the country; a great principle will survive you, and the generation which follows you will read upon your tombs the programme of the Italy to come." *

As a practical measure, *La Giovine Italia* recommended guerilla warfare, which is improperly called "*guerre de partisans*," and which is known in Italy by the name of "*guerra per bande.*" This was the war of Spain in 1808, and is that of almost every people which has to reconquer its independence; it is not only possible, but natural in Italy. It is the subject of a long article inserted in the fifth number of *La Giovine Italia*, and of a work of Carlo Bianco, an exile of 1821, but a member of the association, an experienced officer, whose constancy has never been belied during all the trials of the time, and who, after having taken part in the Piedmontese insurrection, displayed Italian valour in Spain, in the war of Catalonia. This idea is pregnant, perhaps, with the fate of Italy. It is not in fact simply as a method of warfare preferable to all others in Italy that it ought to be regarded, but as a powerful means of education and of nationalisation. Considered from the first point of view, guerilla warfare has the triple advantage of setting in motion the greatest possible numbers of elements, of requiring the least possible quantity of military materials, and of rendering a reverse of the smallest possible importance. It is the only plan compatible with the want of organisation, of discipline, and of military education, existing in Italy; it obviates the difficulty of forming regular armies, which would necessarily be weakened during the first days of the insurrection by desertions, by change of officers, by the want of sympathy and confidence between the soldiers and their new chiefs. It never risks, as regular warfare is often forced to do, the salvation of the country in a single battle; it does not depend on the fate of the metropolis; its centre is every where, its circumference nowhere. It demoralises the enemy in dragging him upon new ground, in interrupting all his habits, in harassing him by fatigue, incessant exertion and alarm, without ever consoling him by the chance of annihilating his persecutor at a single blow; it is opposed, in our case, to an enemy who — the Tyrolese alone excepted — is unfit for mountain warfare, and who upon the mountains of Genoa in 1795 and 1796, in 1797 on those of the hereditary provinces, in 1799 amongst those of the Grisons, and in 1800 amongst those of Nice, was always beaten.

Considered from the second point of view, it is the war of the people *par excellence*; it summons every where every man to arms, without destroying the popular, free, and spontaneous march, by the materialism of military regularity; it opens a path to every individuality, to every species of activity, to those even whose turbulence or ambition might be prejudicial in an

* See particularly the exposition of principles addressed to the Italians by the association, in the twenty-fourth number of *La Giovine Italia.*

army; it annihilates for ever all aristocratic tendency, in giving to the people the conscience of its force; it teaches it to love liberty, in causing the latter to issue from its struggles and dangers, and to be cemented by its blood; it consecrates by a crowd of deeds of arms every inch of ground, every stone of the country; it renders all military usurpation impossible; it saves the cause of the country from the treason or ambition of a single chief, so frequent and so dangerous in revolutions. Passes like Thermopylæ are not defended, says Napoleon, "*par la charge en douze temps.*"

Now there are Thermopylæean passages every where, where it is the foreigner who attacks and the citizen who defends. By war in bands, by associations, by public meetings, by the press and by popular journals, by a military organisation, in which care should be taken to mix together men from the most distant points of Italy, by all the means, in short, which well-intentioned chiefs can find in a country in fermentation, *La Giovine Italia* proposes to form, during the progress of an insurrection, a national political sense in the people, and to develop rapidly the germs of education which exist in it, sufficiently at any rate to enable it to exercise worthily its first act of sovereignty—its suffrage in the formation of the Italian Assembly. I say, during the progress of the insurrection, for *La Giovine Italia* appears to wish to distinguish two phases in the enterprise of emancipation—the insurrection and the revolution. In its idea, the former only finishes when the last inch of national territory has been torn from the enemy; and it does not appear to it that it can be otherwise conducted than by a band of men of courage and talent, belonging to the different Italian states, who themselves have issued from the bosom of the insurrection, who have been recognised by provincial assemblies according to a provisional organisation, superintended by them, and responsible to the nation. Not until the ground had been swept to the foot of the Alps, would the constituent assembly, elected by universal suffrage, be convoked at Rome to give its fundamental law to the nation. It believes that any national assembly meeting from the commencement of the insurrection would be fatal to the Italian cause. It is necessary that men, worthy by their virtues and their talents to represent the country, should have time to make themselves known to the people. It is necessary, too, that the constituent assembly should calculate in its labours all the elements which are at work in the bosom of the country, and which the insurrection will bring to light; and that it should not be influenced by events: it is to the nation declared free, issuing renovated from the struggle, and proud of its victory, that it ought to offer the pact which is to regulate its life at home and abroad.

Now are the ideas of the *Giovine Italia* of which I have only sketched some of the principal, really the result of the experience of the past?—Do they mark a progress in the ascending march which I have sought to trace in Italian life; or are they but the ideas absolutely premature of a handful of ardent enthusiasts, strangers to the reality of the elements existing in Italy?

Men stunned by disappointment, after some years of misfortune; writers interested to discredit every enterprise which may reveal her own force to Italy, or actors in past insurrections, who find their condemnation written in every page of *La Giovine Italia*, have sought, especially since that association has ceased to have a periodical organ, to insinuate the truth of the latter opinion. I believe I have data which refute it; they have none to support it. The failure of a conspiracy proves nothing against the popularity of the ideas of which I here trace the history. That is an affair of centrality which establishes nothing with respect to the army; and if I have asserted—

and perhaps my readers will allow that it is not without grounds—that the failure of Italian insurrections has nothing in common with the state and the resources of Italian patriotism, I think I may deny the force of the argument which may be deduced against the extent of the ideas promulgated by *La Giovine Italia*, from the fact that a conspiracy prematurely discovered and repressed with atrocious ferocity, has not hitherto been able to realise them. The history of this conspiracy, and of the whole period from 1831 to the present time, remains to be written; it will perhaps be one day published, and in revealing numerous causes now obscure, which have contributed to stay our youth in their course, it will furnish a useful study of men and things. But there are circumstances from which we may even now deduce the power of the principles of *La Giovine Italia*, viz., the very ferocity with which the conspiracy was opposed; the boundless fright with which the Italian governments have to this day persecuted the slightest movement of the members of the association, and sought to banish them as far as possible from the frontiers of Italy; the furious and immoral edicts hurled against its writings *; and above all the fact of an association establishing itself at the end of 1831, and being able already, in the summer of 1833, to cause the governments to tremble. Such an association must have evidently found an echo in every part of the peninsula.

This association organised itself in a very simple manner. Having principles, and reckoning upon them rather than on the power of mystery and of symbols, it rejected all the complete machinery of the carbonarian hierarchy, and all the pomp which was only calculated to hide the absence of all real purpose. It had a central committee abroad to keep upreared its standard, to form ties between Italy and foreign democratic associations, and to direct the general enterprise; it had also interior committees, directing the practical conspiracy, established in the important provinces, and corresponding with the central committee; men for the purpose of presiding over the work in the cities, corresponding with the committee of their province: then the mass of members, all equal, except that only such as were believed to be endowed with the necessary prudence and discernment were allowed to introduce others into the society. It had the formula of an oath or declaration of political belief; a method of recognition, especially for the envoys of the association; a branch of cypress for a symbol in memory of the martyrs of the Italian cause, and as an image of the constancy to which all were pledged; and the words "Now and for ever" (*ora e sempre*) for device. Reckoning for success on other elements than its predecessors, having at heart especially to banish distrust and scepticism, and to call forth in the hearts of the young, enthusiasm, devotion, and that faith which does not exclude the observation of facts, but which does not allow itself to be subjugated by them; having besides to initiate a work of education, the association only decreed secrecy in as far as necessity required it, that is to say for its interior operations; with respect to its existence, its object, its hopes, its principles, it challenged publicity. The journal *La Giovine Italia* was established at Marseilles, of which the situation was favourable for communication. Another secondary journal was afterwards established in the canton Ticino, in Switzerland, and was more especially devoted to Lombardy. The exiled members of *La Giovine Italia* there developed the doctrines of the association, and its ideas on the prospects of Italy. Others undertook to render these familiar

* The edicts of Charles Albert punish with imprisonment and with the galleys, the introduction' possession, or perusal of these works. Two years' imprisonment and a fine is the punishment for *not denouncing* their possessor: the informer receives one half of the fine; and his name is kept secret, unless he should prefer publicity. These edicts are signed by four ministers, Caccia, Pensa, Barbaroux, and L'Escaréne. Their names deserve to be known.

to the people, under the form of dialogues or catechisms. The object was to spread all this throughout Italy. This was effected by means of a considerable pecuniary outlay, and through the devotion of a valuable class of men, for the most part eminently Italian,— the merchant-sailors. These men were worked upon, and they accepted their mission with enthusiasm. By organising actively relations at every point where communication is most frequent with the peninsula, regular transmissions were effected; the packets were confided to devoted youths, who braved every risk to carry them to their destination; they were finally distributed throughout the country; and in spite of "espionnage," severe penalties, and a thousand acts of imprudence, their circulation was immense, and their effect also.

The Italian youth had found its men. The language which was addressed to it expressed all which it had long felt, without giving it utterance — all the secrets of its heart. It caught the inspiration; it took its fire. Organisation commenced at every point. In the twinkling of an eye the chain of communication was formed from one extremity to the other of the peninsula. Every where the principles of *La Giovine Italia* were preached; every where its standard was recognised and hailed. Its members continued to increase; its emissaries were continually meeting each other, crossing from province to province. Every day the demand for its publications became louder; presses were set up in some parts of the interior, where small publications, dictated by local circumstances, or reprints of what was sent from Marseilles, were thrown off. Fear was unknown. There was no doubt of success. All this was the result of principles; and all this effected by some young men without great means, without the influence of rank, without material force, is strong evidence, it appears to me, in favour of the standard they had reared.

Persecutions commenced; and I say it with regret, they commenced on the part of France. They were directed, under vulgar pretexts, against the nucleus of the association at Marseilles. Engagements were entered into with the Italian governments to destroy the journal; but the French had a hard-necked race to deal with. They commenced by chicanery, but were baffled; they arbitrarily expelled the director; the director concealed himself; by shutting himself up he escaped the police, and pursued his labours. Then all were expelled who took an evident part in the actual publication of the writings of the association, or in their transmission; but others came and took their place. Nothing was interrupted. At the same time the conspiracy pursued its course in Italy. From the youth it descended amongst the people; from the people it proceeded to the army; there it found, as was natural, the chiefs and the officers of rank inimical or indifferent; but the inferior officers were admirably disposed. An excellent publication on the *oath taken to the government*, dictated by the purest soul it has ever been given me to know (see *La Giovine Italia*, No. 2.), made many converts, and these made others; by degrees the affiliations became numerous; the association began to feel itself strong enough to think seriously of the plan and period proper for the revolt.

But here I must stop; my letter is already long enough; nor can I, I think, reveal the causes which appear to me to have frustrated the projected insurrection — they are multifarious. There are amongst them some inherent to every conspiracy — accidental, independent of all foresight — such, in a word, as the best organised enterprise may encounter in its march. There are others which testify the revolutionary inexperience of the Italian youth, and the impossibility of uprooting in two or three years all the prejudices, all the habits of distrust and of hesitation there, where it

is necessary to act, and to act in spite of every thing. There is none, I think I may affirm, which proves a want of sympathy with the principles I have described; not one which indicates a want of courage or devotion in the young conspirators. Personal courage is rarely absent in Italy; it is *social* courage, if I may so express myself, the spirit of common action, which has not yet reached the necessary degree of force. There are doubt, hesitation, and distrust of all; and in this case the energies of the individual conspirators were frustrated by a something very vague, if we attempt to define it, but very real in practice — the result of long centuries of slavery, of the want of experience, and of the narrow and corroding spirit of analysis, in which the youth of Italy are educated. These energies were great and active, though destined to remain unknown. At the critical moment, when arrests were taking place on all sides, men who had been warned and urged to save themselves, became victims, rather than augment the general dismay by their flight; many others, proscribed and condemned, re-entered Italy, to bear an order or to gather information, though the least result of their conduct might easily be their seclusion for ever from the light of the sun. Such deeds are now forgotten; and such forgetfulness is ingratitude.

But that which I could not, without remorse, pass over in silence, are the names and the sanctity of the victims, and the infamy of their executioners.

There is here, in the second half of the year 1833, in events which transpired in the Sardinian states especially, a grand and terrible page of history, which I must at any rate — since I cannot write it here — point out to my too forgetful contemporaries: one of those bloody pages full of instruction, which men should re-read whenever they feel their indignation against tyranny inclined to relax, and which mothers should whisper to their children, to teach them the fate of a country without liberty. As soon as a few words, which had imprudently escaped a soldier in the heat of a quarrel, and which were directed against one of his comrades belonging to the association, had furnished the government, which had hitherto merely felt that there was a conspiracy, without being able to discover it, a trace of its existence, arrests and other repressive measures commenced: a general examination of the knapsacks of the artillery-men at Genoa furnished other indications. Finding itself attacked in its only safeguard, the army, the government, struck with terror, adopted terror as its system. Arrests multiplied with rapidity; wherever there was the slightest suspicion, the individual was seized. The conspiracy was so general, that with no other assistance than simple conjectures, some of those who were seriously compromised were necessarily hit upon. The prisons of Genoa, Turin, Alexandria, Chambery — every where indeed — were filled; only intervals were allowed to elapse between the arrests at different cities, in order that an air of probability might be given to the report that the arrests were made in consequence of revelations divulged by different prisoners. Then commenced a plan of demoralisation of a nature to brand with eternal shame, not those who adopted it — for them shame has long ceased to have a meaning — but the magistrates and all respectable men who allowed such things to be done without protesting against them. By this means an explosion was prevented. The Piedmontese Gazette declared that it was clear, from the papers found on them, that the conspirators professed that they had no religion; that they had engaged to avail themselves, for the destruction of the throne and altar, of all means whatsoever, from the poniard and poison to the match of the incendiary; that in fact a quantity of poison had been found in the apartments of two officers; that at Chambery it was in-

tended to blow up the powder-magazine behind the barracks, and that a subterranean passage was already dug for this purpose; that Turin was devoted to the flames; that it was to have been set on fire in eight different places at one time, and so on. These infamous inventions were commented on by a crowd of subordinate agents: by some of these it was whispered to the soldiers at Genoa that the conspirators had contemplated a kind of Piedmontese vespers; they flattered local or other prejudices wherever they found any, in order to prevent a general understanding. Whilst, without the walls of the prison, the parents or friends of the individual arrested were told that nothing had been found against him, and that he would soon be at liberty, very different scenes took place in the dungeons themselves.

Every thing which hatred and experienced villany could suggest was called into operation in order to tear from the prisoners confessions or accusations. With some, corruption was tried; with others falsehood, and the machiavelism of interrogations — terror with all. Those who were thought the least firm were thus addressed: — "We know that you are culpable, and you will be shot within twenty-four hours if you do not reveal all you know." To those whose virtue was known, the following appeal was made: "You have erred, but you are sincere; we know it, and we pity you; you thought you were engaged in a work of devotion, and you have confided in traitors unworthy of your sacrifice; you think you will save virtuous and constant friends by your silence; far otherwise! you sacrifice yourselves and your family for the sake of miserable traitors; it is by them that you are accused; here is their evidence against you: now, are you resolved to perish, or will you, by confirming their statements, make your families happy?" And the forged evidence of their friends, bearing forged signatures, was held for an instant before them. With those from whom it was wished at least to extort something confirmatory of their personal culpability, recourse was had to the "espionnage" of prisons.* False conspirators were placed in their company, who undertook to profit by every moment of sympathy or confidence. For each individual new tortures were invented; but all were equally base, ignoble, and ferocious. Here a crier stationed near the window of the cell shouted, "Your friends have just been shot: to-morrow it will be your turn." There, one of the friends of the accused was placed in the same corridor, and vague intimations were given to the latter of the dangerous position of the former; at length, some day, after much passing to and fro, his chamber was changed suddenly; but whilst the prisoner hearing him led away, feared that he was about to meet his fate, a few muskets were discharged, in order to make him believe in the reality of his suspicions.† In some places, the prisoners were deafened by continual noises; they were prevented from sleeping; then after one or two sleepless and agitated nights, they were assailed with the moral torture of minute interrogations, of which the extent and effect cannot be conceived except by

* This was resorted to in the case of a sergeant of the guards (Miglio). A man was thrown into the same dungeon with him, who, with tears in his eyes, lamented that he was implicated in the conspiracy. Upon his asserting that he possessed the means of communicating with his family, Miglio opened one of his veins, and wrote with his blood a few lines to his friends. This note was part of the main evidence against him on his trial (at Genoa).

† The officer Pianavia was placed in the same corridor with Giovanni Re, one of those whom it was wished to force to a confession. He was in the habit of singing: on a sudden he ceased to sing. Persons were heard frequently to enter his cell: the governor remained there some time, and proceeded thence to that of Re, having with him a chaplain. All appeared serious, — melancholy, even, and the governor, in an agitated tone, demanded of Re if he felt himself tranquil. During the night, the bustle continued. At break of day, Re heard some one leave the cell of Pianavia, and in a short time the report of several muskets caused him to believe that he had been shot. Pianavia still lives; he had yielded, and betrayed his confederates (at Alexandria).

those who have passed through the prisons of Italy.* It was when his moral energy was thus harassed and exhausted, that an offer of pardon was made to the prisoner, or that the sanctity of domestic emotions was profaned by sending the grey hairs of a father to extort confessions, or a mother, who believed that in saving her son she should injure no one. Some succumbed: they must be now extremely unhappy, that is if they are not villains. Others resisted, and were devoted to death. One only, the author of the publication on the military oath, which I have mentioned above, a man of pure and powerful soul, whom the seductions and menaces of all the kings of the world could never have polluted or conquered, refused, in a burst of noble indignation, to submit his body to the executioner. In the night, with a nail torn from the door of the cell, he severed the bonds of his mortality, and went to appeal against tyranny to God: this he could do, for he was without spot. He was a youth the most loving, the mildest, the most delicate and constant in his affections, that could be found on earth. He loved his country, of which he comprehended the whole mission, his mother, a model of every virtue, his brothers, now in exile, and a friend. His intellect was vast and active: he was capable of the grandest ideas, for the grandest ideas rise from the heart. He was one of the chiefs of the *Giovine Italia* at Genoa. His name was *Jacopo Ruffini;* and those who knew him intimately revere his memory like that of a saint.

Those who perished at this mournful time were *Joseph Tamburelli*, corporal in the brigade Pinerolo, May 22d, 1833, at Chambery; *Anthony Gavotti*, of Genoa, aged forty-seven, fencing-master, June 15th, at Genoa; Joseph Biglia, of Mondovi, aged twenty-nine, sergeant in the grenadier guards, on the same day, at Genoa; *Francis Miglio*, of Rivalta (Turin), aged forty-seven, sergeant in the guards, the same day, at Genoa; *Dominick Ferrari*, of Taggia, aged twenty-five, sergeant in the brigade Caneo, on the 14th June, at Alexandria; *Joseph Menardi*, of Rocca-Sparviera, aged twenty-five, sergeant in the same brigade, on the same day, at Alexandria; *Joseph Rigasso*, of Leghorn, aged thirty, sergeant in the same brigade, on the same day at Alexandria; *Amande Costa*, of Lisiana (Genoa), aged twenty-one, sergeant in the same brigade, on the same day, at Alexandria; *John Marini*, of Sunna, aged twenty-six, sergeant in the same brigade, on the same day, at Alexandria; *Effisio Tola*, of Sassari (Sardinia), aged thirty, lieutenant in the brigade Pignerol, on June 11th, at Chambery; *Alexander de Gubernatis* of Gorbio (Nice), sergeant in the brigade Pignerol, June 19th, at Chambery; *Andrew Vochieri*, of Alexandria, legist, June 22d, at Alexandria. Afterwards, at the commencement of 1834, fell *Volonteri* and *Borel*, at Chambery.

Those who were condemned to death, but who succeeded in escaping, were the advocate *Scovazzi; Ardoino*, lieutenant in the brigade Pignerol; *Vacarezza*, sub-lieutenant in the same; the sergeants in the same, Vernetta,

* "The following day my books were taken from me; that is to say, a bible, a book of prayers, and a history of the illustrious captains of Piedmont. My cell was changed, and a chain was fastened to my leg. The cell was dark, bare, with double-grated window, and a door with two bars. The chain, fastened to a ring in the wall, permitted me to approach the window. Opposite my cell was that of poor Vochieri. There were cracks at the bottom of my door, which had been imperfectly closed; and as the door of Vochieri's cell was kept open, the light from his window rendered me curious to know whence it came. I looked through the door, and saw Vochieri seated on a chair, with an enormous chain fastened to his foot, and two guards, with their sabres drawn, at his sides: he changed his position every hour; not a word was spoken either by him or his guards. A third sentinel, with a musket, was stationed before the door. During the day, two Capuchins came to speak to him: he remained thus before my eyes, in a sort of agony, for the space of a week; then he was taken away and killed." This took place at Alexandria. I have extracted the above passage from a narrative in manuscript written by one of the prisoners for the affair of *La Giovine Italia*, who is now free, and out of Italy.

Enrici, Giordano, Crina, *Scotti*, a surgeon; *Gentilini*, a person of property; the Marquis Charles Cattaneo; the advocate *John Ruffini*; the advocate *Berghini*; the officer of division, in the district of Turin, Barberis; the Marquis Rovereto, &c. Several individuals already in exile were formally condemned to death. Other sentences were commuted, in consideration of confessions and denunciations. *Thappaz*, lieutenant in the royal corps of engineers, was condemned to twenty years' imprisonment; the general out of service, Joseph Guillet, to ten years; the physician Orsini, to twenty years; the merchant Noli, and Moja, to perpetual imprisonment; the jeweller Lupo, to twenty years' imprisonment; a crowd of others to five, three, and two years. Several officers were cashiered. The confinement already endured appeared a sufficient punishment for several individuals belonging to the principal patrician families of Genoa, — *Spinola*, *Durazzo*, *Cambiaso*, &c., and they were set at liberty.

All this was done in a hurry, without a shadow of legality, without the slightest appearance of that solemnity which renders human justice at any rate imposing. It was a sort of madness which raged, a somewhat revolutionary terror, but without the grandeur of its object. It was such haste as if it were feared that something might happen to tear the victims from their gaolers. Every difficulty was surmounted by arbitrary measures; an absolute will uttered its sanguinary commands from the throne. Charles Albert demanded his prey; the trials and the condemnations were the work of military commissions, — soldiers or citizens, it was all the same.*

Protests were useless; a billet royal of the 1st of June 1833 set them all aside. Defence was a cruel mockery; the documents were given to the defenders incomplete and mutilated; scarcely any time was given to examine them; only a military man could read the defence, and nevertheless, a short time afterwards, almost all the officers who took the part of the accused were punished; perhaps a trace of emotion had been discovered in their voice, or on their countenance. The executions generally took place at break of day, or almost in the night. The murky hues of crime invested these bloody deeds. The hands of justice were those of a murderer.

Here and there horrors took place which chill the listener. The butchers outdid in bestial cruelty their master, sure as they were of his royal smile.† General *Morra* at Chambery; *Favenga*, the governor of Cuneo; the general governor *Galateri*, at Alexandria, signalised themselves by their ferocity. Charles Albert recompensed them; on the most ferocious amongst them he

* The law by which all were judged was the royal penal military edict of August 27. 1822, — a law essentially Piedmontese; but it was nevertheless called into force equally against the Genoese, though it was stipulated by the Congress of Vienna that the laws of Genoa could not be violated. We cannot here pass over without honourable mention an attempt, which was not without danger at the time, to cause justice to be respected. A certain number of advocates of Genoa signed a long argumentative consultation against the application of military jurisprudence to civilians. They presented it to the king, July 17. 1833. Of course no notice was taken of it. The billet royal of the 8th of June is countersigned by Villamarina. Several condemnations to death were pronounced solely for the crime of non-denunciation, on persons who were not accomplices: see, for instance, the preliminaries of the sentence of June 13., on Rigasso, Costa, and Marini.

† Let it suffice here, that I mention the conduct of *Galateri* with respect to *Vochieri*, the same who is mentioned above. *Galateri* did every thing in his power to extort from him revelations. Irritated by his refusal, he loaded him with insult. After the sentence, he went again to see him, and urge him to confess, telling him that he was acting for his best. "The best that you can do for me," said *Vochieri*, in the midst of his guards, "is to rid me of your odious presence." *Galateri* then kicked him on the abdomen. *Vochieri*, whose limbs were fettered, spat in his face. The only favour the latter demanded was, that in marching to the scaffold, he might not pass by his own house, where there was his wife, then pregnant, his sister, and his two little children: — it was refused: his sister has been mad ever since. "*Sbirri*" were appointed to shoot him; they wounded him at the first discharge, without killing him. Galateri was present at the execution: it was he who was favourably distinguished by Charles Albert. See *Angeloni*.

conferred the order of the Holy Annunciation, which gave him the right of calling the king his cousin. He deserved it.

Such was the result of the first conspiracy of *La Giovine Italia* for the realisation of the principles which it has proclaimed. Was it, as the central committee of the association expressed it in 1834, *only a simple incident in the struggle*, and is the work persisted in which duty imposes on all those whose country is enslaved and suffering? * Or has the association slept since then? We have nothing to say respecting the actual state of subterranean Italy. Woe to the Italians, if the martyrdom of their brothers has only taught them despair! Woe to them if they do not feel what a sacred and binding cause is that which has furnished such pages to history! But however that may be, the march of ideas, I repeat, has nothing in common here with the march of the conspiracy; the latter may fail twice ten times; the former will keep always advancing, for they cannot be destroyed by the musket. It is these ideas, unknown or misunderstood, which I have sought as much as possible to verify; they govern the fate of Italy: 1821, and its monarchico-federal standard is gone for ever, as is also 1831, and its standard without a name. The arena is now open for the standard of the people and of unity, and it is *only* under this banner — let all those who would aid us in the sacred cause remember — that the regeneration of Italy can be accomplished, and will be accomplished, sooner or later.

JOSEPH MAZZINI.

PROPOSALS FOR A NEW ACT OF PARLIAMENT TO PREVENT THE USE OF HORSES.

A POOR village schoolmaster sends us the following embryo of a petition to parliament, countersigned by three very small hucksters of his parish: —

"Amidst the continual repetitions of 'The time has at length arrived!' it could hardly have been anticipated, by the most far-seeing philosophers and telescopic speculators on social reform, that the period would really dawn upon us when every thought and feeling of humanity and sound legislation should cry aloud for the suppression of horses. But the voice of the Animals' Friends' Society has, at last, been heard; and the eyes of statesmen will shortly be opened. Horses are not 'noble animals' in themselves, (having far less sagacity, magnanimity, courage, and faithfulness than dogs, and many other quadrupeds,) nor are they the cause of nobility in mankind. They are the medium of all barbarity, and a mere relict of barbarous times. They not only impede the progress of knowledge, but are constantly liable

---

* "For ourselves, our task is plain; our path is marked out before us. Nothing has changed — nothing can change our belief — our object — our mission. We have suffered a repulse: this is only an incident in the struggle. There is something on which, in their turn, all the artifices of despotism will be wrecked, viz., the force of things, moral progress, the mind of the people, liberty, which alone is immortal. She falls to-day, but it is to rise to-morrow more lofty of stature than ever . . . . . We shall fulfil our duty: we must first hold ourselves firm and unshaken in the line which we have taken; and this we engage ourselves to do on our honour: we will never desert it, come what may." Declaration of the committee, February 1834. Geneva. Vignier.

to produce the most tragic disasters to the best-informed people. They are an unmitigated cause of anguish to all refined sensibilities, and an insult to science: in fine, they are a nuisance, and must be abated."

Our village schoolmaster proceeds to state at some length the innumerable grievances which he considers to result from the use of horses. He says they lead, by the shortest cut, to the ruin of rich families, "in an eminent and salutary degree, by the *facilities* they afford for the loss of property by racing;" and tend, also, to produce utter distress of mind in the aforesaid families, "by the breakage of necks, and the detriment or destruction of human eyes and limbs, in the deleterious mania called 'hunting.'" They are, moreover, highly conducive — when attached to deep-cushioned carriages — to the miseries of indigestion, plethora, obesity, selfishness, and sudden death by apoplexy. They expose gentlemen of the middle class to live beyond their means, "to the great objection of tradesmen in general, and to the distress of innumerable families." They place the whole body of the fair sex, of the middle and lower classes, in continual jeopardy "of their pedestrian lives;" and out of this jeopardy they do not always escape, being frequently knocked down by one or other of these "high-spirited nuisances," and either trod upon by hoofs, or "trundled over by wheels, in the most horrible and unbecoming manner." In touching upon the "equestrian lives" of the fair sex of the higher class, our village schoolmaster winds up with a burst of loyal apprehension for the safety of her most gracious Majesty; and this reflection brings him at once to the consideration of a remedy against the fatal practice of using horses, and suggestions for a substitute.

He proposes, then, that oxen should be used instead of horses, and that these animals should be carefully bred for the purpose, to eradicate all seeds of viciousness, and trained up from their earliest calf-hood upon the most humane and philosophical principles. Their horns are to be sawed off, and they are to wear shoes, or rather, as he says, "a sort of cloven patten," on their feet. They are to have "soft bits" in their mouths, made of prepared leather or India-rubber, and the head is to be reined-up a little, but not so as to prevent their exercising it on all great occasions, as an aid in drawing; a prevention universally and absurdly adopted in England with regard to "the exploded nuisances now in use;" meaning, of course, the horses. In carriages, he suggests that the oxen should also have their ears cropped, "so as to conform to old associations of natural grace as much as possible," and their tails docked, and encouraged to a horizontal, or even ascending position, — not, he says, by the insertion "of a steel skewer or other barbarity," but by a back rein, or training noose, attached to an elevated part of the body-harness. After noting these and sundry other parts of his proposed bill, our friend of the village falls into raptures with the ameliorated condition of all classes, especially of those high circles, concerning whose thoughts, feelings, and habits, he declares himself to be as intimately conversant as they are with those of the working classes, and anticipates the day when he shall read in the newspapers that, "Yesterday her majesty took an airing in St. James's Park, mounted on a fine, docile, cream-coloured heifer, and attended by a numerous suite on young fleabitten cows, and noble liver-and-white three-year-old oxen, of the most superb action and sonorous voice; the whole *kortayge* being in excellent health, spirits, and security."

But the main point and object of the whole argument and proposed bill of this village scribe and reformer, who is so full of original views, is to be found in a few sentences which we have hitherto omitted. After remarking

upon the temptations to rob, lie, and cheat, encouraged and necessarily attendant on "the curse of horses," as exemplified in the sale of horses, and in the jockeys and grooms purloining the corn, &c., he breaks forth into invectives against the waste of money and patronage bestowed "in the diffusion of vice," and then draws a really affecting picture of a man in the humblest station of life, who, with uncomplaining fortitude of toil, supports himself and family by the sale of small hardwares, wending his weary way in sun and shower, from daybreak till late in the night, his labours being shared by one faithful companion, — his dog, who assists in drawing his little cart from town to town. Among the nuisances and abominations of horses, we consequently find it set down that "the dog-carts of poor people are continually almost, and sometimes quite, run over by these larger beasts; and that this tyranny and wilfulness is very difficult for a poor man to bear, who may have as good a spirit as any coachman, although he is not so high up."

Here, then, we perceive the gist of the whole matter, for matter there is amidst all this eccentricity. The village schoolmaster's method of arguing against the real value and importance of a thing, by overlooking all its uses, and giving only a catalogue of its abuses or imperfections, is precisely what he has been taught to do by the example of those who undertake to legislate for the poor, — pretend to know all about them and their affairs, and fancy they have conferred a public benefit, when they have done nothing but display their ignorance and tyranny. This is but too common an occurrence, as witnessed by the public debates. In the present instance, however, we allude to a recent enactment, which has been accomplished with a quietude that leads us to imagine there was some degree of consciousness, (though it might be of peculiarly characteristic smallness), that if made the subject of a public debate, or even if made known, it might stir up some of the few friends who are conversant with the feelings and affairs of the working classes to a strenuous opposition.

In this country, measures of the greatest importance to individuals and to classes, and more especially to those who, from their humble station in the social scale, possess no sort of means of resistance or remonstrance, are often, what may be justly termed, *smuggled* through parliament, and never seen or heard of till in their operation and effects. Certain individuals, who take it into their heads that a particular class of people ought to be restricted or annoyed by legislative enactments, contrive to introduce the restricting clauses into some bill which has no obvious connexion whatever with the matter, and take all possible pains that the most profound silence shall be maintained relative to the clauses in question during the whole progress of the bill through its respective stages. By these means, the people, or class especially affected, hear nothing of the measure which has attacked or destroyed their interests, until they learn, as by a thunderclap, that it has passed into law! Ought such a system to continue? Should there not be a publicity in these matters which would supersede such disgraceful occurrences?

A remarkable instance of this abusive mode of legislation has just taken place. A clause has been silently introduced into the bill for improving the police, which is to prevent any poor person from employing dogs in carts, or in any other way which they have been accustomed to find useful. Not a word was breathed of this clause in the House of Commons. It was by the merest accident that it was mentioned in the House of Lords. The moment it was heard of, some individuals, well known to the public and to both houses for the interest they take in the welfare of the working classes,

and for the exertions they have successfully made for the improvement of their condition, drew up the following petition, and were about to present it to the House of Lords on the very day that they found, by the newspapers, that the bill containing this obnoxious enactment had actually passed through all its silent stages.*

"To the Right Honourable the Lords Spiritual and Temporal in Parliament assembled, the humble Petition of the undersigned

Sheweth,

That your petitioners are not accustomed to interfere in party politics, but take a deep interest in all matters which influence the condition and happiness of the working classes of the community.

That your petitioners have learned through the public newspapers that, in the bill for improving the metropolitan police, there is an enactment which, if adopted, will greatly annoy and injure many very poor but industrious members of the community, who aid their own labour by the employment of dogs, and are thereby enabled better to support themselves and families.

That your petitioners are well aware that this enactment will be considered by many persons too trifling and ludicrous to be the subject of a petition, even from individuals so unimportant as your petitioners; but your petitioners cannot deem any matter frivolous or a fit subject for ridicule which concerns on the one hand the annoyance, and on the other hand the advantage and comfort, of the industrious poor.

That in the judgment of your petitioners such an enactment is totally uncalled for, and the alleged protection to the animals employed is a mere pretence, inasmuch as, if cruelty be at any time practised, it is sure to call forth the indignation of all who witness it, and moreover subjects the perpetrators of it to summary punishment before the magistrates. Your petitioners, therefore, submit that the existing law is amply sufficient to prevent cruelty to the dog, in common with all other animals.

That the dog is less liable to ill usage than any other animal employed in the service of man, inasmuch as, from his intelligence and other good qualities, he becomes the friend and companion of his master; and it has been a matter of observation to your petitioners that the dogs, now the subject of legislation, go to their work with as much animation as is manifested by sporting dogs, and that they perform their task with great apparent zeal and satisfaction.

That numbers of dogs are employed in various sports well known to your lordships, some of which are constantly so exhausting to the animals that hot baths and other means of NURSING (indispensably necessary after a hard day's sport, to prevent the death or permanent injury of the dogs) form a regular part of the apparatus of the kennel; yet your petitioners have never heard of an enactment to protect the hound or any other sporting dog. It therefore appears to your petitioners to be flagrantly unjust in principle, and most annoying in its practical tendency, to let the dogs of the rich entirely alone, and to legislate only for the dogs of the poor.

That your petitioners humbly represent, that there are a number of persons in the community whose morbid sensibilities constantly lead them to endeavour, in every possible way, to interfere with the occupations and amusements of the working classes; that through their influence enactments are introduced into acts of parliament which are directed exclusively against the poor — enactments which, although they may apparently apply to all classes indifferently, yet, in practice, are nevertheless exclusively put in force to the harassment and disadvantage of the poor; the cowardice of their oppressors deterring them from making the slightest effort to interfere with the occupations and amusements of the rich, wherever or however carried on, and with whatever evil results to themselves or others.

That your petitioners have remarked that the parties who thus interfere with the poor, not only do not direct their attention to the hardships inflicted on sporting dogs, but that they do not extend their benevolence to race-horses, nor to any other creature whatever employed in any manner in the service or the amusement of the rich, and that they thus prove that their alleged feeling of humanity is a mere hypocritical pretence.

That while your petitioners are perfectly assured, and know that a great part of the working classes are satisfied that no unkind disposition towards them exists in the breasts of your lordships, yet they do feel, and they know that a great part of the working people also feel, that, through false representations, enactments are made which the legislators, if

* Whatever may have been thought of the village schoolmaster, and his one-sided views, our readers may depend upon the truth of the above statement, and the authenticity of this petition. It was drawn up by several gentlemen eminent in science, statistics, and various branches of knowledge; and the only reason for omitting their names is because they do not wish to get credit for a purpose which they have at present failed (however excusable under the circumstances) to accomplish. — ED.

they had a more perfect knowledge of the working people, and of their calumniators and oppressors, never would sanction.

"Your petitioners, therefore, think it the more obligatory upon them to come before your lordships, humbly to represent that the vexatious legislation, and the vexatious exclusive enforcement of legislative enactments to harass the working people, produces, more than any other cause, soreness of feeling, distrust in the legislature, and disunion in society, and produces these, and the like evils to an extent which never would have been excited by the public burdens, severe as they are, which are to be borne for the support of the state.

"That this distrust in the legislature, the lower house of which is chosen chiefly by the middle classes, is one principal cause of the desire now felt and expressed that the elective franchise should be extended to all the members of the community; and your petitioners feel assured that this desire never can be pacified as long as the occupations, amusements, and pleasures of the working classes are vexatiously interfered with by unnecessary legislation.

"Your petitioners therefore pray that the clause restraining the employment of dogs by the poor, may be struck out of the bill now before your lordships for improving the police of the metropolis.

"And your petitioners will ever pray."

A petition more just and reasonable we never read; and we may entertain some hope that the large and unexclusive benevolence of its purpose, and the conciliating spirit in which it is couched, may induce Lord Ellenborough to return to the subject next session, with increased objection to a clause so foolish and injurious. We may also anticipate that if these facts and remonstrances can be fairly brought before the mind of Lord Brougham, he will not persist in the line of argument which he used upon the question. The only ground of any validity for this tyrannical proceeding against the dogs of the poor, is that they are liable to be driven mad, or to bite those who approach too near the cart or truck they may be drawing. Now with reference to the first of these grounds (which involves the second) it is true that, as dogs do not perspire from the skin, but by exhalations from the lungs, through the medium of the tongue, the use of a muzzle (as ordered by magistrates) is not unlikely, in the hot months, and under circumstances of over-exercise, to induce hydrophobia. But where are the facts resulting from this liability? Where are the reports of cases of dogs, so circumstanced, going mad or biting people? On the contrary, the exercise appears to do them good. It is the rich dog that most commonly goes mad; and high-fed lap-dogs are absolutely famous for hydrophobia. In fine, the only real objections that can be urged against the dogs of the poor is, first, that men sometimes, though very rarely, get into the cart drawn by dogs, which ought to be prohibited; secondly, that a muzzle is used in hot weather (whereby hydrophobia *might* be induced); and, lastly, the criminal fact that they are occasionally in the way of carriages and long stages, the drivers of which are painfully afraid of running over them. But to put them down on such flimsy assumptions and partial views is at least as preposterous as it would be to put down horses, because they "now and then" occasioned the loss of life and property.

E. W.

BYRON AND GÖTHE.

We witnessed one day the commencement of a storm at a Swiss village at the foot of Mont Jura. Black and massive clouds, their borders tinged with a crimson purple by the rays of the setting sun, were rapidly spreading themselves over the azure of the most beautiful sky in Europe, the Italian only excepted: the thunder was growling in the distance, and a biting wind was scattering large drops of rain in sweeping gusts over the thirsty landscape: the smaller birds sought the leafy shelter of the trees. Looking upwards, we beheld a large Alpine falcon sinking, rising, and floating bravely in the very midst of the storm; we could have fancied that he was bent on contesting its power. At every roll of the thunder, the noble bird bounded aloft into space, as if in answering defiance; and we followed him with our eyes for a long time, till he was lost in the east. Beneath, on the ground, at fifty paces from us, was a white stork, tranquil and unruffled in the midst of the elements of discord. Twice or thrice she turned towards the quarter from whence the wind came, looking before her with a kind of careless curiosity; then she drew up one of her sinewy legs, bent her long neck on her wing, and set herself to sleep. We thought of Byron and Göthe; on the sky of tempest that hung over them, and still hangs over us; on the struggles of the one, and the calm of the other; and on the two sources of mighty poetry which they opened, followed out, and, we think, exhausted.

Byron and Göthe — are two names that predominate, and, whatever may happen, always will predominate, in all our recollections of the fifty years that have just passed away. They preside as masters, almost as tyrants, over that period of poetry, — so brilliant, and yet so melancholy; so glorious in youth and audacity, and yet carrying despair in its bosom "like a worm i' the bud." They characterise the two great schools under which are grouped almost all the intelligences that rendered the era illustrious. The qualities that adorn their writings are to be found — scattered it is true — in other poets, their contemporaries; still we catch *their* names on our tongue whenever we wish to designate the poetical tendencies of the age. Their poetry pursues different, and often, opposite routes; still thought cannot glance on the one, but the image of the other immediately springs up as a sort of necessary companion. The eye of Europe has been fastened on the pair as on two wrestlers treading the same arena. Like two frank and generous combatants, as they were, they admired, praised, and held out the hand to each other. Other poets have grown up in their footsteps; — none have been so popular; none have caused so many hearts to beat, or excited so many brains. Others have found judges, — have been appreciated calmly and impartially; — not so they: for them there have been but enthusiasts or enemies — wreaths or stones. When they disappeared in the great night that enshrouds and transforms men and things, there came a wide silence around their tombs. Little by little poetry had passed away from the world, and we might say, that their last sighs seemed to extinguish its sacred flame.

Just now, a reaction has commenced; good in that it betrays a desire for, and gives the promise of, life; bad in that it discovers narrow views, a tendency to injustice towards genius, and the want of a fixed rule for the appreciation of the past. The human mind, like Luther's drunken peasant on horseback, too often mounts on the one side to fall on the other. The re-

action against Göthe, begun by Menzel during his life courageously and justly, has, since his death, been pushed to exaggeration; social opinions, holy in their principle, and our adherence to which we are proud to own, but which ought never to interfere with the impartiality of our judgment on the men of the past, have pressed heavily on the scales, and an ardent youth —may their ardour be proof against temporary disappointments — have reiterated with Börne that Göthe is the worst of despots, *the cancer of the German body*. The reaction against Byron — we are not speaking of that medley of cant and unintellectuality that withholds from the poet a place in Westminster Abbey, but of the literary reaction — has shown itself still more unreasoning. We have met with adorers of Shelley denying Byron poetical genius; others seriously comparing with his the poetry of Sir Walter Scott; we have seen a critic write that "Byron makes man after his own image, woman after his own heart; the one is a capricious tyrant, the other a yielding slave." The first forgot the verses in which their master saluted

> "The pilgrim of eternity, whose fame
> Over his living head like heaven is bent *;"

the second, that after "Childe Harold" and the "Giaour," Sir Walter Scott renounced poetry. † The last forgot that, almost at the very time he was writing his criticism, Byron was dying in Greece for regenerate liberty. All judged, and still judge, the two poets we are speaking of, after an absolute type of the Beautiful, just or unjust, which they had formed in their own imagination, without regard to the social state as it was or as it is — without a just conception of the destinies of poetry, of its mission here below, of the law that governs its existence.

There is no absolute type on earth: the absolute is in the mind of the Divinity alone, whose intelligence the human being follows after, making nearer and nearer approaches, but unable to attain it here below. There is the eternal evolution of life manifesting itself in idea and in action, strengthening itself by all the produce of the past, ascending from age to age through a series of successive transformations, towards the less and less imperfect expression of this mind. There is the eternal aspiration of the soul towards Progression, which is the law, ever launching itself with more purity and power from the finite to the infinite, from the real to the ideal, from what is to what shall be. There it is — in this immense depôt of the evolutions of the past, constituting the universality of tradition; and in this instinct of presentiment extant in the depths of the human soul — in this, so to say, living life-tide continually flowing — there it is that poetry is nourished. She changes with the times, for she is their expression; she is transformed with society; her song, whether she know it or not, is the life of humanity; only, according to circumstances and individual bias, she is imbued with a preference sometimes for the life of the actual time, sometimes for that which is already preparing to succeed, and is revealed to her by the intuition of genius: she sings the song of the cradle or of the tomb; she is the initiative or the abstract. Byron and Göthe were the abstract. Was this their fault? No; it was the law of the times. Society at this day, twenty years after their song, presumes to punish them for that they were born too soon. Happy are the poets whom God permits to flourish at the beginning of an era, under the rays of a rising sun! A sequence of generations will lovingly repeat their verses; they will attribute to them the life of whose germ they caught but a glimpse, and but hinted the theme.

Byron and Göthe are abstracts; there is the philosophic view of their

* Adonais, 30.

† Lockhart's Life of Scott.

labours, and there also is the secret of their popularity. A whole epoch of the European world became incarnate in them as a prelude to its decease; just as in the political sphere, Rome and Greece became incarnate before death — the one in Alexander, the other in Cæsar. They were the poetical expression of what England has produced in economy, France in politics, Germany in philosophy: the last formula, the last effort, the last result, of a society founded on the principle of *individuality*. The epoch that had received, first from the philosophy of Greece, then from Christianity, the mission to re-establish, to develop, to emancipate the *individual*, was desirous of concentrating all its forces in them, as in Fichte, in Adam Smith, and in the French School of Rights, to show what she had dared, and what she had accomplished. This was much, but it was not all, and so sealed its death irrevocably. She thought the goal almost attained, and, behold, new and immense horizons expand in the distance before her; unknown virgin lands that, with the single principle she held, she felt herself powerless to go in unto and possess. By her long and painful efforts, the great human unknown quantity had been disengaged from all the quantities of a different nature that were about it; but weak and isolated, and feeling as though terrified at the solitude. Her politics had proclaimed, as the sole basis of civil organisation, those grand rights of liberty and equality (liberty for all) that form and constitute human individuality; but she blundered against social anarchy. Her philosophy had installed *self* as sovereign throughout her dominions; and had ended in a mute adoration of *fact*, in Hegelian immobility. Her economy had thought to organise *free* competition, and found she had organised the oppression of the weak by the strong, of the labourer by the capitalist, of the destitute by the wealthy. Poetry had toiled for ages to exhibit individuality in all its shapes, to translate feelingly what science had coldly and theoretically established, and, at length, came to a vacuum: as society had, on a sudden, perceived that the destinies of the race were not contained in a mere problem of liberty, but rather in a problem in which liberty and association should harmonise together; so she became conscious that her life, hitherto supported by the study of individuality, would perish for want of food, and that, to exist, she must enlarge her sphere and be transformed. Society and poetry uttered a cry of anguish. The agony of society produced that agitation we have seen increasing in Europe since 1815. The agony of poetry evoked Göthe and Byron. We know not if this point of view be novel; but we believe it to be true, and the only one that can lead to a useful and impartial appreciation of these two giant spirits.

Individuality has two forms, two lives; the internal and the external, subjective and objective, as the Germans call it. These two lives, these two forms, they shared between them. Byron was the poet of the subjective life, Göthe of the objective.

In Byron *self* is shown mighty and fierce, great in freedom and appetite, in all the uncontrolled plenitude of its faculties, breathing existence at every pore, active, daring, "a flaming energy," willing to snatch "the life of life." The external world on him imposes nothing; it tempers him not; to him nothing, if not his subject. Not to command its pleasures does the Byronic *self* aspire to rule it, but solely for the dominion, to exercise on it the Titan strength of its will. He draws not even from it, to speak accurately, colours, sounds, or images; for it is *he* who colours, *he* who sings, *he* whose image is every where reflected and reproduced. Poetry passes from him to things external. He holds his state in the centre of the universe, and thence gives out the light that kindles at his soul's hearth — scorching as the rays of the

sun concentrated. Thence the terrible unity that worn-out and superficial readers alone can take for monotony. Byron's heroes, whatever form they may please to assume, all resemble each other; for they are all brothers, all the poetical children of his powerful thought, all springing from the depths of his conception, none of them from without. And they are born free — born for the struggle, not for servitude. They believe in themselves. They defy the world, the conventional society around them, good and evil principle: they "will bend to neither." In life as in death, they "stand upon their strength;" they resist every power, for their own belongs entirely to themselves; it was purchased by

> "———— superior science — penance — daring —
> And length of watching — strength of mind — and skill
> In knowledge of our fathers."

They court not love; they *seek* it not, they *will* it; and it might be said that it is by a sort of fascination of the will that they find it. They dread not sorrow nor danger; they front them fearlessly, and will not deviate from their route an inch to avoid them. Each of them would be estimated as worth the whole of society; and should he find himself not at ease, would set his strength to break it piecemeal. Each is the personification, slightly modified, of one same type, of one same idea: the man-king, but the solitary king — the *individual* free, but nothing beyond free, such as the epoch now ending has made him — Faust, but without the covenant that yields him to the enemy: Cain kneels not to Arimanes; and Manfred, about to die, proclaims —

> "The mind, which is immortal, makes itself
> Requital for its good or evil thoughts —
> Is its own origin of ill, and end —
> And its own place and time — its innate sense
> When stripped of this mortality, derives
> No colour from the fleeting things without,
> But is absorb'd in sufferance or in joy,
> Born from the knowledge of its own desert."

Are they happy? — happy, we mean, not in the vulgar happiness of success — for men wreck themselves and are merry — but happy with a cheerfulness that flows from the consciousness of its own strength, happy with the enjoyment that accompanies the feeling of life in the plenitude of independence? No; they are not — and that is the ring that links the poetry of Byron to the future. They could not be so; for they all carry in their breasts, without telling it, without taking count of it even themselves, the ideal of another world, the presentiment of a life that liberty alone could not give them. Free they are: iron souls in iron frames, they climb the Alps of the physical world as well as the Alps of thought; still their visage is stamped with a gloomy and ineffaceable sadness — still their thoughts, whether with Cain and Manfred they plunge into the abyss of the infinite, "intoxicated with eternity," or whether with the Corsair and the Giaour they scour the vast desert or the boundless ocean, still are they followed by a certain secret and ever-wakeful terror. We would say they drag rivetted to their feet the chains they have broken. Their souls feel ill at ease not only in the petty societies with whom is their struggle, but also in the world of spirit. Neither is it under the attacks of these societies that they for the most part succumb, but under the assaults of this nameless sadness — under the corroding action of powerful faculties, "inferior still to their desires and their conceptions" — under the deception that comes from within; they are "their own destroyers." What shall they do with this

liberty so painfully achieved? On whom, for what, shall they spend the exuberant life boiling in their veins? *They are alone;* there is the secret of their sadness and their impotency. They thirst — Cain has said it for them all: — they "thirst for good," and they cannot produce; for they have neither mission, nor belief, nor understanding of the world they desire to transform. They have never thought on that humanity which is thronging around them, which has thronged before them, and which will throng after them. They have never thought on the place they occupy between the past and the future — on the continuity of labour that unites generations — on the grand object of common perfection, to be realised only by common efforts — on the spiritual and post-sepulchral life on this earth of the individual, by the thoughts that he transmits; and, perhaps, when he lives devoted and dies in hope, by the guardian agency that it is given him to exercise unseen over his brothers in terrestrial relationship. Alone they stand before God, and they recoil terror-stricken; alone, in face of the universe, and they feel cowed by its grandeur; and in place of drawing new strength from that ocean of life they comprehended so well — we need no other proof than the wonderful third canto of "Childe Harold" — they lose their own, they are absorbed; the individual is so little in the presence of God and the world! Thus, gifted with a liberty they know not how to use — with an active strength they know not how to apply — with a life whose object they know not — discontented and irritable, they lead an unsteady and useless existence. They die alone, as they have lived: unknown, unwept, they fall like the dead leaf into the current that bears ages on its bosom. Nature, that they so much loved, blooms indifferent over their tomb: —

> "Nor earth nor sky will yield a single tear,
> Nor cloud shall gather more, nor leaf shall fall,
> Nor gale breathe forth one sigh for thee, for all."

No, never have we seen the life and death of solitary individuality so energetically, so thoroughly summed up, as in the pages of Byron. How is it that those who reproach him with the habitual melancholy and the frequent frenzies of his characters, have not perceived that it is precisely by these frenzies and this melancholy that the work of the poet is moral, social, and prophetic? There is much of calmness in Göthe, — do we gain any thing more in consequence?

Göthe — individuality in its objective life — living at the same time as Byron, and having like him a consciousness of the then actual reality, followed an absolutely opposite path. After he also had uttered his cry of anguish in Werther — after having stated in all its frightful nudity, in Faust, the problem of the epoch, he thought he had done enough, and refused to occupy himself with the solution. Perhaps he despaired of the task, as beyond his powers; perhaps the feeling of resistance to social ill, that broke out for an instant in Faust, exercised his soul in secret for a long time afterwards. He himself remarked in his later years, commenting on a Frenchman who when he saw him exclaimed "That is the face of a man who has suffered much," that he should have said, "*That is the face of a man who has struggled energetically.*" But there remains no trace of this in his works. Whilst Byron writhed, bleeding, under the ill, he attained the calm — we cannot say of victory — but of indifference. In Byron, the man always overcame the artist; in Göthe it was smothered by the artist. In him there was no subjective life; no unity coming from the head or the heart; Göthe is an intelligence that receives, elaborates, and reproduces. Poetry is affluent to him in external objects — from all points of the circumference

to him as centre. He takes his lofty watch alone in the midst of creation: his curious look dives with the same penetration and the same interest into the bottom of the hare-bell's cup and into the ocean's depths. The rose exhales to the sky its eastern perfume—the sea throws on its shores the breakage of a hundred wrecks; but the aspect of the poet remains calm: they are for him but two forms of the Beautiful, two subjects for his art.

Göthe has been called a pantheist. We know not what sense was given to this vague and very often ill-understood word by the critics who used it. For there is a materialist pantheism and a spiritualist pantheism; there is the pantheism of Spinoza, there is that of Giordano Bruno, there is that of St. Paul; others also, and all different. But there is no poetical pantheism possible save on the condition of embracing the whole world of phenomena in one unique conception; on the condition of feeling the life of the universe in its divine unity, and of living that life. There is nothing of this in Göthe. There is pantheism in some parts of Wordsworth, in the third canto of "Childe Harold," in the poetry of Shelley: there is none in the most brilliant compositions of Göthe, for life is there admirably seized on and reproduced in *each* of its *successive* manifestations, never in the mass: Göthe is a poet of details, not of unity—of analysis, not of synthesis. None so able as he to dive into details, to set off trifling points; none to throw so beautiful a light on parts; but the connecting tie escapes him. His performance is a magnificent encyclopedia unclassed. He has felt *every thing*, but he has not felt the *whole*. Happy at catching a spark of the beautiful from the humblest blade of grass gemmed with a dew-drop—happy at discovering the poetical element beneath an incident in appearance the most prosaical, he knew not how to reascend to the common focus and to frame anew the mighty ascending scale, in which, to avail ourselves of a fine expression of Herder, "each creature is a numerator to the grand denominator, which is Nature." How could he?—he who had no place in his works, and in his sympathies as a poet, for Humanity, the crown of the pyramid, which alone determines the worth of sublunary beings? "Religion and politics—(said he)* are a troubled element for art: I have always kept myself aloof from them as much as possible." Around him were being agitated matters of life and death for millions; around him were resounding the war-songs of Körner; Fichte, at the close of one of his lectures, threw himself, with a musket on his shoulder, into the ranks of the volunteers, who rushed forward—(alas! what have kings made of that magnificent outburst)—to fight the battles of their country; the ancient soil of Germany heaved with the future under their footsteps: he, an artist, looked on!—his soul, old before its time, stirred not at this movement of his nation; his genius, become entirely passive, kept itself without the current of action that carried away whole races. He witnessed the French revolution in its terrific grandeur; and whilst a world crumbled under its blows—whilst the good and candid spirits of Germany, who had fancied that the birth of another world might come to pass without the labour-pains, were wringing their hands in distress at sight of the crisis—he found in it only the subject of a farce. He saw Napoleon, his glory, and his fall. He saw the reaction of forgotten nationalities—sublime prologue to the grand epic of the people which will one day or the other unfold itself! He remained frigid. He neither learned to estimate men, nor to better them, nor to suffer with them. Save in the beautiful type of Berlichingen; an historical inspiration of his youth, and belonging entirely to the past: the man of thought-action, the man artificer of the future, that Schiller has so divinely sketched in his dramas, has no expression with

* Göethe and his Contemporaries.

Göthe: he has carried something of his nonchalance even into the manner in which his heroes make love. His universe is beautiful, but motionless. On the altar he has erected we certainly behold the choicest flowers, the most exquisite perfumes, the first fruits of nature; but the priest, where is he? In his work of second creation — for it must not be denied that such it was — he went over the vast circle of things visible, but ceased before the seventh day. God withdrew from him before the time, and the existences the poet has evoked run the round of the circle, dumb, uncomplaining, and prayerless, waiting on till the MAN comes to give them a name, and to teach them their destination.*

No, Göthe is not the poet of pantheism; he is a polytheist; in his method as an artist, he is the pagan poet of the modern era. His world is, before all, a world of forms; his heaven, a multiplied Olympus: the Mosaic and Christian heaven is to him veiled. Like the pagans, he splits nature into fractions, and makes divinities of the fragments; like them, he rather adores the sensuous than the ideal: he sees, touches, and hears far more than he feels. And what pains are bestowed on the plastic portion of his art! What attention given, we say not to objects, but to the exterior representation of objects! Has he not somewhere said that "The beautiful† is the result of happy position?" Under this definition is concealed an entire system of poetical materialism, preferred to the culture of the ideal — a whole series of consequences, a rigorous deduction from which drove Göthe to indifference, to the suicide of the noblest faculties of genius. The determined concentration of all the powers of observation on each of the objects to be represented, without relation to the *ensemble*, without a thought on the destination of the object — the determined absence of every impulse likely to influence the manner in which the object might be looked at — became with him the two most effective means of art. Thenceforwards poetry was, in his eyes, no more the rapid stream that divides and fertilises the country, its waters ever breaking in their course; or the flame that with unsteady point ascends to the sky, and dies away in light and heat: it was the peaceful lake, that reflects by turns the neighbouring landscape and the passing clouds, its surface never ruffled by the slightest breeze. Passive calm, and a distinct successiveness of impressions, into each of which he had thrown his whole power; such were the two great characteristics of Göthe. "I leave (said he) the objects that I desire to retain *to act tranquilly upon me;* I then *observe the impression I have received* from them, and I endeavour to render it *faithfully.*" In this well-known expression, Göthe pourtrayed his every feature. He was in his life such as Madame d'Arnim proposed to represent him after his death: — a venerable old man, with a serene and almost radiant countenance, clothed with an antique robe, his hand on a lyre placed on his knees, and listening to the harmony drawn from it by the hand of a genius or the breath of the winds. The last har-

* While expressing our entire sympathy with the general tone and spirit of the high-minded views of our most deservedly admired and esteemed correspondent, we may be permitted to entertain a doubt with reference to his estimate of the *cause* of Göthe's immobility and quiescence to all practical struggles for the good of mankind. We cannot think that because he persisted in remaining calm amidst the storm, he had therefore "no place in his works or in his sympathies, as a poet, for Humanity." His personal character, and his notions of Art, led him to a belief that by the production and influence of Beauty he should create a more extensive and permanently beneficial effect than by taking up a musket, like Fichte, and killing, perhaps, one man, and wounding or putting to flight half a dozen more before he was killed himself. Göthe's quietism must be excessive provocation to all who are ardent onward-workers in this transition state of the world; but future times may see reason to forgive his placid star, that looked so cold and bright upon the troubled waters, and feeling no power in itself to appease them, concentrated its beams upon abstract parts, or sung a hymn to some concrete principle of universal Harmony. — En.

† In the Kunst und Alterthum, we think.

mony wafted his spirit to the east, the country of inactive contemplation. It was time; Europe had become too agitated for him.

Such were Göthe and Byron in their general traits: both great poets—distinguished and approximated, if we may be allowed the expression, by a striking analogy of contrasts—pursuing two independent and opposite paths to arrive at the same point, at a homogeneous conclusion. Life and death, character and poetry, every thing differed in them; and yet the one completes the other. Both are the children of fatality; for it is, especially at the close of epochs, that what has been the law of Providence for generations assumes with respect to individuals the appearance of fatality; and compelled by that, they go on, without knowing it, to work out the accomplishment of a great mission. Göthe contemplates the world in parts, and delivers the impressions that he received one by one just as chance supplies them: Byron looks at it from one single comprehensive point of view, and modifies in his own soul all the impressions that ensue. Göthe successively absorbs his individuality in each of the objects that he aims at portraying; Byron stamps every object with his own individuality. Nature is to Göthe the symphony, to Byron the prelude; she furnishes to the one the matter, to the latter the occasion, for his verse: the one executes, the other obtains his inspiration, and composes. Göthe better expresses *lives;* Byron, *life.* The one is more vast, the other more profound. The first skims the plain in his flight; he just moistens his plumage in the ocean-foam, and loves not to explore its depths; he plays on the surface of the tempest, but never buries himself therein. The second investigates, searches till he reach the root of things; like the true aquatic diver, he plunges boldly into the watery profound, without a thought that he may find there the voracious shark. The first looks every where for the beautiful, he loves harmony and repose; the second, for the grand, and he adores action and force. Characters like those of Coriolanus and Luther disturbed Göthe. We know not if, in his numerous pieces of criticism, he has ever spoken of Dante, but, assuredly, he must have felt for him somewhat of that antipathy felt also by Sir Walter Scott; and if, from respect to art, he placed him in his Pantheon, certes, he threw a veil between the eyes of his soul and the lofty and saddened countenance of the exile who dreamt of the empire of the world for his country, and, through her, of the harmonious development of that world. Byron drew inspiration from Dante; he loved Franklin and Washington; he followed the comet-like career of Napoleon, the greatest genius of action that our time has produced, with all the sympathies of a spirit covetous of the quality: he was indignant—perhaps wrongly so—that he died not in the struggle. Travelling in Italy, that second father-land of all spirits blessed with poetry, these two still pursued a divergent route; the one experienced sensuousness, the other emotion; the first attached himself especially to nature, the second to extinct grandeur, to living wrongs, to the traces of humanity.* And yet throughout these contrasts that we here merely

* Nowhere is the contrast so striking as in a comparison of the sensations of the two poets at Rome. In Göthe's elegies, and particularly in his Travels in Italy, we find the impressions of the artist. Rome he understood not. The eternal synthesis that spreads from the pinnacle of the Capitol and of St. Peter, its circles ever widening, and at each of its manifestations conquering first a nation, then Europe, and at length, perhaps, Humanity, to him was silent; he saw of it but one circle — paganism, the most barren and the least indigenous: or, if he caught a glimpse of it for an instant in the passage, "History is read here far otherwise than in any other place of the universe; elsewhere we read it from without to within; here we fancy we are reading from within to without," he soon falls back and becomes absorbed in external nature. "Whether we halt or advance, we discover a landscape continually renewing itself in a thousand fashions. We have palaces and ruins, gardens and solitudes; the horizon lengthens in the distance, or suddenly contracts; huts and stables, columns and triumphal arches, all are pell-mell, and often so close that all might

enunciate, but which we could well support by extracts from their works, they arrived — Göthe, the poet of individuality in his objective life, at the selfism of indifference — Byron, the poet of individuality in his subjective life, at the selfism (for with regret we say that it is one also) of despair. Double condemnation of the epoch they represented, and came to close!

That was their mission.

They have both — we meddle not with their purely literary merits, great, undenied, and universally acknowledged — the one by the spirit of contest that breathes in all his creations, the other by the spirit of sceptical irony that runs through all his descriptions, and by the independent sovereignty attributed to art over all social existences; they have both powerfully served the cause of intellectual emancipation, and scattered abroad the seeds of spiritual liberty. They have both — the one directly by an implacable war against the vices and absurdities of the privileged classes, indirectly by the nature of his heroes, whom he invests with all the brilliant qualities that constitute the despot, and then dashes to pieces as if in disgust; the other, by the importance attributed to details, by the poetical renovation with which he elevates and embellishes objects the most insignificant, forms the most modest; they have both combated aristocratical notions, and laboured for the development in the world of the sentiment of equality. In exhausting, by their excellence, both forms of the poetry of individuality, they have ended the cycle of its poets, reduced, beforehand, to the subaltern rank of imitators all those who might have persisted in that course; created thence the necessity of a new poetry, and changed to a craving what was only a wish. They have laid an era in the tomb; have wrapped it in a shroud that none can unswathe; and, as if to certify its death to the young generation springing up, the poetry of Göthe has written its history, and the poetry of Byron has engraven its epitaph.

And now, farewell to Göthe! farewell to Byron! farewell to the troubles that oppress and sanctify not — to the poetic flame that illumines without warmth — to the ironical philosophy that analyses without recompounding — to the poetry that, in an age where there is so much to do, teaches us inactive contemplation — to the poetry that would inoculate us with despair in a world where there is so much room for self-devotion! Farewell to all types of power without aim — to all personifications of individuality, solitarily seeking its object and not finding it, feeling the life-blood boiling in its veins, and not knowing how to apply it — to the joys and griefs of selfism, —

> " ——————— Bastards of the soul,
> O'erweening slips of idleness: weeds — no more —
> Self-springing here and there from the rank soil:
> O'erflowings of the lust of that same mind
> Whose proper issue and determinate end,
> When wedded to the love of things divine,
> Is peace, complacency, and happiness." *

---

find room on the same sheet of paper." At Rome, Byron forgot passions, troubles, his own individuality, for the ideal, and gave utterance to this burst of a soul born for devotedness:

> " Oh Rome! my country! city of the soul!
> The orphans of the heart must turn to thee,
> Lone mother of dead empires! and control
> In their shut breasts their petty misery."

When he came to a recollection of himself and his position, it was with a hope for the world (stanza 98.), and a pardon for his enemies. — " My curse shall be forgiveness!" There is in the fourth canto of Childe Harold, and in some stanzas of the third, more of the spirit of her father than could be taught to the daughter of Byron by all the volumes that have been written on him, or than by all that she might hear.

* Ernest, or the Regeneration of Man.

Farewell! a long farewell to the past! The future already dawns to those who know its signs, and to that we owe ourselves entire.

The duality of the middle ages, after having struggled for centuries under the name of the emperor and the pope — after having left its traces and carried its fruits into every branch of intellectual development, has reascended to the sky, its mission accomplished, in the double-pointed meteor of poetry, called BYRON and GÖTHE. The two formulas of life, hitherto distinct, became incarnate, before death, in these two men. Byron is the isolated man, living only his *internal* life: Göthe, still man, but living only his *external* life. Beyond Byron and Göthe — beyond these two incomplete existences — at the point of intersection of these two poetries that aspire to heaven without the power of attaining it, is found another. This will be the poetry of the future and of humanity, and she will bring harmony, life, and oneness.

But because we at this day foresee, and yet very vaguely, the new social poetry that will sing the destination of man, and soothe the suffering soul within him, teaching it to rise to the Deity through Humanity, are we therefore, from the threshold of the epoch where without them we should not be, to speak ill of those men who, coming so many years before us, could do no more than fill with their giant bodies the chasm that kept us all on the other side doubting and trembling? From all time, genius has been made the scapegoat of generations. In all time, men have been found who are pleased to make it a crime to the Chattertons of society that they were not examples of self-devotion, that they were morally or physically suicides, without thinking for an instant whether, during their life, they placed aught else within their reach but destitution and doubt. But we are not of this class, and we feel the necessity of protesting earnestly against those sentiments of reaction inconsiderately raised by some ardent spirits against the mighty-souled, and that soon afterwards serve for a cloak to the grovelling spite of mediocrity. There is something harsh and repulsive, — as it were, ingratitude, — in this destructive instinct that makes us so often forget what *has* been done by the great men who have preceded us, to demand from them an account of what more they *might* have done. Is it believed that the pillow of scepticism is so soft to great intellects that it may be thought these poets sometimes laid their burning brows thereon from selfism? and are we so thoroughly cured of the evil reflected in their verses as to feel the right of inexorably condemning their memory?

Evil was not brought into the world by these poets: it was about, in the air, in that society that now seeks to charge it on them. They saw it, felt it, respired it; they were themselves the first victims: how then was it possible that it should not be reproduced in their verses? Is it not the first characteristic of genius to assimilate to itself the utmost of the life of its time? It is not by deposing Göthe and Byron that we shall destroy what there is still amongst us of sceptical indifference and anarchical despair: it is by making of ourselves believers and organisers. Be such, and fear nothing: — as is the public, so will be the poet. Reverence enthusiasm, self-devotion, the hopes of immortality, virtue, country, and humanity: let your hearts be pure, your intelligences patient and firm; and the genius that should register your aspirations for the future, and carry to heaven on the wings of sacred melody your vows, your thoughts, and your sufferings, will not be wanting. Let these statues remain. What fear you? Do the noble monuments of the feudal times create a desire to return to the condition of serfs? But there are imitators! We know it well; but what influence can they exercise on social life who have no life in themselves? They

enunciate, but which we could well support by extracts from their works, they arrived — Göthe, the poet of individuality in his objective life, at the selfism of indifference — Byron, the poet of individuality in his subjective life, at the selfism (for with regret we say that it is one also) of despair. Double condemnation of the epoch they represented, and came to close!

That was their mission.

They have both — we meddle not with their purely literary merits, great, undenied, and universally acknowledged — the one by the spirit of contest that breathes in all his creations, the other by the spirit of sceptical irony that runs through all his descriptions, and by the independent sovereignty attributed to art over all social existences; they have both powerfully served the cause of intellectual emancipation, and scattered abroad the seeds of spiritual liberty. They have both — the one directly by an implacable war against the vices and absurdities of the privileged classes, indirectly by the nature of his heroes, whom he invests with all the brilliant qualities that constitute the despot, and then dashes to pieces as if in disgust; the other, by the importance attributed to details, by the poetical renovation with which he elevates and embellishes objects the most insignificant, forms the most modest; they have both combated aristocratical notions, and laboured for the development in the world of the sentiment of equality. In exhausting, by their excellence, both forms of the poetry of individuality, they have ended the cycle of its poets, reduced, beforehand, to the subaltern rank of imitators all those who might have persisted in that course; created thence the necessity of a new poetry, and changed to a craving what was only a wish. They have laid an era in the tomb; have wrapped it in a shroud that none can unswathe; and, as if to certify its death to the young generation springing up, the poetry of Göthe has written its history, and the poetry of Byron has engraven its epitaph.

And now, farewell to Göthe! farewell to Byron! farewell to the troubles that oppress and sanctify not — to the poetic flame that illumines without warmth — to the ironical philosophy that analyses without recompounding — to the poetry that, in an age where there is so much to do, teaches us inactive contemplation — to the poetry that would inoculate us with despair in a world where there is so much room for self-devotion! Farewell to all types of power without aim — to all personifications of individuality, solitarily seeking its object and not finding it, feeling the life-blood boiling in its veins, and not knowing how to apply it — to the joys and griefs of selfism, —

> " ——————— Bastards of the soul,
> O'erweening slips of idleness: weeds — no more —
> Self-springing here and there from the rank soil:
> O'erflowings of the lust of that same mind
> Whose proper issue and determinate end,
> When wedded to the love of things divine,
> Is peace, complacency, and happiness." *

---

find room on the same sheet of paper." At Rome, Byron forgot passions, troubles, his own individuality, for the ideal, and gave utterance to this burst of a soul born for devotedness:

> " Oh Rome! my country! city of the soul!
> The orphans of the heart must turn to thee,
> Lone mother of dead empires! and control
> In their shut breasts their petty misery."

When he came to a recollection of himself and his position, it was with a hope for the world (stanza 98.), and a pardon for his enemies. — " My curse shall be forgiveness!" There is in the fourth canto of Childe Harold, and in some stanzas of the third, more of the spirit of her father than could be taught to the daughter of Byron by all the volumes that have been written on him, or than by all that she might hear.

* Ernest, or the Regeneration of Man.

Farewell! a long farewell to the past! The future already dawns to those who know its signs, and to that we owe ourselves entire.

The duality of the middle ages, after having struggled for centuries under the name of the emperor and the pope — after having left its traces and carried its fruits into every branch of intellectual development, has reascended to the sky, its mission accomplished, in the double-pointed meteor of poetry, called BYRON and GÖTHE. The two formulas of life, hitherto distinct, became incarnate, before death, in these two men. Byron is the isolated man, living only his *internal* life: Göthe, still man, but living only his *external* life. Beyond Byron and Göthe — beyond these two incomplete existences — at the point of intersection of these two poetries that aspire to heaven without the power of attaining it, is found another. This will be the poetry of the future and of humanity, and she will bring harmony, life, and oneness.

But because we at this day foresee, and yet very vaguely, the new social poetry that will sing the destination of man, and soothe the suffering soul within him, teaching it to rise to the Deity through Humanity, are we therefore, from the threshold of the epoch where without them we should not be, to speak ill of those men who, coming so many years before us, could do no more than fill with their giant bodies the chasm that kept us all on the other side doubting and trembling? From all time, genius has been made the scapegoat of generations. In all time, men have been found who are pleased to make it a crime to the Chattertons of society that they were not examples of self-devotion, that they were morally or physically suicides, without thinking for an instant whether, during their life, they placed aught else within their reach but destitution and doubt. But we are not of this class, and we feel the necessity of protesting earnestly against those sentiments of reaction inconsiderately raised by some ardent spirits against the mighty-souled, and that soon afterwards serve for a cloak to the grovelling spite of mediocrity. There is something harsh and repulsive, — as it were, ingratitude, — in this destructive instinct that makes us so often forget what *has* been done by the great men who have preceded us, to demand from them an account of what more they *might* have done. Is it believed that the pillow of scepticism is so soft to great intellects that it may be thought these poets sometimes laid their burning brows thereon from selfism? and are we so thoroughly cured of the evil reflected in their verses as to feel the right of inexorably condemning their memory?

Evil was not brought into the world by these poets: it was about, in the air, in that society that now seeks to charge it on them. They saw it, felt it, respired it; they were themselves the first victims: how then was it possible that it should not be reproduced in their verses? Is it not the first characteristic of genius to assimilate to itself the utmost of the life of its time? It is not by deposing Göthe and Byron that we shall destroy what there is still amongst us of sceptical indifference and anarchical despair: it is by making of ourselves believers and organisers. Be such, and fear nothing: — as is the public, so will be the poet. Reverence enthusiasm, self-devotion, the hopes of immortality, virtue, country, and humanity: let your hearts be pure, your intelligences patient and firm; and the genius that should register your aspirations for the future, and carry to heaven on the wings of sacred melody your vows, your thoughts, and your sufferings, will not be wanting. Let these statues remain. What fear you? Do the noble monuments of the feudal times create a desire to return to the condition of serfs? But there are imitators! We know it well; but what influence can they exercise on social life who have no life in themselves? They

will flutter in the vacuum, as long as vacuum there shall be. On the day that something shall take the place of what has just deceased, they will disappear like wandering spirits at the crow of the cock that heralds the coming day. Shall we not then feel ourselves strong enough in belief to respect the great historic figures belonging to an anterior period? Truly, it would be useless to speak of social art — of conceptions widely sympathetic — of the intelligence of Humanity, if we could not raise on our altars other gods without trampling the ancient under foot — if we were not capable of extracting and revering the eternal principle that is in them, without linking ourselves to what they have vicious and imperfect. Let those alone venture to utter the sacred name of Progression who have in their brain intelligence enough to comprehend the past, and in their heart poetical religion enough to respect in it all that it has of greatness. Believers in art, our temple is not a little sectarian chapel, it is a vast Pantheon; and in this Pantheon the glorious images of Göthe and Byron will keep their place and our admiration, long after Göthism and Byronism shall be no more mentioned.

And in this holy reverence that our spirits, purified from all irritation and all fear, will pay to the "mighty dead," we know not if Göthe will obtain a larger share of our admiration as an artist; but we do know, and we hesitate not to declare, that Byron will obtain a larger share of our love, as a man and a poet; — the larger for that our injustice has been, and still is, the greater towards him. Whilst Göthe separated himself from us, and from the summit of his serene Olympus seemed to smile with disdain at our desires, our sufferings, and our griefs, Byron lingered through the world, sad, gloomy, unquiet, bearing the barb — the barb of us all — in the wound, and made not even one effort to draw it thence. It might be said that desires, sufferings, struggles, — he longed to take them all on himself, to relieve us — us, his brothers.* Never did he desert our cause; never was he false to human sympathies. Solitary and unfortunate from his infancy; cruelly wounded in his first love, and still more cruelly in his marriage; attacked and calumniated in his acts and intentions, without inquiry or defence; annoyed by pecuniary difficulties; forced to quit his country — his home — his child; friendless — we have seen it since his death; pursued, on the Continent, by a thousand absurd tales, and by the cold malignity of a world that made even his sorrows a crime, he preserved, in the midst of inevitable reaction, his love for his sister, his Ada, his pity for misfortune, his fidelity to the affections of the years of his childhood and youth, even from his old nurse Mary Gray to Lord Clare. He was generous of his money to those to whom he could be useful, from his literary friends to the wretched libeller Ashe. Impelled by the temper of his mind, by the period in which he lived, by the fatality even of his mission, towards a poetry whose place has now to be filled, towards the incomplete tendency we have sought to characterise, he by no means set himself up as a standard; he presaged the future; he vindicated the prescience of genius, in this definition hitherto misunderstood, and yet the best we know of,—"Poetry is the feeling of a former world and a future;" he always preferred activity for good, to all that *his* art could do. Surrounded with slaves and their oppressors, a traveller in countries where remembrance even seemed extinct, a witness of the progress of the Restoration, and of the triumph of the principles of the Holy Alliance, he never swerved from his courageous opposition; he publicly preserved his faith in the rights of the people, in the final triumph * of liberty, in the duty

* To this, and one or two things which follow, bearing reference to private matters, we are obliged to demur.— Ed.

of devoting body and soul to hasten it whenever the occasion should present itself. The passage following, the very abstract of the law of our present efforts, is from his pen: — "Onwards! it is now the time to act, and what signifies *self*, if a single spark of that which would be worthy of the past can be bequeathed unquenchedly to the future? It is not one man, nor a million, but the *spirit* of liberty which must be spread. The waves which dash upon the shore are, one by one, broken, but yet the *ocean* conquers, nevertheless. It overwhelms the *Armada*, it wears the rock, and, if the Neptunians are to be believed, it has not only destroyed, but made a world." At Naples, in the Romagna, wherever he saw a spark of life stirring, he was ready for exertion or for combat, could it but break into flame. His lay was of splendid ruins, lofty thoughts, and great actions; he stigmatised baseness, hypocrisy, and injustice, whencesoever they sprang. Thus lived Byron — unceasingly tossed between present ill and future hopes — often unequal, sometimes sceptical, but always suffering, even when he seemed to laugh; always loving, even when he cursed.

The "eternal spirit of the chainless mind" never assumed amongst us a more brilliant port. A transformation of that immortal Prometheus whose cry of agony and woe, yet of futurity, rang out at the cradle of the European world, and whose grand and mysterious form, transfigured by time, reappears from age to age, between the entombing of one epoch and the accession of another, to wail forth the lamentation of genius, tormented by a presentiment of things that it will not see realised in its time — Byron, too, had the "firm will" and the "deep sense" — he, too, made of his death a victory." † When he heard a cry of patriotism and liberty arise from the land that he had so much loved and sung in his early youth, he left his harp unstrung, and set forth. Whilst the powers of Christendom were protocolising, if not doing worse, — whilst the nations of Christendom gave alms of a few piles of ball to the Cross struggling with the Crescent, he, the poet and pretended sceptic, went to throw his genius, his fortune, and his life at the feet of the first people that rose, and to mingle in the ranks of her combatants. We know no more beautiful symbol for the destinies of art in our modern times than the death of Byron in Greece. The holy alliance of poetry with the cause of the people — the union, still so rare, of thought with action, the only one that makes complete the human Verb, the only one that will emancipate the world — the grand solidification of men of all nations in the conquest of the rights which God has given to all his children, and in the accomplishment of the mission for which alone they were granted — all that makes our religion and our hope, shines forth gloriously in this image, that we, barbarians as we are, have already forgotten.

England will one day recall to her recollection, we hope, the mission, entirely English, and always overlooked by us, that Byron fulfilled on the

* "Yet, freedom! yet thy banner torn, but flying
Streams like the thunder-storm *against* the wind:
Thy trumpet voice, though broken now and dying,
The loudest still the tempest leaves behind:
The tree hath lost its blossoms, and the rind,
Chopped by the axe, looks rough and little worth,
But the sap lasts — and still the seed we find
Sown deep, even in the bosom of the north,
So shall a better spring less bitter fruit bring forth."

† "——— a firm will and a deep sense,
Which even in torture can descry,
Its own concentred recompense,
Triumphant where it dares defy,
And making death a victory." — PROMETHEUS.

Continent. She will recollect that he led the genius of Britain as on a pilgrimage throughout Europe; that from him, him alone, dates the impulse of the youth of Europe towards the study of English literature, and the sympathy of men of heart towards this land of liberty, whose vocation he worthily represented amongst the oppressed of all countries. She will then comprehend that it is bad, not for the memory of Byron, but for herself, that the foreigner who lands on her shores has still, in the temple that should be a national Pantheon — there where she has found room for the pedant Casaubon — to search in vain for a statue of the poet whom Europe admires, and whose death two nations, Greece and Italy, wept as the death of one of the best of their sons.

For ourselves, in these few pages — brief, but written from the heart — we have endeavoured, as far as was in us, to put criticism on a wider, more impartial, and more useful path than that which seems so generally followed. The voyagers of the fourteenth century relate that they found at Teneriffe a prodigiously lofty tree, whose immense extent of foliage collected all the noxious vapours of the atmosphere, which the branches, on being shaken, discharged in a shower of pure and wholesome water. Genius is the parallel of this tree; and the mission of criticism should be to shake its thick branches. Now-a-days, like the savage, she seems bent on cutting it down to the very root.

"At Vienna it was believed, on the 20th of March, that she remained an hour on her knees, begging mercy of the Queen." — HAMILTON FITZGERALD'S LETTER.

WHERE was the "man" who should such mercy beg,
If guilt, or image of his wrong, were there?
He sits in judgment! — whether on the bench,
His office chair, or in his moral house;
The club-room, billiard-room, horse-mart, or box
Of four-in-hand, or in the jaunty saddle;
And, smiling, plots new treacheries 'gainst the fair.
Believe this, one-eyed courtiers of Vienna!
Guilty or innocent (the Angel of Death
Proving that innocence), a victim see,
Of ignorant man's most selfish vanity!

R. H. H.

ON EXCHANGES AND BANKING.

ADAM SMITH writes as follows on exchanges: — "When for a sum of money paid in England, containing, according to the standard of the English Mint, a certain number of ounces of pure silver, you receive a bill for a sum of money to be paid in France, containing, according to the standard of the French Mint, an equal number of ounces of pure silver, exchange is said to be at par between England and France. When you pay more, you are supposed to give a premium; and exchange is said to be against England, and in favour of France. When you pay less, you are supposed to get a premium; and exchange is said to be against France, and in favour of England."

This is a perfectly intelligible account of the terms "favourable" or "unfavourable" exchange. These terms, however, in the extract from Adam Smith, apply only to *an adjustment in the exchange of pure silver.* When applied as they are in Parliament, by Mr. Palmer and Mr. Loyd, by merchants on the Royal Exchange, and by all the newspapers, to exchanges generally, the terms become quite erroneous; since what is termed an unfavourable exchange, is favourable to the exporter of *merchandise.* Now, it is certain that the exports of Britain greatly exceed the imports in value. They have been as 3 to 2; but the exact ratio of excess is unimportant; the fact of excess in any degree is sufficient. So long as it exists *a low exchange, or what is termed an unfavourable exchange, is beneficial to the country at large.*

Let us suppose a case in illustration. British goods to the amount of 20,000 francs are sold in France, for which the seller in France is desired to remit in English money to the exporter in England. Let us suppose this transaction to take place at a time when the exchange is said to be *unfavourable* between France and England, being twenty-four francs to the pound sterling. The seller remits to England 20,000 francs divided by twenty-four francs, or 833*l.* 6*s.* 8*d.*

Another transaction at a different period takes place between the two parties. Times are now said to be better. "The exchanges get in our favour;" say twenty-six francs to the pound sterling. The seller now remits to England 20,000 francs divided by twenty-six francs, or 769*l.* 4*s.* 7*d.* Loss by exchanges "turning in our favour" 64*l.* 2*s.* 1*d.*

The truth is, these terms, "favourable" and "unfavourable" exchange, which have got into general use, relate solely to the state of bullion or coin in the coffers of the Bank of England, which bullion or coin is increased by a high exchange, therefore called "favourable," and diminished by a low exchange (which encourages the exportation of the precious metals as of every thing else), therefore called "unfavourable." It is scarcely necessary to say more to prove that the adoption of any system in the currency ought not to be rejected merely because it will or may "turn the exchanges against this country." Get foreign countries in your debt, and leave the exchanges to shift for themselves.

In both Mr. Palmer's and Mr. Loyd's pamphlets the general reader finds difficulty and obscurity, in consequence of their employing the terms (as applied to the Bank of England) "securities," "liabilities," and "deposits," to which Mr. Palmer adds "assets." The question would be simplified if the Bank employed only the terms CIRCULATION, viz. their notes out, to be met by bullion or coin in their coffers, and SECURITIES, viz. bills dis-

counted. Government securities, in our opinion, they ought not to be permitted to purchase. Deposits are none of these, but should be in the Bank of England as in the Bank of France — viz., property of any kind deposited in the Bank of England as a place of security, to be restored on demand in the shape in which it was deposited to the party depositing, and for which accommodation the Bank should charge a certain per-centage.

Both Mr. Palmer and Mr. Loyd seem to consider trade as depending on banking, not banking on trade. Banking is the servant of trade; it exists solely to facilitate trade. But, in the opinion of these gentlemen, to manage the currency is the great object of banking, and it will be found not much unlike the desire of the countryman to be intrusted with the management of the weather. The chief, if not the only, use of a currency, be it paper or metallic, or both, is to facilitate the exchange of one commodity for another — to render unnecessary the intolerable grievance of barter. This is the origin, and this the object of money, of whatever kind, and of its machinery — banking; and whenever this, the true object of either, or both, is lost sight of, the subject becomes embarrassed and unintelligible.

Let it be observed, by the way, that "under the management of the currency" by the Bank of England, the interest, that is the value of money, varied from 2½ to 4 per cent. in the course of three years ending in 1833 (see Mr. Palmer's pamphlet, pages 6. and 7.), and that, under the same management, the interest is now, in 1839, 6 per cent.

Mr. Loyd's distinction between the Bank of England as a manager of the circulation, and as a body performing the ordinary functions of a banking concern, has been received, I believe, with general approbation. He says, "As a manager of the currency, it is undoubtedly a sound rule by which to guide itself, that against the amount of notes out it shall hold at its disposal securities and specie; that the amount of the securities shall be invariable; and that, consequently, all fluctuations in the amount of notes out shall be met by a corresponding fluctuation in the amount of specie in deposit. Thus the public, and not the Bank, will be made the regulators of the amount of the circulation, and that amount will, by this principle, be made to fluctuate precisely as it would have fluctuated had the currency been purely metallic.

"For the regulation of the conduct of the Bank as a manager of the currency, this rule is perfectly unobjectionable, and rests, indeed, upon the soundest principles." It is painful to object to a theory so well expressed. Mr. Loyd goes on to say, "But when the same rule is farther applied to the regulation of its conduct as a banking concern, it is necessarily found to be wholly impracticable. * * * * It is, therefore, quite absurd to talk of the Bank in its character of a banking concern keeping the amount of its securities invariable, — the reverse must necessarily be the case." If I mistake not, however, this distinction seems lost sight of when Mr. Loyd (paragraph 9.) says, —

"A bank of issue is intrusted with the creation of the circulating medium.

"A bank of deposit and discount is concerned only with the use, distribution, or application of that circulating medium.

"*The sole duty of the former is to take efficient means for issuing its paper money upon good security, and regulating the amount of it by one fixed rule.*

"The principal object and business of the latter is to obtain the command of as large a proportion as possible of the existing circulating medium, and to distribute it in such manner as shall combine security for repayment with the highest rate of profit."

Now it appears that the duty of the bank of issue is here mixed with the duty of a bank of discount; unless it be denied that "among other efficient

means for issuing its paper upon good security" is that of discounting bills. But it is required by Mr. Loyd that the amount of securities should be fixed; consequently, if bills discounted and not due are part, and probably the chief part, of these securities, a certain amount, and no more, should be vested in them.

Now, suppose the necessaries of life to rise 200 per cent.; suppose, for instance, wheat to rise from 50*s.* to 5*l.* per quarter, or more, as we have frequently seen, is the same quantity of circulating medium that would be sufficient to represent it at 50*s.* sufficient to represent it at 5*l.*? If the circulation were purely metallic, would the same quantity of gold or silver suffice in both cases? Certainly not. The dormant capital of the country must be called into action; the deposits at the Bank of England would be demanded; the balances of the private bankers would be drawn out; and if all these were not sufficient, a sort of currency would be introduced which would be far from desirable (unless by the Chartists), and not at all under the control of the Bank of England.

The condition that the amount of securities should be fixed, which is insisted upon, seems very questionable; but let the condition be conceded, by whom then shall these securities (bills for discount) be offered to the Bank of England? By banks of deposit and discount, says Mr. Loyd; for so we understand him. Why may not the merchant offer the *same securities* to the Bank of England? Because, says, or rather infers, Mr. Loyd, all such securities are to be offered to the Bank of England through the medium of the private banker; *and thus the Bank of England will not be exposed to the perils of complying with the pressing calls of the trader.* But be it observed, at the same time, that upon this plan the merchant is made to depend upon the private banker to negotiate with the Bank of England, when he would rather be, as he ought to be, at liberty to enter into direct negotiation with the Bank of England, himself.

The term deposit, as applied to the Bank of England, is objectionable, if used in the same sense in which it is understood by private bankers. Deposits in the Bank of England need not and ought not to be used. The private banker, on the contrary, gains by using his deposits, and the more he discreetly uses them the more he gains. This is a palpable distinction between a bank of issue and a bank of deposit and discount.

It is insisted upon that the Bank of England should contract its issues "in strict and undeviating conformity" with the diminution of its specie in deposit, and that it should increase its issues in proportion to the increase of its specie. The Bank being constantly a buyer of bullion, it is necessary that it should circulate paper for the amount of those purchases which it thus hinders going into circulation.

This last operation seems reasonable; but the former, viz. the contracting of the circulation in consequence of a diminution of specie in deposit, is a questionable proceeding. The specie withdrawn from the coffers of the Bank goes, say the advocates of the measure, into circulation; therefore, a reduction of bank notes equal to the specie so withdrawn, and said to circulate, should take place. But in point of fact the specie so withdrawn does *not* go into circulation; it goes abroad. The quantity of circulating medium is thus reduced by the Bank contracting its issue; money, as the phrase is, gets scarce, and the trader is distressed.

All this complicated policy seems to arise from the Bank being constant purchasers of bullion. Mr. Loyd in his second pamphlet, "Further Reflections, &c.," seems somewhat embarrassed by this operation of the Bank. And *why* should the Bank be a constant purchaser of bullion to be locked up in

its coffers, and consequently not immediately entering into the circulation? For whose benefit is this proceeding? It can give no security or confidence to the public in the stability of the Bank, for as its hoards increase its notes or liabilities increase also. When a demand comes for gold to send abroad, the exporter knows immediately where to find it, viz. at the Bank: the Bank, on the other hand, fears that its treasure will be exhausted; few or no discounts can be given to the trader; a panic ensues, and multitudes are ruined.

It is not intended on the present occasion to advocate a paper currency; but no one will at this time of day assert that a currency purely metallic can be, or ought to be, restored. Our currency is necessarily mixed: paper comes in aid of gold and silver; but to base paper on those metals is a palpable fiction, of which no greater proof can be, or need be, adduced than the statements of the Bank itself exhibiting the amount of paper in circulation and the amount of gold in deposit. For instance: in March 1837, the amount of the circulation was 18,178,000*l.*, while the amount of bullion was only 4,048,000*l.*

The great problem, and much will he deserve who shall solve it, is to discover a currency, the possessor of which cannot fear or suffer loss; that shall relieve the trading world from such destructive fluctuations in the interest of money, and in its plenty and scarcity. Such in a great measure is the currency of Scotland, based on property which exceeds the notes in circulation an hundred fold. The banks in Scotland are banks of issue as well as banks of deposit and discount; a fact which renders the soundness of Mr. Loyd's distinction between the two very questionable.

To conclude. No intention has here been entertained to analyse Mr. Palmer's statements or Mr. Loyd's searching replies; but rather to give publicity to a few long-digested opinions, revived, not occasioned by, these pamphlets, with a view to invite inquiry on topics of vital importance to the commercial world.

THE SPANISH THEATRE.

Tesoro del Teatro Espanol. Obras escogidas de Calderon. Por Eugenio Ochoa. Paris: 1839.

Origen del Teatro, Español de D. Nicolas Moratin. Nueva Edicion. Paris: 1839.

Ensayo sobre el Drama Español de Martinez de la Rosa. 1838.

Calderon's Schauspiele ubersezt von Gries und Schlegel. Vien. London: Senior, Pall Mall. 1839.

It has long been matter of surprise that the masterpieces of one of the great dramatic writers of modern Europe should have so long remained totally unknown to the bulk of English readers. Frequent as are the essays of journalists upon the characteristics of the Spanish drama, and numerous as are the translations and adaptations upon our stage, of French and German pieces, we believe we may correctly assert, that English literature does not possess a single version of a Spanish play from beginning to end executed in the forms and spirit of the lyrical original. The cause of this may be as much the difficulty of rendering into the vernacular the intricate

measures, as the proverbs, puns, jokes, conceits, and hyperbolical flights of Calderon. It is impossible to assign too much praise to the translations of Gries and Schlegel, or to admire sufficiently the elegant facility with which each shade and peculiarity of the master is rendered with a fidelity which, like the German versions of Shakspeare, is absolutely marvellous. Persuaded of this difficulty, and, at the same time, of the impossibility of creating an interest in these works, unless the task be accomplished, we abstain from dealing in philosophical criticism or general characteristics, and address ourselves exclusively to the infinitely more laborious task of laying before our readers the means of judging for themselves, and drawing their own conclusions. At a period when dramatic literature is turning on all sides in search of a new inspiration, or a new picture of manners and morals, it may not be uninteresting to indicate to the student in this collection of Señor Ochoa's the sources of a species at once novel and beautiful, clothed in a form which the popularity of the lyrical drama shows to be agreeable to the general taste, and which, indeed, in the musical languages of Spain and Italy, is a natural adjunct of a work which ought to unite in itself, according to the best critics, the flower of poetry, painting, and music. We do not anticipate that an English audience, like a German one, would endure to listen to a rhymed lyrical play any more than they would to rhymed heroical verses, but as dramatic poems, we see no objection to them exactly as they were written by their author. Calderon's plays, and those of all the Spanish dramatic writers, are divided into three distinct species — the comedy of every-day life, the heroic comedy, and the religious drama. Every reader knows the characteristics of the common Spanish comedy of intrigue; its salient features have been preserved traditionally on every stage of Europe; its intrigue, courtesy, point of honour, and bombast: its elegant form and poetry alone have escaped imitation, by reason of the difficulty of equalling or excelling them. In the heroic comedies, the same traits are manifested, with the addition of more improbable events and historical fables or anachronisms, coupled with a spice of humour, character, and gaiety, which show the poet at his ease amidst his air-drawn creations, and from which we suspect, notwithstanding the neglect of character with which Spanish dramatists are charged, our own Elizabethan school derived many of their conceptions. In Calderon's *Conde Lucanor*, for example, the characters of two fops, amatory and military, are contrasted with a *preux chevalier*, in very entertaining verses, sketched with a light and airy pencil, and, as it is one of the most characteristic of its tribe, we select it as a specimen. In order to its better comprehension, it is necessary to inform the reader, that the scene takes place in the cave of the sorceress Irifela, whom Federigo, Duke of Tuscany, captive to the sultan of Egypt, invokes to conjure up the suitors of his absent daughter.

Irifela. What three are these whom you would fain behold?
Federigo. Show me the two! I know the other well.
Irifela. Their names?
Federigo. Are Casimiro, Prince of Hungary,
And the young Astolfo, Russia's lord.
Irifela. Approach, and view their persons through the gloom,
And listen how each one employs his time.
[*Within, on one side, sound of trumpets and drums; on the other, soft music.*
Voices within.] O, war, thou scourge! To arms! To arms!
Within, Astolfo and Casimiro.
Astolfo. Let all sound horror and alarms!

Casimiro. Sing, and let all be peace and love,
All shapes that in this garden move! [*Music.*
Like groves, where still blithe song doth flow,
When odorous flowers in spring-time blow! [*Instruments sound again.*
Irifela. What see'st thou?
Federigo. I behold a city stormed,
Wherein no living creature 'scapes the wrath
Of a fierce youth.
Sultan. And I a garden view,
Enamelled o'er with flowers of various dyes;
And there, a fair boy, in a myrtle bower
Retired, sits smoothing down his silken hair.
Federigo. That to his conquering troops exclaims—
Voices.
War! War!
Astolfo. To arms! To arms! Let all be overthrown!
Sultan. And this——
Casimiro. O sing; and, in your languid strain,
Let birds, and flowers, and leaves, and all things move [*Music within.*
To love, only to love!
Irifela. Now, ye have gazed on both. [*Covers the mirror.*
Federigo. Stay, cover not
So soon the magic mirror, till we view
Something of their achievements and their minds.
Irifela. Therefore, that ye may nearer see their forms,
Another phantom figure I will show;
And thus to young Prince Casimiro listen.

Enter Casimiro, dressed in the Hungarian manner, viewing himself in a mirror, which a page bears. Musicians discovered singing

Casimiro. But with regard to my design,
Touching the motto and the song. [*Music.*
Ah! fond hope, still lingering, vain;
How long wilt thou increase my sorrow?
Hiding still the present pain,
Hoping still the cure to-morrow!
Casimiro. Yes! the hope that song creates
Well defines my heart's desire;
Since, while I view the days expire,
Fate my bliss procrastinates.
To-morrow and to-morrow's wane
Still usher in to-morrow's pain,
And nought my passion's tyranny
Decreases, but still stores for me,

He and Music. Ah! fond hope, still lingering vain!
[*Passing to and fro, admiring himself, at each turn, in the mirror, and arranging his locks.*

Casimiro. Rosimunda fair, I love
Since first I saw the pictured glance
Of her matchless countenance.
He who seeks her worth to prove,
A portion of her charms must borrow:
If I, in presence of the maid,
As faultless look, as here portrayed,
I scarce can find her frown severe;
And thus with useless doubt, I fear,
He and Music. How long wilt thou increase my sorrow!
Casimiro. For it is plain that love secures
The first election mine; because,
In love, proud beauty ever was
The card that first of all allures;
And then, when in its rigour, I
Yield all my soul, love's strength to chain;
Since they alone deserve who sigh——
He and Music. Hiding still the present pain
Casimiro. Yet, tho' I may her scorn inherit,
Still will I love, tho' fate may choose

That I may her bright beauty lose
(Tho' not the less her favour merit).
Thinking then, 'midst her disdain,
Whose is the loss, and whose the gain,
I'll comfort take, and soothe my sorrow,
Smiling at my former pain ——
He and Music. Nor hoping for the cure to-morrow!
[*They turn to depart in the order in which they entered, repeating the motto.*
Ah! fond hope, still lingering vain,
How long wilt thou increase my sorrow,
Hiding still the present pain,
Hoping still the cure to-morrow?
Sultan. This is vain, affected.
Federigo. His presumption
Disgusts me; for, though beauty in a man
Be an adornment, yet is it no merit.
But now proceed, and let the action tell
Regarding young Astolfo, Russia's lord.

Enter Astolfo, clothed in the Polish dress, armed with a sword and buckler, combating with citizens, who retire before him.

All. O war! thou ruthless scourge! to arms! to arms!
Astolfo. Let the affrighted orb resound with dire alarms!
Our conquered foes in vain for mercy strive!
Let not a man our onset fierce survive! —
Glory is not for me if victory's crown
Circle my brows for bloodless triumphs won.
All. Pity, great lord!
Astolfo. Ho, villains! This from me?
What mercy more than by these hands to die?
Fly! for a foe's rebellion to repay: [*All fly.*
This mercy 's mild — more would be thrown away!
Now, fire the city, 'till with blood the plain
Flows in empurpled torrents towards the main!
So that the quenchless dropsy of my rage
May, in that tide, its cruel thirst assuage,
And drown in oceans there.
O Rosimunda, fair!
Who, that he might in thy pale presence stand,
Would change the haughty pride of high command,
The stormy joy, the trembling hope, that wait the victor band

Enters with his troop, and trumpets sound again.

Sultan. Why, this is proud!
Federigo. And well I know his mind,
Since, to their prayers, a deaf ear he inclined;
And happy is the crown alone whose king
In war o'ercomes his foes, yet pardons, co nquering.
Irifela. Now ye have seen the two that you desired.
Federigo. And for one's softness, and the other's pride,
My choice rejects them both.
Sultan. Pass to the third.
Federigo. Nay, that were useless; for already I
Have some small knowledge of his dignity.
Sultan. And who is he? for now your doubts and care
Awake my interest.
Federigo. 'T is Count Lucanor,
A youth of fortune, whom my blood ennobles,
But whose condition and misfortunes shame it.
He was my soldiers' general, and, in war,
Many and noble victories obtained;
And, failing now the school of Mars, devotes
His time and study to Apollo's school,
Displaying with the falchion and the pen
The graces of a most accomplished mind.
But has no other heritage to boast
Than being my kinsman.
Sultan. Him, too, I must see.

Irifela. Then hear that which within a wood occurred
To Rosimunda's chase.
All. Beware the lion!
Enter Rosimunda, alarmed; Lucanor after her.
Rosimunda. Will no one, then, to my succour fly?
Clori! Estella! Sirene! haste,
See you me not by the monster chased?
Lucanor. Ah, lady! yes there is one to die
In thy defence the foremost; then turn,
And, while he draws near, in safety retire.
Fear not, Señora! he cometh no nigher.
Rosimunda. I tremble, lest fear my frame o'erturn.
[*Stumbles, and leaves a shoe on the stage.*
Federigo. Ah! she 's in danger. I die to behold!
Lucanor. But my envious stars this favour withhold —
Nor permit me to die for the beauty I love:
For the beast, in his fury, now towards the grove
Once more his last footsteps retraces.
Enter Pasquin.
Pasquin. Señor!
Lucanor. Whither go you so fast? Stay, sirrah, Pasquin!
Pasquin. And the wild beast?
Lucanor. E'en now, midst the bushes our foe
With furious speed hastens towards his den.
Pasquin. Not lions alone to turn tail will begin
Now-a-days.
Lucanor. Sirrah! mean you your folly to show?
Pasquin. No folly, I say, or impertinence, for
As I am a sinner, 't is even just so.
Lucanor. Then who is the coward — the wild savage?
Pasquin. No!
'T is just her young cousin, the Count Lucanor.
Lucanor. That fortune the bliss that I seek should debar!
Nor give me of that happy cup to partake!
O fair Rosimunda! to die for thy sake!
More cruel than lions, thou envious star!
Pasquin. Why didst thou not somewhat of this to her break,
And tell her the tale of thy heart-losing; or
Is thy star more thy duchess than Rosa, señor?
That one, not the other, forbids thee to speak.
Lucanor. 'T is the beauty which I saw,
And, seeing, became blind with error.
Weak ambition, which the awe
Of her presence bound in terror.
Had I the world's sovereignty
At her feet with pride to lay,
Or had the power to essay
Federigo, her sire, to free ——
Federigo. Hear I this?
Lucanor. Then would I tell
My tale of love; but, can I soar
(His poor esquire, and no more)
So highly that I should excel
In rivalry with princes? No!
Poverty and love betray
Great arrogance, or they display
Small prudence; but what glitters so?
Pasquin. A slipper 't is!
Lucanor. Now, Pasquin, hold!
I must not, dare not.
Pasquin. Why? 't is gold
Which dazzles and which shines so bright,
With a thousand sparkling rays —
'T is the brilliant diamond's blaze,
Or golden fringe, that meets my sight.
When sold, I think I may expect
For nakedness a remedy.

Lucanor. I may not but with gallantry
Handle this, and deep respect.
[*Takes out a handkerchief, casts a knot on it, and raises the shoe.*
Come Pasquin! to the miniature
A noble cover I have found.
This, than I, better will expound
The meaning that I would assure.
Pasquin. But, whether it have that effect
Or not, 't were better, in my mind,
To sell the slipper that we find,
With the most profound respect. [*Exeunt.*
Federigo. Now you have seen if with my first description
Agrees his person.
Sultan. Yes, Federigo!
And were I to make choice among the shadows,
This were the man.
Federigo. Your reasons, pray you, sir?
Sultan. That, still withholding, for decorum's sake,
He does not yet withhold himself from danger,
Because he, with the passion most refined,
Loves, and still feels with sensibility;
That, with a manly courage, he aspires,
Yet still is conscious of his own demerit;
Because he knows his star, and, in his pain,
With hope dissembles.
Federigo. Strange!
Sultan. Why dost thou marvel?
Federigo. That 't is——
Sultan. Proceed: what troubles you?
Federigo. The counsel
Of my worst foe, and yet, that I adopt it.
Irifela. Night's gloomy mantle falls:—before you leave
The cover of this solitary hut,
To quicken your false memory, these shades,
United, shall once more their song repeat.
[*This to be sung and acted in concert, trumpets, flutes, and drums sounding incessantly, till the scene closes, taking care that, whether heard or not, all must end at the same moment.*
Voices. O war, thou scourge! To arms! to arms!
Astolfo. Let the hoarse trumpet sound alarms!
Casimiro. O sing! and see ye murmur love,
All shapes that in this garden move!
Music. Like groves, where still blithe song doth flow,
When odorous flowers in spring-time blow!
Rosimunda. Estella! Sirene! hasten, or I,
In your defence, the foremost shall die!
Sultan. To prison, and there to your questions reply.
Federigo. A man, 't is the noblest, first to provide,
And, last of all, beauty of person and pride. [*Exeunt.*

It is to events more than to physical accidents of climate or situation that Spanish poetry is indebted for its particular type or form. The Peninsula contained an aggregate body of men scarcely sufficient to merit the name of a nation, when it was engaged in one of the longest and bloodiest contests of which the annals of any people make mention. Powerful and grasping conquerors assembled from the extremity of Africa to invade Spain, and laid the foundations of a brilliant and lasting empire. The whole kingdom was bowed beneath their yoke. The standard of Mahomet already floated from the shores of the Mediterranean to the banks of the Bidassoa, when a handful of men who had taken refuge in the mountains of Asturias conceived the idea of delivering their country from the yoke of strangers, and began a career of exploits which was continued for nearly six centuries, and terminated by the expulsion of the oppressors. That war had a particular character which necessarily exercised its influence upon the whole

nation, for the whole nation took part in it. It was carried on against a distant people whose manners, customs, language and dress differed essentially from those of all other nations then known. The contests were partial, and took place at different periods, according to circumstances; sometimes in one province, sometimes in another; one day against formidable armies, at another against detached parties. The war was pursued without any diplomatic view, and, without the aid of any government, through the sheer force of opinion and patriotism, and above all through a spirit of religion. It is this latter feature which historians have not sufficiently observed, and to which they have not attached all the importance that is due to it. Hence comes that religious colouring which, during so many ages, has been spread over the character, institutions, manners, and entire existence of the Spaniards. Among all Catholic nations there is no one which has followed a system of fanaticism and persecution so decided, general, and violent as Spain, from the days of Pelayo to our own day; because no other European people have been formed and matured in the midst of religious wars; because those wars which devastated other countries have only been occasional and transient, whilst in Spain they formed the basis of social instruction, the atmosphere in which the political body was nourished and developed; it is, in short, because Spain has always identified the country with religion, and because the enemies she has had to contend with have always been as dangerous for the one as the other. Hence those fantastic devotions which at first were only so many different manners of imploring the protection of heaven against their enemies — hence that blind respect for the ministers of religion, whose cause was mixed up with that of the national interests — hence that ferocious disposition, so favourable to the establishment of the Inquisition, which was considered as an instrument of war, or a species of hostility against the common enemy. Such were the muses which inspired the first accents of the Castilian lyre, and to the influence of which they owed their origin and strength. It is to these sources that we must attribute the ineffaceable character of the Spanish poetry: firstly, its heroic and romantic tone; secondly, its superfluity of images; and, lastly, its eminently religious spirit. The oldest compositions which deserve the name of poetry are all the products of these causes. Such are the celebrated romances and ballads which are so greatly admired for the elevation of the thoughts and the force of the sentiments. And let us not reject contemptuously these imperfect essays. They have supplied the silence of history, and saved from oblivion illustrious names and deeds worthy of admiration and gratitude. The ballads form the chronicle of those stormy times when every man was a soldier, when no one had either the leisure or instruction necessary to hand down his historical reminiscences to posterity. All that we know at present of the famous Cid, one of the greatest warriors who ever figured on the world's stage, has been preserved to us only by means of the ballads which were composed and sung in his time, of which Herder has made the beautiful translation recently published with such elegant illustrations. The same may be said of an infinite number of other heroes. Monuments like these are much less equivocal than statues and historical praises. Enthusiasm may have enlarged objects, but the praise at least has not been poisoned by flattery. In the Spanish character there exists a disposition particularly favourable to that species of poetry, the noblest of all, if we merely consider in it the interest of truth and the original beauties of the human mind. The Spaniard is by nature a poet; but he does not, like the Frenchman, give voice to his feelings amidst the gaiety of festivals or

banquets. He sings when he is solitary, or when he is animated by some strong passion, or induced by that vague and pleasing melancholy which is inspired by religious impressions and the serene nights of a beautiful climate. Even this disposition may be merely a moral languor, the necessary result of that warmth, and the absence of all mental excitement. When the reason is not provided with all the materials which it requires, its power is naturally directed towards the dreams of the fancy. The Spaniard, full of spirit and fire, dreams rather than reflects, and sings instead of converses. Actual existence affects him but slightly. His carelessness and sobriety serve him instead of philosophy; he does not live amidst the realities which surround him, but amidst the dreams of his fancy. Perhaps there does not exist a single remarkable event in the annals of Spain, from Pelayo to Mina, which does not furnish a proof of this characteristic trait of national genius. It is thus that the ballad multiplied and became the support of public spirit, and the traditional history of men, places, and events.

This period ended on the destruction of the empire of the Arabs. The ballad, like the swan about to die, then uttered its most harmonious accents. In fact, all the most beautiful Spanish ballads, in regard to poetical imagery and style, are those in which the conquest of Grenada, the civil wars of the Moors, and the virtues and magnanimity of Isabella, are celebrated. That celebrated woman united upon her brows all the crowns of the Peninsula; and from that moment Spain became a state, and ceased to be poetical.

Garcilasso de la Vega, one of the most famous captains of those heroic times, marched to the wars in Italy, and returned from that country with his head full of poetical innovations. He introduced the endecasyllabic verse; the taste for *canzone;* the affectation of sentiment, and that ingenious verbiage which makes Italian poetry a kind of music agreeable to the ear, but void of sentiment, nature, and reason. Peace had given leisure for mental cultivation. Garcilasso's novelties spread with astonishing rapidity. The simplicity of the ancient poetry was regarded as vulgarity of style.

The bad taste which reigned in other departments of literature served to increase and develope these seeds of corruption. The Latin language, which was spoken in the schools, communicated to poetry barbarous phrases, forced constructions, and false ornaments. On the other hand, the pomp and etiquette which Charles V. established at his court, and in the national manners, imparted to the language, and above all to its poetical expression, that turn of conceited phraseology, that spirit of exaggeration, and taste for the monstrous and gigantic, with which all civilised nations have reproached the Spaniards, as a caricature which degenerates into the ridiculous. Scholastic disputes, abuse of the syllogism, and Aristotelian jargon, passed from the schools into Parnassus, and poetry became pedantic and unintelligible. Lastly, devotion ceased to be tender, reflective, and sincere, to become argumentative and ascetic; and sacred poetry was overcharged with those affected circumlocutions which deprived it of its finest essence. Such was the general state of Spanish poetry under the reigns of Charles V. and the three first Philips. The Spaniards wrote a great deal in verse, because they did not know what subject to treat in prose. They were what the slaves of absolute power are every where — grown-up children, who are forbidden to meddle with things of value, but allowed to amuse themselves with trifles. This poetical activity, however, gave rise to distinguished talents, which, perfecting themselves by the study of the ancient classics, wrote with taste, purity, and moderation. Many names figure honourably in this career. They form a brilliant constellation, which modern Spaniards

quote with pride, and designate under the general denomination of the golden age of their literature.

In speaking of this small number of distinguished writers, we cannot refuse the first place to the sublime Luis de Leon. The perusal of his exquisite works can alone afford us any consolation for the loss which Spanish poetry suffered at the moment when foreign innovations deprived it of its natural beauties: it is in them that we learn to feel how capable the Castilian language is of expressing whatever is most profound in the meditations of philosophy, most touching in religious sentiments, and most noble in lyrical inspirations. Full of the classic beauties of Homer and Horace, still more deeply penetrated with the grandeur of imagery and mystic unction of the Bible, nurtured in the study of the best authors of preceding ages, and versed in the oriental languages, Leon has managed the Spanish poetry like a prism, to reflect the brilliant creations of his fancy and the treasures with which he had stored his mind. His translations of Horace, Job, and David, are models of perfection. He has preserved the original colours of his prototypes in all their original purity. He has developed in the Spanish language the facility with which it accommodates itself to all the harmonious combinations of which the organ of speech is susceptible. He bestowed roundness on its periods, variety to its rhythm, and ease to its inversions. This purely mechanical labour is, however, concealed in his works under the appearance of the most natural simplicity. It is not a painful arrangement of words and syllables,—it is like the creation of a new idiom.

In his original pieces he exhibits all the elevation of his genius, the grandeur of his thoughts and the sensibility of his soul. Nothing is more simple or majestic than his "Prophecy of the Tagus." The genius of that river arises from the waters to predict to King Roderic, who reposes on its banks in the arms of his Cava, the misfortunes which are on the point of bursting upon Spain by reason of his insane passion. He paints to him the legions of Africa, profiting by his lethargy to overwhelm the kingdom. Already he beholds the cities in flames, their virgins violated, their temples profaned, and the rivers bearing to the sea the bleeding bodies of the Spanish warriors. Finally, he terminates his terrible imprecation by the prophecy of the long slavery which his beloved country is about to suffer. In this admirable composition every word bears the impression of that sacred fire,—*qui vatum pectora nutrit.* His anger is terrific, but noble and majestic; his language pure as the waters of the river he personifies. The style of this fine poem may be compared to the awful calm of the ocean at the moment that precedes the tempest which is to swallow its thousand victims.

In the magnificent ode, entitled "Noche Serena," it is no longer the indignant prophet that speaks,—it is the contemplative philosopher pouring out his soul in a transparent and perfumed atmosphere; allowing his imagination to wander among the stars that gild the firmament, and feeling himself transported by an irresistible power to the gates of the sanctuary of the God he adores.

Leon had many imitators, but no rivals. Whilst the poets of his time busied themselves in flowery groves, or sang the torments of love, the rivalries of shepherds, the praises of kings, or the miracles of saints, his flight, like that of the bold eagle, bore him into regions more elevated. He penetrated into the mysteries of contemplation—disdaining whatever pleased but did not elevate, whatever amused the ear without enriching the mind. Pastoral poetry was of this species. It is not in the

bucolics of cardinals, counts, and marquises, sighing for their *patita*, and hiding their vain compliments under rustic verbiage, that we find real sentiments and ardent passions; but all that is nature and truth, under whatever form it be, is banished from the abode of despots and the cave of persecuting fanaticism.

After an Austrian family had seated itself upon the throne of Castile, the fear of offending the idol, the mania of hyperbolical and oriental affectation, the desire of pleasing a foreign king by affecting foreign manners, were the sources which corrupted taste in all the arts, and morals in all classes of society. The last Philip of the house of Augsburgh was a poet, and poetry became a national fever or universal contagion. It was the only means by which men could obtain place or fame. Every one wrote verse; and, amidst this deluge of compositions, classical beauties were totally lost sight of, and they remembered no longer that poetry is an art of which the beautiful is the model. In the midst of this universal profanation, one grieves to see placed a man of such genius as Lope de Vega, whom nature had gifted with such an astonishing versatility of talent. He possessed a great knowledge of the human heart, as well as of the rules of art; and whilst he spurned so contemptuously those sage laws, he explained them in a didactic poem, declaring at the same time that he despised the rules, though he well knew the use of them, — that he wrote merely to please the public; and that, as it was the public who paid him, he was obliged to speak to it according to its taste. Thus in writing he proposed to himself neither to improve his art, nor to acquire reputation, but simply to please and amuse. Many of his innumerable comedies were composed, learnt, and repeated within the space of twenty-four hours. One may judge of the dignity of the muse at this period, and of the glory which could be acquired by such means. More than forty writers of his school laboured at the same time with himself. Thus there is not a mythological fable, an historical fact, or a miracle in the lives of the saints, which has not been formed into a play by these dramatic workmen. Lope de Vega, however, must be admired for his admirably managed plans, his carefully drawn characters, his theatrical situations, and a style sparkling with wit.

Spanish genius was next doomed to traverse, in its poetical career, not only vulgar and ignoble paths, but the precipices of extravagance and the labyrinths of obscurity. A writer, who had deservedly acquired reputation by his romances full of charm and sentiment, and by satires remarkable for their justice and elegance, ashamed to speak in the language of other poets, invented a peculiar idiom, the whole merit of which consisted in clothing the simplest ideas in the most unintelligible phrases. This man was Gongora, the founder of a sect which reigned for a century in the republic of letters. He deserves that we should pause for a moment to define his system and examine the influence which he exercised upon the public mind.

Gongora had studied the learned languages, the philosophy of Aristotle, and the scholastic theology; he was, besides, well versed in history and mythology, and, despite the agreeable *badinage* with which he filled his youthful productions, possessed a mind prone to melancholy. The style which he invented participates in all these qualities and dispositions. He abandoned simple and regular construction, contrary to all rules of syntax, and separated by enormous parentheses and long tirades the correlative words which depended upon each other, precisely as if he had written Latin with Spanish words. His favourite metaphors are

those which are the farthest removed from the objects he sought to represent, his allegories are puzzles which we attempt in vain to solve, and his hyperboles are lost in the clouds. He chooses for his allusions the most unknown circumstances and the most mysterious relations between the things which he proposes to explain. Add to all this, eccentric epithets, an affectation to employ words of the longest and most guttural sounds, pictures charged with the most extravagant sentiments, the most incoherent choice of expressions, and we have an idea of Gongora's style, — a style decorated with the name of the *cultivated*, to distinguish it from the language of nature. It was a mortal blow to all branches of literature. *Gongorism* invaded the tribunals, writings of all kinds, official documents, and private conversation; and such progress did it make in the pulpit, that more than a century after its introduction it was necessary to interfere seriously, to set bounds to an abuse not less contrary to the interests of religion than to the rules of taste. The witty Jesuit, Isla, was inspired by it with the idea of his "Friar Gerund," a work which almost deserves the title of the "Don Quixote" of literature.

Such was the state of Spanish poetry when the Austrian branch became extinct upon the throne of Spain, and Louis XIV. succeeded in placing upon it a king of his own family. The first Bourbon who governed Spain, without inheriting the talents of his grandfather, possessed all his faults and vices. He was above all things infatuated with that vanity which recognised nothing good or beautiful, except what was born on the banks of the Seine. Spain became French, as she had previously become Austrian; and extravagant romanticism gave way to a classical taste the most monotonous, insipid, and barren. Scarcely escaped from a war which the opposing interests of two powerful houses had produced, governed by a feeble and voluptuous prince, excluded from literary and scientific commerce with the rest of Europe by the barrier of the Pyrenees and the sinister projects of France — despoiled, in fine, of their ancient institutions, their ancient customs, and their ancient prerogatives, the Spaniards remained many years in a moral and intellectual lethargy, in a state of complete degradation and privation of all education and mental enjoyment. The successor of Philip was not the man to rescue his subjects from this lethargy. Under Ferdinand VII. the only art cultivated in Spain was Italian music, of which he was passionately fond. The increase which the commerce of America experienced produced none of those advantages which are every where the effect of the circulation of wealth. An ignorant and superstitious people trafficked with people to whom they had communicated their own ignorance and superstition. In such circumstances the exchange of products was only the removal of the superfluities of each people, and produced as its result merely the prosperity of a few commercial houses and the monetary death of the royal treasury. Ferdinand amassed immense sums, the greater part of which was squandered on singers and dancers.

Charles III. ascended the throne of Spain after having occupied that of Naples. He brought with him from the latter place that taste for the arts and passion for study which constitute the elements of social life in Italy, and which all the efforts of superstition can never efface from the minds of the natives of that country. Chance placed in his court and around his throne enlightened men desirous of reform, and burning with the desire to restore their country to the height from which she had fallen during preceding reigns. The general impulse then given to the rest of Europe communicated itself to Spain, and revived the principles of civilisation. Canals were opened, roads constructed, cities founded, learned societies, public

courts, and academies for the fine arts, instituted; foreign artists were liberally paid, abuses reformed, and every thing seemed to promise an age of happiness and prosperity. Magistrates, as respectable by their rank as by their knowledge and virtue, openly attacked the usurpations of the court of Rome. The grandees of Spain allied themselves to the *philosophes* of Paris. Aranda became the friend of Voltaire. The monks yielded to the writers, and in place of building convents and chapels, magnificent edifices, destined to the study of the sciences, were erected every where. Depressed until then by so many shameful bonds, public spirit took a new spring. Curiosity and the desire of knowledge penetrated into those countries whence they had formerly been banished. Poetry followed the general movement. Modest and timid muses gave prelude to the great innovation that was about to be accomplished. Gonzales, Cadalso, Jovellanos, Moratin (the father of the celebrated comic writer), wrote with taste and precision. But it was reserved to their friend Melendez Valdes to open a new career. It was the lot of this superior man to found a school of which the principles do not belong to particular opinions or beauties of fashion or convention, but to the eternal and immutable rules of all that has been admired as beautiful, and sanctioned by taste among every people and in every age. Sublime in the ode, simple and true in the Anacreontic, always original, philosophic, and pure, Melendez appears less to have created a new style than to have purified other styles. His imagination which avails itself of all beauties susceptible of poetical colouring, never flies from the salutary yoke of an irreproachable taste, and his manner of painting nature shows that he knows how to embellish without failing in resemblance, to be exact without being common, and to obey its rules without laying aside the wings of his imagination. But the greatest service which Melendez rendered to Spanish poetry was to open to it the sanctuary of science. He proved by his example that poetry might explain the phenomena of nature, and interpret the oracles of human knowledge, without descending from the lofty regions which it inhabits, and that the discoveries of the astronomer and botanist may be expressed in harmonious verse without being obscure or pedantic. From that time poetical language and taste were fixed in Spain. Numerous imitators proved how well Melendez traced the vast carer. Cienfuegos, Quintana, Lista, and many others of whose works the English public knows little — as, for example, Martinez de La Rosa — are upon a par with most of the modern lyrical poets. Novelty of imagery, purity of style, boldness of thought, care in selecting the most harmonious sounds, a philosophic tone, and finally truth and warmth of sentiment — such are the characteristic traits of this school. It has yet, however, a great step to make ere it attain perfection. Despite the latitude which it grants to the inspiration of genius and the study of nature, it still advances trammelled by a certain number of turns that give it an air of monotony and affectation. It is still too lyrical, too elevated, too *recherché* in its ornaments.

It seeks too much for circumlocutions to express simple things as if it dared not exhibit truth in its plain nakedness. The source of this defect is the same as that which has produced so many errors and prejudices in the public mind of Spain. It proceeds from her unfortunate geographical position, since nature has separated her from the rest of Europe by a nation from which she is obliged to receive every thing—books, ideas, and fashions. Spanish literature is still too French. It must study a little more the freer, more natural, and more energetic style of the English. The history of literature is merely the expression of society,—the picture of events, morals,

and vicissitudes which have influenced its changes, and marched in accord with it. To the literary man and the historian this point of view may furnish reflections upon the mutual action of human institutions, as well as upon the character imparted to the arts by the errors of the mind, the passions of mankind, and the movement impressed upon ages by the interests, errors, and faults of politics. The Earl of Clarendon, in his speeches in the House of Lords, has painted the character of the nation among whom he lived so long as our ambassador in terms of glowing praise. Spaniards, according to one who has had an opportunity of knowing them, are not sunk in the depths of moral and political degradation which would justify us in regarding them as a nation of murderers and cut-throats. When our own course of political conviction and action shall have been made more manifest to the rest of the world, we doubt not that their line of policy will be definitively fixed; but what rule of conduct the Spanish or Turkish nations are to deduce from the wavering policy of French and English parties must depend more upon deeds than upon professions of principles. The voice of England, like the monetary exchanges of her capital, influences the whole civilised world — for weal or for woe.

The civil war in Spain has, at least, had this good effect, — that it has decided the mass of the population one way or other. By drawing their attention to the contest between Carlist and Christino, they have been led to give attention to the two principles which they represent. The minds of the peasantry have been led to inquiry, and the fatal apathy of ignorance has given way before the excitement of battle. Three out of four provinces of Spain have pronounced unequivocally in favour of liberty. Not a Carlist can show his front in them; or if so, only during a swift and disastrous flight. Commerce, agriculture, and prosperity are on the increase, and the national resources are greatly developed. Capital is being employed in works of public utility; and, what is of vastly more importance than all, a numerous class of independent landed proprietors, created by the sale of the national property, have sprung up, and constitute, as in France, the bulwark of the new order of things,—all vitally interested in the success of the constitutional cause. Sooner or later Carlism, like the Vendean insurrection, must burn to its ashes; for organic changes in the basis of society itself have for ever prevented the permanent restoration of absolute power.

FORTUNATE FOLLY.

HAD he possess'd the proper complement
Of senses, this good fortune he had miss'd;
But, from a marvellous deficiency,
He 's blind to some things, sees but half of others,
And thus slips through the dangerous wheels of reason,
Which would have crush'd a man of pausing thought,
While such a fool gains safe the open flood,
And floats in gold by his own levity.

THE AMERICAN CONSTITUTION — POLITICAL AND RELIGIOUS.

A Voice from America to England. By AN AMERICAN GENTLEMAN. London: Henry Colburn. 1839.

ALTHOUGH the reader, if he expect the contents of this work to correspond with its title, will be sadly disappointed, he will find it in other respects both interesting and instructive. "A Voice from America" should be a voice of warning, or condolence, or congratulation, or of something or everything; but this is a mere hubbub of comments on the different phases of American society, which the author seems to have transmitted across the Atlantic without having any definite object — any advice to convey — any principle to refute or establish; but merely, as he says himself, "to exhibit a true and faithful picture of American society, mainly as political and religious," and to leave the reader to draw his own conclusions. While, however, he thus professes to have no particular object in view, he directs attention to two principal subjects, with which he himself is almost exclusively engrossed, the alarming inroads of "the demon of Radicalism" on the thrones of Europe and the constitutions of America, and the danger of separating religion from the state. The other subjects noticed in the volume are, the abolition of slavery, the Canadian rebellion, the "Jackson dynasty," and "the American constitutional party and the democracy."

The writer commences with a chapter of definitions, which appears to have been principally designed as a safety-valve to "let off" a variety of notions about democracy, liberty, equality, political rights, &c. &c. From the first definition the reader may learn the character of all: —

> "Democracy — a government of primary assemblies; this is pure democracy. Type Grecian, — as in the small states of Greece, at one period, the people are supposed to be convoked for original legislation, for judicial decisions, and for all purposes of government." — p. 1.

This he again calls the "primary *grammatical* form" of democracy. Concluding that, because in some of the states of Greece the *power of the people* was occasionally exercised in this manner, a democracy must be, in all times and places, "a government of primary assemblies," he raises the monster in every variety of shape, and destroys it again with the same zest and facility, with which, in our younger days, after reading "The Life and Adventures of Robinson Crusoe," we used to conjure up and slaughter as many ferocious savages as ever that illustrious hero had consigned to eternity. When he comes to the consideration of the words Liberty and Equality, he exhibits the impatient desire of a schoolboy, to enlighten mankind as to the real nothingness of these terms, as if every one did not already know that they were mere "words, by cunning caught and spread." In illustrating them by the passage in the Declaration of Rights, "That all men are born *free* and *equal*," he displays a *naïve* ingenuity; which, if not convincing, is at least amusing. Instead of saying that those words in that document are a national lie, he very coolly lays it down, that the framers of it were only comparing themselves with those against whom they were struggling; that the term "*free*" referred only to the denial of the right of the British Crown to enforce taxation without representation; and that the term "equal" merely indicated the abolition by Congress of the hereditary titles of kings and nobles!

In speaking of the political organisation of American society, our author contrasts what is called the British constitution, with the constitution of the United States. The latter he describes as "a summary of powers delegated originally by the States in general convention, for federal and national purposes, having a palpable, prescribed, and definite form." But that which is called the constitution of the United States should be more properly styled Articles of Confederation, for it is merely an agreement between several independent states to combine for certain specified purposes, on certain principles, and under certain conditions; so that the majority could not inflict on one or more states any injuries to which they would not be liable, had they remained independent of the Union. This differs materially from a power conceded by a single nation to its own representatives, to promote its welfare by every means which their ingenuity could devise. We are aware of the undefinable nature of "the British constitution," but the American Gentleman should have compared it, not with the *constitution* of the United States, but with that of each and every of the states in its separate character, so far as it is not controlled by the general government. If he had done this, he would have found that the *constitution* of each was as undefinably illimitable (with the above exceptions) as that of Great Britain.

Of "*the constitution*" he seems perfectly enamoured, and as opposed to any changes in it, as if he were a Mede or a Persian. Since the time of Jefferson, he describes "the popular will in the shape of a dynasty of opinion," as habitually assailing "the constitution," and triumphing over its provisions, "and the all-ruling element of democracy constantly increasing in power and efficiency."

"It is true, indeed, that *the constitution* has presented a strong barrier to the operation and progress of this power, as it has been explained and defended in the national councils and elsewhere, by the opposing party; and also as guarded by the shield of the national judiciary; but in every great pinch, *the constitution* has been forced to bend to this antagonist power, and sometimes to give way."— p. 48. . . . . "The victorious party in a state will of course deny the violence charged upon them, the vanquished are compelled to submit, and make the best of their defeat; while both, it may be, profess respect for *the constitution*, and the nation goes on under its rule, acknowledging its authority. Such hitherto has been the fact in America." — p. 49.

But this "fact in America" is not an American fact; it is an universal fact: and although the writer seems to think there is something peculiar in it, a little observation would have shown him, that it is no more a peculiarity in America, than the spring and fall of the leaves, or the ebbing of the tides.

About the specific character of the constitution, it seems that different opinions have been entertained, the author having "known the startling doctrine advanced by very high American authority, that the popular will for the time being — meaning of course the majority of voices — is the constitution, and consequently the supreme law of the land." Taking the constitution to be, according to his definition, the document, or articles of confederation, adopted by the national legislature in 1788, we learn that the fate of *the Republic* depends on whether the people will be bound by this specimen of "the wisdom of *their* ancestors," or will make use of their own.

From an American Gentleman, evidently conversant with the laws of his country, strongly attached to the constitution, and hostile in proportion to the inroads of democracy, we did not expect a defence of *Lynch Law* — that most extraordinary emanation of "a government of primary assemblies." Indeed, one would think that his love of the "constitution" must have necessarily implied a horror of popular violence: but the combination of antagonist elements is not at all uncommon in America.

"The American people, knowing and feeling themselves to be the authors of law, are accustomed to take the liberty of altering it, and sometimes of adapting it to present exigencies before it can be altered. Like the horse that takes the bit in his teeth, defying the hand which vainly attempts to check his way — like the ocean wave, that rolls onward by its own irresistible momentum, so a people of such habits will sometimes take the law into their own hands, and run riot in the extemporaneous use of their original powers; hence Lynch-law and mob-rule, which may be practised when they happen to anticipate the will of the people in an opinion already formed. For the sake of order, however, and to assert the supremacy of law, these practices are of course reprobated, at the same time that there is a secret and silent acquiescence, by a sort of instinctive sympathy pervading the public mind, though not openly expressed." — p. 50.

"This *en masse* popular license, at one moment suspending the operation of the laws, and at another apparently trampling them under foot, we are quite aware, may seem in the eye of foreigners an inexplicable mystery in American society. But it is to be considered, that, in America, it is the law-making power that resolves upon and executes this extemporaneous process; whereas, in Europe, it may be the germ of a revolution, or a revolution itself. In America, it is the momentary expression of the popular will, in anticipation of its legitimate functions, and then it dies away into a calm." — p. 53.

"Popular disturbances of this kind are not always void of respect for existing law, as in the case of abolition riots, in one of which, Pennsylvania Hall, at Philadelphia, was burnt to the ground, May 17. 1838. *On the contrary, the people, who looked quietly on this scene, and permitted the proceeding, regarded the erection and opening of that building, under the circumstances connected with it, as an outrage on public feeling, and looked upon the place as a nest of sedition against the peace and integrity of the American Union. While, therefore, they appeared to be conniving at the violation of law, and were in fact doing so in regard to one of its lower departments; they were governed by a respect for the 'supreme law of the land,' the constitution of the country.*" — p. 273.

If the opening of the Hall were an outrage on the constitution, why did not the constitution provide a remedy for abating the nuisance by "the forms of law?" No, no; the constitution had nothing to do with the matter — but whenever, at either side of the Atlantic, a statesman, a lawyer, or a scribbler, discovers a *nodus vindice dignus*, and has in vain appealed to every other divinity in his professional mythology, he, as a last resort, invokes the aid of *the constitution.*

The writer next draws our attention to the subjects of education and religion, as "two capital conservative elements, indispensable to the permanency of the American government and its institutions, in this present form." "Education," he observes, "has received some care and attention from the government, but by no means proportionate to its importance. After devoting a chapter to a "Comparative View of American Religious Sects," and another to the "Political Character of Religion," he proceeds to exhibit the consequences which have flowed from divorcing religion in America from the state, and allowing it "to take care of itself." These have been the same as have at all times followed from the government of a free country leaving, to the unrestricted competition of an enlightened community, the promotion of any object in which every member felt interested. In America "free trade" in religion has produced the same results as "free trade" in every other article of public consumption; and these results cannot but be gratifying to every one whose mind is imbued with enlarged views of the scope and objects of Christianity. The following passages will afford a glimpse of these results: —

"In no country of Christendom, in our view, has religion so much vitality as in America, and in none does it wield so much political power." — p. 83.

"The separation of church and state, and other causes, have given rise to a new species of social organisation, before unknown in history, and one of a very important and formidable character, and prolific of great results, though public attention has not yet been much directed to it, as involving such a tendency. Within the space of about thirty years it has entirely changed the character and aspects of the American religious world, and set up a gigantic religious power, systematized, compact in its organisation, with a polity and government entirely its own, and independent of all control. It exists, indeed, in different forms, or collateral branches, having no visible corporate connection, but a common sympathy." — p. 87.

"And, behold! — the Religious and Benevolent Society System is thoroughly established over the wide American public. It is a system so entirely independent of the state, that the state cannot reach it: it is so powerful that the state cannot contend with it: it is so all-pervading, that it comprehends the state itself, in its individual parts, and in its most vital and influential portions. It has stolen a march on the public, on 'the powers that be,' on the world." — p. 89.

After detailing the great advances which this system has made, and the extraordinary social and religious wonders it has accomplished, our author says, that he thinks —

"It has attained to a supremacy of influence over the state. American society, as we have observed in a former chapter, is a dynasty of opinions, and the state must yield to it. And it happens that these voluntary associations are so numerous, so great, so active, and influential, that, as a whole, they now constitute the great school of public education, in the formation of those practical opinions, religious, social, and political, which lead the public mind and govern the country — at least xercise an influence over the state, which cannot be resisted."— p. 97.

"The Religious and Benevolent Society System" is merely a phrase to express an organisation of various societies similar to those in this country, for the celebration of whose anniversaries Exeter Hall seems to have been specially erected. But it appears that the Exeter Hall societies cannot bear comparison with the societies in America as to political influence. The great power of religion over the minds of the Americans, is partly ascribable to their activity and fondness for excitement. "*The Americans*," saith our author, "*like a fervent, not to say a hot, religion. Like the Welsh, many of them want a religion that will make them hop and jump.*" — p. 94.

"Religion in America," says De Tocqueville, "must be regarded as the foremost of the political institutions of the country."

When we see Christianity thus obtaining such extraordinary influence over the public mind, when we see that, although specially excluded from political power, it is regarded "as the foremost political institution of the country," and is alone sufficient, without the aid of legislation, to prevent the publication of immoral and irreligious works by the mere hold it has of the faith of the community, are we not justified in concluding that its real ascendancy would be strengthened elsewhere by relieving it from a position which, by its wealth, indisposes it to exertion, and, by its character, as a stipendiary of the state, deprives it of the confidence of the people?

To the present movement in America for the abolition of slavery, this writer is decidedly opposed: indeed, so strongly opposed, that, at the end of his first chapter on the subject, he deems it necessary to add a note in these words:—

"On account of the ground taken by the author on the subject of slavery, it may be proper for him to state that he is a Northern man; that he has never had any interest or connection with slavery whatever; and that he is opposed to the system in all its forms, as a Christian and as a man."

After demonstrating the comparative facility of procuring the abolition of slavery in the British dominions, in consequence of "the remote geographical relations of slavery to the seat of empire," the right and the power of the government at home to liberate the slaves, and the ability of the nation "to indemnify all parties, — to execute the project with safety to all — to establish the most salutary mode—to supervise its operation—to sustain an armed force and police adapted to the exigencies of the progressive change—to consummate the plan—and finally, if that should be necessary, to cover the retreat of the white population, and to indemnify their losses" (query, Is not the American Union rich and powerful enough to do the same?) and next showing, that, by the constitution of the United States, the power

of legislating on the subject of slavery is guaranteed exclusively to the legislature of each state as to all within its boundaries; that therefore the general government cannot meddle with the subject; and that,

"No matter what the moral sense of the nation or its will may be," as Dr. Wayland says, "should the majority of one hundred to one of the people of the United States be in favour of the abolition of slavery, still that would not alter the case, the one being competent, under 'the supreme law of the land,' to over-rule the one hundred."

He says,

"In this state of things a popular movement has been made in the United States, simultaneously with that of Great Britain, and under a wide-spread excitement on the subject, to abolish American slavery; and an organised power has arisen, under the name of the American Anti-Slavery Society, which has taken this subject in hand with an apparatus and force of no mean consideration. The object of our present inquiry is to ascertain, as near as may be, by the estimate of probabilities, the aspects of this enterprise, and whether it is likely to succeed. The title of this chapter ("*American Abolitionism in a false Position*,") as will have been seen, intimates our opinion."—p. 119.

This society seems to be of precisely the same character as the many associations lately adopted in these kingdoms for the attainment of moral, religious, or political objects. The "American Gentleman" goes into some considerations to prove, that it is "an organised sedition, at war with the genius of the American constitution." But his notes on this subject can have no interest for our, or for any, readers. The only curious point in them is a sort of indication, that he acquired his slight acquaintance with constitutional law in the office of an attorney.

To oppose the exertions of this society the writer assures us, that the general government has been compelled "to connive at a constant violation of one of the most sacred laws of the country, *in allowing committees of vigilance at the South to enter post-offices, to examine parcels and papers, and to order what may and what may not pass.*" What a *constitutional* proceeding in "*the model republic!*"

He conceives that the success of the society will be more disastrous than defeat: either will be injurious, and may involve extensive ruin:—

"Success will involve the stability, not to say the existence, of the American government; for both these powers cannot occupy the same field as victors. The American abolitionists must trample on the constitution and wade through the carnage of a civil war, before they can triumph..... All truce is, therefore, necessarily suspended, till the strife shall be brought to a close by the suppression of one of the hostile parties. Henceforth nothing can be done for the amelioration of the condition of the slaves, till this warfare is ended."—p. 127.

"The effect of the abolition movement" he considers to be, in consequence of its recklessness and violence, most injurious to the cause it was designed to advance. It had "arrested the improvements which were in progress in the slave states, for the amelioration of the condition of the slave; it has broken up the system of intellectual and moral culture, that was extensively in operation for the slave's benefit, lest the increase of his knowledge should lend him a dangerous power in connection with these crusading efforts;" it had blighted the prospects of the slaves in every way, and made the planters of the south resolve "on the pro-slavery system absolute, unconditional, and for ever. They aver that God has ordained it; that it is right and proper; and they have sworn by heaven and their own swords to maintain it." (p. 135.) When people begin to swear in this manner, it may generally be concluded that they have determined on some atrocious course of action.

The number of slaves in the Union being "probably little less than 3,000,000, increasing with a rapidity in excess of the whites in the same

states, as 112 per cent. is to 80 per cent. in the term of forty years, and constituting about one-third of the population of the slave-holding states, besides about 400,000 free blacks scattered over the Union" (p. 146.), our author deems it necessary to consider how the system of slavery may be disposed of, and suggests that the vast public unoccupied domain should be mortgaged for the price of every slave in the Union, and the African race should be settled in various colonies, and encouraged to return to the land of their fathers. This plan seems reasonable enough; and was, it appears, suggested in the national senate in 1825, and supported by very high authority, though our author remained unaware of it till he had himself committed it to writing.

To the subject of religion he again draws our attention, devoting a chapter of fifty pages — the longest in the book — to prove the necessity of the states paying the ministers of Christianity. This is a question which has been so repeatedly discussed, that it is unnecessary to follow him through the details of his arguments.

The following extracts from "The Blue Laws" of Connecticut will perhaps afford some "valuable" hints to the framers of our own sabbath bills and marriage acts. We regret to say that these pious enactments are not the law of the land at present in Connecticut. They are given in the volume before us, merely as historical curiosities, the degeneracy of modern days having removed them from the statute book: —

"17. No one shall run of a Sabbath-day, or walk in his garden or elsewhere, except reverently to and from church.

"18. *No one shall travel, cook victuals, make beds, sweep houses, cut hair, or shave on the Sabbath-day.*

"19. *No husband shall kiss his wife*, and no mother kiss her child on the Sabbath-day.

"31. No one shall read common prayer, keep Christmas, or Saint's-day, *make mince-pies, dance*, or play on any instruments of music, except the drum, the trumpet, and the Jew's harp.

"36. No one shall court a maid without first obtaining the consent of her parents: five pounds penalty for the first offence; ten pounds for the second, and for the third, imprisonment during the pleasure of the court."—p. 313.

As "in America, the strife is between a constitutional republic, as originally set up, and a radical democracy," and "on Webster and Clay, in no small measure, hang the destinies of republican empire," the author has given an elaborate sketch of these two gentlemen.

A few extracts from the chapter on the "Jackson Dynasty" will show the line of argument taken by the party to which the author belongs, and their points of attack on their opponents. The author affirms, that though "Jackson contributed not a little towards raising himself to power by declaiming on the importance of retrenchment in the expenses of government," yet "these expenses, called in England the civil list, increased rapidly from the moment he was installed in the chair of state, till before he retired they had nearly or quite doubled; and they are still increasing under his successor, who was raised to power by his influence;" and though in his inaugural speech, March 4. 1829, he noticed the necessity of correcting "those abuses that have brought the patronage *of the federal government into conflict with the freedom of elections*," no preceding administration had been "so active and efficient through all its dependencies, in those matters which would render it liable to this specific charge."

"It is a simple matter of fact, that all the public funds lost in this way * have actually gone to buy up friends to the government, whether the defalcations were matters of under-

* Failures of banks, in consequence of Jackson's opposition to the United States' Bank.

standing between the powers at Washington and these parties, or not. The money is gone; and is going; and it goes to friends: so much is true, whatever else is false. And what has already been used up in this way, according to official report, is sufficient to buy the votes of a large fraction of the population of the United States — that is to say, sufficient to produce an influence adequate to secure them."

"On the 17th of January, 1838, the United States' treasurer reported to Congress *sixty-three* defalcators (individuals), in all to the amount of 1,020,587 dollars, without touching the vast sums in the local banks,— a mere beginning of the end."—p. 243.

A committee of the senate of the United States, of which Van Buren was a member, made a report, in 1826, on the executive patronage, from which the following are given as extracts in the work before us: —

"With the Blue Book they will discover enough to show, that the predictions of those not blind to the defects of the constitution are already realised; that the power and influence of federal patronage, contrary to the argument of "The Federalist," is an overmatch for the power and influence of the state patronage (the patronage of the states respectively); that its workings will contaminate the purity of all elections, and enable the federal government eventually to govern throughout the states, as effectually as if they were so many provinces of one vast empire.

"The whole of the great power will centre in the president. The king of England is the fountain of honour—the president of the United States is the source of patronage: he presides over the entire system of federal appointments, jobs, and contracts; he has power over the support of the individuals, who administer the system; he makes and unmakes them; he chooses from the circle of his friends and supports, and may dismiss them — and upon all the principles of human action, will dismiss them as often as they disappoint his expectations. His spirit will animate their actions in all the elections to state and federal offices.

"We must then look forward to the time when the public revenue will be doubled; when the civil and military officers of the federal government will be quadrupled; when its influence over individuals will be multiplied to an indefinite extent; when the nomination of the president can carry any man through the senate, and his recommendation can carry any measure through both houses of Congress; when the principle of public action will be *open* and *avowed*. The president wants my vote, and I want his patronage. I will vote as he wishes, and he will give me the office I wish for. What will this be but the government of *one* man? And what is the government of one man but a *monarchy?* Names are nothing; the nature of a thing is in its substance, and the name soon accommodates itself to the substance. The first Roman emperor was styled the emperor of the republic; and the last French emperor took the same title.

"And," quoth our author, "this is a true picture, a veritable history of the Jackson dynasty, continued under Mr. Van Buren, who, as is understood, stands pledged to 'follow in the footsteps of his illustrious predecessor.'"—p. 238.

The writer cites some authorities to show that, "in whatever state an individual unites in his person the execution of the laws, the command of the army, and *the management of the revenue*, that state may be termed a monarchy," and then enters into some details, from which it follows, as clear as any demonstration in Euclid, that "King Andrew I." was real and veritable monarch of "*the model republic.*" He had the command of the army, the execution of the laws, and the federal patronage of right — and he assumed to himself the keeping and disposal of the public funds, we will not say wrongfully, but "without law and in violation of the constitution," for such is the phraseology of our learned and accurate author. The entire passage is worth quoting: —

"And what is extraordinary, he invaded* the province of the legislative department of government, to which alone is entrusted the care of the public funds by the constitution, removed them from the bank, where they were deposited by order of Congress, and took them into his own keeping..... The powers thus assumed by president Jackson, have passed into the hands of his successor, and are used by him. This is now the established govern-

* The word in the volume before us is "*involved*," but we suppose it is a typographical error.

ment of the republic — established without law, and in violation of the constitution. It has been proposed to Congress to sanction it by the passage of the sub-treasury bill, but it was refused. And yet it continues." — p. 241.

Let us pause, and compare for a moment the relative powers of the quadrennial elective monarch of the states, and the hereditary monarch of this degenerate country. The former has all the patronage of the government, the execution of the laws, and has transferred to himself from the commons of his realm the custody of the public revenue! Could our monarch appropriate the public funds? What is the amount of her patronage? Scarce seven weeks have passed since a *constitutional* statesman attempted to deprive her of the right of selecting her own female society — of being the sole mistress of her own house, or of touching a custard, unless it were doled out to her by some ministerial retainer. The difference between the powers of the two is great. Neither is called monarch in *constitutional* phraseology: but if either deserves it, it is the President, — he enjoys the reality of monarchy, until he feels himself no longer able to discharge its duties; then, perchance, he appoints his successor; and, having laid aside the cares of state, becomes a clown or a philosopher. He, while in office, has the power to commit mischief, and is nominally responsible for it. The sovereign of these realms is not responsible, as she is considered incapable, and deprived of the power of committing it. In fine, the president has power and patronage — our sovereign has not. The rival *monarchical* claims of the two are ordinarily determined by the simple fact, that the former is elected every fourth year, and gets an annual stipend of only 6000*l.*, whereas the latter holds office for life, and by hereditary succession, at a salary of something less than a million.*

The volume closes with a chapter on "the Canada rebellion." The author states that the people of the United States can have no interest in the independence of the Canadas — as it is probable that neither would desire a union —

"That no more quiet or more comfortable international relations could be formed, than those which have hitherto existed, while the Canadas have been under British jurisdiction; that, although the United States would have no fear of a superior power in that quarter, there might, nevertheless, and probably would, arise serious and vexatious jealousies and collisions; and that both the government and people of the United States would deprecate most grievously the change contemplated by these rash proceedings."

We are glad to hear that the citizens have not the temptations of profit or interest to stimulate their love of freedom, in aiding the revolters of Canada.

In conclusion we may observe, that the work, though it will disappoint those who will be entrapped by its title, to buy or peruse it, will be acceptable to the general reader; and that, though the writer appears on the two principal subjects of the volume, religion and politics, to be a mere sciolist, he amasses a considerable amount of details, both novel and interesting, to all who look forward with solicitude to the results of "the great experiment" of "the model republic."

* If the definition of the term "monarch" is to be any one of those enumerated above, viz. the possessor of a large salary, or hereditary right, or power, or patronage, or the execution of the laws, or the custody of the public revenue, — it would be rather a knotty problem for the people of England to solve how many monarchs rule over them. — Ed.

AN OLD TRAGIC BALLAD,

MODERNISED.

"Quhy dois zour brand sae drop wi' bluid," &c.*

"WHY does your blade sae drop wi' blood,
Edward, Edward?
Why does your blade sae drop wi' blood,
And why sae sad gang ye, O?"
"O, I ha' kill'd my hawk sae good,
Mither, mither;
O, I ha' kill'd my hawk sae good,
And I had nae mair but he, O."

"Your hawk! his blood was never sae red,
Edward, Edward!
Your hawk! his blood was never sae red,
My dear son, I tell thee, O."
"O, I ha' kill'd my red-roan steed,
Mither, mither;
O, I ha' kill'd my red-roan steed,
That erst was sae fair and free, O."

"Your steed was auld, and ye ha' got mair,
Edward, Edward;
Your steed was auld, and ye ha' got mair,
Some other grief feel ye, O."
"O, I ha' kill'd my father dear,
Mither, mither;
O, I ha' kill'd my father dear,
Alas! and wae is me, O!'

"And what is the penance ye 'll suffer for that,
Edward, Edward?
And what is the penance ye 'll suffer for that,
My dear son, now tell me, O?"
"I 'll set my feet in yonder boat,
Mither, mither;
I'll set my feet in yonder boat,
And I'll fare over the sea, O.

* From the Percy Reliques, a new and excellent edition of which has just been published in one volume. This tragic ballad, which finely and comprehensively epitomises the history of two lives, passed in the indulgence of evil passions, is designated by its editor as "a curious song." Under the impression that there was far more in it than its curiosity, an attempt has been made to rescue it from its obsolete dialect. Two explanatory stanzas have also been interpolated.

"But how can ye bide this bloody mishap,
Mither, mither?
But how can ye bide this bloody mishap,
And aye think penance can pay, O?
O, there in your heart was an awfu' gap,
Mither, mither!
O, there in your heart was an awfu' gap
As deep as the judgment day, O!"

"And what will ye do wi' your towers and your hall,
Edward, Edward?
And what will ye do wi' your towers and your hall,
That were sae fair to see, O?"
"I'll let them stand till they down fall,
Mither, mither;
I'll let them stand till they down fall,
For here never mair may I be, O."

"And what will ye leave to your bairns and your wife,
Edward, Edward?
And what will ye leave to your bairns and your wife,
When ye gang over the sea, O?"
"The wide world's room: — let them beg through life,
Mither, mither;
The wide world's room: — let them beg through life,
For them never mair will I see, O!"

"And what will ye leave to your ain mither dear,
Edward, Edward?
And what will ye leave to your ain mither dear,
My dear son, now tell me, O?"
"The curse of hell from me shall ye bear,
Mither, mither!
The curse of hell from me shall ye bear,
Sic counsels ye gave to me, O!

"I'se leave my father's blood in your lap,
Mither, mither!
I'se leave my father's blood in your lap,
For your heart's a dark pit to see, O:
O, the curse of hell shall fill up that gap,
Mither, mither!
O, the curse of hell shall fill up that gap,
And its flames my penance be, O!"

R. H. H.

*** It is to be observed that the mother of the parricide knows very well from the first (her knowledge being betrayed even by the very cautiousness of her progressive interrogations) what he has done. It seems likely that she had brought it about herself, and had trained up her son to the deed, from some old, remorseless, "lodged hate;" the cause of which, however, is "another story."

THE LAST "BOOKS" OF SUMMER.

Now that bevies of gentlemen are scouring over the country after coveys of partridge—now that the pavement of Palace Yard is as silent as the court yards of the Alhambra—now that Fashion is gone out of town to try on her cottage bonnet—now that London is like a theatre with the lights put out, the audience gone, and the scenery in a state of confusion, and the windows and curtain up to let the air in upon the stage,—it cannot be expected that the publishers would waste their activity in the production of new books. There is nobody to read them. People have something else to do in the country besides reading. The publishers know this very well; and although there is no class of producers that exhibits greater constancy of purpose, there is no class that knows so well how to *time* its operations. Look into the newspapers in the "dead watches" of the year, and you will discover scarcely a solitary literary announcement; unless it be, perhaps, the poem of some enthusiast who thinks that genius can vanquish all artificial conventions, or a book on quack medicine or cookery, or a perpetual spelling book, whose use is perennial, and does not depend on modes and customs. But the flat interval is not idle. The embryo catalogue is in a state of incubation; and when the proper season comes round again, the birth of a thousand volumes is advertised in the journals with as much pomp of circumstance as if so many duchesses had just been blessed with heirs to their estates.

In the meanwhile the last books of summer, like the last rose and the last swallow, must be duly noticed, ere some fade and others die away from the public mind; albeit, we have two or three to mention, the influence of which, we confidently anticipate, will be beneficial, elevating, and enduring. Several of these final books of the season come like drops after a shower;—some of them, indeed, are of an earlier date, but have suffered postponement, as many excellent measures have done of late, in consequence of the "pressure of business." As they are not sufficiently numerous to require classification, we will take them in the order in which they happen to dispose themselves before us; and the poetical appears at present to rule in the "ascendant."

After the feverish avidity with which poetry was read some years ago, when the meteoric genius of Byron blazed with a light at once baleful and beneficial, startling the dormant imagination of the public, and leading minds whose energies were stagnant into new trains and exercise of thought, thus assisting to bring round the time when higher poetic aims and deeper views of humanity will become more generally appreciated, it can be no matter of wonder that a period of repose has followed, when poetry has been only read by the few; while the many, obeying the necessary conditions of great excitement, sank into comparative indifference and inanity. But this dull and phlegmatic state,— this prostration of the soul's vitality,— this half stupified interval, in which the young men of the age have deserted the old book-shops and stalls of dusty immortality and unfading life of mind, not for the games of healthful manly exercise, but to loll their enervated limbs and clouded heads amidst the fatal folly of cigar divans, and thus lose themselves and become a nuisance to others;— this period is passing away, and in the clearing atmosphere we may discern the signs and tokens of a manlier and a brighter day, in which poetry and divine philosophy will again exert their due influence, and a lover of literature be well content to

buy a book without a picture. In such a belief, independent of what is done from time to time by old-established poets, we find several new ones (to say nothing of the legion of very creditable versifiers) continually putting forth their works; and in such a spirit have various publishers given us reprints of standard poems. By the term of "new poets" we do not mean tyros, but those who are "rising geniuses" of the time; *i. e.* to the estimation of whose genius *the public is rising* for this is the real sense of the foregoing expression. We allude to those who have been working for the last fifteen or twenty years, and have only put forth a few works, the merits of which generally require almost an equal period for the public to discover, and which the Quarterly Reviews never discover till after the public. We have no reason to complain of the dearth of new poetry of the finest order during even the last twelvemonth only, beginning with Miss Barrett's "Seraphim" (published about a year since), taking the beautiful "Prothanasia" of Mr. Wade as the nucleus of the intermediate appearances, and finishing up to the present day with the epic poem of "Ernest, or Political Regeneration,"—a work not yet published, and smothered up for the present, apparently by the author himself, owing to certain political or personal misgivings. Of the poetry we have no sort of misgivings; but it is much to be feared that the author's power is *of* him, rather than *in* him, or he would not thus shrink away from the great work of his own hands. Of the republication of standard poetry and rich gatherings together of poets, we have spoken as they severally appeared. Among the last of these, there is not one in the whole series the appearance of which we hail with more pleasure than the "Percy Reliques;"[1] while the circumstance of the book being already on the brink of a second edition proves the awakening taste of the time, and the healthful character of its resuscitation.

Mr. Caunter has given to the world two elaborate volumes of mingled criticism and historical disquisition on the Poetry of the Pentateuch[2]—a work which displays an extent of erudition and a severe refinement of taste, which have rarely been equalled by any writer within the memory of the living generation. The subjects embraced in this recondite and laborious production include all those magnificent prophecies in which the inspired language of the Hebrew authors took the most elaborate shapes of poetry; and Mr. Caunter's main object is to draw out this inner poetical life, or spirit of the prophecies, and expound the sacred mysteries of its beauty. In the execution of this great undertaking he exhibits varied accomplishments and profound research; traces the history and establishes the authenticity of the Pentateuch; collates a multitude of analogous specimens of poetry; shows the exact character of all the most striking passages, not merely as the integrity of their purpose is concerned, but the structure and peculiarities of their versification; and produces on the whole one of the most comprehensive criticisms on these antique relics of Hebrew genius, elevated by inspiration, and heightened in its glory by the surrounding darkness, that has ever been presented to the contemplation of the students of Holy Writ.

But the predominant charm of these noble commentaries—the charm which is most likely to recommend them to extensive popularity, and which will penetrate even where their learning can be least appreciated—is the graceful simplicity and unaffected clearness of the style and treatment.

[1] *Reliques of Ancient English Poetry.* Collected by Bishop Percy. One Vol. Templeman, Smith, & Miller.

[2] *The Poetry of the Pentateuch.* By the Rev. John Hobart Caunter, B. D., Incumbent Minister of St. Paul's Church, St. Marylebone; and Domestic Chaplain to the Earl of Thanet. Two Vols. London: Edward Churton. 1839.

They will be intelligible to all classes of readers; and are as full of intellectual fascinations as if they dealt in the lays of the Troubadours or the legends of the middle ages. The cultivator of the modern springs of literature must not turn away from these volumes under an impression that they contain any esoteric doctrines, or crabbed philological investigations. Mr. Caunter conducts us through the inquiry in a path so lucid, that the mere English reader can see around him on all sides as far and as clear as the most profound scholar. This quality of masculine perspicuity constitutes the high and peculiar merit of the book,—a merit that cannot be too strongly recommended for imitation. The design of such labours is less to instruct the explorers of sacred lore, than to draw into its circle the great multitude who hover on its confines and are afraid to enter, believing that the vast philosophy it encloses is too solemn or too mystical to be sounded by them.

All throughout the volumes, Mr. Caunter treats poetry as an Art, and in that sense develops the exquisite designs of the numerous passages he traverses. While we are much disposed, upon general grounds, to dissent from this view of the subject, because we believe that poetry exists in an endless diversity of forms that was not recognised by the canons, we grant the critical privilege of so considering it for the sake of the admirable critical disquisitions to which it gives occasion; and, having so granted, there is not one position assumed by our author which we think can be impugned. His explanations of the remarkable metres of the Pentateuch are exact and luminous, and sustained by discursive evidences that confer additional value upon the production. It is to be regretted that we are compelled to generalise our notices of works of this description, which, treated with any approach to analysis, would occupy a greater space than we can afford to bestow upon any single publication dedicated to topics of remote or abstract interest. There is, in fact, no choice between a close inquiry, step by step, into such books, and a vague glance at their nature and character. To indicate the chief and paramount aim of such a dissertation, is therefore all that can be accomplished in a periodical limited in its scope, and miscellaneous in its plan.

A very close translation of the Abbé de Lamennais' "Book of the People" has recently appeared.[3] It is a reproach to those literary labourers who have rendered the works of De Kock, Thiers, and Chateaubriand familiar to the English reader, that they should have allowed the productions of Lamennais to remain unknown in this country, except to those who can read them in the original. Of all the writers of the time, De Lamennais is that one who has penetrated most deeply the spirit of the Present and the Future; who has, with a power, most characteristic of the inspiration of genius, cleared off the clouds of prejudice from the forms and manifestations of Life as it is, throughout all its modes and institutions, and developed to us Life as it ought to be, and as, according to the necessity of things, it must be; and who has luminously, fearlessly, and prophetically initiated the Idea of the age. In the "Book of the People" he addresses himself especially to the great duties of social existence; traces the dependencies and relations subsisting amongst men; shows the obligations and the rewards of labour; and, above all, points out the grand distinction between the revolution that has nothing for its object but the overthrow of despotism, and the revolution that is directed solely to the establishment of liberty. This is the great moral of the book; a moral that has been perverted, by false criticism, into a multitude of hideous shapes of conspiracy against the peace

[3] *The Book of the People.* By F. De Lamennais. Translated from the French. Glasgow J. Hedderwick & Son. 1839.

and welfare of society. There never has been a writer so grossly misrepresented as Lamennais. If we are to credit our Quarterly reviewers, Lamennais preaches sedition against all human authorities, and desires to set up in their place an impracticable equality. This is pure fabrication: Lamennais is the advocate of order, of justice, of charity, of truth. His precepts are full of Christian philanthropy, — the means by which he proposes to reform the community of men are, union for the common good, mutual support, active benevolence, and the universal recognition of those rights which God has given to us, and which are in their nature inalienable; and he nowhere justifies selfish brute force, which is too often confounded with higher and nobler efforts for regeneration. "If ye would succeed," says Lamennais, "do what is good by good means. Confound not strength, directed by justice and charity, with brutal and ferocious violence." A code of precepts might be compiled from the works of Lamennais, which would prove of inestimable value to the people at large. This little book is full of such wise suggestions, and the translator has rendered it so faithfully, that it entitles him to the thanks of all those who cannot otherwise make acquaintance with the distinguished author.

The collected works of the Rev. Sydney Smith[4] will be received with no slight enthusiasm by the reading public, to whom his brilliant essays in the Edinburgh Review are already well known. In this collection we have the celebrated Letters of Peter Plymley, now acknowledged for the first time. When the last edition of these Letters was published the author disavowed them, or at least repudiated ambiguously the honour of their authorship. The custom of anonymous writing is understood to sanction a *ruse*, which, in this case, at all events, deceived nobody. The spirit of the witty divine could not be mistaken; for who but Sydney Smith could have thrown so much caustic ridicule, so much playful illustration, and so much practical intelligence, into a series of papers on Catholic emancipation? The pamphlets on the ballot, the correspondence with Archdeacon Singleton, the criticisms on the "Consecrated Cobblers," which excited such curiosity several years ago in the Edinburgh Review, and a variety of pieces on education, slavery, colonisation, and other topics, are gathered into the volumes, and present on the whole a sufficient amount of talent and knowledge to justify the high reputation which their author has long enjoyed. We learn from the preface that the Edinburgh Review was suggested in the first instance by Sydney Smith, who commenced it with Brougham and Jeffrey. Perhaps there is no living writer who excels him in the art of hitting the exact point of success in periodical literature. His essays are illuminated all throughout by an incessant play of wit; but so diversified in manner, and so rich and varied in its resources, as never to fatigue the attention, supplying, on the contrary, a succession of agreeable and diversified excitements. The charm of these compositions consists in the admirable union of sound sense and healthy vivacity. They make you think while they make you laugh, and render intellectual enjoyment subservient to the ends of utility. A tolerant spirit pervades the publication. While he advocates the maintenance of the church establishment (which is natural enough), the author demands the best means of maintaining it by urging upon its "heads" the necessity of just and extensive voluntary reforms. Upon the question of the ballot alone he seems to retreat behind the advancing spirit of the age. He ridicules the machinery of the ballot-box, endeavours to show that it is averse to the national character, and struggles hard to prove that a dishonest man may be

[4] *The Works of the Rev. Sydney Smith.* In Three Vols. London: Longman & Co. 1839.

as dishonest in the dark as when he has the eyes of his neighbours watching him. But all this is beside the real argument. The machinery may be puerile and cumbrous — a fanciful national character (wonderfully distorted by undue influences in the present state of things) may be irreconcileable with secret voting — and neither the ballot-box nor any other ingenious contrivance can make rogues honest; but what is wanted is protection for the voter. Give him, at least, the chance of acting honestly, without the certainty of being kicked out of doors for it if "unsuitable." Now, as the Rev. Sydney Smith does not propose any better practical mode of enabling a man to vote so that he shall incur no penalty for voting agreeably to his conscience, all this ridicule — apt as it is — goes for nothing. The ballot may not be desirable *per se*, but it is the only resource left; nor does it exhibit to advantage the usual sagacity of the writer that he should be found opposing a measure which recent circumstances, even putting out of view all past experiences, appear to have rendered inevitable.

"The Forester,"[5] by Miss Boyle, is a romance of the times of the English revolution of 1688. The interest of the story is skilfully preserved through a series of vivid incidents; the characters are strikingly contrasted and individualised; and the historical *tableau* is drawn and coloured with fidelity. The loves of Lord Fleming and Mary Savile, attached to the fortunes of king James, constitute the main plot. The lovers are estranged by false reports, are reunited by explanations towards the close, and are permitted by the generosity of William III. to follow their beloved mistress, Mary of Modena, into exile. This narrative of ruffled attachment and personal devotion is very touchingly related; and in the delineation of Mary Savile a very high order of ability is exhibited. She occupies a prominent place in the foreground, and reminds us of those figures of marvellous beauty, resignation, gentleness, and truth, for which Raffaelle, Guido, and others among the old masters, are so eminent and unrivalled.

The successful and useful labours of the missionaries in the South Seas has furnished the subject of a very affecting little poem, entitled "Polynesia."[6] The difficulties encountered in the first instance, the savage customs and rude idolatry of the aborigines, the gradual introduction of Christianity, the arts of civilisation, and the final transformation of the scene from the wild usages and wilder tenements of barbarian life to the placid and peaceful habits and orderly life of a religious community, are treated with remarkable simplicity and poetical fervour. The versification is melodious — the images are chaste and highly appropriate — and the purest taste, in sentiment and diction, prevails throughout. Some of the descriptions of Tahiti are highly graphic, and worthy to be ranked as companion sketches to the beautiful cabinet views scattered through the tales of St. Pierre.

"Ninian," a poem in three cantos[7], is of a different class. It is a tale of horrors — partially suggested by a tragical incident in Prince Puckler Muskau's "Tutti Frutti" — full, to the running over, of disappointed love, insanity, and suicide. The subject is ill chosen and worse treated. The "fatal facility" of the octo-syllabic has seldom been more painfully illustrated.

The "Old Sailor" gives us a novel, in which he blends, more truthfully

[5] *The Forester: a Tale of* 1688. By Mary Louisa Boyle. Three Vols. London: Longman & Co. 1839.

[6] *Polynesia; or, Missionary Toils and Triumphs in the South Seas.* A Poem. London: John Snow. 1839.

[7] *Ninian.* A Poem, in Three Cantos. By John Wilson Ross. Edinburgh: Adam & Black. 1839.

than the majority of our naval writers, the traits of life ashore and afloat. "Hamilton King[8]" is a cleverly constructed story. The scenes at sea, especially the chase of the "Blue Bob," and her escape through a storm on the Irish coast, are powerfully described. In this element lies the main strength of the author; on land he is less felicitous, and sometimes hurries us into unpardonable extravagancies; but his characters are nevertheless life-like and vigorous, and the action of the tale is exciting and dramatic. The portrait of the Dwarf is appalling, and some of the sketches of subordinate persons are extremely well conceived. The great defect of the novel, considered as a work of art, consists in the introduction of numerous episodes, which interrupt the continuous interest and perplex the attention of the readers. This error is very frequently committed by the authors of naval fictions; they seem to have too little faith in their powers of invention to rely implicitly upon the development of the principal narrative, and hope to mend it by collateral aids. They overlook the importance of unity in productions of this kind, which are never so moving and absorbing as when they are simple, clear, and uniformly progressive.

A curious and interesting work upon Metaphysics, in relation to the principles of reasoning, by Sir Graves Chamney Haughton, may be recommended to the careful perusal of the students of logic and philosophy. The volume is entitled "Prodromus[9]," and its main object is to develop the right use of language *quoad* things. A variety of other considerations branch out of this principal trunk; and we are conducted by a process, at once perspicuous and profound, into a series of inquiries which are well calculated to improve our choice and use of words, and, as an inevitable consequence, to render our views of all the subjects, of which we speak and think, more accurate and determinate. Sir Graves Haughton repudiates the employment of what are called abstract terms. He grapples boldly with the Nominalists; maintains that abstract ideas are pure moonshine; that it is utterly impossible for the mind to contemplate or comprehend an idea, unless we attach it to something actually existing in nature; that every abstract word implies either a state or an action; and that when we talk, for example, of goodness, we mean the *state* of a man who is good, that is, a *good man's state;* and by *vibration* and *movement*, we mean the *action* of bodies that *vibrate* and *move*. If this discussion proceeded upon the actual signification of the word "idea," there could be no doubt of the correctness of this argument; but waiving that point, we think it must be admitted that the entire subject, as it is laid down by our author, is fortified on all sides by general experience and common sense; but where such fortifications end, the author will admit of no more things "in heaven and earth than are written down in *his* philosophy." The fault of the work is its tendency to encourage the too material and mechanical spirit of the age, and proportionately to bring into contempt all subtle abstract inquiries. The work is, nevertheless, deeply interesting, and is written with remarkable precision and excellent taste.

We have to notice a series of very useful and pleasing little publications, cheap in price, and of waistcoat-pocket portability, entitled "Hand-Books for the Million."[10] They comprise rudimentary instructions in various departments of both useful and ornamental knowledge and art; such as the

[8] *Hamilton King; or, the Smuggler and the Dwarf.* By the Old Sailor, Author of "Tough Yarns," &c. Three Vols. London: R. Bentley. 1839.

[9] *Prodromus; or, an Inquiry into the First Principles of Reasoning, including an Analysis of the Human Mind.* By Sir Graves Chamney Haughton, K. H., M. A., F. R. S., &c. London: Allen & Co. 1839.

[10] *Hand-Books for the Million: a Series.* Tyas. 1839.

German language, archery, short-hand, swimming, cooking, architecture, &c. We have examined three of them, taken up promiscuously, and found much reason to be pleased with their concise and clear information as primers. The "Swimmer's Hand-Book" does all that words can do to teach the beginner how to save his own life, and after the ordinary mode of swimming has been learned, how to swim on the back, or like a dog, or to "creep" on the water, in order to break through or pass over weeds, which are most dangerous things to get among. The method proposed for the acquirement of "confidence" is also good; and the art of hanging in the water, called "the suspension by the chin," is as clearly expressed as the advantage it gives of entire rest for an indefinite period is valuable towards the preservation of life. It contains no artistical tricks and tumbling tom-fooleries; but is simply practical throughout, as any experienced swimmer may see at a glance. The "Hand-Book of Archery" is sufficiently complete in all necessary details, which are very accurate, from the method of "proving the bow," to the fair and unimposing price of "the grease box." The "German Scholar's Hand-Book," as far as it goes, is the most clear, comprehensive, and concise book of elementary instruction in that language we have ever seen.

This is the season of the vintage on the Rhine. The progress of fashionable transmigration through that quarter has increased of late years in the geometrical ratio. The statistics of the river would furnish a more curious table than ever entered into the most complicated dreams of M. Ceasar Moreau. What eyes with souls in them, — what hearts full of incommunicable emotions, — how many people whose thoughts were absorbed in the "castled crags" and pendant vineyards, the churches buried in foliage, the picturesque rafts, the historic monuments, the ruins of forts and cities, the panorama of a thousand stories, — how many people whose thoughts were elsewhere, yearning for quiet home-scenes and distant associations, hallowed by some secret spell of the affections, — and how many people who had no thoughts about any thing except themselves, to whom these miracles of nature and glories of art were no better than blind outlines — mere stones and naked hillocks, and who passed up the Rhine, as the camel traverses the desert, exhibiting all his stupor and dulness, but lacking his patience and his bells! Could we get a catalogue *raisonnée* of the crowds who congregate in the Preussich-Rheinish-Dampf-Schiff-Fahrt Company's pretty little boats, what a world of contradictions, and passions, and perplexities, of enjoyments and disappointments, it would open to us! The English form the majority of the tourists, and the English, of all nations, are the very last to enter heartily into the spirit of the scene. They spoil everything by their ostentation and their dyspepsia. They carry their gloom and their unbending manners into the very depths of the green solitudes, and look as if they thought the hills and the forests were not sufficiently patrician for them. The blood of the courtezans of Charles II., of money-lenders and parasites, coursing through the veins of mushrooms, spurns the old Teutonic mountains, and revolts haughtily from the races of northern and central Europe! This miserable and most selfish pride is a mockery all over the Continent. The poor German student, with his wallet at his back, his cap in his hand, and his head full of erudition and enthusiasm, smiles at the empty vain-gloriousness of the travelling English. A fractured plinth of some antique dilapidated statue is more inspiring in his sight than all their cold grandeur, their equipages and their lackeys. But we have forgotten all this while reading the suggestive book that carried us away into the trellices and

wrecks of the Rhine,—a small volume of Letters from an Autumn Tourist [11], who, starting from Hamburg, made a little journey through the German cities, and relates very concisely and agreeably the results of his observations. He tells us nothing which is not already familiar to the mass of travellers, and is deficient in the power of bringing the places through which he passed vividly before us. There is too much reflection in the book — too much speculation, and too little sentiment. In such publications we look for feelings translated into pictures, and not pictures broken up into wise saws; yet, as it is impossible to write about strange sights, and to keep the imagination wholly apart from the process, the reader will find, here and there, a few passages that cannot fail to interest him. But he must not rely upon it *en route;* it is not full enough, minute enough, or accurate enough for reference. The best book of that kind extant is the Hand-Book [12], which, although it does not come within the period legitimately embraced by our notices, we may venture to recommend, at this seasonable opportunity, to all tourists in Holland, Belgium, Prussia, and Northern Germany. It is written with extraordinary care and precision, contains information upon every point essential to the stranger — the choice of inns, routes, and modes of travelling; the value and variations of different currencies; the sights to be seen, and the best way to see them; and is also entitled to praise beyond every preceding guide book for the good taste and literary ability it displays throughout. The real importance of such a work may be estimated from a glance at the great increase that has taken place in the number of visitors to the Rhine, from the different lines by which that magnificent river can be reached, — Holland, Nassau, Switzerland, France, Hanover, Belgium, &c. In 1827, the old company's steam-boats conveyed 18,000 passengers up and down between Cologne and Mayence, the termini of the principal beauties: in 1836, the number had increased to 136,000; and in 1837, to more than 150,000. Last year, an opposition company was established, by which means the facilities were increased, and the fares lowered; so that a still greater number may hereafter be calculated upon to whom information of this kind will be necessary.

Of Robson's "Greek Lexicon to the New Testament" [13] we need not say more than that it is very well calculated to answer the purpose for which it is designed. We wish we could say half as much of Mr. H. G. Knight's "Hannibal in Bithynia." [14] He has mistaken the fatal talent of verse-making for the genius of poetry, and he accordingly presents us with the facetious "second edition" of as excellent a crop of dullness as ever grew upon the broad table-land of mediocrity. It rather reminds us of the Spanish Drama, without its music and its pomp.

THE MONTHLY CHRONICLE.

LORD NORMANBY'S ADMINISTRATION IN IRELAND.

Lord Roden's Speech on moving for a Committee on the State of Crime in Ireland.

Report from the Select Committee of the House of Lords on the State of Ireland in respect of Crime; with Minutes of Evidence, Appendix, and Index.

When the future historian of this kingdom shall enter upon the period which embraces the acts of the present Administration, and when he shall have collected before him the strange materials out of which the fluctuating narrative is to be wrought, he will be amazed by discovering the most brilliant and remarkable feature of the whole presenting itself prominently in the very last place where he could have expected to find it. If any man had predicted, ten years ago, such an anomaly as the existence of the most lamentable disorders and party warfare in England, paralysing the course of legislation, and invading even the domestic retirement of the sovereign, while Ireland should contemporaneously exhibit a rapid diminution of crime, a growing confidence in the impartial administration of the laws, and an enthusiastic attachment to the Government; if any man had ventured to prophesy such a state of things as this, so contradictory to all past experience —so utterly irreconcilable with the principles upon which the affairs of the two countries have been invariably conducted, from the time of Henry II. to the commencement of Lord Normanby's administration — he would be treated with the contempt and ridicule that are usually showered upon visionaries and blockheads. Yet this state of things has actually come to pass; the extraordinary phenomenon of an Irish administration dispensing pure justice to the people, correcting social abuses, repressing crime, and abolishing those feudal barbarities which had long demoralised and disorganised the population *, has actually taken place; and throughout the whole term of this novel experiment of benevolence and wisdom, England has been convulsed by riots, and the machinery of Government obstructed at all points by an imperious and malignant faction.

The merits of the Marquis of Normanby's administration in Ireland are of so signal and striking a nature, that they do not admit of any such doubts as may possibly attach to any other parts of our policy, at home or abroad. By a singular felicity in the appreciation of the national character, and in the constancy, activity, and steadiness with which the grand objects of amelioration and improvement were pursued, his lordship's efforts were crowned with complete and unparalleled success. The management of our affairs in other quarters may be open to discussion; but no discussion can arise as to the description and extent of the good conferred upon Ireland by the government of Lord Normanby. There may be a variety of opinions upon the

* For a full account of the faction-fights, see the *Monthly Chronicle* for April last.

policy adopted towards Canada — towards Turkey — towards the West Indies; but there can be but one opinion, drawn from authenticated facts, upon the enlightened spirit in which Lord Normanby conducted the government of Ireland. We assert this deliberately, after a careful and minute examination of all the public documents in which the scattered history of that government is contained; and it is the special purpose of this paper to establish the truth of our assertion beyond controversy.

But if Lord Normanby's government, it will be asked, presents such undeniable grounds for admiration and gratitude, how has it happened that a committee of the House of Lords was actually formed for the express object of instituting a rigid inquiry into its conduct; that Lord Roden, and a great many other lords denounced that government as the greatest calamity that had ever befallen Ireland; and that the impeachment of Lord Normanby was not only contemplated, but confidently anticipated, as the inevitable result of that investigation? The answer to this question is, simply, because the purity and integrity of the administration rendered it obnoxious to the enemies of order, of freedom, and of justice. If we required a collateral proof, clear and indisputable, of the wisdom of Lord Normanby's administration, we should refer to the conclusive fact, that it had incurred the hatred of Lord Roden. To those who know Lord Roden, who have accidentally noticed the colour of his opinions, the crazy superstitions he has from time to time embraced with the credulity of a dupe, and promulgated with the zeal of a fanatic; who have observed the unwearied hostility with which he has prosecuted a sort of parliamentary crusade against every measure that has been introduced for the improvement of his native country, this answer would be complete and decisive: but as every body cannot be supposed to know even that there is such a person in existence as Lord Roden, and still fewer to be aware of the spinal distortion with which his lordship's judgment is afflicted, it becomes necessary to exhibit evidences of a different and more comprehensive kind. Had Lord Normanby's administration been distinguished by appeals to the gibbet and the bayonet; had it deluged Ireland with blood, forced the wretched and oppressed population into rebellion, and then taken advantage of its own criminality to wreak a sanguinary vengeance upon its victims; had it substituted fraud for justice, force for reason, and allowed a rampant faction to continue paramount over the people; had it endeavoured to stifle the operation of the law, and to rob the Catholics of the rights they had acquired under it; had it encouraged conspiracies against the British connection, for the purpose of creating a pretext for a military despotism; had it revived religious animosities, corrupted the tribunals, and overrun the country with fire and sword; had Lord Normanby's administration been dignified by such honourable exploits as these, not a murmur of censure would have been breathed against it in the House of Lords, and the world would never have heard one word about Lord Roden's Committee of Inquiry!

That the foreground of the political picture should be occupied by so mean a figure as Lord Roden is not a little astonishing; but it is at the same time characteristic of the preposterous nature of the whole proceeding. If the Tory party really thought that the inquiry was likely to terminate in results creditable to their sagacity, or calculated to strengthen their power; or if they sincerely believed that there was a particle of foundation for the grave charges which were so vehemently levelled against Lord Normanby, is it to be supposed that they would have committed the management of the case to an individual so utterly destitute of all the requisite qualities of personal weight and statesman-like ability as Lord Roden? Where was Lord

Lyndhurst, who holds the brief of Toryism, on this momentous occasion? We happen to know that Lord Roden had no sooner announced his intention of moving for a committee — which, it is only right to observe, he had formed upon his own responsibility, and without consulting with any of the members of his party — than the leading Tories, both in the Lords and Commons, were thrown into a state of consternation which they did not attempt to conceal. * They saw the jeopardy in which the rash and furious bigotry of Lord Roden had placed them; but it was too late to retract, and the only alternative that remained was to follow out the investigation to its consequences; to protract it as long as they could; and to employ all the arts their ingenuity could devise, to extract mischief from its progress.

With the issue of the labours of that committee our readers are already acquainted. But although its failure, not merely to establish the general accusations enumerated by Lord Roden against Lord Normanby's government, but even to establish the truth of any one isolated fact amongst the multitude of facts stated by Lord Roden, and upon the presumed veracity of which the House of Lords consented to grant the committee, is a matter of public notoriety, it is not so well known that the evidence taken before that committee affords such overwhelming practical illustrations of the extraordinary benefits which have flowed upon Ireland from the administration of Lord Normanby, as we will venture to say even Lord Normanby himself could hardly have anticipated. It must be borne in recollection, that this committee was formed in a spirit of avowed hostility to Lord Normanby; that a large majority of its members were selected from the Opposition; and that the Government, in the first instance, openly abandoned all participation in its proceedings. We will not affect to conceal our conviction that the Government ought not to have left the vindication of their policy to be thus worked out by its own innate force; that they were pledged to sustain, in the house and in the committee, the acts which they had done out of the house in their administrative capacity; and that, if the chivalry they exhibited in relying implicitly upon the justice of their cause challenges admiration on the one hand, it exposed on the other a want of discretion, which must have endangered any cause less fortified by truth. Under such unfavourable circumstances it might have been expected that even the strongest case would have been perverted; that the testimony would have been led insensibly into unfriendly channels; that the weaker parts of the details would have been expanded, and the more important passed over slightly, or cast into shadow. Yet, notwithstanding these circumstances, the evidence, instead of justifying Lord Roden on any solitary point—instead of yielding the most minute inference in support of the vaguest censure upon the Government, exhibits from the beginning to the end an uninterrupted series of irrefragable proofs that Lord Normanby's administration of the government of Ireland produced more salutary effects in that country, laid the foundation of more permanent good, and removed a greater amount of real evil, than all the administrations added together from the commencement of our connection with Ireland up to the hour when his lordship took charge of the government! We state this with a full and profound impression of the value of the words in which

* Upon the 21st of April, 1839, Lord Roden, in the House of Lords, charged Lord Normanby with having encouraged crime, and the House of Lords granted him a Committee of Inquiry on the strength of that charge. Upon the 22d of April, 1839, Sir Robert Peel, in the House of Commons, expressed himself in the following very remarkable words: — "I DO NOT SAY THAT THE IRISH GOVERNMENT HAS ENCOURAGED CRIME. . . . I WILL NOT VOTE ANY CENSURE, OR CONCUR IN ANY CENSURE OF LORD NORMANBY . . . WHOSE GOVERNMENT IS IN SEVERAL RESPECTS ENTITLED TO MY HIGHEST APPROBATION."

we shape the statement; and, before we conclude, we will demonstrate its accuracy. The whole body of the evidence must be regarded as the most noble panegyric that ever was drawn up on the conduct and services of a public man; and the country have much reason to be grateful to Lord Roden for putting them in possession of so much valuable information. Had it not been for Lord Roden's committee, Ireland could never have known how deeply she was indebted to Lord Normanby's administration.

It is not alone that the evidence adduced and sifted before the committee does not prove Lord Roden's assertions to be true, but that it proves them to be false. It is not alone that the evidence proves his assertions to be false, but that it proves the contrary of them to be true. We suppose it is desirable that we should, once for all, hold ourselves to be free from intending or desiring to impugn his lordship's private veracity in the freedom which we feel it to be our duty to use in dealing with this subject on public grounds. We are quite conscious of the importance of that political convention, which assigns one morality to a man in his public capacity, and another morality to him in his private capacity; and it will, probably, save some trouble in the way of subsequent explanation, if we observe that we are now, and all throughout, speaking of Lord Roden in his public capacity alone, just as Lord Roden thought fit to speak of Lord Normanby in his public capacity.* When, therefore, we say that the evidence proves Lord Roden's assertions to be false, we mean the assertions he made in his public capacity, which of course do not come within the consideration of Lord Roden's character in any other light. What Lord Roden's respect for truth may be in his private capacity we know not; but as it is generally admitted that a man may be a great lover of truth in private, and yet not in any way answerable for his faith in public, we have no reason for doubting that Lord Roden may be a miracle of truth throughout all his domestic and social relations. Having thus cleared our conscience of all misgivings, we will proceed to the details requisite to disentangle the truth from the web of most fallacious assertions in which it was concealed by Lord Roden — in his public capacity.

The documents to which we shall refer are, first, Lord Roden's speech, containing his general and special allegations against the Government; and, second, the minutes of the evidence taken before the special committee. The evidence occupies three large folio volumes, and contains 15,384 questions and 1336 pages. As it may be assumed that very few readers, who are not compelled into the examination of this vast mass of matter, either by some personal, political, or professional necessity, are ever likely to satisfy their curiosity on the subject by such a careful perusal and classification of its contents as could alone enable them to arrive at a comprehensive view of the numerous topics it embraces, we believe we shall have performed a useful service in drawing out the principal points from the body of the evidence, and placing them under the several heads to which they refer. In order to avoid any danger of obscurity, we will separate and number, in consecutive order, all Lord Roden's charges, upon his power to prove the truth of which he deliberately claimed a select committee at the hands of the House of Lords; and will subjoin to each charge a distinct answer, derived in substance from the testimony of the witnesses, supplying the numbers of the question in the printed evidence, wherever a reference may be necessary for the further satisfaction of the reader.

* "He was speaking of the noble marquis only in his public capacity as a public officer; and, as a public man, he had a perfect right to deal with him in that house, and to arraign those proceedings under his government of Ireland which had been, he thought, so detrimental to the public safety."—*Lord Roden's Speech in the House of Lords.*

The first tangible statement refers to the deplorable condition of the Orangemen; for they, we presume, comprise the only portion of Irishmen whose "confidence" Lord Roden can be supposed to enjoy.

"I. That the distress — the deep and great distress [*Times*] — the great tribulation [*Morning Chronicle*] — to which that portion of his countrymen whose confidence he enjoyed were then reduced, had arrived at a degree which in his lifetime had, until very lately, been wholly unknown; and that in such circumstances he would be acting in a very criminal manner, if he did not come forward and state plainly the causes which rendered life and property insecure in Ireland.

"II. That the tranquillity mentioned in the speech from the Throne in the preceding session was the tranquillity of death."

These statements may be briefly disposed of. The whole testimony taken before the committee, from Sir Michael O'Loughlin and Judge Moore down, shows that no outrage is ever committed against a man upon account of his religion or politics; that the outrages are indiscriminately committed against both Catholics and Protestants, and most frequently against the Catholics, because they are the most numerous and the most assailable; that outrages of every kind, and for every cause, had diminished during the progress of Lord Normanby's government; and that the country generally, during that period, enjoyed a degree of real and living tranquillity, which had long been unknown in Ireland.

In support of these facts a few passages may be cited from the Evidence, and reference may be made to the whole.

Mr. Barrington, crown-solicitor for the Munster circuit, says, that there being no manufactures in the country, the actual existence of the peasantry depends upon their having land; the whole disturbances of the country depend upon the desire to keep it [7641.]; that it does not make a particle of difference, whether the person put in is a Catholic or Protestant — he is equally the object of their fury, and they would murder him equally [7640.]; and that, in his thirty-five years' experience, he never knew an outrage committed for a political object [7437.].

Major Warburton says, that the causes of faction-fights are universally local and personal [692.], and that the outrages were directed against Catholics as well as Protestants [1000.].

Mr. Maxwell Hamilton, crown-solicitor for the North-east circuit, says, that no outrages were committed against Protestants, as such, nor any of a rebellious character [9100.].

Mr. Kemmis, crown-solicitor for the Leinster circuit, says, that on the Leinster circuit outrages are mostly agrarian, committed neither on account of religion nor politics [6817–18–19.].

Mr. Piers Geale, crown-solicitor for the Home circuit, says, that it scarcely ever happens that religion has any thing to do with outrages on the Home circuit [8710.].

Mr. Cahill, sessional prosecutor for Tipperary, says, that the crimes which he knows to have been committed in Ireland were totally disconnected with politics [10,895.].

Judge Moore says, that the disturbances of 1830–31 had nothing of a political or a religious character [14,379–80.].

Mr. Hickman, crown-solicitor for the Connaught circuit, says, that he never knew one offence committed against a man on account of his religion [8404.], nor any of a rebellious character; that they all arise from land, wages, &c. [8406–7.].

Mr. Tierney, crown-solicitor for the North-western circuit, says that almost all the offences on that circuit arise from dispossessing tenants and occupiers [7727.].

With respect to the "deep distress" and "tribulation" of the Orangemen, the Evidence furnishes some curious information, of which take the following remarkable samples: —

Mr. Hamilton says, that on the 17th of January, 1835, the Orangemen assembled in vast numbers, and set fire to a number of houses of the Catholics at Armagh [9139.]. The Roman Catholics had therefore all left their houses on that day (17th January) [9144.]. This outrage was perpetrated to revenge the waylaying and beating of the Orange party coming from the Armagh races in the preceding October. They had previously given notice of their intention to do so, unless reparation was made for the damage done to their hats and clothes in the preceding assault [9141.]. *They marched down to the commission of the outrage publicly, in the middle of the day, with drums beating, colours flying, and bayonets fixed* [9145.].

Major Brown. — "I was sent to Belfast in 1836 to meet them. I found the *Protestant mob the worst mob I ever met in my life.* I was never so abused, although I am a good Protestant. They put up an effigy of O'Connell, and shot at it [5101.]. According to my belief, Ribbon Societies began in the North [5115.]. *And that they may have been formed many years ago for the purposes of protection*" [5105.].

Mr. Drummond says, that so many Orangemen were found guilty, in autumn, 1837, *that there was a difficulty in finding room for them in gaol*, and the ringleaders only were selected and punished [12,309.]. Stipendiary magistrates were sent to the North, *because it was the opinion of the Government that the local magistracy, with some distinguished exceptions, did not interfere in the manner which their duty required* [12,329.]. They were out of the way [12,330.]. Those processions had been in existence for many years, *and nothing was done to suppress them until* 1835 *and* 1836 [12,343.]. Believes that, were it not for the stipendiary magistrates, the processions would now be in as active operation as ever [12,345.]. There was a great extension of clemency in the spring of 1836; yet they persisted in walking in procession on the 12th of July of that year [12,337.]. There occurred a "most wanton and premeditated murder" of "four brothers," out of a party of twelve, consisting partly of children, who were sitting round a fire, on a hill, in the county of Monaghan. The youngest of the murdered persons was nine or ten years old. They were all Catholics, belonging to a family of the most industrious, well conducted, quiet, inoffensive, and peaceable character, and entirely free from all party spirit. "This diabolical murder," the police inspector calls "the most wanton, unprovoked, cold-blooded, premeditated, and cruel, that ever came under his notice." No clue to the perpetrators has been discovered [15,079.]. In another case seven cabins were in flames in Armagh, fired by the Orange mob, all armed (being yeomanry), *who marched off the ground with sloped arms, in regular order, drums beating, colours flying* [15,080.]. It was known beforehand to the magistrates of the neighbourhood, *who did not interfere, and who might have prevented the outrage, which was committed openly between twelve and one o'clock.* Another house burnt on the 21st of January, and one attempted to be burnt on the 29th. They all, of course, belonged to Catholics.

Lord Gosford, after a close and minute inquiry, reports that it was a most wanton and atrocious outrage, without any palliation.

Such are a few illustrations of the "deep distress" and "tribulation" of the Orangemen furnished by the Evidence.

"III. That he well knew that at the time there was in existence, and in full operation in that country, a *combination* of the most dangerous and alarming kind, the effects of which had been to terminate the lives of many of those whose exemplary conduct had brought them within the vengeance and under the ban of this foul and bloody proscription.

"That the facts which he meant to quote upon this subject were literally and truly facts; and if he were not convinced that he could prove them to be so before a committee of their lordships, he should not have ventured to trouble the house on the subject. He should be able to prove that combination and crime existed to such a degree in Ireland as called for the interposition of the legislature, and strongly demanded inquiry at the hands of their lordships. That country was now suffering under a tyranny, was now groaning under a system of proscription, which he believed was altogether unknown in any other country in the world. He had taken his statements from different counties, in order to show that crime was not confined to one or two counties; that it was not confined to Tipperary or Westmeath, in which there had always been crime. No: he should prove that crime, in its most frightful and repulsive forms, was extending to all the counties of Ireland."

[In this part of the speech, however, he introduced several observations about the state of the county of Longford and the property of Lord Lorton.]

The general assertions contained in this statement, about the "existence" and "full operation" of a most dangerous combination, shall be answered a little lower down, when we come to the details in which his lordship indulged on this subject. The want of lucid arrangement in the distribution of the topics referred to in the speech, obliges us to group them ourselves, in order that we may exhibit the assertion and the refutation side by side. When we come to the examination of this awful confederacy, it will be seen that his lordship's facts, instead of being "literally and truly facts," are, in so far as they are of any importance, or have any tendency to support his general propositions, "literally and truly," nothing more than mere flights of a diseased imagination.

The statement about a system of proscription is another monster of his lordship's brain, in support of which there is not a *scintilla* of evidence of any sort whatever, notwithstanding that his lordship assured the house that he would not have ventured to trouble them about these matters, if he were not prepared to prove them. His lordship indirectly assigns to the counties of Tipperary and Westmeath a decided pre-eminence in combination and crime. In reference then to these counties, let us look at the evidence of witnesses, whose local acquaintance and long connection with those counties qualify them to form the most accurate opinions on the point.

Mr. Piers Geale, the crown-solicitor for the Home circuit, states, that the whole circuit, including Westmeath, is more peaceable than it was [8575.]. Few prosecutions had taken place in Westmeath of late years [8586.]. In 1827 there were forty-six cases prosecuted by the Crown, and seventeen capital convictions, and fifteen executions. This was in one town (Mullingar), and at one assize. In 1833 there were forty prosecutions, many convictions, and nine executions in Philipstown. In 1834 seven persons were executed at Trim in Meath. Those are cases you seldom hear of now [8580.]. Meath is now very tranquil [8577.].

Mr. Kemmis, the crown-solicitor for the Leinster circuit, states, that three-fourths, or more, of the outrages committed in Tipperary are attributable to the letting of land [6743-4-5.], that, according to his experience in Ireland, crime increases in proportion to the increase of population [6756.]; that population in Tipperary has considerably more than doubled within the last twenty-eight years [6759.]; but that crime has *not* doubled [6760.]. And even Lord Donoughmore, who cannot be suspected of any great affection for Lord Normanby's administration, carries the case no farther than by stating that Tipperary *has not improved* within the last twenty years [11,999.]. Mr. Cahill, however, expressly states that it has. The commencement of such improvement, he says, was after the spring of 1836 [10,785.]; and the cause of it was the superior manner in which justice was administered, and the confidence which the people felt in those who were

engaged in its administration [10,786.]. Mr. Tabiteau states, that there are about the same number of homicides in Tipperary every year [9634.]; that he does not think the rights of property secure there; but that such has always been the case, and that no decrease of security has occurred within the last five years [9665-74.]. The whole testimony concurs in showing that there is no general system of combination in Tipperary for the purposes of outrage.

Mr. Howley, chairman of the county, says, "I have never seen a single trace of Ribandism in Tipperary, nor heard of any such in any intercourse with the magistracy, *nor of any other sworn confederacy.* I have made vigilant and anxious inquiries into the state of crime in Tipperary, and all the means of judging in my power lead me to conclude that there is no such conspiracy; and if any other person told me he believed it to exist, I should suppose he was mistaken" [10,098–101.].

Mr. Cahill says, "I am perfectly convinced that there is no such thing as Ribandism in the country with which I am acquainted. *It could not be without my knowledge, and I have never had the* SLIGHTEST INTIMATION OF IT" [10,781.].

Lord Donoughmore says, "I KNOW NOTHING OF ANY SECRET SOCIETY IN TIPPERARY" [12,128–30.].

With respect to the county of Longford, to which Lord Roden also refers, Mr. Barnes states, that in 1836-7-8 more than 330 ejectments issued from the Quarter Sessions Court [11,800.]; that the murders then committed were in consequence of persons being turned out of their land, and strangers put in [11,755.]; *that the parties ejected were all Catholics, and those put in all Protestants* [11,756-8.]; that up to 1833 the barony of Longford was the quietest in the county, and the county itself the quietest in Ireland [11,834.]; that there are six baronies and thirty-six police stations in the county of Longford; and that of these thirty-six stations there are twelve in the barony of Longford, in which Lord Lorton's property is situate [11,792-3-4.]. Mr. Barnes further goes on to state, that he received the strictest orders from the Government to *leave no stone unturned* for the discovery of criminals in that neighbourhood, with authority to *give rewards to any amount;* that he received every sort of assistance Government could bestow; and that he consequently discovered the murderers of Cathcart, and has some of them now in custody.

"IV. He then proceeds to state that the conspiracy before mentioned was completely organised in Westmeath, where the gentry and magistracy were only living on sufferance; and desired that their names should not be mentioned as the authors of the information which they transmitted.

"That there was a general organisation in Louth. That such offences, which had formerly been rare in Carlow, were now becoming very common. That in Clare no evidence could be procured in consequence of the intimidation exercised through the conspiracy, and that his information in reference to those several places had been furnished by magistrates who would not suffer their names to be mentioned through apprehension of assassination."

With regard to general outrage in Louth, Mr. Hamilton, the crown-solicitor, says, that "Louth is not very tranquil, although there is not a great deal to be done at the assizes" [8921.]. If there be "a *general* Riband organisation" in the county, its *generality* must be of a truly Irish description, as it appears by the report of Mr. Little, chief-constable, April, 1838, page 417. of the Evidence, that the disturbances there were produced by "*two parties of Ribandmen, who had been beating each other for some time past!*"

As to the general outrages committed in Carlow, Mr. Piers Geale says, that some bad homicides have been *lately* committed there between two brothers, *about property* [8558.]; and upon the subject of Ribandism in that county, Captain Vignolles says, that "*he is not aware of any Ribandism in Carlow*" [3669.].

In reference to the county of Clare, Mr. Tomkins Brew states, that he does not think that, for the last ten years, a homicide has been committed in Clare for which the parties have not been made amenable to justice [12,803.]; that so far from their being any difficulty in procuring evidence, his difficulty was in *selecting* it, as the *witnesses were too ready to come forward* [13,023.]; and he specifically mentions the case of a man, named Shelham, who, after having caused the execution of twelve men, went home and lived unmolested in the county, until he died of a typhus fever in 1837 [13,059.]. Instead, therefore, of witnesses being intimidated by Ribandmen in Clare, it appears that they are not intimidated at all, whilst it is expressly sworn by Major Browne [5081 to 5089.], and Mr. Barrington [7540-1.], that *there is no such thing at all as Ribandism in that county.*

Mr. Barrington states, also, that the outrages which were committed in that county some time ago *have been put an end to*, BY GIVING THE PEOPLE SOME GROUND FOR POTATOES [7343.].

Mr. Brew says, that the *outrages in* 1837 *arose from want of provisions* [13,048.]; and *that crime of* ALL KIND *has been diminished in the county* [13,024.].

It is worthy of observation, that no notice whatever seems to have been taken in the committee of the *anonymous magistrates*, upon whose communications the statements of Lord Roden about those counties appear to have been founded.

"V. He then made the following statement about the conduct of Lord Normanby and his government, in reference to the repression of crime :—Above all, he hoped their lordships would agree to the motion for a committee, as an act of justice to the noble marquis, on whose government rested so much responsibility for those tears of sorrow and streams of blood that had marked the career of his viceregal authority. He was speaking of the noble marquis only in his capacity as a public officer, and as a public man he had a perfect right to deal with him in that house, and to arraign those proceedings under his government of Ireland, which had been, he thought, so detrimental to the public safety. He knew that the noble lord would tell the house that crime had always existed in Ireland, and it would not be denied by him (the Earl of Roden) that unhappily for many years past that country had been stained by crime; but what he said was this,— that never had crime been suffered to go on as it had been by the noble marquis: his predecessors, when they met with crime, grappled with it and subdued it. That he had always acknowledged, notwithstanding any difference of opinion he might have had with former governments, with regard to other departments of their policy.

"After again repeating that the law had not been administered, he said that the astounding fact remained undisputed, that, at the present moment, animosities in Ireland were more prevalent, religious distinctions more marked, the social bonds more extensively broken, the Protestant faith more assailed, and life and property less secure than in any former period since the passing of the legislative act of union. All this he should be able to prove, if they would grant him a committee."

The gross ignorance, or grosser misrepresentation, exhibited in the allegations contained in this statement, is altogether unprecedented. The whole of the Evidence proves, that the anxiety of Lord Mulgrave to *anticipate*, *repress*, and *punish* every degree and kind of crime was perfectly morbid; and that he carried the practice of giving rewards for information to an extent which exceeded any thing that had ever been done by any preceding government. Not only does the Evidence prove this by the testimony of witnesses drawn from all parties, but not one syllable of testimony of a contrary character was adduced upon the inquiry. Lord Normanby not only

did grapple with crime when he met it, but he made many and very expensive efforts to grapple with it even where it was not visible, and where, perhaps, it did not at all exist.

The evidence upon this subject, as far as it relates to repression, detection, and punishment, is complete; but it is unavoidably broken up into such a number of small facts, that it will necessarily carry us into lengthy details. Upon the very important department of the prevention of crime, the best evidence is the account of the efficiency of the police force, both in Dublin and throughout the country; the credit of which efficiency appears upon the evidence to be mainly attributable to the zeal of Lord Normanby, and his abandonment of even his patronage, in order to enable him to render the police efficient agents alike of prevention and detection.

Mr. Drummond, whose testimony is of the highest importance throughout in reference to this subject, states, that one of the first objects to which Lord Normanby directed his attention was the constabulary force. He perceived, after a short experience, that on this force the Government must chiefly rely for making all offenders amenable to justice, from the perpetrators of the greatest crimes to trivial offenders; and he therefore took into immediate consideration the means by which the constabulary force might be improved. A bill was accordingly framed, and introduced into the House of Commons in August, 1835, by Lord Morpeth, for the purpose of increasing the vigour and efficiency of the body. That bill passed the House of Commons in that session, and was rejected in the House of Lords, and the benefit which would have been derived from a more efficient and a more perfect force was postponed for a whole year. The same bill was introduced in the following year, and passed with some alterations; it effected very great improvements. In the first place, the force was united under one inspector-general, who having an office in Dublin Castle was thus placed in immediate communication with the Government; the correspondence with the constabulary officers in different parts of the country was accelerated; means were afforded of creating a better description of officers; the selection of the men was vested in the lord-lieutenant, and practically in the inspector-general, instead of being, as previously, in the hands of the local magistracy. The bill also provided more effectually for the investigation and punishment of offences against discipline, by establishing constabulary courts; and it gave a greater degree of system and efficiency throughout to the whole constabulary force. Great improvements were also effected by regulation. The lord-lieutenant introduced several military officers to improve the discipline and raise the character of the corps; and having done that, he resolved that all the superior officers should in future be filled by promotion from amongst the chief-constables. His lordship gave up all the appointments, and left the promotion entirely to the inspector-general; and when Colonel M'Gregor was appointed, the whole of the promotions, which had formerly been vested in and exercised by lords-lieutenant, were confided to that officer, on the distinct understanding that he was to be responsible for selecting the most deserving and efficient men. It is now known to the whole corps, that to the inspector-general alone they must look for promotion. The result of this system is, that the constabulary force is unequalled by that of any other country. Such are the improvements introduced during Lord Normanby's government. They depend partly on the act of Parliament, partly on regulation; and, in effecting them, he voluntarily divested himself of the patronage which had been invariably exercised by the lord-lieutenant.

There were two classes of offences which especially attracted the lord-

lieutenant's attention — faction-fights in the South, and processions in the North. These he determined to suppress; and his success is to be mainly attributed to the action of the Government on the constabulary fixing their attention to these violations of the peace. Formerly it was the practice to withdraw the police from the riots at fairs, it being supposed that their presence only led to tumults; but this practice has been reversed, and the best results have followed. The presence of the police, in fact, prevents riots, as it gives greater facility to prosecutions, they being both witnesses and prosecutors, and as it effectually renders compromises impracticable.

Colonel Kennedy says, that the organisation of the force is perfect, that no advantageous alteration can be made in the powers or duties of the body, and that it is perfectly efficient for the accomplishment of its objects [77. 82, 83.].

Major Warburton says, that outrages have decreased, in consequence of the better organisation and increased number of the constabulary [682.].

Mr. Plunkett says, that Roman Catholics and Protestants discharge the duty equally well [4680.].

Lord Donoughmore says, that the constabulary is an admirable and well-conducted force [12,115.].

Major Browne says, that when a man is recommended by Government, he does not take him unless he has the necessary character, appearance, and so forth [5172.]. Promotion is the consequence of exclusively good conduct [5177.]. The men have never shown any party spirit, nor any degree of religious dissension [5181.]. No appointments of officers or men have ever been made subservient to party purposes. The Government never recommended any men, except two, whom they refused as being too short [5192.]. They are one of the most noble corps that was ever seen. He had served in some of the king's regiments, and never saw a body of men to compare with them [5196.]. *There was not a man of them that would not arrest the Pope or the Archbishop of Canterbury* [5196.]. *Witness used the Protestant police to prevent an Orange riot, at a meeting in the theatre* [5225–36.].

Of the indefatigable zeal of the Government in seconding the efforts of this admirable body, there are innumerable testimonies.

Mr. Hickman bears evidence to Mr. Drummond's extreme zeal to punish every shadow of crime [8387–91–8.].

Major Browne says, that when any outrage had been committed, Mr. Drummond *was never easy until he got at it* [5056.].

Mr. Sylvanus Jones, stipendiary magistrate, says, that Lord Normanby first introduced the practice of rewarding constables for the detection of offenders [14,527.]; and that of all the governments under which he served, Lord Normanby's was the most persevering and indefatigable in its exertions to discover and punish crime [14,525.].

Mr. Tierney says, that Lord Normanby carried the practice of giving large rewards and protection to witnesses to a greater extent than any preceding lord-lieutenant [7754–7978.].

We might extend these extracts until they filled the whole of this publication; but as every item of testimony in the Evidence tends to the same results, these specimens will be sufficient to disprove the assertion of Lord Roden.

The beneficial effects derived from the organisation of so effective a force, are abundantly exhibited in the remarkable and rapid diminution of crime. Upon this point a great many very ridiculous and contradictory statements have been made in the newspapers, which the Evidence completely and finally overturns by such an unanimity of opinion amongst the witnesses,

including all those who are known to be hostile to the Government, as to leave no room even for speculation on the subject.

In the first place, testimony is given in reference to every county in Ireland by law officers, magistrates, and constabulary officers; and in almost every instance a diminution of outrages is distinctly averred to have taken place under Lord Normanby's administration. In some places riots had decreased in number, in others they had wholly ceased — faction-fights had nearly gone out every where — murders had considerably decreased; and the only classes of offences that had either increased or still maintained their former average, were offences of a minor description.

In addition to this class of evidence, numerous returns are exhibited from the different counties, in which the different classes of crime are specified, and the numbers compared with former years. These returns not only bear out the general statements of the witnesses, but show a numerical decrease of crime in a ratio which, considering the short period within which it was effected, is almost incredible.

We may here observe that a table, extracted from the Evidence, has been published in the newspapers, in which the crimes are distributed under a variety of minute heads; and according to the results of which it appears that the total number of offences committed in the years 1836, 1837, and 1838, exceeded the total number of offences committed in the years 1826, 1827, and 1828, by 4897, or nearly 27 per cent. Upon the surface, therefore, it appears that there has been an extraordinary increase of crime in those years, but an examination of the principal items of which it is composed will at once enable the reader to estimate its real importance. Amongst the items of the increase, we find the following, —

Assaults - - - -	1090,	or twenty per cent.
Riot, breach of the peace, pound breach, &c.	974,	or ninety-nine per cent.
Larceny, &c. - - - -	1840,	or forty-nine per cent.
Misdemeanours, &c. - -	2775,	or one hundred and twelve per cent.
Total - -	6679	

It will be allowed, we believe, on all hands, that these are minor offences, and that they form a very slight feature in the crimes of a country; or that, at all events, however much such offences are to be lamented, they exhibit a lesser degree of depravity than offences that affect human life and the general repose of society. It is not certainly from such offences as these that any individual would be justified in forming an opinion upon the state of a community, but rather from the darker crimes, which violate the rights of property and take away life. The only item of a serious character which has increased during the above three years is that of assault with intent to commit murder, under which head there was an increase of twenty-seven, or thirty-one per cent. But if we turn to the side of the decrease, we shall find such items as the following: —

Murder and manslaughter -	- 56,	or nearly ten per cent.
Shooting, stabbing, &c. - -	- 43,	or forty-six per cent.
Conspiracy to murder - -	- 7,	or twenty-nine per cent.
Abduction - - -	- 29,	or forty-seven per cent.
Burglary - - -	- 164,	or fifty-six per cent.
Arson - - -	- 41,	or fifty-six per cent.
Administering and taking unlawful oaths	- 5,	or nine per cent.
Housebreaking, sacrilege, &c. -	- 548,	or eighty-six per cent.
Cattle, horse, sheep, and pig stealing -	- 299,	or thirty-four per cent.
Forgery, and offences against the currency	- 127,	or forty per cent.
Illicit distillation - - -	- 665,	or seventy-seven per cent.
Vagrancy - - -	- 185,	or fifty-six per cent.
	2169	

Such are the materials which constitute the decrease of crime under Lord Normanby's administration — a decrease which, in every point of view, exhibits an improvement in the morals and prosperity of the country, that cannot be regarded without feelings of gratitude and surprise. His lordship has effected in five years that which all former administrations had failed to effect; and had he continued to remain at the head of that administration a few years longer, there is no doubt that he would have materially elevated the condition and happiness of the people. We might readily exult over these unanswerable proofs of the falsity of Lord Roden's assertions, but no language can improve upon the eloquence of these figures.

"VI. The next subject towhich he was anxious to call their lordships' attention as a ground for the committee he intended to move for, he had before alluded to — the subject was that of a conspiracy in Ireland — a conspiracy, systematic, organised, and secret, and which was directed against the life and property of all who would not join it and support the *treasonable* objects which its members had in view. From that conspiracy the poor farmers were the greatest sufferers; for however anxious they might be for security, peace, and quiet, yet, if they refused to join this conspiracy, or to obey the dictates of its members, they were visited at night, beaten, maltreated, and exposed to the greatest cruelties. The object and ultimate aim of the Riband conspiracy was exactly thesame as those of the Precursor Association, namely, separation from England, in which was involved the annihilation of the Protestant faith: such he believed were the chief objects of both bodies. He had stated before, that the Government were acquainted with the existence of that conspiracy from the investigations of its own officers; and he well remembered that, when he made that statement, the noble marquis opposite had said that he knew nothing of such a conspiracy; and, if he recollected right, the noble marquis also added, that he did not believe such a conspiracy existed."

[His lordship then proceeded to quote the opinion of Judge Burton, that such a conspiracy did exist, and to cite the testimony *on oath* of a Ribandman, revealing the oath of the association (which, of course, he must have taken and violated if his statement were true), the password, &c.; and then referred to other particulars, which merely went to exhibit further illustrations of the general fact, and with which we need not trouble the reader.]

Upon this conspiracy — its treasonable objects — its organisation — and its religious character — the Evidence develops a few very remarkable circumstances. It appears that the only sources of information that have ever been procured respecting it, are ten or twelve individuals, all of whom, without exception, are persons of infamous character, incredible on their oaths from the enormity of their crimes alone; that they all stipulated not to be called upon to prosecute, or to give any test of their veracity; that all attempts at getting information to enable a prosecution to be carried on have, consequently, failed, except one; that the society, whatever it is, is principally kept up by publicans; and that it is composed of the lowest classes. The most remarkable differences of opinion prevail as to the organisation, pass-words, &c.; but it is clearly shown by the evidence that they have no leaders, no central head, and no arms. The objects of the association are also variously stated. One witness says, that he heard the object was to make O'Connell king, and put down the Protestant religion, with the help of the Duke of Leinster; all the witnesses say, that the Ribandmen themselves do not know what their objects are; and Mr. Drummond thinks that the real object is to enable the publicans to make money. The grand difficulty is to ascertain what Ribandism is. Upon this head let some of the principal witnesses speak for themselves.

Major Warburton says, there is the greatest possible difficulty in getting at the nature of it, and that he should be much puzzled indeed to give any description of it [619.].

Mr. Plunkett says, he can't exactly explain what he means by Ribandism [4676.].

Mr. Tomkins Brew says, he never knew what it was [12,740.].

Mr. Barrington says, he hardly knows what it is [7514.].

Mr. Barnes says, he don't know any thing about it [11,806.].

Mr. Hickman says, he don't very well know the meaning of it [8734.].

Mr. Green says, he has read a great deal about it in the newspapers, but don't know what it is [11,656.].

Captain Vignolles says, he knows very little about it [3994.].

Colonel M'Gregor says, he has had reports of the meetings and passwords of the Ribandmen, but could make nothing of them [1621.].

Mr. O'Ferrall says, that whilst he has been in office, he has received a great deal of information about Ribandism, but he knows no more about it than before [4752.].

It being, therefore, clearly impossible to ascertain what Ribandism is, the next thing is to ascertain what it is like.

Major Browne says, it is the same as Whitefootism [5006.].

Mr. Seed says, it is the same as Blackfootism [10,236.].

Mr. Rathbone says, it is the same as Terryaltism [14,448.].

Captain Warburton says, it is the same as Rockitism and Terryaltism [9408.].

Captain Vignolles says, it is the same as Whitefootism and Peep-o'-day Boyism [3611.].

Mr. Barrington says, it is the same as Terryaltism, and Rockitism, and Old Whiteboyism [8430–1.].

Sir William Somerville says, it is a sort of Trades' Union [14,539.].

The issue of all this is, that nobody knows any thing about it; that, whatever it is, its power is a rope of sand; and that no means have ever yet existed by which it could be traced and prosecuted to conviction. The crown-solicitors, who are all men of thirty to forty years' experience, declare that they never had a case of it. We take it for granted, therefore, that Lord Roden's "conspiracy," and all its terrible adjuncts, may be set aside as having no existence whatever. It is, no doubt, the same conspiracy that has been disturbing the slumbers of poor Sir Harcourt Lees for the last twenty years, but which even that energetic alarmist has been wholly unable to develop.

"VII. He said, that the last subject upon which he should trouble the house was more important than any he had yet touched upon, and called imperatively for their lordships' interference. It referred not to the spirit of resistance originating in ti the disputes, or any political controversy, but to the conduct of the Roman Catholic priesthood,—first of all in endeavouring to impede the Protestants in the exercise of their religious duties; and, in the next place, it referred to the conduct of her Majesty's ministers, who, when the facts were represented to them, took no measures for insuring civil and religious liberty to these aggrieved Protestants. He was sure that many of their lordships would agree with him in thinking, that much of the misery and agitation of which they had to complain in Ireland arose from the violence of the Roman Catholic priesthood; and he would fearlessly assert, that many of his poor Roman Catholic brethren, in a humble sphere of life, might be pointed to as examples of a good peasantry, were it not for the lessons they received from those who ought to teach them better things.

"Further on he says, that there can be no doubt but there is organised in Ireland, and that it is in active operation also, a secret, powerful, and dread tribunal, which has assumed to itself the government of the land, and that its members take upon themselves to regulate the affairs of the country, and exercise a power far more formidable than that of the law. They denounce from the altar, they excite the people to lawlessness, and exercise over them an unlimited despotism by the agency of their superstition. There can be no security for the country, nor any hope for its civilisation and prosperity, until this order is put down. *Delenda est Carthago.*"

The general conduct of the Roman Catholic clergy appears from the Evidence to have been exactly the reverse of the conduct attributed to them by Lord Roden.

Colonel Shaw Kennedy states, that the priests in Longford, and generally throughout Ireland, have used their influence for the prevention of crime [347–53.].

Major Warburton says, that he has received great assistance from them; that they have been generally very anxious to assist in preserving the peace, and discovering the perpetrators of crimes; and that they have given previous notice of offences about to be committed [821–7.].

Captain Despard states, that the Riband system had been dormant for a considerable time in some parts, in consequence of the exertions of the Roman Catholic clergy [3219.]. He heard from the priest, that some persons, with whom he had remonstrated, had given up the society [3224.]. The Roman Catholic clergy in Meath used efforts beyond the common to put a stop to Ribandism [3269.]. He says, that he could give many reports of the efforts of which he had been speaking, made publicly in the chapels from the altars [32,569–3450.]. One Ribandman told him that he had not been to confession for many years; and another told him that he was obliged to leave the system, as the priest would not hear his confession [4032.]. Other instances were stated to the same effect.

Captain Warburton's testimony is also to the same effect [9392.].

Captain Despard states, that the priests have made a "steady resistance" to Ribandmen going to confession [3283.]. Where the Ribandmen are the most numerous, the priests are the most anxious to put them down. The system puts an end to the power of the priests over the populace [3287.]. He believes that they look to the increase of the system with the greatest alarm [3449.]. Parish priests and curates have equally expressed their horror of it [3452.]. Both classes of the clergy have shown the greatest anxiety to assist in putting down all disturbances [3447–8.].

Captain Vignolles says, that, whilst engaged in prosecutions, he had received very great assistance from the Roman Catholic priests [4010.].

Captain Despard states, that an ineffectual attempt was made by the Rev. Mr. Newman, Roman Catholic curate of Courtown, in Meath, to induce a body of Ribandmen to disperse [4023.]. A Roman Catholic clergyman had sworn before him an information which is to be prosecuted at the next assizes, regarding a proposal to shoot a gentleman, nineteen miles off [4072.].

Mr. O'Ferral says, that he has known Roman Catholic priests denounce the society from the altar [4906–7.]. The Roman Catholic priests always co-operated with the authorities in discountenancing Ribandism [4964.].

Mr. Barrington says, that he often received information from them [7457.]. In the late disturbances in Clare, the priests did every thing to put down disturbance [7458.].

Mr. Seed says, that the only case of Ribandism, on the Home circuit, is one on the information of Doctor O'Reilly, the parish priest of Navan [10,455–9.].

Mr. Cahill says, that the amount of crime is greatly reduced by the influence of the priests; and but for that influence there would be, in Tipperary, a much greater quantity of crime than there is at present. The priests are the best police against the commission of crime; they use every exertion to suppress it [10,851.].

Mr. Drummond says, that the "Shamrock Society" in Sligo was discovered by the Roman Catholic dean, who went and kept them in the house until the provost Fawcett, whom the priest sent for, arrived and arrested them [13,254.]. The conduct of Mr. Dunleary, the parish priest, was so very laudable, that he ought, in the opinion of the inspector, to receive the thanks of the lord-lieutenant. The Ribandmen are publicly and

constantly denounced by the Roman Catholic clergy [13,368.]. Captain Warburton was able to bring the perpetrators of an outrage to justice *solely* through the information given by a priest, and through his valuable and meritorious exertions, for which he received the special thanks of the lord-lieutenant [13,375.]. Mr. Drummond concluded by saying, "I ought to add, that the constabulary reports *abound* with instances of exertions made by the Catholic clergy, both with regard to Riband societies and to every other cause which tends to a violation of the laws. I cannot, therefore, express myself too strongly, when I am questioned as to my belief in their sincerity."

A multitude of similar testimony, from a variety of witnesses, might be adduced; but it is superfluous to accumulate evidence of this nature, which consists solely in a reiteration of the same fact, that the Roman Catholic clergy, instead of being denounced by a peer of the realm as the abettors of crimes and disorders, are entitled to the gratitude of the community for their incessant exertions to prevent crimes, and to bring the criminals to justice.

"VIII. Before the conclusion, his lordship made a long statement about the Achill mission; and intimated that Mr. Reynolds, a Protestant officer in the Coast-guard Blockade, had been murdered in consequence of the evidence which he had given before a committee of the House of Lords." [Neither this case, nor any other circumstance connected with the Achill mission, seems to have been at all brought under the notice of the select committee.]

In reference to this statement and the insinuation it contains, we refer the reader to the "Monthly Chronicle" for April last, in which the whole case and the result of the trial of Lavelle, the imputed murderer of Mr. Reynolds, is given; by which it will be seen that Mr. Reynolds broke into Lavelle's house at night, attempted, without the slightest provocation, to take his life, and was killed in the "scuffle" which ensued. The accused, therefore, was not only fully acquitted, but the friends of the deceased unanimously declared that the man was fully justified by the circumstances and the necessity of self-defence. So much for one of Lord Roden's special facts.

We have now disposed of the whole substance of the speech, and, by the exhibition of the character of the evidence bearing upon each part, we have shown that not one of Lord Roden's allegations were sustained by an atom of proof before the committee. We have gone farther: — we have shown by this very evidence, that wherever Lord Roden made a distinct charge against the administration, that charge was distinctly rebutted by a host of witnesses. Within the space to which we are of necessity limited, it is impossible to do more than indicate the tendency of the evidence under each head, and to give such specimens of it in detail as would be sufficient to illustrate that tendency. But if we have succeeded in directing attention to a valuable body of facts, we shall have attained the whole object we proposed. Lord Normanby's triumphant answer to Lord Roden's accusation is the testimony of Lord Roden's own witnesses.

It would be impossible to construct a more complete series of refutations than the Evidence affords to the various allegations. Lord Roden stated, that the Protestant party (by which his lordship meant the Orange party), were reduced to great distress and tribulation: — the Evidence proves that the Orange party have been habitual disturbers of the peace, and that the number of Orangemen who were convicted upon one occasion was so great that it was difficult to find room for them in gaol. Lord Roden stated, that the tranquillity of Ireland was the tranquillity of death: —

the Evidence proves that the tranquillity was that of restored animation, and a return to order and industry. Lord Roden stated, that crime had increased under Lord Normanby's administration: — the Evidence proves that crime had considerably diminished in intensity and in amount; that a greater number of committals had taken place, through the vigilance of the constabulary organised by Lord Normanby, than had ever taken place before in an equal period; and that a greater number of convictions had been procured. Lord Roden referred specially to several counties in which crime had increased, and stated that murders on account of religion prevailed to a most alarming extent:—the Evidence proves that in the counties specially referred to crime had uniformly decreased, but that in one county it had increased *in consequence of ejectments arising out of electioneering politics;* and the whole evidence explicitly and unanimously proves that no outrages whatever had been committed on account of religion or politics, and that nearly all the outrages were traceable *to the letting of land.* Lord Roden stated, that the Government had neglected to provide the requisite means for the prevention and punishment of crime and the protection of life and property: — the Evidence proves that the Government had organised the most effective civil force that had ever been in Ireland, or in Europe; that the influence of that force in prevention and discovery was unparalleled; and that the Government had all throughout exhibited a morbid anxiety to put down and punish disturbances of every description. Lord Roden stated, that there exists in Ireland an atrocious conspiracy against England and the Protestant religion: — the Evidence proves that the information upon which this statement rests is vague in itself, and that it comes from parties who are not worthy of credit on their oaths; that the most persevering efforts have been made to trace this conspiracy; that large rewards have been offered, and large sums of money expended, with a view to prosecute the inquiry to conviction; and that the Government have not only been utterly unable to do so, but that neither Lord Roden nor any body else can furnish the smallest fragment of information, of a useful or practical character, on the subject. And we may here observe, that when the investigation before the committee was concluded, Lord Wharncliffe declared in the House of Lords, that he had no evidence before him to satisfy his mind as to the political character of Ribandism — an important declaration, considering the quarter from whence it came. Lord Roden stated, that the Roman Catholic clergy were constantly in the habit of encouraging and screening offenders against the law: — the Evidence proves that the Roman Catholic clergy are amongst the most efficient and zealous instruments for the repression and detection of crime, frequently exposing, and sometimes even losing, their lives in the discharge of their duty.

But the Evidence proves a great deal more than this, which we find it impossible to enter upon now, and which must be reserved for a future opportunity. It gives elaborate details of the labours of the Government for the conservation of the peace, which no general description can fairly or truly reflect. But we may observe, that until this Evidence was published, an adequate estimate could not have been formed of the vast benefits conferred upon Ireland by the Marquis of Normanby — benefits which are of so permanent a kind, that the administration of the affairs of that country will in future be a work of much less difficulty than ever it was before.

Upon the subject of the clemency that was extended to offenders it is necessary to say a few words, although it does not come within the allegations of Lord Roden. The misrepresentations that have been put forward

on this subject may be described as being in the last degree disgraceful to the parties who sanctioned them. Of all the acts of Lord Normanby's government in which the exercise of his lordship's discretion was attended with beneficial results of the most striking kind, these acts of clemency are unquestionably the most deserving of unmixed approbation. In no other part of his administration did his lordship display so much knowledge of the character of the people, or so much judgment in dealing with their offences. A few passages from the Evidence on this branch of inquiry will show the admirable effects that have been produced by an experiment, which was as novel in Ireland as it was peculiarly applicable to the circumstances of the country.

Mr. Howley says, "In Ireland there prevailed a great want of confidence in the administration of justice. This has lately been disappearing, and the exercise of clemency has a strong tendency to increase the confidence of the people" [1059.]. "From what I know of the Irish character, I am convinced that any thing which inspires them with confidence in the paternal character of the Government, would materially promote the tranquillity of the country. These naked penalties, without the admixture of temperate kindness and consideration, will never put down offences in Ireland" [10,061.]. "The exercise of clemency at Clonmel was calculated to produce a good effect on the minds of the people" [10,051.]. "The old system of gentlemen screening their tenants and retainers from punishment is fast disappearing" [10,139.]. Mentions the case of an insane person as the only individual discharged by Lord Mulgrave who was recommitted [10,324.].

Major Warburton says, "The exercise of clemency has in many instances reclaimed men that would have been hardened by punishment, and produced good effects upon the popular mind" [1248–9.]. "In discharging at Leitrim some persons who were confined for faction-fights, Lord Mulgrave said to me, that he thought letting them out would have the effect of making them good friends in future, and I agreed with him." [1263–4.]

Mr. Irwin says, "The persons who had disturbed Leitrim for several years at the fairs and markets never came in contact again" [3182.]. "In this instance the exercise of clemency put an end to faction-fights." [3184.] "In regard to the prisoners released at Sligo, only one has been recommitted, and that for a common assault" [24,867.].

Captain Despard says, that seventeen were discharged at Mullingar (Westmeath); only one or two of those have been recommitted, and those for trifling offences. Another on a charge of assault, where a life was lost; but, as he considered him the person originally assailed, he recommended his discharge [3469.].

Mr. Prendergast says, that at Clonmel forty or fifty were discharged [5560.]; principally those who had short periods to serve, and were well conducted [5562.]. They promised to behave well, and have done so [5550.]. I thought the subsequent state of the neighbourhood was better than it had been before [5652.].

Not one of the prisoners so liberated has since been guilty of fighting. They pledged themselves to keep the peace, and have observed their promises. The lord-lieutenant's clemency has also produced a good effect upon the feelings of the relations of the prisoners, and of the whole population of the different neighbourhoods to which they belonged. There have not been any faction-fights in any of those neighbourhoods since. Of the whole number discharged only two have been recommitted: one for breaking windows; he was an idiot, and is now in the House of Industry: the other was for driving cattle, supposing that he had a right

of distress for arrears under a grant of an annuity. He was charged with robbery, and found guilty; but the judge passed no sentence, and discharged him on his own recognisance [5667–79.].

From the evidence of Mr. Howley [9949–60.] it seems that the liberation of the Clonmel prisoners was only the performance of a sort of contract previously entered into with the prisoners by Mr. Howley on the part of Lord Mulgrave.

It must appear extraordinary to every person who had not attentively followed the details of the investigation, that the committee should have closed their labours without submitting a report of the results to the House of Lords; a course which is not only usual in all similar cases, but which the records of Parliament expressly declare to have been one of the two purposes for which the committee was formed. This remarkable abandonment of the natural consequences of their proceedings would appear still more extraordinary, but for the fact that the Evidence happened to run so directly counter to the expectations of the majority of the committee. It is not, however, to this circumstance alone that the omission of a report is to be attributed.

That a report was expected is evident from several facts. In the discussion which took place in the House of Commons on Lord Roden's committee, the principal ground relied upon by Lord Roden's party was that the House of Commons was premature in coming to any decision on the matter until the committee of the House of Lords should have made their report. The "Dublin Evening Mail" (the organ of Lord Roden's party in Ireland) immediately on the announcement of the termination of the labours of the committee, expressed its astonishment and disappointment at the fact of their not having presented a report; adding, that they knew, from unquestionable authority, that up to four o'clock on the day on which the committee closed, it was the determination of the committee to report; and as a corroborative proof of that fact, it stated that the heads of the report were drawn up, printed, and distributed amongst the members of the committee; and that a copy of these heads, or special reports, as they may be designated, was in the custody of the writer of the article in the "Evening Mail." In a subsequent number of that paper, the whole of these reports appeared, and the publication was thereupon brought under the notice of the Lords as a breach of privilege; when some of the Lords felt it necessary to express their wonder how these copies could have got into the possession of the editor of a newspaper, seeing that the whole number printed was only equal to the number of the members of the committee, and that each copy was not only to be considered, but was actually inscribed, "private and confidential."

If we refer to the proceedings which took place in the House of Lords when Lord Wharncliffe laid the evidence upon the table, and endeavour to extract from them the reason why a report was not made from the materials which were thus prepared, we shall find ourselves totally bewildered amongst statements of the most contradictory character. Lord Brougham assigned as the reason, that the great quantity of the evidence rendered it impossible to make a report at that late period of the session; whilst his lordship, in the preface to a recent edition of his Speeches *, assigns as the reason, that "the Ministerial defenders of Lord Normanby in the committee took such a course as prevented the possibility of a report being made." But how any course taken by a very small minority could have prevented a very large majority from making a report, or doing any thing else they pleased, his lordship has not thought it necessary to explain, nor can we

* Lord Brougham's Speeches on the Administration of Justice in Ireland. With a Preface. London: Ridgway. 1839.

conjecture. From the manner, however, in which his lordship alludes to the conduct of the Ministerial friends of Lord Normanby, it is evident that he considers it to have been highly reprehensible, which renders the whole case only the more inexplicable, inasmuch as Lord Roden, the original mover of the investigation, explicitly declared in his place in the House of Lords, on the occasion above referred to, that the conduct of the noble lords who represented the Government in the committee was so just, so candid, and so impartial, as to render it a matter of deep regret to himself that he had never before their attendance on that committee enjoyed the happiness of their acquaintance!

The actual circumstances, we believe, were these: — the labour of drawing up a report was distributed amongst the several members of the committee, who undertook to collect, under each head, such evidence as they considered appropriate to that part of the subject assigned to each. Amongst these was a report upon Ribandism, prepared by Lord Wharncliffe; and which, except the report of Lord Brougham upon the administration of justice, was the longest of them all. This report upon Ribandism, on being examined, was found to have omitted some very material statements which had been made upon one side of the case: it was found that the omissions, when supplied, qualified considerably, and, in many instances, altogether changed, the effect of the whole text; and it was also found that the evidence of some witnesses was wholly omitted, which evidence was considered, by the parties representing and assisting Government, to be in direct opposition to a great part of the testimony selected by Lord Wharncliffe. These omissions being supplied, the whole report, so amended and expanded, was taken into the committee by a noble lord, a friend of the Government, and presented for adoption as the report which the committee was to make under that head to the House of Lords. The fact then appeared, that the report in this form, if presented to the House of Lords, would have produced an effect diametrically opposite to that which was intended and desired by a majority of the committee; and the adoption of the whole report, therefore, became impossible. To adopt only the original part collected by Lord Wharncliffe, rejecting the evidence tendered on the part of the Government, after that evidence had been openly brought under the notice of the committee, would have been a course too flagrantly unjust to be adopted by any collection of gentlemen making the slightest pretensions to the lowest degree of integrity or candour. There, therefore, remained nothing for the majority of the committee to do, but to agree that there should be no report at all.

We believe this to be a true history of the reason why the committee, at the close of its labours, did not make a report; and we believe that this decision was arrived at within an hour of the dissolution of the body.

ON THE PRACTICABILITY OF CIVILISING ABORIGINAL POPULATIONS.

Although the following remarks may be applicable to most of the uncivilised tribes whose extermination is threatened by the progress of colonisation, they are more particularly so to the Indians of North America, by whose peculiar circumstances they have been suggested.

The capability of progressive improvement forms so marked a characteristic of the faculties of man, whether we consider him individually or collectively, that it would, at first sight, seem to be almost a needless effort to advocate the truth of the proposition.

There are, perhaps, none who will dispute it in the abstract; yet it is a lamentable fact, that it is practically denied with regard to some of the most interesting sections of the human race. It is asserted that the noble-minded, independent, brave, and heroically patient North American Indian, who has given so many undoubted proofs of possessing strong intellectual powers, is insusceptible of elevation; that he is doomed to perish by the decrees of Providence, if he remain in the proximity of civilised man; and that the utmost amount of good that can be hoped for as his lot is, that he may be driven to the most inaccessible, most worthless tracts of his remaining territory, there to await the deferred but certain extinction of his race—a consummation which must one day be inevitably effected by the extension of civilised society. This idea, which may be traced to the worst enemies of the red race, has been readily and credulously adopted by some whose minds might have cherished juster sentiments, and whom we would forbear to suspect of hypocrisy, when they profess to be the friends of humanity.

By whichever party this unworthy sentiment has been entertained, it has proved equally fatal to the Indians, whose unhappy lot it has been to be placed very much at the mercy of the two parties who have adopted this opinion. Whilst the one from interest, and the other from mistaken philanthropy, have taken measures in accordance with the conclusion that the happiness of the Indians is most promoted by removal to the depths of the forest, those who have professed and acted upon opposite principles have been greatly impeded, or wholly arrested, in the prosecution of their best and most successful efforts.

In opposition to the opinion that the Indians are necessarily irreclaimable, it may be urged that,—

First: Other races, amongst which, for centuries, there existed a want of civilisation, very similar to that which has prevailed amongst the North American Indians, have successfully struggled for their own advancement, and, under the development which cultivation has produced, have reached the greatest height to which human talent and industry have yet attained.

Secondly: We need not trust to this analogy, however strong, to sustain our hope that the Indians, if also favoured by circumstances, might similarly rise. We have numerous scattered examples of Indians of various tribes, which prove that the Indian mind and intellect form no exception to the law of progressive improvement which applies to the human mind generally.

Thirdly: If we proceed from individuals to assembled multitudes, we

shall find, that though the opportunities have been few, and invariably very imperfect, they have, notwithstanding the disadvantageous circumstances which attended them, been amply sufficient to remove every doubt that the Indian race has all the requisite capabilities for a thoroughly organised system of social order.

Fourthly: The objection, that notwithstanding these encouraging instances, the result of past experience has generally been of a gloomy and disheartening character, may be met by evidence which shows that there have been powerful and adverse causes in operation, quite adequate to account for all the obstructed good and active evil which we have so much reason to lament, and which we are so loudly called upon to retrieve.

Fifthly: If we look to those instances in which the scheme of removal, suggested by the erroneous principle in question, has been adopted, it will be found that they have invariably been marked as total failures; and that, so far from conferring the advantages which they vainly promised, they have proved amongst the most active means for promoting the spoliation and ruin of the people.

Sixthly: It may be shown that, if the malign causes which have attached so foul a blot on the character of Europeans and their descendants in their treatment of the aborigines of America were suspended, and an opposite feeling substituted in their room, measures, neither expensive in themselves nor doubtful in their results, might easily be adopted, which would confer lasting honour on the authorities by whom they may be introduced, and great and reciprocal blessings both on the red and the white population.

It may not be amiss to enter separately into the consideration of these heads in the order in which they have been stated.

First: Although, when we look back to the origin of Grecian civilisation, we find that our inquiry is necessarily rendered almost fruitless by the want of any thing like certain history, yet we can scarcely doubt that a time existed when the inhabitants of that interesting portion of the globe were plunged in a state of deep degradation and barbarism.

There is sufficient evidence to show that civilisation was there a foreign importation, and that the gems of Grecian art and science were derived from Egypt and Phœnicia. But the new and peculiar character which those arts and sciences assumed, will not permit us to believe that in Greece civilisation flourished only amongst an imported and exterminating race; but, on the contrary, that it was engrafted upon the native population, which only needed a favourable opportunity to develop their great but latent intellectual powers.*

If we trace the same people through succeeding periods of time, in which we have the more certain light of history to give accuracy to our observations, we may see that the recurrence of adverse circumstances have been fully competent to replunge the Greeks into a state of great degradation, and almost into actual barbarism; and this, notwithstanding that the memory of their illustrious ancestors has never ceased to be proudly cherished amongst them. We may see, too, how often concurrent circumstances have, from time to time, brought into cultivation and notice individuals from amongst that people in the midst of their greatest degradation. When we contemplate these facts — much as we may be disposed on

* In the commencement and progress of civilisation in Greece, we see the operation of two causes, which will deserve attention: — 1. The Egyptian and Phœnician colonies introduced their arts amongst the more rude inhabitants with whom they united. 2. For a long subsequent course of years talented Greeks travelled in Egypt and the East to acquire knowledge and wisdom, which they brought back for the general benefit of their countrymen.

good ground to vindicate the superiority of particular races — we cannot deny the almost immeasurable influence which it is in the power of circumstances to exert.

If we turn our attention to the numerous states of Europe in which civilisation has made such great but such various progress, we cannot doubt for a moment that their population is mainly, though with greater or less amount of admixture, made up of the descendants of those very hordes whom the polished Romans despised or dreaded as barbarous savages.

Who can read the description which Tacitus gives of the ancient Germans, "*truces et cerulei oculi, rutilæ comæ, magna corpora et tantum ad impetum valida*," and fail to recognise the lineal ancestors of those very individuals who form the brightest ornaments of the most polished and cultivated nations of the present day? and who can refuse to admit the parallel which exists between the picture which Tacitus has drawn of the state and manners of those Germans, and the actual condition of the Caffres and the North American Indians? Who for a moment can entertain a doubt, that in various parts of Europe, insular or continental, we may find the almost unmixed remnants, not only of Germans, but of Belgic and Aquitanian Gauls, — of Ancient Britons, Celts and Iberians, — of Goths, and of Huns, who have progressively emerged from various degrees of barbarism to prove, not the uniformity of capacity of all the families of the human race, but that none must necessarily be exterminated, and that none are incapable of great mental improvement?

What can have been more barbarous than the state of the Picts and Scots? When we recollect that, within a comparatively recent period, some of the distant Highland clans were in a state which caused them to be regarded as barbarous by the rest of Europe, and contrast them with their descendants of the present day, who are continually and successfully competing with their fellow-men in all those situations which require the highest intellectual development, we certainly ought not to admit the discouraging idea, that actual barbarism necessarily implies that that state must be perpetual.

Has not Ireland offered another and equally encouraging instance? But it is, perhaps, to Russia that we may refer, as offering on the largest scale the proof of what may be done within a comparatively short interval of time for the progressive elevation of man from barbarism to civilisation. We may there observe that, with many unquestionably vicious modes of procedure, with many adverse circumstances to contend with, a regular system of organisation — comprehending the means whereby disorder may be repressed, instruction may be afforded, and merit may be rewarded — has succeeded in bringing forward a population composed of various kindreds and languages, and exhibiting almost every gradation of natural capability.

Though very much confessedly remains of barbarism in a large portion of the Russian dominions, it is notorious that the Russians have established for themselves a national reputation for skill in languages, science, and politics, which will bear comparison with that of the most polished and longest settled states of Europe.

The great elevation of the favoured few amongst them, contrasted with the co-existing degradation of those to whom the necessary opportunities for improvement are denied, seems to furnish the full demonstration of all which it is the object of these remarks to establish. Yet it may not be amiss, before coming to the examination of the present state of the Indians, to adduce another example, furnished by a race which has been long despised as one of the most abject of the human family. The Hottentots,

who are evidently of the same family with the Bushmen, who are stigmatised as the lowest of the African races — the Hottentots, who have been regarded as but one degree above the monkey, who have been deprived of every inch of territory which they could call their own, who have ceased to exist as an independent people, and, till lately, were only suffered to remain as slaves of the lowest description — these very Hottentots, under the superintendence of a Moravian missionary, have founded a settlement in which, in a few years, social order, European arts, and Christian morals were seen to flourish in a most satisfactory manner.

The writer of these remarks has been informed by an independent, and therefore impartial, witness, that the articles of hardware produced in that Hottentot settlement had acquired distinguished reputation in the colony. The ruin, but it is to be hoped only the temporary ruin, of that and similar settlements of Hottentots, has sprung from no intellectual incapacity of the Hottentot race, but from the lawless and unbridled passions of degenerate Europeans.

Secondly: If the preceding instances have contributed in any degree to remove the unfortunate persuasion, that existing barbarism is necessarily a permanent and unalterable condition, it may perhaps not be difficult to show that, with the Indians in particular, intellectual improvement is by no means impracticable. Facts related by numerous individuals, who have described the character of the Indians, sufficiently demonstrate that there exist amongst them strong native talents, distinguished by great acuteness, quick and accurate observation, close and sound reasoning, and very great power of foresight and combination, conjoined, in many instances, with extraordinary personal influence and persuasive faculties, which, if properly directed, would have entitled their possessors to be remembered by coming ages as the benefactors of their race, but which, turned aside by European artifice, have been rendered instrumental in accelerating its ruin.

Many schools have been established in Indian villages; and whilst their continuance has been permitted, and the services of suitable masters have been enjoyed, the progress of the children has been considered satisfactory. Indian children and youths have been educated in American schools and colleges; and, notwithstanding the obstructing and discouraging influence of the American prejudice against persons of colour, some of these Indians have become remarkable by the successful cultivation of their talents. The writer has corresponded with John Ridge, a chief of the Cherokee nation, who defended the claims of his countrymen against the unjust and oppressive measures of the United States, and succeeded in obtaining decisions in their favour in one or more of the American courts of law, although he was unable eventually to establish their right in opposition to the eminently anti-Indian policy of President Jackson. A citizen of the United States, who was personally acquainted with Ridge, declared that such were his talents and acquirements, that if he were not a Cherokee senator he ought to have been a member of Congress. An English gentleman connected with the commission for the settlement of the American and Canadian boundary informed the writer, that actual observation had impressed him with a very favourable opinion of the Indian's talents; and that a young Indian lad, attached to his service, had proved remarkably apt to learn.

It is needless to dwell on individual cases, yet it may not be amiss to add one other fact to show that the Indians have both the will and the power to learn. John Sunday, a Chippaway Indian, at the age of thirty, and whilst living in the woods, managed to teach himself to read, and has acquired such

a knowledge of Scripture as to enable him to be a successful as well as zealous preacher to his countrymen.

Thirdly: The most complete proof which can be adduced in support of the third proposition, is that which has been furnished by the Cherokee tribe of Indians. Although it may be objected that, in this tribe, some intermixture of European blood had taken place, it is unquestionable that they were retaining the Indian character and mode of living until they formed for themselves a social system of their own. It was neither imposed upon them nor servilely copied, although it is extremely probable that they may have listened to the few missionaries residing amongst them, and that they may have borrowed from the institutions of neighbouring states. They showed their originality in contriving and adopting a new and extensive alphabet for the expression of their language, and they employed it in a newspaper, which was printed and published amongst them. They had established a kind of police; and, as before observed in speaking of John Ridge, they so well conducted their cause with the United States, as, on one or more occasions, to defeat that government in its own courts, and to defer for a considerable time, though they could not ultimately avert, the fate which overwhelming power had decreed against them. Some of the Indians in the North-Western territory, not far from Lake Michigan, although they do not appear to have adopted so complete an organisation as the Cherokees had done before their expulsion from their territory, not only made considerable advances in agriculture, but commenced working the valuable lead mines, which excited the cupidity of their white neighbours, and constituted the real cause of their unjust expatriation. Different companies of Indians, which have come under the care and instruction of the Society of Friends in the United States, have made very gratifying progress in agriculture and the most useful mechanic arts. They have acquired herds of cattle, and barns stored with grain. Schools have been established for the children, whose progress in the different branches of their education has been very encouraging. The exertions of missionaries of other societies, who have laboured amongst the Indians, have also in different instances been attended with gratifying success. This has been particularly the case with the Chippeway Indians under the care of the Wesleyans, and with others under that of the Moravians.

Fourthly: With regard to the fourth head, it unhappily cannot be denied that the Indians have shown a great disposition to cling to the worst parts of their uncivilised customs, and a great readiness, when partially civilised, to relapse into what may be termed the savage state; and that, in conjunction with this, they have shown a no less lamentable aptness to acquire many of the vices which accompany and disgrace civilisation. That this is true, both of individuals and communities, is shown by the fact, that in very many of those cases in which young Indians have received a good education, and have lived for a sufficient length of time in cultivated society to become accustomed to its habits, they have nevertheless, on returning to their kindred, resumed all the habits of their countrymen, whilst they have communicated few of the advantages which they had received.

The tribes, or portions of tribes, which have been the subjects of the assiduous care of different religious societies, have, in several instances, suffered the progress of civilisation amongst them to be arrested, and to a greater or less degree have returned to their former state. Nor can it be denied that those portions of tribes which have remained in proximity to the settled parts of the country, and have had little of an efficient character attempted for their improvement, have lost nearly all those native virtues

which in their ancestors commanded admiration and respect; and that, in many instances, they have become intemperate, profligate, mendicant, dishonest, abject, and, in every sense of the word, degenerate.

The causes of all these failures are sufficiently obvious.

It is not to be expected that an isolated youth, whatever may have been his education, could possibly retain the habits of civilised life when thrown back amongst his countrymen, devoid of arts, implements, and other resources. Could he create these for himself in his native forests? Could he put his countrymen in the way of procuring them, were they most ready to listen to his representations and follow his directions? Is it not obvious that whilst many of his descriptions must be necessarily unintelligible to them, they would be very competent to detect his want of prowess and inferiority in all those pursuits which they regard as necessary or commendable in their own mode of life? Supposing the youth to have brought with him the desire to benefit his countrymen, who can doubt the overpowering influence of the discouragements with which he would have to contend? and who can question the fascinations which the chase must present to a youth escaped from the trammels of a school or a college, and restored to the haunts of his boyhood? In civilised nations the most abounding in talents, there is probably not one in a thousand who, whatever may be his acquirements, possesses those natural requisites which are essential in an individual who is to take the lead amongst his fellows, and exert such a sway over them tha·tall their powers may be combined for the fulfilment of his designs. Does it come within the range of probability that the few youths, taken almost indiscriminately from amongst an uncivilised nation, shall be the very persons to possess these rare qualifications; or that, even if formed by nature to possess such abilities, they could, by any possibility, bring them into effectual operation whilst young and devoid of personal authority?

But it may be said, that if the causes alluded to are sufficient to account for the fact that Indian youths, after having enjoyed the benefit of education in civilised society, have failed to raise the character of their brethren, the suspended progress, or even retrograde movement of portions of tribes, which in a degree have submitted to the influence of civilisation, is a clear proof of the essentially irreclaimable nature of the Indian character. It must, indeed, be admitted that nothing remains of those settlements of Christian Indians which appeared for a while to flourish in the early part of the eighteenth century; that there is probably scarcely a trace to be found of any satisfactory result of the labours of the devoted Brainard and his missionary brethren; and that some of the remnants of Indian tribes, still existing in some parts of Canada, are a helpless, miserable, degraded, and dwindling people, although they have been, for several successive generations, nominal Christians, the disciples of Roman Catholic missionaries.

Careful inquiry will, however, leave no room to doubt that these failures have not so much depended on the impossibility of effectually introducing civilisation amongst the Indians, difficult as the task must be confessed to be, as upon the imperfect manner in which the work has been attempted, and on the adventitious obstacles which have interrupted its progress.

As respects the imperfection of the method, it would appear that, with very few exceptions, the changes introduced for the purpose of effecting a new order of society have not been sufficiently engrafted upon their original system of government, which, defective and rude as it was, had, nevertheless, acquired some degree of permanence and durability.

From the want of this engrafting, it would seem that the new order, instead of possessing in itself the power of self-preservation and progressive

advancement, has been dependent on those individuals by whom it was introduced, and upon those foreign teachers by whom they may have been succeeded. Such teachers either ceasing to exist amongst them, or falling off in their character, has had the inevitable effect of allowing the infant community to relapse towards its former state; deteriorated, however, in two important particulars:—first, it has new wants, introduced by their civilised associates, which, being unaccompanied by the ability to meet them, produce absolute dependence; and, secondly, the disposition to associate with the white men having been established, they are rendered the more accessible to those who continue to make them their prey, depriving them of their property, and contaminating them by vice and disease, when their teachers either cease to exist, or are too feeble or irresolute to afford any valid protection. Although there can be no doubt that the *bonâ fide* introduction of genuine Christianity would have worked incalculable good for the Indians collectively as well as individually, and that the want of this may be admitted as one of the causes which have operated to produce the failure which has been complained of, it can scarcely be doubted by the impartial inquirer that in some instances, at least, in which the attempt at conversion to Christianity has been made, it has contributed to retard both Christianity and civilisation. Sometimes the individuals to whom this responsible task has been assigned have not only lived upon the Indians, but lent themselves to the designs of those who were seeking the unjust acquisition of the Indian territory.

In other cases there has been a great want of simultaneous effort to impart to the Indians a practical acquaintance with the arts and knowledge enjoyed by civilised men; and the invitation to embrace a new faith has consequently been met by the objection, that there was no inducement to adopt a religion, the professors of which they knew as their worst enemies,—their instructors in crime, disfigured with vices which they perpetrated with impunity. It can scarcely be doubted that the mere fact of the attempt to introduce a new faith, being conjoined with a tendency to diminish authority in the hands of those by whom it had previously been held, may have thrown impediments in the way of conversion and civilisation in some cases, in which no other charge than want of tact could be raised against the missionary labourer. In some instances, however, it would appear that the spiritless and unfrequent periodical discourses of our official preacher, with the addition of baptism, merely employed as a ceremony, and unaccompanied by any attempts to improve their intellectual and physical condition, have served only to keep them in a state virtually heathen and uncivilised, although nominally Christian.* To draw discouragement from such instances is no less irrational than to reject the encouragement offered by the great improvement, religious as well as social, which quickly followed the introduction of a better system. The last point which it seems necessary to notice amongst the imperfections in the attempts which have hitherto been made to improve the condition of the Indians, is the absence of adequate stimulus to call forth individual exertions, both amongst the youth and adults. With the exception that some few have been employed as native preachers, it does not appear that the advancement in the arts and acquirements of civilisation has opened the door to any superior advantages amongst their countrymen, or procured for them any patronage from the British or Americans calculated to reward their efforts, or make them instrumental in benefiting their countrymen. On the contrary, their acquirements have not unfrequently

* See Statements relating to the Mohawks, given before the Committee of the House of Commons.

been directed against their nation, either as auxiliary to treaties for the acquisition of land, to obtaining service in war, or in seconding the designs of traders who seek to enrich themselves by a traffic disgraced by the greatest injustice. The children who have distinguished themselves in the Indian schools have not been encouraged to further attainments by removal to more advantageous situations, either in this country or in Canada; and the pursuits in which their mode of life requires them to be engaged in a country nearly or quite uncultivated, furnish them with few inducements and opportunities for the exercise of even the very limited acquirements which they have made.

The influence of these imperfections, great as they are, can scarcely be compared with the evils which have arisen from the obstacles which have been thrown in the way of Indian advancement. Perhaps the greatest of these obstacles has been the constant succession of removals which the Indians have been induced to make, as one reservation after another has acquired such an increase of value by the approach of white settlements as to excite the insatiable cupidity of speculators in land, who have not suffered the Indians to rest until, by some artifice or other, they have prevailed upon them to quit their settlements and seek fresh abodes in the more remote wilds of the unbroken forests.

The most promising settlements under the watchful care of members of the Society of Friends have been broken up by the operation of this process, to which the American government has given its sanction and assistance, under the pretext of protecting the Indians. As it is not the object at present to bring forward these instances for any other purpose than to show why partial success has not been succeeded by greater advances, it will be needless to follow the Indians in their removal, until the subject of the fifth head is considered.

The employment of the Indians in the chase and in war has tended very powerfully to promote their adherence to their wandering and unsettled habits; and the new arms placed in their hands for both purposes have produced the double evil of rendering war and the chase more injurious, and of making them rely upon the production of their civilised neighbours, obtained on disadvantageous terms, rather than exercise the low degree of mechanical art which they have been accustomed to use.

The modes of carrying on the fur trade in particular has had a very baneful influence, from the system of supplying the Indian with articles upon credit, which places him at the mercy of the trader when his successful hunting has obtained a stock of fur for his disposal, and which leaves him in a state of perfect destitution, if infirmity or deficiency of game deprive him of the means both of repaying the trader and of providing for the future wants of himself and his family.

The laudable, and in some instances manifestly successful, efforts to improve the moral and physical condition of the Indians have been powerfully counteracted by the poisonous influence of a more numerous and no less persevering class of instructors, whose example has led them into the grossest profligacy and intemperance. Our vices and our diseases which have been thus introduced amongst the Indians have, in a few years, decimated tribes which not long since were numerous and powerful.

All travellers who have had an opportunity of observing the condition of the Indians who have come under the influence of these causes, concur in describing the awfully destructive and demoralising effect which the introduction of spirits has universally produced. But it is not merely their direct effect, great and destructive as it has undoubtedly been, which has

made them so fatal to the Indians; they have facilitated their seduction into every course which could tend to retard their progress, and bring them into a state far worse than that in which their ancestors were found by the first colonists.

The facts and considerations connected with the fifth head seem in a particular manner to claim the attention of those who, with really philanthropic intentions, are inclined to promote the removal of the Indians, with the design of rendering them service by such a measure; since, if they can, before it is yet too late, be convinced of the fallacy into which they have been drawn, they may refrain from trying an experiment which must prove as fatal and as irretrievable as that which the daughters of Pelias are fabled to have tried upon the person of their aged father.

It would be well for the advocates of the removal of the Indians to consider that their plan involves the suspension of whatever may now be in operation for the improvement of the Indians in the way of civilisation, as well as the creation of great and almost insuperable difficulties in the way of fresh attempts for that purpose. It must, therefore, be remembered, that the only advantage to be looked for in the execution of this plan is, that they may be able to enjoy a little longer a state which at the best can only be an approach to that in which their forefathers were found on the discovery of America.

It is then to the degree of possibility of obtaining this object that we must now direct our inquiries.

If the Indians are removed from the neighbourhood of civilised men, will they meet with that abundance of game which was known to exist in the American forests before the European axe and the European rifle were heard amongst them? We have the testimony of various travellers to prove that this is not the case. Every credible evidence confirms the fact, that the game, especially of the larger species, has become more scarce and more wild, and consequently less attainable by those means which the Indians, unaided by European arts, can employ.

If the Indians be removed from the vicinity of their white friends, and driven to encroach upon the territories of other Indians, can we be sure that they will find those Indians ready to receive them as friends, and not regard them as pernicious intruders? Our past acquaintance with the Indian race has shown that the different tribes are very ready to engage in war with each other; that trespasses upon their respective hunting grounds have proved powerful causes of animosity. It is also well known that their wars are of a cruel and exterminating character; and it must be obvious, that if one of the contending parties can command the exclusive or much more general possession of European arms, the total defeat of the other must be certain.

If the Indians, whilst living upon their reservations, surrounded by settlers in some degree advanced in civilisation, and whilst more or less assisted by the superintendence, instruction, and counsel of those who sincerely desire their preservation and improvement, have, notwithstanding, felt the baneful influence of those whose interest it is to injure and demoralise them, can we suppose that, when removed from such protection, they will not be followed by those whose interest in injuring will remain the same, and who will be freed from all the restraints which may hitherto have been put upon their base designs? The fact that every part of the wilds of North America, between the most western settlements of Canada and the United States to the shores of the Pacific, are traversed by the traders of England and America, can leave us little room to hope that a spot can be found upon which

the red man may be placed in security against the approaches and contaminations of his white enemies. When his white friends have removed him from their view, they may vainly flatter themselves that the evils which they do not witness have ceased to exist, although they will in fact be advancing with increased activity. Such appears to be the fate which the advocates of Indian removal are preparing for the unhappy aborigines of the North American continent; and past facts demonstrate that the anticipation is not visionary. The native population of Van Diemen's Land had been rapidly reduced in numbers by the treatment which they received from European invaders of their lands. As a measure of professed humanity, they were removed to Flinder's Island; but their compulsory emigration only hastened their decline, although they had the protection and care of the colonial government, — advantages which could scarcely be bestowed on expatriated Indians.

The experiment of removing Indian tribes has already long been tried by the United States; and the result, though it has answered the purpose of the American government, has been lamentably fatal to the Indians. The tribe of Shawnese, who, under the superintendence of the Society of Friends, had cultivated valuable farms, and acquired considerable property in corn and cattle, and were therefore enabled, by the sale of their stock, to carry with them into their exile greater resources than some of their brethren, who had only the government supplies to depend upon, were, nevertheless, soon reduced to a state of the greatest destitution in their new territory.

In their remote situation it was difficult for them to receive the succour which friends were desirous of sending for their relief. It is evident that their removal has reduced their means of subsistence, and it is equally certain that it has not secured them against the worst influence of the Whites; for these same Indians have been induced, as auxiliaries to the American troops, to send their warriors to the east to assist in the slaughter of their brethren of the Seminole nation. The Indians of other tribes who have come under the operation of this system of removal have grievously suffered in the course of their emigration, from the mode in which this has been conducted by the unprincipled contractors engaged in the work; and hundreds have been drowned in the crazy vessels into which they were crowded for passage up the rivers. The Cherokee tribe, which clung so closely to their valuable possessions and cultivated tracts in Georgia, have been thrown back into a state of barbarism; and the writer has been informed by an American citizen that the land of promise given to them in exchange was a barren tract, inadequate to the support of its new population, when as yet but a part of the tribe had been removed. If these instances are not sufficient to damp the hopes of those who anticipate the benefit of the Indians from their removal, it may be well to look at the actual state of the present inhabitants of the territory into which it is proposed to transfer the remnants of tribes at present within our provinces; and it will surely be a legitimate conclusion, that if the condition of those who from infancy have been accustomed to the country, and whose mode of life more nearly resembles that of the North American Indians of the seventeenth century, is in every respect dissatisfactory and deplorable, we cannot look for any gratifying result from the importation of a much more dependent class of men, who have the rudiments of civilisation to unlearn, the prowess of the hunter to acquire, the haunts of the game to explore, and who must be constantly on the alert to defend themselves by

arms against the insidious approaches of an enemy, to whose operations every thing in the country must lend most powerful assistance.

A comparison of the descriptions given of the Indians to the west and north-west, in the narratives of the expeditions of Sir John Franklin and Captain Back, will convince us that in the interval which elapsed between the two expeditions the condition of the remote Indians has been rapidly declining. Disease, intemperance, famine, and mutual hostilities, have fearfully reduced the numbers of various tribes. It was unquestionably proved, during the last expedition, that by the irregular movements of the game, or from want of the ammunition by which it was to be taken, the Indians, but more especially the aged, the young, the infirm, and the females, are liable to be reduced to such a state of extreme starvation as to be driven to devour the tattered and filthy skins which they wear as an imperfect protection against the severity of a winter in which the thermometer sinks many degrees below zero — whole families are cut off by the combined influence of cold and hunger, and even cannibalism is known to have been occasionally resorted to under the pinchings of famine. Surely the condition of a most abject remnant of a tribe which can be found in our provinces, however exposed to evil and neglected by those who might be expected to study their improvement, can offer no picture so revolting and so hopeless as that of these distant Indians. The Chippewyaw Indians, who appear to have been the least contaminated by our vices and diseases, and who therefore may be regarded as giving the most favourable illustration of what the condition of the Indians might be if so far removed from white settlers as only to come under the occasional influence of the fur-trading voyagers, have by no means escaped from the miseries of starvation and inadequate protection from the inclemencies of the winter season, which appear to be the inseparable attendants of the present fur-hunting system. As a proof of their diminution in number and power, it may be stated that they now dread the feeble Esquimaux, of whom they were formerly the terror and scourge. This decline of the remote Indians is not confined to those who are exposed to the severity of an almost arctic winter, — it is fearfully advancing amongst the Indians of the western coast. Although we can learn little respecting them except from individuals attached to the Hudson's Bay Company, who are obviously interested in withholding any thing which can tend to bring their system into discredit, and who are doubtless perfectly unconscious that they have furnished the proofs which their testimony affords, it is nevertheless abundantly evident that the tribes in that direction have already been greatly reduced in number, and degraded in power and character, through the operations which originate with us. In fine, there is evidence defying all contradiction, that the blasting influence which our cupidity and profligacy have carried into the most distant and almost inaccessible regions has gone far beyond the limits to which the efforts of benevolence and Christianity have yet had the means of extending themselves. Can it then be pretended that the Indians, or any other race of aborigines, are to be benefited by banishment beyond the reach of our better influences, to abodes where it is probable that they may be exposed to the unchecked operation of our vices; or where, if by some extraordinary chance they can for the present escape them, they must shortly be exposed to them before the more slowly advancing progress of good can overtake and counteract them?

It may perhaps be said that the Indians reject our proffered assistance as civilisers; that they are determined to cling to all the customs and usages of their forefathers, however incompetent to enable them to compete with their

more competent rivals; and that all the prospects of temporal and eternal welfare which the philanthropist and the Christian can place before them can only be held out to them in vain. Such may be the insinuations of their plausible but mortal enemies; but they are contradicted by numerous and authentic proofs that the Indians, within our provinces at least, are well aware of the advantages of civilisation: they are convinced of the superiority which our knowledge and our arts have conferred on us, and anxiously desire to participate in these advantages.* Although they do not fail to recognise us as the authors of their adversity, they continue to regard us with a most remarkable and touching confidence; they address us as fathers, and earnestly and repeatedly implore us not only to succour and protect them, but also to supply them with the means of instruction. Can we call ourselves Christians, and yet, when they ask for an egg, shall we give them a scorpion? And shall we adopt a course, of which it may most truly be said "that the tender mercies of the wicked are cruel?"

Although the sixth head is unquestionably the most interesting and the most important, provided those who have the power to undertake the work have also the time and the inclination to set about it with full determination to compass its achievement, it seems the less necessary to dilate upon it in this place, since the most important heads, and it would be an impertinence to attempt to offer more, have already been respectfully suggested to the highest authorities by several bodies who have memorialised them on behalf of the Indians.

It may, notwithstanding, be allowable here to remark, that a new and general stimulus is necessary to be given to such parts of the Indian department as can promote the real interests of the Indians. The points of most vital importance appear to be — 1st, To give to the Indians within our provinces, in conjunction with some special but temporary protection, the fullest participation in the rights of British North American subjects, and the permanent security of their landed possessions. 2dly, That all the efficient means at present in existence for the advancement of the Indians in religion, school education, and the arts of civilised life, should be encouraged, improved, and extended. 3dly, That efforts should be made to bring forward and encourage successful and meritorious individuals, in the first place, by employing the system of *concours*, or competition, in the

* This is not only true of the Indians connected with the Canadas and the United States, but the same feeling exists amongst the most barbarous tribes of Guiana.

Extract of a Letter from John Scoble, Esq. to T. F. Buxton, Esq., dated Demerara, June 1. 1839.

"In the year 1836 I visited the Indian station at Caria Caria, and had the happiness to enjoy Christian intercourse with above sixty converted natives of the Arrawaak nation. They were the fruits of the labours of a zealous and disinterested individual, a Mr. Peters, a black man. This worthy man had gone from creek to creek, preaching the gospel to these children of the forest; and in a period of less than six years the number above mentioned were united together in Christian fellowship, were married and baptized with their offspring,— had erected themselves, at their own cost and expense in money and labour, a neat chapel, in the midst of their native woods, capable of containing 250 people; and were longing to obtain a Christian teacher for their children, who should instruct them in the 'white man's knowledge.' During my present visit to this colony, I have again visited this highly interesting people, and find that there has been a considerable accession to their numbers — that their chapel has been enlarged — and that they now wish above all things to be formed into a community in some suitable locality, where they can have sufficient room, and enjoy protection under the direction of some one in whom they can place confidence, and who would direct them in so important a matter. Until this be done, they feel it will be impossible for them to make much progress as a people, or to get their children properly educated.

"I was much affected when up the Essequibo the other day, to learn that some Indians residing on the banks of the Mazaroony River had sent a message to Caria Caria to this effect, that they could not conceive why the Arrawaaks should be taught and instructed in religion, and they be neglected; and that they were much hurt that they were overlooked — and begged that a teacher would come among them."

schools, and also amongst those who apply themselves to agriculture and the arts; and, secondly, by appointing the individuals so selected as teachers to be distributed amongst their brethren; and in case of the discovery of more than ordinary talents, by giving them the advantages of a higher degree of instruction in the best colonial schools, or even in this country. 4thly, To form, with the assistance of the most worthy and influential chiefs, such a system of police or civil government as may both suit the Indian character, and lead to the Indian settlements becoming integral parts of the province in which they exist, like the Welsh counties in England and the Basque Provinces in France and Spain. 5thly, To extend the advantages of organisation, instruction, and participation in British laws and British protection, to the Indians beyond our frontier. They will thus not only be put in the way of promoting their own security and happiness, but will also become of incalculably greater importance to us as allies, or rather as fellow-subjects, for the maintenance of our frontier, and the extension of our commerce.

It is so evident that association, under suitable regulations, must powerfully contribute to the progress of civilisation, and facilitate the introduction of equitable traffic, that it must be very desirable to promote the formation of Indian towns in those situations which are at once well adapted to support a permanently numerous population, and to receive the easy visits of distant Indians who may resort to them for mutually advantageous exchange of commodities, and also for instruction. Such towns, which in their tendency would resemble that which the Hanstowns formerly exercised on the civilisation of the North of Europe, might be founded in some of the most favourably placed Indian reservations within the Canadas. They would thus contribute to strengthen our influence over the distant tribes, before whose eyes they would place a most important and stimulating example, whilst they would hasten the progress towards civilisation and equality with their fellow-subjects, which it is so desirable that our Canadian Indians should make.

SONNET.

HUMAN GREATNESS.

TIME! thou destroy'st the relics of the Past,
And hidest all the footprints of thy march
On shattered column and on prostrate arch
By moss and ivy growing green and fast.
Hurled into fragments by the tempest-blast,
The Rhodian monster lies — the obelisk,
That with sharp line divided the broad disc
Of Egypt's sun, down to the sands was cast;
And where these stood no remnant trophy stands —
And even the Art is lost by which they rose!
Thus with the monuments of other lands —
The place that knew them once no longer knows.
Yet triumph not, oh Time! Strong towers decay,
But a great name can never pass away.

PARK BENJAMIN.

New York, July, 1839.

THE STATE AND PROSPECTS OF SPAIN.

The fearful tragedy, of which Spain has been the theatre during the last six years, has at length terminated; although many an act of rapine and murder will still be committed, even after the departure of Don Carlos and his family. To those who are acquainted with the nature of the Spanish people, and the contradictory qualities which characterise them, and which render them unable, or unwilling, to avail themselves of the advantages which the country offers in abundance, it may seem hazardous to come to a certain conclusion as to any shape which affairs may hereafter assume in the Peninsula. A nation possessing within herself resources so varied and so rich, — with a history rendered illustrious from the remotest periods by deeds of high valour and noble daring — a spirit of vast enterprise, which taught her, though weakened and exhausted in a lengthened struggle for existence, to appreciate the sublime conceptions of the Genoese navigator, whose projects had been already listened to with indifference by the wisest and most powerful monarchs* of the age, and excited her to send out, with equipments which the most paltry prince in Europe could have supplied†, those bold adventurers who were destined to carry her name, her beautiful language, her arts, and her superstition to the unknown regions of the earth,—with a territory not too vast to create difficulties in its preservation, and sufficiently extensive to enable her to become a leading power on the continent of Europe, — with such recollections and such resources, it is indeed a startling anomaly that Spain should present the humiliating picture she has so long exhibited. Knowing all this, and knowing the conflicting and unaccountable elements which have entered into her recent history, all speculations upon the future must be entertained with a large allowance for contingencies, upon which it is impossible to calculate even from day to day. Perhaps while this article is going through the press some extraordinary convulsion may occur, and scatter all pre-existing theories to the winds. Against such events we derive no provision from experience; but there are, nevertheless, many circumstances in the progress of Spain, and certain points of view from which they may be examined, that will enable us to render some assistance towards the solution of this great political problem.

The present catastrophe has been brought about by causes which are by no means of recent date; and Maroto has merely availed himself of the discontent and insubordination which have existed in the army of the Basque provinces for some time past. The attempt at insurrection made by Muñagorri was founded on the hope of still farther weakening the faltering allegiance of the Guipuscoans and Biscayans, and of forming from the loose materials of the faction a *nucleus*, around which the really patriotic, as well as the discontented, might gather; and if that individual possessed even a moderate portion of military talent, or the decision of a leader, his expedition might not have been attended with so signal a failure. It must, however, be admitted that, as in most cases where an attempt is made to better

† "Christophe Colomb découvrit l'Amérique; et quoique l'Espagne n'y envoyât point de forces qu'un petit prince de l'Europe n'eût pu y envoyer tout de même, elle soumit deux grands empires et d'autres grands états."— *Montesq. Esp. des Lois*, l. xxi. c. xxi.

the civil condition of the Spaniards, pride and jealousy effected more in thwarting his efforts than even his own want of capacity.

The numerous emigrants, — many of them large proprietors, and all of them Navarrese, or natives of the Basque provinces, — who, for some years past, have contributed to swell the population of Bayonne, and the small towns on the French frontier*, were persons whose properties had been confiscated by Don Carlos, or who had themselves disposed of them, and who preferred residing in inglorious safety in another land, to participating in the varying dangers and contingencies of civil war in their own. Each party, Carlist as well as Christino, had formed a *junta* to watch over the fluctuating success of the combatants; and though nothing could surpass the activity with which supplies were forwarded by the Carlist party, the liberal section, by some extraordinary fatality, not only did not effect any service to the body which it assumed to represent, but was ready to thwart any attempt, made by another independent of either, to divide the interests and weaken the force of the faction in the provinces. A miserable feeling of dislike for any measure not originated by themselves urged them to throw every impediment in the way; and an overweening self-conceit, the usual characteristic of a petty and provincial aristocracy, prompted them to render abortive the bold attempt of Muñagorri to raise the banner of the *Paz y Fueros*. The spirit of intrigue, too, which is so interwoven with the constitution of a Spaniard as to become essential to his existence as the air he breathes, and which pervades all ranks, from the prime minister down to the clerk who copies a despatch, from the commander-in-chief to the alferez, combined to oppose his purpose; and their barbarian pride was shocked at the idea that a ruined speculator in public works, a discontented *Fuerist*, an *escribano* by profession, should presume to claim the glory of being a leader in a design which they had neither the talent to conceive, the energy to aid, or the courage to follow up: and after the failure of the attempt, and the dispersion of the *Fuerists*, they published a manifesto, in which they declared, that they had all along foreseen the ill success of a cause not originally undertaken by men of respectability, and possessors of large properties, like themselves!

However unfortunate may have been the issue of that undertaking, there is no doubt whatever that it not only occasioned dismay to the apostolic party, but also weakened considerably the moral strength of the faction, by taking prompt advantage of previous dissensions, and by proving the practicability of another and a similar attempt; neither was it deficient in forwarding the measures of Maroto, and in producing the present happy results for the cause of the queen.

It is notorious that the rebellion of the Basques has been occasioned, less from any strong attachment to the person of Don Carlos, than as the means of defending their own privileges from invasion. Whatever might have been, in this respect, the feeling in Navarre, arising from circumstances peculiar to the nature of its inhabitants and its institutions, that sentiment has been always avowed by the army of the three provinces. It may appear strange that a people governed, from periods of which the memory of man has no account, by laws and institutions, varying indeed, more or less, from each other, but all essentially republican, should have made so many sacrifices to uphold the claims of a man who has never concealed his detestation of every thing approaching to liberalism. The cause is to be sought in the

* In Bayonne alone there have been residing no less than 6000 Spaniards, all emigrants from the Basque provinces.

previous history of Spain, and its internal administration, so different from that of surrounding nations. The government of the Basque provinces has been always mismanaged by those who have advocated constitutional principles, and who wished to see their own peculiar ideas of liberty established throughout the kingdom: and the triumph of the constitution there gave the death-blow to the *Fueros*. The few enlightened princes who swayed the destinies of the Spanish monarchy, who restrained the excesses of the Inquisition, resisted the encroachments of papal power, and endeavoured to lessen the gorgeous wealth of the monastic establishments, even whilst making those efforts for the happiness of their subjects, were unfortunate enough to invade the privileges of those fierce yet faithful mountaineers; and the Basques were, in their own defence, compelled to link their cause with the despotism which touched them not, rather than with the liberalism which had not the discretion to respect their prejudices.

We have said that the political administration of Spain was different from that of the other governments of Europe, and that to this fact is traceable the present position of affairs in that country. Until the close of the fifteenth century, the attention of the nation was solely directed to the expulsion of the Moors; and the efforts of all were united exclusively for its accomplishment. In the same year in which this result was obtained, namely in 1492, the discovery of America took place; and, from that time forward, the establishment of the faith on the reconquered territory, and in the vast possessions of the new world, became the object of undivided attention: and to these causes may be assigned the establishment of the Inquisition, as well as the colossal power of the Jesuits. It is not difficult then to understand that circumstances which were of vast importance to Spain scarcely, or not at all, affected the interests of the rest of Europe; whilst the mighty events which, in the sixteenth century, acted with so much influence elsewhere, produced no result in Spain. Thus it happened that, in the country of which we treat, the national independence was so interwoven with the national faith, as to render it one and the same cause; and the minds of men were so undividedly engaged with the contest, that they felt no sympathy with any measures which did not directly tend to produce this result. For this reason the Inquisition was established to continue that warfare against *individual* heretics which had been previously waged against the *mass;* and, in order to organise, on all sides, an army of defence to protect this Christian unity from decay or attack, a bold and ambitious soldier of the faith created the institution of the Jesuits. Religion being then the conservative principle in Spain, and its institutions being so closely amalgamated with the civil government, it is not difficult to account for the social condition of the country, and for the causes by which the interests of the clergy, of absolute power, and of the people were so linked together. To these objects,—namely, those of establishing the faith in Spain and in the new world, and the maintenance of the interests of the crown abroad, —the efforts of the Austrian dynasty, since the accession of the heroic descendant of the Emperor Maximilian, were directed with equal and unceasing assiduity.

In consequence of this exclusive devotedness of the resources of the country to the promotion of these schemes, and its non-participation in the affairs of surrounding nations, Spain was found, on the accession of the Duke of Anjou, the grandson of Louis XIV., without any internal administration; the clergy alone being the directors of the public spirit, and her only revenues supplied by the wealth of the Americas. The political tendencies of

the House of Bourbon were destined to affect those which had swayed the Castilian monarchy, and promised soon to carry out those views, if not of universal dominion, at least of vast territorial aggrandisement, which even still mingled themselves with the superstitious dotage of Louis XIV.* In a short space of time an administrative tendency was observable in public affairs, and the seeds of a struggle were sowed against that conservative spirit of the preceding monarchy which we have noticed above.

Notwithstanding the expectations which induced the saying, that "the Pyrenees no longer existed," Philip V. found it impossible to carry out the political views of his grandfather to the extent he had desired, and for which he had struggled for the throne of Spain. This monarch did not possess the statesmanlike qualities of his celebrated ancestor; and his weaker powers were unable to impart to the general administration of his new kingdom, that concentration in the management of affairs which prevailed in the country he had left, and which actually prepared the way for the revolution of 1789. On assuming the reins of power he felt himself obliged, by the very circumstances of his accession, to consolidate the federalism which existed at the time in Spain, and to recognise, by legal enactments and royal decrees, the particular interests of the provinces, of localities, and of individuals, as strongly and as distinctly as they had previously existed.

The only portion of the monarchy which did not participate in this general confirmation of rights was Catalonia; and she lost her privileges, because, with her usual fierce impatience, she had flown to arms to maintain them, and, in the struggle which ensued, she was so unfortunate as to be vanquished. The inhabitants of the Basque provinces, however, had no cause to regret the accession of the new monarch to the throne of Spain and of the Indies; and their rights and privileges were not only recognised, but they also received, as the reward of their adhesion and fidelity to the crown of Castile, additional and important ones. At this period Spain presented the appearance of an aggregation of separate communities, and only formed one state in its political aims and its moral union.

The reforms effected by the Bourbon dynasty were not without their result. The changes introduced in the public administration by Philip V. were followed up by Ferdinand VI.; and, during the reigns of these two princes, that ministerial system was founded to which France owed all the benefits she enjoyed previous to the revolution, and which, in Spain, produced considerable ameliorations. This tendency to liberalism and enlightenment in the internal economy of the government assumed a larger development in the reign of Charles III. Abuses of many kinds were touched by his unsparing hand; and the Church of Rome, which, till his time, was almost omnipotent in that land of intolerance, and the gloomy and stern Inquisition itself, within whose deadly and baleful influence no kindly virtue dared take root, crouched beneath the determined spirit of an enlightened reformer. Veneration for the memory of this good monarch, and gratitude for the benefits imparted by his exertions and those of his able ministers†, remain still deeply implanted in the hearts of all good Spaniards, who cannot forget that to him Spain owes the greater part of her public establishments, as well as the few canals, high roads, manufactures, and commercial

* "Les ennemis d'un grand prince qui a si long tems regné l'ont mille fois accusé, plutôt, je crois, sur leurs craintes que sur leur raisons, d'avoir formé et conduit le projet de la monarchie universelle."— *Esp. des Lois*, l. ix. c. vii.

† "Le Comte d'Aranda importa les idées Françaises en Espagne, et initia aux hardiesses de la philosophie quelques hommes d'elite, qui partagerent avec lui le merite de cette direction nouvelle." — *Histoire des Provinces Basques*, p. 547.

associations which are yet to be found there. During his reign the population increased to an extent far beyond the proportion of other periods. Agriculture, the usual concomitant of a spreading community, became a science; and its practice, heretofore considered a slavish and degrading occupation, became a dignified and meritorious pursuit. The sale, too, of a large portion of the enormous property of the church, which perhaps none but such a man would have ventured to effect, added to the wealth, and exalted the industrious energy, of the nation.

Those new ideas of reform and of national improvement, the offspring of the inquiring and free-thinking spirit which had its origin in France, pervaded the country: the universities of Madrid, Seville, and Salamanca received them with enthusiasm; they became a part and parcel of the education of the nobility, and softened down the dogmatism of a narrow and bigoted theology. Lessons, imbued with the liberalism of the French school, were delivered from the chairs of divinity. The political doctrines of the *Encyclopedistes* were clothed in the fascinating garb of verse; and poetry herself,—she who first catches the inspiration, and who is never so eloquent as when she becomes the priestess of liberty,—disseminated those new ideas of the regeneration of the human race in strains * of sublimity and sweetness. The sagacity and firmness of enlightened statesmen were thus slowly but steadily developing the vast resources of the country; and the free doctrines of the French school, though of a more impetuous character in the land of their birth, were becoming imperceptibly blended with the phlegmatic and graver disposition of the Castilian race. Two events arrested the progress of improvement; one of which, in particular, produced results of the most disastrous nature—the war of 1793, and the accession to power of the favourite Manuel Godoy.

The powerful intellect of Carnot, and those of the convention who most resembled him, discovered immediately that, notwithstanding appearances, the Spanish people were not yet sufficiently prepared to cast aside those feelings which were connected with the noblest associations, and to fraternise with a nation that had not only flung off old prejudices, but had even rushed to the extreme of licentiousness; and it was soon perceived that an alliance with the monarch of Spain would better forward the views of the republic, than any attempt to excite the sympathies of the people. The peace, which was the fruit of the discovery of the error they had committed, presented to Cabanus, Jovellanos, and others of the like stamp, opportunities, which were not allowed to pass unheeded, of carrying on the good work which had been interrupted; and the movement principle, once more renewed, was directed against the temporal influence of the clergy, — which body, and not, as in France, the *noblesse*, was the principal privileged class in Spain. Hatred to the persons of the French republicans was, however, accompanied by admiration for the political doctrines of the more moderate amongst them; and the result of the labours of the Spanish statesmen was the production of that code which is known by the name of the *Constitution of Cadiz*.

It is not difficult to believe that the adoption by the Spaniards of those liberal principles may have been one of the causes of the failure of the French arms in the Peninsula; and the patriots of Spain found no better means of arousing and combining the national resistance to the invasion of Napoleon, than by disseminating the Constitution. The new form of govern-

* "A Salamanca Melendez introdució la filosofía Francesa bajo el velo de la poesía."—*Hist. de la Constit. de Cadiz.* At the restoration of Ferdinand VII. the poems of Melendez were ordered to be burnt by the hands of the executioner.

ment was eagerly caught at. Their enthusiasm, universal as that which in other days excited them against the Moors, made them postpone all subordinate interests to national independence alone; and they hastened to adopt, as the best mode of effecting it, that system of concentration, though by it all local and particular privileges were annihilated. All united together: nobility, clergy, people, provinces, and localities, became inflamed with the same ardour, and eagerly grasped this new weapon of defence; whilst Navarre and the Basque provinces were not amongst the last to accept, for the time, the constitution which annulled their *fueros*.

Those principles, caught up and cherished in the hour of danger, and under the pressure of extraordinary circumstances, did not, however, long survive the existence of the danger. They had been appreciated only by the enlightened classes, — a small portion of the community, — and had not penetrated the nation with sufficient force to ensure a long endurance. The danger passed away, and the people manifested their repugnance for that constitution which had proved their safeguard. The danger that had threatened the national independence no longer existed, and a powerful reaction commenced. During the war with the French the clergy were foremost in urging on the people, and they detested alike the principles and the persons of the late invaders. When tranquillity returned, they, without much difficulty, resumed their ancient hold on the feelings of the lower classes; and the recollections of their past history, when the combined efforts of all—the nobility, people, and clergy—were directed to the expulsion of the Moors, and the establishment of the faith, served at present to render them unwilling to listen to any other teachers. Though the constitution of 1812 annihilated the privileges of the Basque provinces that were engaged in the struggle against the French, yet it was accepted by them at the time without hesitation or inquiry. The necessity for universal combination, created by those dangers, passed away when the object for that combination was effected; and the reaction introduced at the restoration of Ferdinand VII. not only was met by little resistance, but, in most parts, was received with the greatest sympathy.

Until the invasion of 1808, Spain was merely a federative monarchy — an aggregation of communities with different institutions. With the exception of Andalusia and Murcia, each province enjoyed its own distinct rights; and these privileges were most considerable wherever the adhesion to the Castilian monarchy had been most voluntary, and where, above all, the Mussulman yoke had never been imposed. Of those districts thus favoured, the Basque provinces were the most considerable; and the distinctions of local government there were still more strengthened by the difference of language. On the return of Ferdinand to Spain, his first act was to re-establish those privileges of communities and individuals, which had existed previous to the grand combination of the Spanish family. The spirit of national independence passed away with the departure of the French, and that of local interests resumed its influence, and found a protector in the monarch; *and, from henceforth, as before, the Basque provinces were taught to consider their cherished rights and beloved fueros as inseparably linked to the maintenance of absolute power in the kingdom.* Those feelings were, unhappily for the sake of liberty, disregarded by all who have, since then, attempted an insurrection in the country. This reliance on the aid of absolutism was confirmed by the revolution of 1820; it was consolidated by the restoration in 1823; and the firm conviction was, unfortunately, impressed on the minds of the Basques, that the existence of their *fueros* would be always endangered by any

tendency to political improvement, either in the shape of a constitution or otherwise.

In the recent defection from the standard of Don Carlos, it will be found that the Navarrese remained attached to his cause. The reason for this difference between them and the Basque provinces will be found in the peculiar history of that people.

Though republican in many of its institutions, Navarre retains much of the feudal system of the middle ages. In a country whose population does not amount to more than 286,000 inhabitants, there exists a class of nobility comprising more than 13,000 persons. The services rendered by this privileged portion of the community to the cause of Navarrese independence, from the most remote periods downwards, have endeared it to the people. Each property is, in law and in fact, a manor, always bearing the name of the family and the date of its foundation. The rights of the *mayorasco*, or the eldest born, are there in the most complete vigour, and the family name is transmitted with the manor. In the valleys of Navarre, families are found that can prove an uninterrupted residence in the same locality for 1000 years. No other nobility is recognised by the Navarrese in their own country; and this dignity with them can be only bestowed by the provincial cortes, or created by naturalization.

Powerful as the nobles are in Navarre, there exists another class of individuals whose immense influence overwhelms that of every other body. The secular clergy, amounting to nearly 2000 in number, exclusive of monks and nuns, possess the privilege not only of deliberating as an assembly of the state, but they also exercise the rights of an executive. The government is composed of four different branches — the viceroy, representing the king of Castile; the deputation, or cortes, composed of three *estamentos*, or estates— the ecclesiastical; the military; and *procuradores*, or representatives of towns. The first comprises the sacerdotal dignities of the kingdom, bishops, abbots, and priors of Roncesvalles; the second is composed of the nobles and barons; and in the third are found the representatives of the *pueblos* or towns, who are elected by the proprietors, the merchants, and lawyers. The grand council of Navarre, resembling the old French parliaments, and the chamber of finance, complete the general administration. In addition to the number of secular priests enumerated above, there are monastic establishments of large extent, whose inmates have been reckoned at about 1700; and the ecclesiastical estate possesses the right of *veto* in the deliberations and resolutions of the other two branches of the legislature. It is not then extraordinary that a body so numerous in proportion to the population, and possessing such overwhelming influence in the management of public affairs, should thus connect their cause with one whose entire conduct has been guided by spiritual advisers, and whose ultimate success would not only confirm, but enlarge, if possible, their present power.

During the last three years, frequent and alarming symptoms of discontent have been observable in the army of Don Carlos, which had for the scene of its operations the northern provinces of Spain. These signs of insubordination were not alone confined to the Guipuscoan, Alavese, and Biscayan divisions, but they likewise extended to the Navarrese. They were chiefly caused by the decided preference which, of late years, the Pretender seemed to manifest for his Castilian followers; who, by intrigues, succeeded in gradually insinuating themselves into the management of affairs, both civil and military, and who, in a short time, occupied the principal offices about his person. By a fatality which seemed destined to lead to

an unhappy result, they persevered not only in making an open display of the influence they exercised over the mind of their master, but every measure suggested by them was strongly opposed to the feelings and prejudices of those provinces from whose population the army of the north was supplied. The Basques saw their native chiefs, the heads of the great families with whose names their old renown was connected, obliged to give place to strangers from the other side of the Ebro, who were mere adventurers, devoid of principle, and wholly uninfluenced by those feelings of patriotism and sincerity, which, when directed even to mistaken purposes, serve to hallow the cause in which they are engaged. The suspicion arose that the specious promises of Don Carlos as to the recognition of the *fueros* were only made to serve his own immediate purposes, and were only uttered for the purpose of misleading them. They began to entertain well-founded fears also, that even if Don Carlos were well inclined, he should find himself obliged to belie his own principles, and establish a constitutional government, which, however modified, would in any case annihilate the privileges for which they fought. They saw, besides, their population drained for the purpose of supplying expeditionary armies to send to the other side of that boundary which they never willingly would pass; and, witnessing the discomfiture of those predatory bands, and the forlorn condition in which they returned, they murmured at, and arraigned the evil counsels which had entrusted the Guipuscoan and Biscayan youth to the guidance of Castilian adventurers, who had neither country nor rights to fight for.

The frequent and heavy contributions to which they were subject became a serious source of discontent; and their indignation and astonishment were at the same time excited at beholding the collection of the imposts taken out of the hands of their natural rulers, whose authority only they were accustomed to recognise, and placed in the hands of foreigners, whose persons they despised and hated. As if nothing should be left wanting to fill up the measure of discontent, a band of idlers from Castile and Andalusia, to whom the appropriate name of Oxalateros* has been well applied, crowded the court of Don Carlos. With the usual talent for intrigue, they wound themselves into the affairs of the Pretender; and in a short time their influence was felt in all the departments of the civil and military administration. Those persons had no standing in society; they were not employed in any official business of the state; and though the movements of the army were supposed to be in a great measure directed by their suggestions, they not only held no appointments, or no rank in the military force, but were not present even as amateurs when the troops were in action with the enemy. They subsisted on the miseries of the country, without contributing in any way to advance the cause in which all around them were engaged.

The dissensions thus occasioned were never healed; and in the engagements which latterly took place between the hostile armies, the success which, in most cases, attached itself to the army of the Christinos, did not by any means tend to allay the discord. Since the return of Maroto, who had himself been the victim of intrigue, those angry feelings became more than

* *Oxala*, in the Castilian idiom, means, "*God grant it*," or "*I wish*"— the *utinam* of the Latin language bears the same meaning. It is applied to all those who, without using any exertions of their own, depend solely on Providence.— A humorous application of the term is also made to gipsies, tinkers, pedlars, mendicant friars, and all others who lead a wandering life, who have neither a fixed place of residence, nor any well-defined mode of living, and who exist on the folly, or the credulity, of their fellow-men.

ever manifest. It has been said that the many desertions which had taken place since the second appointment of Maroto to the command in chief were caused with the intention of forwarding the latent purposes of that general. The line of conduct had been previously marked out for those persons who passed over to the Carlist camp; they were intended to aid Maroto in the defection which he meditated, and to protect him against the consequences of any sudden and unforeseen change which might take place in the minds of those whom he might be able to seduce. We believe there is a good deal of truth in this opinion.

The intercourse which, for the last year and a half, has been permitted to subsist between the town of San Sebastian and the interior of the province of Guipuscoa, most powerfully assisted, in our mind, to bring about this consummation. In San Sebastian alone, the emigrants from Tolosa, Aspeitia, Ascoitia, and other inland towns in possession of the Carlists, amount to more than 1000 persons. There are 300 from Tolosa alone, who bear arms in the national guard. All these had been obliged to abandon their homes, and many their families, on the retreat of the Pastor before Zumalacarregui, in the commencement of the war. The communication being once more opened by the mutual consent of the hostile commandants of the provinces, the intercourse between friends and relations gradually softened down the asperities of political hostility; and the longing to return again to the bosom of those quiet valleys, on one side, and the desire to renew the ties of friendship and natural affection, on the other, aided, too, in a powerful manner, by the recollection of all they had lost in supporting a cause, which, if not utterly hopeless, did not certainly promise a speedy termination, rendered the Guipuscoans and Biscayans more susceptible of reconciliation and peace. The most important difficulties had been previously got rid of by Maroto; and the banishment of one portion of the apostolical party, and the putting to death of the other, left him free to practise on those feelings which were half prepared to receive the first powerful impulse imparted by a daring and powerful will, reckless and unprincipled though it may be.

Though the negotiations which have led to the present result have been going on for some time, it is certain, that, but for the part which Lord John Hay has taken in them, they never would have been brought to their present satisfactory conclusion. His lordship has been most indefatigable in his exertions to confirm the determination of Maroto, if at any time that chief manifested indecision, — prompted, perhaps, by the excusable feelings of fear, or shame. His visits to the head quarters of the Carlist general-in-chief were long and frequent; and, by his active co-operation as representative of the English government, he became successful in removing any impediments that might have arisen between the negotiating parties, and in entirely securing the defection of Maroto from the declining cause of the misguided prince who had confided to him the command-in-chief of his armies. The sanguinary measures previously adopted by Maroto, in order to prepare the way for this last act, cannot certainly be commended; and we are persuaded that however great may have been the influence of those representing our government, the monstrous acts of cruelty perpetrated by Maroto were beyond their control. For some time past the British government would have desired that the *fueros* of the Basques were recognised by the cabinet of Madrid; and the very decided aid in supplying engineers to construct a fort near Irun, in giving arms and ammunition, (ostensibly delivered on the receipt of Jauregui, a retired general in the

queen's service,) for the purpose of promoting the designs of Muñagorri, even in open defiance of O'Donnell, the captain-general of the province, sufficiently proves the sympathy of our government with the demands of the insurgent provinces for the *fueros*. We certainly should have preferred open and direct interference on the subject; because we foresee, that, in case any repugnance be manifested in the cortes, or any difficulty be thrown in the way of the execution of the articles of the treaty by differences existing between the *Exaltados* and *Moderados*, —circumstances not at all improbable, —our government, pledged as it is by the acts of its agents, will be compelled to lay aside its secret diplomacy, and, in order to maintain its consistency and good faith with the mountaineers, who have not trusted to Spanish dissimulation, but to British honour, will have to insist on the honest fulfilment of that treaty which they have all but dictated. Its position, in case of refusal, would be awkward and embarrassing in the extreme.

In the town of Bergara (Guipuscoa), a solemn treaty was entered into, between Rafäel Maroto and Baldomero Espartero, Duke de Victoria, by the terms of which that portion of the army under the immediate command of the Carlist general were to lay down their arms, and submit to the government of Queen Isabella II. In accordance with this arrangement, five battalions and two squadrons of the Castilian division, three battalions and four companies, with a squadron of the Guipuscoan division, eight battalions of the Biscayan division, with four pieces of heavy artillery, were united, on the 2d September, with the army under the command of the Christino general. Espartero ordered a review of the combined forces on the same day. Accompanied by Maroto, he rode slowly along the extended line, where Carlists and Christinos were now associated as fellow-soldiers. As they moved along in front, shouts, that might have startled the eagles on the crags of Santa Barbara, burst from the assembled multitude. The two generals were bareheaded, and tears flowed fast from the eyes of Espartero. The day was beautiful and still, and the gentle and soft repose of the delicious valley harmonised well with the feelings of peace and brotherhood which seemed to animate the bosoms of all. The line was formed into square, and the two chiefs placed themselves in the midst. Unbroken silence prevailed. Espartero addressed them in a feeling and eloquent manner. He seemed to pour out his whole soul in expressions of love and gratitude, for the sublime act of uniting themselves, like brothers, to consolidate the peace so earnestly desired by all. On the conclusion of his address the acclamations were deafening; but the universal feeling rose to a frenzy of delight when Espartero, falling on the neck of his late enemy, clasped him in his arms, strained him to his bosom, and kissed his cheeks repeatedly; whilst the heaving of the heart, and the sobbing of these veteran warriors, showed that the ties of ancient comradeship, and brotherly affection, contracted in far distant climes, and on the field of battle, though interrupted for a season by the misfortunes of their common country, were united, never again to be rent asunder.* At the termination of this affecting scene, the troops were allowed to mingle together without restraint, and friends and relations soon recognised each other.

The treaty thus celebrated consists of ten articles; the first and most important of which is the pledge, given by Espartero, that the queen's govern-

* Espartero and Maroto had served together in the New World against the patriots of Venezuela. It is said that they were in the same regiment, but it is certain they were commanded by the same brigadier. Maroto held the rank of Brevet Lieut.-Colonel; and Espartero, who was their captain, was indebted to him for promotion to the *grade* of *Commandante de Batallon*, in recompense for one of those acts of headlong bravery for which he is still distinguished.

ment shall earnestly recommend to the cortes the concession or modification of the *fueros* of the Basque provinces. The second recognises the grades and decorations of officers of all ranks in the army of Maroto, with the option of serving in the army of the queen, or of retiring to their homes. The third, fourth, fifth, and sixth relate to the distribution and classification of the officers who may choose to serve in the Christino army; and they explain the arrangements to be made for those who may wish to retire on leave or otherwise. The seventh promises the same advantages and conditions to the Navarrese and Alavese divisions that may present themselves, in the same manner as those of Castile, Guipuscoa, and Biscay. The eighth places at the disposal of Espartero the parks of artillery, depôts of arms, and stores of all kinds which remain in the hands of Maroto. The ninth declares that all the prisoners belonging to those divisions that have as yet surrendered, who may wish to follow the example thus set them, shall be immediately set at liberty, and shall participate in the same advantages; but if they persevere in holding out, they shall remain, as before, prisoners of war. The tenth engages Espartero to recommend to the government that a regular provision be made for the widows and orphans of those who were killed whilst serving in any of the divisions comprised in the present treaty.

Maroto, as it has been stated, wished to soften his defection, by insisting on two additional articles, which, whilst their import may have been a matter of indifference to the Basques, to whom their *fueros* were the principal object, would in the other provinces have excited new troubles. These were, the marriage of the Queen Isabella with the Prince of the Asturias, and the establishment of the *Estatuto Real*, in place of the constitution of 1837. The solemn decree of proscription, voted in 1833, by the seventy-two members of the *Estamento de Proceres*, in virtue of which Don Carlos and his family not only are excluded, for ever, from the throne, but are prevented from returning to any part of the Spanish dominions, could not be so easily set aside by the negotiating generals, or acceded to by the representatives of the English government, without violating the principles on which they profess to act; and it would be an attempt little short of madness to introduce, in preference to the liberal provisions of the constitution, a plan of administration in which the legislature would consist of two estates, — one of *proceres*, or nobles, selected amongst the grandees, the other of *procuradores*, or deputies, to be chosen by persons only who possess a clear and unembarrassed yearly income of 12,000 reals (120*l.* sterling), where the monarch alone would have the right of the initiative, and the two chambers merely that of petition.

The most important article of the present treaty, then, is that in which the recognition of the *fueros* is promised. The government will therefore be bound to permit the inhabitants of the Basque provinces to govern themselves, as they have done from time immemorial, by their own municipal institutions; and to confirm those exemptions and rights which the crown of Castile had always recognised, — subject only to such modifications and changes, corresponding to the present state of Spain, as may be mutually agreed on.

The right of any portion of an empire united under one head, and affected by the same interests, to claim privileges distinct from and superior to those of the others, may be called in question by those who think that the obligations of the governed and governing are reciprocal. It should be remembered, however, that the self-government claimed by the Basques is confined to their own municipal institutions; and that where an exemption

from duties on imported merchandise is insisted on, the advantage of sending it for consumption into the interior of the kingdom is equally denied them. In this respect, then, the benefits resulting from such exemptions are merely imaginary; and they are certainly less detrimental to the remaining portion of the empire, vast in comparison with the privileged districts, than to the speculators who would be so unprofitably enterprising as to engage in such a species of commerce under these restrictions. This has been felt by the several sea ports along the Cantabrian coast; and frequent remonstrances have been made, particularly by the trading classes in San Sebastian, to the provincial deputation of Guipuscoa, in which the injury done to their commerce is clearly proved, and the right insisted on that each town, or *alcadia*, enjoying its own distinct *fuero*, adapted to its local wants, and unconnected with that of any other, has a perfect title, through its *ayuntamiento*, or corporation, to modify, enlarge, or change, as it may deem fit, its own particular code, without interfering with, or being subject to, the general *fueros* of the province represented by the provincial deputation; and that, consequently, with regard to the custom-house regulations, any measures of advantage to the commerce of San Sebastian may be considered without the obligation of reference to the said deputation.

One of the most important privileges claimed by the Basques is that of being allowed to protect themselves from foreign invasion. They have built their own fortifications, constructed their own arsenals, and manned their own army and navy. Their history is replete with proofs of their determined patriotism, and their success in repelling aggression, during the wars, in the middle ages, between the Spanish and French nations. Their connection with the crown of Castile was voluntary and free; and the fact of their forming an integral portion of the monarchy was never occasioned by conquest, as in the case of the other portions of the Castilian dominions. Their attachment to their ally has been marked, throughout a long series of centuries, by the purest honour and the most enduring fidelity. Their alliance, too, was formed on the express condition that their *fueros* should be for ever recognised — the monarch, Alonzo VIII., at the same time declaring that this connection was formed without compulsion of any kind, and entirely by their own free will.

It would be impossible, within the limits of this article, to enter into a detailed history of the Basque provinces, or to explain minutely the nature of those fueros by which they have been governed during so lengthened a period. They are found to be singularly adapted to the nature, locality, and pursuits of each community. To the historian and philosopher it would be a task of pleasure to trace to their remote origin those laws by which a number of minute and independent republics, within the recesses of the Pyrenees, and along the shores of the Cantabrian ocean, have been so long administered; and they would be struck with the singularity of the fact, that, whilst contemporary nations of vast extent and power were ruled by despots, these small isolated districts enjoyed the benefit of free institutions, which, even in our days of enlightenment, might impart not useless lessons in local government. We do not mean to assert that the social condition of the Basque provinces may not be benefited by the improvements presented by our more modern forms of administration; and we are quite sure that the elasticity of their code would, without difficulty, adapt itself to the legislative improvements of an enlightened age.

However similar in their origin have been the Basque institutions, a striking difference may be observed in each. Navarre, as we have already

ment shall earnestly recommend to the cortes the concession or modification of the *fueros* of the Basque provinces. The second recognises the grades and decorations of officers of all ranks in the army of Maroto, with the option of serving in the army of the queen, or of retiring to their homes. The third, fourth, fifth, and sixth relate to the distribution and classification of the officers who may choose to serve in the Christino army; and they explain the arrangements to be made for those who may wish to retire on leave or otherwise. The seventh promises the same advantages and conditions to the Navarrese and Alavese divisions that may present themselves, in the same manner as those of Castile, Guipuscoa, and Biscay. The eighth places at the disposal of Espartero the parks of artillery, depôts of arms, and stores of all kinds which remain in the hands of Maroto. The ninth declares that all the prisoners belonging to those divisions that have as yet surrendered, who may wish to follow the example thus set them, shall be immediately set at liberty, and shall participate in the same advantages; but if they persevere in holding out, they shall remain, as before, prisoners of war. The tenth engages Espartero to recommend to the government that a regular provision be made for the widows and orphans of those who were killed whilst serving in any of the divisions comprised in the present treaty.

Maroto, as it has been stated, wished to soften his defection, by insisting on two additional articles, which, whilst their import may have been a matter of indifference to the Basques, to whom their *fueros* were the principal object, would in the other provinces have excited new troubles. These were, the marriage of the Queen Isabella with the Prince of the Asturias, and the establishment of the *Estatuto Real*, in place of the constitution of 1837. The solemn decree of proscription, voted in 1833, by the seventy-two members of the *Estamento de Proceres*, in virtue of which Don Carlos and his family not only are excluded, for ever, from the throne, but are prevented from returning to any part of the Spanish dominions, could not be so easily set aside by the negotiating generals, or acceded to by the representatives of the English government, without violating the principles on which they profess to act; and it would be an attempt little short of madness to introduce, in preference to the liberal provisions of the constitution, a plan of administration in which the legislature would consist of two estates, — one of *proceres*, or nobles, selected amongst the grandees, the other of *procuradores*, or deputies, to be chosen by persons only who possess a clear and unembarrassed yearly income of 12,000 reals (120*l.* sterling), where the monarch alone would have the right of the initiative, and the two chambers merely that of petition.

The most important article of the present treaty, then, is that in which the recognition of the *fueros* is promised. The government will therefore be bound to permit the inhabitants of the Basque provinces to govern themselves, as they have done from time immemorial, by their own municipal institutions; and to confirm those exemptions and rights which the crown of Castile had always recognised, — subject only to such modifications and changes, corresponding to the present state of Spain, as may be mutually agreed on.

The right of any portion of an empire united under one head, and affected by the same interests, to claim privileges distinct from and superior to those of the others, may be called in question by those who think that the obligations of the governed and governing are reciprocal. It should be remembered, however, that the self-government claimed by the Basques is confined to their own municipal institutions; and that where an exemption

from duties on imported merchandise is insisted on, the advantage of sending it for consumption into the interior of the kingdom is equally denied them. In this respect, then, the benefits resulting from such exemptions are merely imaginary; and they are certainly less detrimental to the remaining portion of the empire, vast in comparison with the privileged districts, than to the speculators who would be so unprofitably enterprising as to engage in such a species of commerce under these restrictions. This has been felt by the several sea ports along the Cantabrian coast; and frequent remonstrances have been made, particularly by the trading classes in San Sebastian, to the provincial deputation of Guipuscoa, in which the injury done to their commerce is clearly proved, and the right insisted on that each town, or *alcadia*, enjoying its own distinct *fuero*, adapted to its local wants, and unconnected with that of any other, has a perfect title, through its *ayuntamiento*, or corporation, to modify, enlarge, or change, as it may deem fit, its own particular code, without interfering with, or being subject to, the general *fueros* of the province represented by the provincial deputation; and that, consequently, with regard to the custom-house regulations, any measures of advantage to the commerce of San Sebastian may be considered without the obligation of reference to the said deputation.

One of the most important privileges claimed by the Basques is that of being allowed to protect themselves from foreign invasion. They have built their own fortifications, constructed their own arsenals, and manned their own army and navy. Their history is replete with proofs of their determined patriotism, and their success in repelling aggression, during the wars, in the middle ages, between the Spanish and French nations. Their connection with the crown of Castile was voluntary and free; and the fact of their forming an integral portion of the monarchy was never occasioned by conquest, as in the case of the other portions of the Castilian dominions. Their attachment to their ally has been marked, throughout a long series of centuries, by the purest honour and the most enduring fidelity. Their alliance, too, was formed on the express condition that their *fueros* should be for ever recognised — the monarch, Alonzo VIII., at the same time declaring that this connection was formed without compulsion of any kind, and entirely by their own free will.

It would be impossible, within the limits of this article, to enter into a detailed history of the Basque provinces, or to explain minutely the nature of those fueros by which they have been governed during so lengthened a period. They are found to be singularly adapted to the nature, locality, and pursuits of each community. To the historian and philosopher it would be a task of pleasure to trace to their remote origin those laws by which a number of minute and independent republics, within the recesses of the Pyrenees, and along the shores of the Cantabrian ocean, have been so long administered; and they would be struck with the singularity of the fact, that, whilst contemporary nations of vast extent and power were ruled by despots, these small isolated districts enjoyed the benefit of free institutions, which, even in our days of enlightenment, might impart not useless lessons in local government. We do not mean to assert that the social condition of the Basque provinces may not be benefited by the improvements presented by our more modern forms of administration; and we are quite sure that the elasticity of their code would, without difficulty, adapt itself to the legislative improvements of an enlightened age.

However similar in their origin have been the Basque institutions, a striking difference may be observed in each. Navarre, as we have already

remarked, possesses a feudal organisation, in which the clergy have a large share. Biscay is a pure republic, where the whole population directly participates in the government. Guipuscoa is a species of aristocracy, where the chief power is concentrated in certain families; and Alava is a sort of elective monarchy, in which the executive is vested in the representative of the sovereign, who is named by the *junta*, which is itself elected by the people. The obvious policy of the Spanish government would be to leave the provinces to the enjoyment of their own privileges, until a better knowledge of a more enlarged representative system would convince the Basques of the superiority of that constitution by which the rest of Spain is governed. Experience will teach them to appreciate its benefits; and a constant intercourse with European civilisation, and European policy, will enable them to understand those institutions whose superior utility will supersede their own.

The cause of Don Carlos is at an end; but we are by no means therefore prepared to anticipate that the horrors of civil war will have entirely passed away, on the ratification of the treaty between Maroto and Espartero. The treaty itself will present no small difficulties in the way of an universal pacification. By the second article, the ranks and honours of the officers in the army of Maroto will be recognised by the queen's government; and in case these officers, or any of them, join the ranks of the Christino army, they will of course take precedence according to the dates of their respective appointments and promotions. The old captains of the Christino army, who have gone through all the hardships of this tedious war, will not be pleased to see men placed over them who never served but in rebellion, and whose only title to rank or dignity consists in having successfully outraged the laws to which they themselves were obedient, and in taking up, as traitors, arms against their lawful sovereign, to whom they preserved their allegiance, and in whose cause they had shed their blood. The cross of Saint Ferdinand will be torn in contempt from the breasts of those who see rebels decorated with the same honourable distinctions; and we should like to know the feelings of old *Santa Cruz*, a brigadier of fourteen years' standing, when receiving his orders on a field day from some Carlist general officer, who was employed in reading his breviary, or conducting his plough, or tending goats, whilst he was making the campaigns of the Americas!

If the government fulfil the fourth article of the treaty, which is doubtful, seeing what their past conduct has been, and are able to pay regularly the retiring allowances which Espartero has promised, what will be said, and felt, by those disabled and worn-out servants, who for years past have been in so miserable a condition, and who have been obliged to accept with gratitude the daily ration in lieu of half-pay? What will become of the widows and orphans of the numbers who have fallen in battle, and who for years past, also, have been obliged to beg alms on the highway? If the government *can* fulfil the obligations entered into, discontent and hatred will be excited in the bosoms of those who have remained faithful to the queen; and if they *cannot*, the violation of a most important article will make the whole treaty null and void, and will afford opportunities, of which due advantage will be taken, of renewed rebellion against those who have deceived them. These difficulties in the settlement of the Spanish question are not, we fear, the only ones which are likely to arise. Should the Navarrese still remain devoted, they can be capable of much and extensive mischief. Such a force, keeping up a *guerilla* war, and making frequent

incursions into the neighbouring provinces, can still give occupation to Espartero. We have remarked on the strong ideas of fidelity existing amongst the Navarrese: their habits of life and their character have imparted a ferocity which often breaks out into acts of cruelty to their enemies; and the feudal nature of their institutions may possibly make them still regard Don Carlos as a chieftain and head of a family, deserted by his clansmen, and abandoned by his children. Unhappily, too, the influence of the clergy has been always so overwhelming in Navarre, that they, who alone might have the power to soften and subdue this fierce spirit, will be the first to urge them on; and the weak intellect of Don Carlos is so guided by those who can never, for a moment, lay aside the hope of re-establishing the Inquisition, that we fear the effusion of blood will not be soon stayed.

Neither must we forget the fourteen thousand men of Cabrera, who still occupy the most important province in Spain. This remorseless and daring chieftain has, since the late events in the Basque provinces, issued a proclamation for a levy, *en masse*, of all between the ages of eighteen and fifty; and he is now employed in preparations to carry on the war with even still greater ferocity than before. Here, too, the name of religion is made use of to forward this unholy cause; and three bishops, who always follow his head-quarters, have fulminated excommunications against all who refuse or hesitate to take up arms. The army of Cabrera is generally composed of the outcasts of society — robbers and assassins; and, in many cases, it is officered by monks and priests, who, from the commission of some crime, or from their zeal for religion and love for the Inquisition, have thrown aside the breviary, and taken up the sword. Cabrera, who had been himself, previously to his taking up arms for Don Carlos, *sacristan* in a convent in Aragon, is popular amongst his soldiers; and his personal influence is consequently very great.

Besides those large bodies, which are still on the footing of a regular force, we must not neglect to notice the predatory bands which have long infested the country, under pretence of fighting for the Pretender, but whose principal object is to plunder all parties; and the old Curate of *Villaviedo*, *Merino*, will not cease to ravage the large extent of country between Burgos and Madrid. The terrible excesses, too, which have already commenced, and which will be continued by those portions of the disbanded battalions of Biscay and Guipuscoa that have not consented to bear arms for the queen, will contribute to keep the country in a state of turbulence and bloodshed.

Notwithstanding, however, the trials to which she may yet be exposed, Carlism is annihilated for ever in Spain. The problem is solved, whether absolutism or constitutional principles shall be established in the fairest countries of the continent of Europe. The arrival of the Pretender in the French territory, and his abandonment of the portion of the Navarrese army that still remained faithful, have completed that which the defection of Maroto began,—the total ruin of his cause. Where now are the earnest protestations, so often repeated, and so solemnly announced some months since, before the high altar and the golden statue of Saint Ignacius in the magnificent church of Aspeitia,—of his resolution to enter Madrid as a crowned king, or to die in a well-fought battle field? Where are the assurances, so often given to his faithful and beloved Navarrese, that even in case of failure he should never become a fugitive, and that the battle which should put an end to his hopes should also terminate his existence? This desertion, and his base and cowardly recklessness as to the fate of those whose fidelity, whilst he remained

amongst them, was unshaken, must deprive him of the sympathy even of those equally despotic, but more courageous tyrants, who have hitherto aided him, and must now render the submission or dispersion of the remaining battalions of Navarre, *as a regular force*, a task of comparative facility.

The complete pacification of Guipuscoa has produced its effects already. Three hundred refugees from Tolosa and its environs, artizans and shopkeepers, who have been, since the commencement of the war, residing at San Sebastian in poverty and wretchedness, have all returned to their homes and resumed their ancient occupations. Bergaca, Guetaria, Motrico, and the other towns of the sea coast and the interior, are once more crowded with inhabitants. Confidence restored, harmony renewed, and enmities reconciled, now gladden the valleys of the "noble and loyal provincio."* In San Sebastian provisions, which had been nearly at famine price, have been diminished more than one half, and commerce is already resuming its former activity. The joy of all classes amounts to delirium; and balls, bull-fights, and illuminations have occupied the time since the auspicious treaty of Bergara. Crowds of emigrants are returning from France; and the principal towns are now presenting an aspect of peace and happiness, which, we trust, will rapidly extend to the other parts of Spain over which the destroying angel may have passed.

SONNET.

AN AUTUMN STORM.

THE Northern Wind hath blown his bugle-blast,
And troops of clouds come hurrying on the fields
Of the blue sky, and wide their banners cast,
And lift above the earth their massive shields.
Now, all unordered, all unmarshalled, they
Make preparation for the dire affray.
Their weapons are the sleet, the rain, the hail —
Concealed behind those parapets of mist:
Lo! now their keen-edged fury doth assail
The guarding atmosphere, and o'er the land —
Save when its breast is cased in rocky mail —
Pours devastation, at thy stern command,
Oh Northern Wind! nor will the war desist,
Till thou art conquered by some hostile gale.

PARK BENJAMIN.

New York.

---

* "*Muy noble y muy leal provincio*" — the title bestowed on *Guipuscoa* by Don Alonzo VIII., and which forms the motto of her escutcheon.

THE CHURCH AND THE ARMY;

A RECENT DISCUSSION.

(*A Nobleman of the Army receives the rebuke of a Bishop.*)

BISHOP. — WITH solemn grief and very mournful thought,
Deep throes of spirit and a righteous fear,
Prompted by Heaven and by my duty's charge,
I claim, my lord, your most attentive ear;
And trust my words, with salutary force,
May sink, deep-settling, in your lordship's soul.

NOBLE. — Since from the body of the Bench, my lord,
Your words proceed, I shall with due regard
Receive the message; nor forget the measure
Of such respect as at fit times may claim
A hierach of divine nobility.

BISHOP. — When from exalted birth and station bright,
Broad lands and influence in this lower world,
Such as your lordship holds in tenure here,
An overt act of serious consequence
Confronts the face of law — that temporal power,
Being duly merged among the flock of Christ,
Must yet succumb before the pastoral crook,
More humbly, as the height wherefrom it shone
Exceeds the common fall.

NOBLE. — Grave lord, proceed:
With reverence profound I wait the charge.

BISHOP. — It hath been known — I speak with deepest sorrow,
With unfeigned horror speak — that heretofore
Have men of lofty rank at sundry times —
Forgetting reverence for the word of law,
Both human and divine, forgetting God
And his most holy and especial Church,
With all its ministrants — unduly given
A ready sense to sanguinary thoughts,
And, by the passionate promptings madly urged,
Cast a free rein unto their desperate will.
Hence, in the catalogue of modern crimes,
Manslaughtering duels stain the fields of peace;
And e'en our nobles, as your lordship wots,
Have met with fierce and fratricidal hands
In peril of their lives.

NOBLE. — It is most true.

BISHOP. — Should we not rather claim your lordship's hands
For justice, charity, and to uphold
The established altar and the country's throne?
Should you not rather feel this human life,
Not as your own, but solely dedicate
To Christian duties and your lordship's God?

NOBLE. — Stand I alone within this deep reproof,
Most reverend lord and father of our church?
Methinks the charge were of a greater breadth
Than thus to fill, and with dismay o'erwhelm,
My single scutcheon?

BISHOP. — O, wide-sinning world!
Too oft thy graves by homicides are oped,
And blood affronts thy sanctuary of rest.
But in such cases, where the offenders bore
That birth and station which command our care,
The Church, with high and holy office crown'd,
Hath risen in rebuke. Forthwith the knees
Of those who thus were bent with heavy sin,
And by the weight of our authority,
Have sought Heaven's pardon through its natural porch,
And gain'd their readmission to the Church;
Whose bosom else had never more received
Their crime-polluted souls. But when such prayers,
And humble penitence in proper form,
Had duly been pour'd forth, they were received
And reinstated in our fullest love.
So may your lordship profit by my words,
And this admonishment its end effect;
Nor thou, a Christian senator and peer,
The odium bear of duel and device,
To take Heaven's law within thy mortal hands.

NOBLE. — My lord! Right Reverend Father in God, Lord Bishop!
That I, in personal conflict, have opposed
Myself to one who call'd me to account,
At peril of both lives, I readily,
And without shame, albeit with due respect,
Acknowledge to your lordship's reverence.
With all becoming gratitude of heart,
And such contrition and humility
As may become a soldier and a peer,
I bow before your most paternal care,
And trust my readmission to the fold
Of your especial church. That I have fail'd,
High station and religious principles
To substitute for the worldly code of honour,
Is true no less; yet do I frankly deem
Myself not strictly subject, by this act,
To fall within the pale like errant sheep,
With leg entangled in the pastoral crook,
And thus laid prone, and brought home to the fold.
It is most true, Right Reverend Father in God,
That this my hand, which hath offended thus
In small particular, would for the general weal —
I mean our rights, your altar, and the throne, —
Be better exercised. But in the code
Of honour, your high reverence should perceive
The world's opinion still rides paramount:
And though the duel nought whatever proves,

With those whose courage was oft proved before,
But leaves the truth at stake just where it was,
Still, must your lordship's all-perceiving mind
See clearly that the law of honour holds,
Like a petrific primogenital tree,
Its influence unshaken. Furthermore,
The army stands amidst the social scheme
With glory bright, and hath the Church's prayers;
Whereby upheld, encouraged, and urged on,
Its valorous deeds have fed the glorious wars,
And round the altar throng'd in times of fear.
At all due seasons, and in public seats,
The army bows its crest, nor ever fails
At wassail boards to toast the Establish'd Church.
Right Reverend Father, these are serious truths,
Nor doth the army and its sworded peers
Ask more return than such amount of prayers
As your best-judging wisdoms may accord;
With steady and consolidating aid,
When brawling politics our rights assault,
And mobs brew tempest in our atmosphere.
I am a soldier — have gone forth to war
With blessings on my head, and have return'd
With bloody laurels, and more blessings, crown'd.
Therefore, Right Reverend Father in God, Lord Bishop,
Look to our mutual bond! Till that the Church,
The solemn mission of eternal peace
And universal brotherhood of love
Shall bring to fix'd maturity, and thus
Put down all need of armies in the world
(Long have your lordships labour'd at this task,
With what success our annals shall unfold),
And from men's minds eradicate the seeds
Of personal quarrel and the sense of shame,
In shunning death for the bare honour's sake;
You shall in vain rebuke the nobleman —
The oft-bless'd leader of a battle's van —
Who may see fit to risk his life to prove
Something, or nothing, as the case may hap,
And hold him guiltless who brings down his man.
It is your business to preach peace on earth;
It is my business to go forth and fight.
A mutual work, and mutual high reward
Each for the other duly thus provides;
And better 't were, my lord, we ne'er forgot
To do our duties in that state of life
To which a bounteous Providence hath call'd us,
Than risk by bickerings to attract the eyes
Of vulgar nature, lest the ignorant thought
Dawn on man's mind that no necessity
Exist on earth for either thee or me.

R. H. H.

POLITICAL STUDIES ON THE FOREIGN STATESMEN OF OUR TIME.

No. I. — M. Thiers.

I.

Some one expressed his astonishment — in the *Revue des Deux Mondes*, if we mistake not — in giving an account of the oration on M. Rœderer, spoken at the Academy by M. Mignet on the 27th December, 1837, that the orator had not recollected the saying of Madame de Stael, as keen as it was true,—"M. Rœderer is ever in a hurry to offer assistance to the victor." This gentleman forgot that M. Mignet is the intimate friend of M. Thiers; that M. Thiers, a member of the Academy, was probably among the audience; and that, at those words, all eyes would instinctively have been turned on him. M. Mignet was doubtless thinking on M. Thiers whilst pronouncing his oration, just as we thought, when — maugre the officious suppressions of the orator—we called to mind the *citizen* Rœderer, *before* the empire, rising, in August, 1791, in the National Assembly, to oppose the article of the Constitution that placed the king in the same rank as the representatives of the nation; — the *Monsieur* Rœderer, *during* the empire, declaring on the subject of the apprehensions objected to the institution of the Legion of Honour, that privilege was no longer to be feared, and that inequality was for ever destroyed; — and the *Comte* Rœderer, a few days *after*, complacently adding to his name the aristocratic qualification — which means nothing, God be thanked, but which at least affixes the pretence of privilege.

II.

Before — during — after: these are what embarrass us in our estimates of the men of the day; these almost drive us to despair as judges, biographers, and reviewers, whenever we try to set before us any one of those forms that attract the regards of the present easy-natured generation. The statesman was anciently a high intelligence, serving *one* grand principle, — an idea reflecting itself, incarnating itself in a long series of acts, — an all-entire life consecrated to the realisation of some conception, national or European, good or bad. These were good times. Now, things have changed; the times are hard for the portrait painter. Each sitting undoes the sketch of the preceding; the kaleidoscope has turned, and the same elements harmonise themselves into a different figure. Adieu to unity, to presiding principle or conception. The statesman is triple; he is a being of succession, and not of concentration. He bewilders us, deceives us, mystifies us; he escapes us like Proteus, by suddenly changing his form. That which we thought to be the goal of his career was but a point of departure. We think to seize him in the gross: — alas! we have but one facet of the polygon; and to-morrow the wind from without will have breathed on this multisided being, and another facet will present itself to our astonished eyes. *Before, during, and after*,—these are the "Mene, Tekel, Upharsin" of periodical writers. Of what man are you speaking, please you? Is it him of 1829, or of 1832, or of 1839? Is it of the General Sebastiani of 1809, writing to General Venegas, "that his duty was blind and unlimited obedience to power, and to his august master Napoleon, the greatest of heroes and the most powerful of monarchs?"— or the General Sebastiani of 1814 and 1815, following

up with all activity the ruin of the august master who had taken the liberty of deducting from his pay the value of certain cannons that he had been the means of losing? Is it of the M. Guizot of 1814, writing the *exposé* of the motives of the Montesquiou law against the liberty of the press? — or the M. Guizot of Villèle's time, who wrote such fine things on the independence of public functionaries, and was rubbing shoulders with the republicans in the committee of the society *Aide-loi?* — or rather of the M. Guizot of *after* 1831, who dismissed his friend, the Professor Dubois, for having dared to put in practice his precepts, and for supporting in the tribune an opinion contrary to his? When these interrogatories meet us — and about whom will they not henceforward meet us? — we shall be tempted to break our palette and pencils. In truth, 'tis pity. There is no further — how shall we call it? *Philosophy of history* is not yet current among us — there is no further possibility of historical criticism. The most acute are lost at it. Look rather at "Blackwood" of March, 1838.

It was, in that month, the turn of M. Thiers to pass under the Caudine yoke that "Blackwood" has erected, as is known, for the notables of Europe. The executioner — the writer we will say — who was charged with the business got through it as well as he was able, as to the biographical part, and the considerations on the "History of the Revolution," by translating from one end to the other — though quoting it but twice only — a very well-done piece of M. Loéve Veimar's, inserted in one of the numbers of the *Revue des Deux Mondes*. Why did he not stop there? The translator was bent on doing more: he determined to play the author in his turn, and pass a judgment after his own fashion on the man whom M. Loéve Veimar had estimated according to liberal views. In this task he was lost. In the contemplation of this undecided, changeful, and mocking figure, amid so many unforeseen, sudden, and multiplied evolutions, from the *Droite* to the *Gauche*, from the opposition benches to those of power, from the alliance with England to that with Russia, sufficient for the characteristics of ten individuals, and which are all represented by one, — his brain was seized with vertigo — his ideas became bewildered — his faculties failed at the proof. France, journalism, the revolution of 1830 — he mixed, confounded, and identified all. The Tory anathema, which he intended to hurl direct at the head of the ex-minister, was spattered over thirty millions of men. Innocent and guilty, he lumped them all; and the result was an awful splash, floating in which, a luminous exposition of the character of M. Thiers, were propositions nearly as follow: — Education exists not in France, and the children there are little demons; a journalist never ought to reason; immorality, produced or connived at, is the end of all periodical reasoning; the *auberges* in France are in general execrably supplied, &c. &c. Beyond all, M. Thiers is a revolutionist. Is not every immorality expressed by that word?

O sublime contemporary! Yes, we are ready to admit it: the beds and dinners of a French *auberge* are bad enough, especially when the traveller, from inclination or necessity, has a turn for economy. But is that a reason why M. Thiers should squander the secret service money, and give his father-in-law, M. Dosne, an average annual income of two hundred thousand francs? Yes, education might be better in France, as every where else; only it happens — mark, how singular! — that the little education they give to children precisely at Aix, the native place of M. Thiers, is, or has hitherto been, Carlist. Ought it not to have produced something better? The mania for ratiocination, think you, drives journalism to rebellion and to immorality? But, oh, most moral of contemporaries! was not Carrel a journalist? Did he not labour on the *National* side by side with M. Thiers?

Was he not a more acute and powerful reasoner than he? How happens it that not one of his enemies has dared to lay on his tomb an accusation of immorality? Carrel is dead — dead in the breach — dead in the most forward ranks of opposition, the most hostile and the most fearful to power — dead a republican; yet, friends and enemies hastened to confess it, he died pure: his adversary's ball found him as in the first days of his political life — innocent of all baseness, of all immorality, of every degrading and low appetite for power or wealth. The masculine virtues of his youth, far from growing unsteady or losing their lustre, were strengthened by the struggle; the progress of ideas, visible in his latter years, only ripened and fortified them. If of these two intelligences, who began their career fighting the same battles,—who had, in appearance at least, the same point of departure,—the one remained firm, the other is fallen, might it not be — differences of character apart — that the one instinctively fought, even although not clearly recognised by himself, under the standard of a creed; whilst the other fought, in the very moments even when he perhaps passed an illusion on himself, only at the beck of passion and interest? Might it not be, we say it boldly, that Carrel was already, at the bottom of his soul, a *revolutionist*, whilst M. Thiers was simply but a *reactionist?*

There is in what we have just said something which appears to us to deserve the pains of an explanation. This word *revolutionist* seems to us to be still so vaguely defined, so generally misunderstood, and this vagueness, this misunderstanding appears to us to involve so much confusion — to produce so many erroneous points of view in the elaboration of political doctrines, that we are convinced of the necessity of endeavouring, as far as in us lies, to rectify the commonly received notions. And we have here to deal, in our opinion, with notions that are not limited in their action to a purely speculative sphere, but that influence the political region far more than is supposed. They are agitating among the masses; day by day they are implanting their results in the heart of the people, and these results are distrust and discouragement. We see an entire generation — for, the truth must be told, it is not to M. Thiers alone, but to a crowd of intelligences that the formula *before, during, and after* has a fatally successful application — we see a generation of men ardent and mighty for the struggle, but lately boiling over with eloquence and patriotism, who set themselves before us as apostles of the movement — who spoke to us "grand swelling" words, glory, honour, progress, liberty — whom we accepted and long followed as chiefs, and who suddenly, at the very moment when we have gained for them the victory, desert us, reproach us with our demands, repulse us to the lowest rung of the ladder, and are occupied solely with the division of the spoils of the conquered, and the fruits of the triumph. We see men who for fifteen years have been growing great under the shade of the revolutionary flag, who have prostrated themselves before it a thousand times, in the name of enthusiasm and virtue, and now envelope it in turpitudes worse than those they combatted, set it up to the highest bidder to satiate their selfish lusts, and nail it to the door of their embassies and their cabinets as an ensign of jobbing and prostitution. Whom are we henceforward to believe, or whom to trust? When the people, in France or elsewhere, murmur at these things, fold their arms, and reply by sullen inaction to those who summon them to the holy battles of right and liberty, who can condemn them, or be astonished? And who is there amongst us that has not murmured in his heart similar complaints, — who has not yielded for a few instants at least to the discouragement produced by deception, — who has not at some time surprised himself saying, For whom do we combat? and, What results shall

we obtain by our long efforts, by our sacrifices? It is a sad history the history of Europe since 1830, a fine text for Mephistophiles to gloss on; and the gloss has not been wanting. The scholar has left the conference, his head bewildered and his heart seared. Shut your doors and your windows, ye youthful spirits, chastely ignorant of the orgies of the old world in her debauch: there is a breath of immorality and scepticism without that benumbs strong feeling, and withers the flower in the bud.

Is there, however, nothing to be done? Are we to leave the empire of the world to Mephistophiles without a struggle? Have we to oppose the spirit of doubt, the effects of which are everywhere felt, nought but blunted weapons, edgeless and pointless? What if there be in all this a vast error of intelligence to expiate? What if we ourselves are in some degree guilty of this state that makes us unbelieving and inactive, and have all required of these men more than their nature and the nature of their doctrines was able to yield us? Ought we to accept the fact without endeavouring to explain it? And if there be a great instruction to draw from that long deception that has followed 1830 in France, can we in conscience neglect it, and be content with the theory of bad taverns and imps of children? It matters little at the bottom, that M. Thiers, or any other individual of his stamp, amuses himself by mystifying his public, after having contributed his part to its exaltation: in a few years there will be no mention of him and his tricks of government, any more than of M. Jules Janin, his literary pendant. But if from his lamentable history we can extract an essence capable of stifling other Thierses in the cradle, ought we not eagerly to embrace the occasion? And shall we not play M. Thiers himself a very amusing trick if we seek a moral in his own history?

Wherefore, gentle reader, coming after so many others, we are resigned to speak of M. Adolphe Thiers; born at Aix, in Provence; sprung, as Blackwood says, with that aristocratic *morgue* that becomes him so well, from nobody *; his age, now forty-two; stature short; an expression of the lip à la Voltaire; a merry companion, if ever there were one; eating almost as much as the Princesse de Lieven; drinking after a fashion, to make the evenings of Grandvaux historical orgies; consuming an immense quantity of "*helas! pourquoi faut-il,*" &c. in his study, and an equal quantity of candles in his office†; thoroughly versed, he himself says, *in the arrangement of figures*, others say in adding them together; master of a *château*, of brilliant equipages, and of property to match, having sacrificed the rest in the revolution of July; once already president of the council of ministers, and looking to be so again; chief, meantime, of the *tiers parti*, and the orator of the opposition on all matters, the budget excepted, — all for having invented transdélimitation, promoted what the world has agreed to call the *Quadruple Alliance*, and proclaimed — yes, proclaimed, — under the government of Louis Philippe, the grand maxim, *The king reigns, and does not govern.*

III.

One man alone has understood me, according to M. Heine, said the philosopher Hegel on his death-bed; *and neither yet have I been thoroughly under-*

* "M. Thiers, on his coming into the world, was not cradled on the knees of a duchess." This is the expression of M. Cormenin, a republican, and, of course, an ill-bred man; but, most exquisite Tory, is it not more gentle, more delicate than thine?

† M. Thiers is the most imprudent, the most inconsiderate of politicians. Ask even the clerks in the foreign department, and they will tell you what a want of order there was in his office. For example, — M. Thiers, during his short ministry, used *three times the number of wax tapers* used by all his predecessors together: this waste ran through all," &c. So said Louis Philippe.

stood by even that one. The *tiers parti*, when on its death-bed, will have the advantage of being able to say as much.

Tiers parti has no meaning. It is in despair of reason, in the acknowledged impossibility of exalting any sentiment whatever into a formula, that it terms itself the *tiers parti* — that is to say, neither the one nor the other; in other words — since out of it there is no passing in the France of the present day — a *juste-milieu* within a *juste-milieu;* a something between both, composed out of the excess of the one side and the defects of the other; or rather, an anonymous letter addressed to power to advertise it that its first false step will be profited by to effect a change of places — *doctrinaires* without doctrine, individuals and no ideas, forms, but no soul and life in common. Some one, we now forget whom, fancied he had made a discovery that of late the essential difference between the *doctrinaire* party and the *tiers parti* was exactly that subsisting between a *because* and an *although*;* but this important formula has often failed us in the application. We know but one man who would have been equal to the solution of the entire profundity of this problem, and he has been dead some centuries. Him, we mean, who, in the Middle Ages, wrote a volume to decide "*Utrum chimera bombinans in vacuo possit comedere secundas intentiones.*" But, with all diffidence, and solely by way of approximation, we may venture to offer the following notion :— *Theoretically*, the *tiers parti* is a *quasi*-synonym of the *quasi* party of *quasi* legitimacy; *practically*, it is the party of those who not being in power seek to win it by parliamentary means. M. Thiers is at this moment — we warrant not the moment after — the chosen man, the hope, the strength, the incarnation of the *tiers parti.*

We owe it to historical truth to add to these hints, that at this moment also, politicians exist who believe that the advent to power in France of the *tiers parti* would be an important and very fortunate circumstance for England.

IV.

In sober truth, and pleasantry apart, there has not been, there never will be, whilst Louis Philippe reigns, but one system for power. It may be amusing, by a species of intellectual gymnastics, to trace divisions and subdivisions, by elevating to the rank of parties mere *shades*, which, in general, are but the expression or result, not of convictions, but of individual interests, and which, consequently, have only a temporary existence; but, whatever may be said, there is only one single conception that sums up the history of powers in France since 1837 — the *doctrinaire*, neo-legitimist conception of the *bourgeoise* monarchy. Casimir Perier was the first who boldly reduced it to a formula as respects politics, by proclaiming that 1830 was not a *revolutionary* fact, but a fact of *resistance*, — a mere episode of the Restoration,—an insurrection of the nation, having no other aim than to defend against the usurpations of a retrograde power that which was in existence before the *ordonnances;* that is to say, the Charter, public order, legitimacy as far as possible, the treaties of 1814 and 1815, and the peace. M. Guizot completed it, in a *social* respect, by adding to it his principle of the middle classes, or, in other terms, the organisation of a *bourgeoise* aristocracy; and the formula thus developed has hovered on high over all the successive administrations, has influenced all the ministers of France, M. Lafitte perhaps excepted. The 13th March, 11th October, 22d February, &c., are simply dates indicating a change of men, by no means of system.

* "The king reigns, *because* Bourbon; the king reigns, *although* Bourbon." — *Axioms of Modern Political Science.*

Not only has the *tiers parti* never seriously sought to unshackle itself of this formula, but it has been perhaps the most submissive, the most devoted of all the other *shades* to its application; the *doctrine*, the pure doctrine, may boast of a few rare inklings of independence, or at least a certain habitual stiffness that has the appearance of it. M. Thiers may now choose boldly to proclaim himself *the issue of July* — the journals of the coterie may complaisantly repeat the phrase which means any thing or every thing, according to the sense in which the *July* is understood, and simpletons may be caught with it. Those who look not to words, but to things, and who have watched M. Thiers throughout the transactions of his political career, know well that the member of the Chamber of Deputies infers nothing as to the minister, and they appreciate at their just value the sallies of an ill-tempered man, who wants a portfolio, and alliances to effect its recovery: the day after, he will break them. They call to mind the doctrine he has often professed,—"that in judging of public affairs every thing depends on the point of view at which we find ourselves, and *the place we occupy*." They call to mind his proverbial facility at contracting and dissolving alliances and engagements, the truly stoical imperturbability with which he contradicts himself whensoever it may be convenient, his stupendous indifference to the judgments of public opinion, and the well-known words that depict at one stroke his character as a statesman — "A note binds us to nothing: if we change our determination, and choose to dissolve the chamber a little later, we will issue another note."* They call to mind also that there is not a single act of the Doctrinaire cabinet hostile to liberty and the revolution of July in which M. Thiers has not been plunged;— his share in the laws of September — the blow aimed at trial by jury, opposed by his colleagues Broglie and Guizot, and carried by his stubbornness — his persecutions, his arbitrary dismissals — his seven hours' speech in favour of the hereditary peerage — and the whole series of his marked adhesion to the system which he now appears to attack, and which his ancient colleagues have at least the courage to support.

We are of those who carry a memory, and we smile at the parliamentary outbreaks of M. Thiers. With us, whatever he may say, the *tiers parti*, and its present incarnation M. Thiers, is a branch, nothing but a branch, of the great *doctrinaire* trunk. These branches may diverge, they may encroach one on the other; there may be an unequal absorption of the moisture that supports the vitality of the whole, but this is a mere temporary derangement. The neo-legitimist triad is one and indivisible in its essence. When its time shall come, its existence will cease at a single stroke, but it will not be dissolved ere then in the persons composing it; we know a shrine at which they will always be in union. At the shrine of the budget is periodically accomplished the great mystery of fusion. The insubordination of M. Thiers goes not so far as that — reverence to the

* It was in 1833, when he opposed with all his powers the dissolution of the chamber proposed by his colleagues, and obtained the insertion in the "Moniteur" of the note proclaiming his success, that these words were uttered.

It is curious to recollect here the precautions taken by M. Thiers on this occasion to make sure of a seat in the chamber, should a dissolution become unavoidable, which Aix would very probably not have again conferred on him. By a careful study of electoral statistics he had unravelled the mystery of the election of a certain deputy for the Comtat d'Avignon. A majority of creditors it was who had determined the selection of this man, head over ears in debt, and whose affairs were hopeless. These worthy people had put him on the list of deputies to prevent his disappearance, and to have him always under their thumb. This gentleman of the south M. Thiers immediately resolved to displace, should matters require it. To do this he had only to take on himself the discharge of his liabilities. This instance of foresight made some noise at the time, having been let out by M. Thiers himself, who, as we shall by and by see, is any thing but prudent. It was noticed, if our memory deceive us not, in the "Revue des Deux Mondes."

golden bough! The Spanish question may indeed find him dissentient; but the secret service money is sure of his white ball, whatever fingers are to have the handling of it.

Looking then at M. Thiers as the third person, proceeding directly from the first, and indirectly from the second, what is the function he discharges in the neo-legitimist trinitarian hierarchy?

He is the material and practical expression of the triad itself — the triad, as it were, in the *flesh;* Messieurs Royer Collard, Broglie, and Guizot constitute the *spirit.* They are the *idea*, the *theory*, the synthesis; he is the form, the symbol, the image, the sensible translation, the palpable realization. Theirs are the premises, the *major* and the *minor;* his the consequence, the *ergo*, bluntly but logically applied. They propound, he deduces; they enunciate, he proves, — himself the example. Such is his mission in the world. To find the *idea* and the *practice*, the *flesh* and the *spirit*, reunited, fused together, identified in one sublime unity, we must ascend to the first, to the veritable chief, — to the *auguste pensée*, as they say in France.

This, some day, we will do. We will endeavour to plunge into the depths of the sacred cave, and to seize, as far as in us lies, on the length and breadth of the monarchico-citizen *conception*, that since the universal peace disdains nothing, down even to the pettiest appanage; and we will take for our motto the pretty phrases uttered by M. Thiers — at the time of the Antwerp affair, we think — from the same tribune that had already resounded with the other axiom, *The king reigns, and does not govern:*—"All governmental perception resides in the brain of the king; nothing has been done but by that perception since the establishment of the monarchy of July." At present we have enough to do with M. Thiers himself.

To represent the *spirit* of the system in its latest practical results and in its material applications, such, we have said, is the mission in the world of M. Thiers. He is thoroughly indeed the creation of the *doctrinaire* system, though he has not elaborated its theory; that care has naturally devolved on heads far stronger and far more philosophically organised than his, and, in this respect, his part is entirely subaltern: he is but a numerator in that series of fractions whose common denominator is neo-legitimacy. But under that mission which we attribute to him, he acquires some importance; he becomes in his turn the denominator in a series of fractions whose numerators vary from the figure representing a councillor of state to that of the *feuilletoniste*, writing under the inspiration of the famous Janinist motto, "Nothing prospers like success," — from that man who coolly exposed to the highest bidder the bolts and the scourge of his *Nemesis*, to the poor devil who found means to annoy and extort from M. Thiers himself, and whose story we shall tell further on. Far superior to that race of *issue of the revolution of July*, who compel their mother to undergo the Cæsarean operation, he is the summary of them all; he constitutes in himself alone a veritable *microcosm*. Between the real and practical microcosm of M. Thiers, and the ideal philosophic microcosm of the high doctrine, there is, moreover, analogy, connection, perfect filiation. Only, whilst the metaphysicians of the school go and chat on the Brocksberg, he amuses himself in the Kitchen of the Wizard. And where is the harm? And wherefore do those very persons who bow with respect before the former, declaim a crusade against the latter? M. Cousin established, as the fundamental dogma of all philosophy, the sovereignty of *me;* by what capricious intolerance would you forbid M. Thiers to transplant this sovereignty of *me* into matters of state? The sovereignty of *fact* is the legitimate consequence of

philosophical principle, and results, as a last analysis, from all the historical works of the school, M. Guizot's course of history not excepted; wherefore then should it be forbidden to M. Thiers to pursue the application of the principle in politics, and to recognise, as the only sovereignty, that of existing fact, — that is to say, that of *power?* Is it not M. Cousin, who, from his theory of *me*, the knowledge of which is all philosophy, arrived in 1828, or 1829,—doubtless legitimately, for who can suspect so great a metaphysician of aught illogical? — at the conclusion, that the ideal in politics was the charter of Louis XVIII., the ideal in creed the *religion of the state*, such as it was. Has not M. Guizot written, "Power is strangely abused when it takes a position without the camp of the victors; it is then its own betrayer, and is false to its own nature; it forsakes those who desire and ought to possess the empire, to go to those who can do no more than call on the name of liberty?" Is not this fine — is it not profound? But then wherefore launch an anathema against M. Thiers, because, seeing that power is sacred solely because it is power, he tries for it at any price, and, when he has it, tries to retain it at any price? Wherefore accuse him of ingratitude or bad faith, because he is in a hurry to desert his friends the moment they are no longer *victors*, and because he bears in mind "that it is folly to separate oneself from force when it has assumed the character of necessity?" * Since when has logic become a crime with you?

For ourselves, we here conscientiously declare it, and to the most entire absolution of M. Thiers, we are profoundly grateful to him. We have learnt, in the observation of his career, to estimate the theoretical value of a school whose seductions were too powerful for the first years of our youth.

We must confess, moreover, that M. Thiers is too happy, too brilliant, too much of an artist in his Protean career, for us long to preserve rancour towards him, or pass a severe judgment on his political drolleries. When bent on power, the man is sublime. See him with a downcast, and what might be called innocent air, hovering around the avenues that lead to the cabinet; scenting out mischances; presaging successes; exhibiting as quick as thought some symptom of coolness towards those who are falling, and in some unaccountable way, with the same rapidity and the same ease, finding himself the partisan, the ancient friend of those who are rising; flattering, for advancement, every bias, every caprice, every the most opposite tend-

* These also are the words of M. Guizot.

It must not be inferred from these quotations that there is any intention of placing M. Guizot and M. Thiers in the same rank. We appreciate perfectly all the distance between them in the threefold regard of character, capacity, and convictions — which last we would always treat with respect, even when they appear to us completely erroneous. But we deem it essential to point out how every erroneous conviction in philosophy and history leads to loose and immoral consequences in political reality. We fancy we perceive a very considerable tendency in the present day to acquit the *doctrinaire* theorists of all the pernicious consequences of their doctrines, which the good instincts of their personal character have prevented them from deducing, but which are not less the results of the system they preach. Such a tendency, though at bottom it be but a homage rendered to intelligence, is in our opinion dangerous, and we desire to guard our readers against it.

Let us be permitted also here to insist on a principle too generally misunderstood, though it flows essentially from the unity of the human being and his faculties. It is, that every system of politics derives, in the last analysis, whether we are sensible of it or not, from a system of philosophy; it is, that ideas precede facts and generate them; it is, that in politics, as in every thing else, there must be harmony between theory and practice; it is, that we can never attain to the composition or destruction of a system of practice, but by establishing or overturning the theory, the creed, that serves as its basis. With us, France since 1830 — we might, indeed, say Europe — is an especial existing proof of what we are advancing. It is but the sequence of an error of principle that she is where we now see her: it is only, too, by the elaboration of a principle, and not by futile questions of forms and details, that she can resume a progression now and thenceforwards arrested. In this light, a work which should exhibit the necessary affinity existing between the *Doctrinaire* or Eclectic schools of philosophy, of history, and of politics, might not be without its use. These matters should, in our judgment, always go hand in hand in the study of the present in regard to the future.

ency,—Soult, Gérard, Molé, Guizot, all the world; then, his aim attained, undermining, upsetting in turn, Guizot, Molé, Soult, and Gérard; making the most of unlooked-for triumphs; bearing reverses philosophically; never despairing; changing, falling, rising from the Interior to Commerce and Public Works; then to the head of both, then to the Foreign Office, and then to the Presidency — having a horror of nothing but resignation; defending himself bravely; offering to agree with every body, and to make an alliance with every principle; never yielding but in extremities, and never quitting a ministry without having, to use the words of M. Capefigue, "manœuvred in ten different *coteries* to assure himself another portfolio; presenting himself as every body's implement, the nimblest of consciences, the most complying of souls:" all this gaily, off-handed, and adroitly, with full confidence in himself and his good star, even so far as to be willing to draw lots with M. d'Argout for situations.* It is pleasant, in following the strange course of all these evolutions, to see him change opinion, shape his pace, his plans, his speeches, in exact accordance with the spirit of the power above him, or the position of the moment; talking war, force, revolutionary energy, Napoleon reminiscences, under Lafitte; peace, the tranquillity of Europe, the treaties of 1814 and 1815, the danger of attacking them, recollections of 1793, and terror as inseparable from every war that might be undertaken, under Perier: to see him incline towards the alliance with England, or with Russia, according to the good or bad temper of M. Talleyrand; then, suddenly recovering, with exquisite *apropos*, his independence of 1828–9, see him, in the bosom of the council, oppose unceasingly the ideas of a minister already tottering; finish the official life of Marshal Soult by a reproach of ingratitude for the opposition he offered to the choice of Decazes for the government of Algiers, and that of Marshal Gérard by the most active resistance to his measure of the amnesty. Persons are astonished at the influence acquired by M. Thiers; they affect not to understand his presidentship of the council. The presidentship! he well deserved it. For four years, from 1832 to 1836, this man manœuvred in a fashion to deserve a crown; for four years he hoarded his secret, cloaking his powers, keeping himself down in order not to alarm, resigning himself to every inferior post — from the preparation of speeches which others were to deliver in the Chamber, down to the petty concerns of the household at the château, flattering, caressing, immortalising † *his excellent king;* submitting, without wearying of the pursuit of power, to the contemptuous protection of Casimir Perier ‡, to the stiff and exacting superiority of M. Guizot, the very military harshness of Marshal Soult §, the somewhat haughty virtue of M. de Broglie, and the nothingness of Marshal Mortier. Liking not the principles, and, partly from his own personal antipathies, partly from those

* A fact. It was the ministership of the interior that it was thus proposed to draw lots for, in October 1832, in the time of the Soult cabinet. The king opposed this mode of election. There was a kind of compromise between the two votaries of fortune, in pursuance of which M. Thiers — it was his first appointment — became minister of the interior; but with no other departments than the police, the telegraph, and the secret service: he gave up all the rest to M. d'Argout, though he bore only the title of minister of commerce and public works.—Vide *M. Thiers, par Loève Veimar.*

† Witness the activity he displayed in 1833, at the time of the arrival of the King of the Belgians, that poetry and painting should transmit to posterity the remembrance of Louis Philippe bleeding the courier Verner. Alas! gratitude is not a royal virtue: — "*It is impossible,*" says the phlebotomist monarch now, "*that there can be consideration in a power in which M. Thiers is found to be an associate.*"

‡ "*That an organ of government!*" — in no under tone said M. Perier to M. Mauguin, in the Chamber, speaking of M. Thiers — "*M. Mauguin is joking with us.*"

§ The untranslatable epithet is well known (*ministre foutriquet*) that Marshal Soult, in a fit of ill-humour, applied to the *petite* and restless figure of M. Thiers.

of M. Talleyrand, liking still less *the men* of the Doctrine, he yet accepts them, becomes one of them, and bows his head under the yoke of the presidentship of M. de Broglie, the most distasteful to him of them all; he proposes to himself for a model in the tribune *the noble frankness of his honourable colleague* *; he gives to the party gage after gage; he draws panegyrics from the "Journal des Debats;" the Doctrinaires were then strong; and with all this, under that instinctive foreboding of a possible mishap which has never yet failed him, M. Thiers was at the same moment working at another point with M. Talleyrand; then, when the possibility was realised, when in 1836 the question of the conversion of the *rentes* provoked the crisis, it was marvellous to see him, proud of his double labour, thenceforth sure of the victory, and aspiring to that presidentship so long coveted, chuckling over the wreck; for the first and only time in his life becoming an ardent lover of resignations; hurrying, dragging on his colleagues; insisting that all the resignations should be given in immediately; stoutly engaging himself never to return unless with all his colleagues, and instantly proceeding to negotiate the formation of a new cabinet.—Vide *Capefigue, Le Ministére de M. Thiers.* Paris, 1836.

This took place in the month of February; and on the 22d of the same month M. Thiers was minister for foreign affairs, and president of the council.

Once again, then, did he not deserve it? And when political fortune attends a character such as we have been pourtraying — when it falls to an individuality, that, again to use the words of M. Capefigue, *is broken with difficulty, because always resigned to bend* — when it is achieved by one of those instruments, that, to borrow an image from M. Cormenin (for to M. Thiers it appertains to harmonise, as far as he is concerned, the sentiments of the republican and the *juste-milieu* writer), "that yield till both ends meet, and then straighten like an arrow, such is their suppleness" — has political fortune, we say, especially in our times, wherewith to astonish us?

After this, and notwithstanding the inference that appears to be authorised by the very expressions we have been driven to make use of, we must declare to our readers, that they will be much deceived if they fancy that M. Thiers is swayed by *the love of power.* He is not, and would to God that he were!

The love of power solely for power, for the unintelligible satisfaction of exercising a certain dominion over one's fellows, without aim and without principle, can only exist in narrow minds and vulgar souls: it is then something deplorable and immoral, and the more base and degrading in a ratio to the vanity that it is destined to pamper. But in souls loftily set, and in intelligences really productive, it is rare, perhaps even impossible, that the love of power is not allied to a system of belief, — to a doctrine, to an idea sought to be realised, to be installed among society. Thus conceived, it may be a holy thing, if the soul that bears it be sufficiently tempered to have nothing to fear from the delusions of pride or individualism, and if the idea whose triumph is intended be useful and true; if it be not, the love of power is still something deplorable and immoral, but not degrading, and though immediately pernicious, not useless in its extended results. It ends by enlightening men on the defects of the idea to which it was subservient: at least a false system dies with it, and the reaction sooner

* "Permit me, gentlemen," — and we quote these words because they also define the sense in which M. Thiers understands the liberty of the press — "permit me to imitate the example of lofty frankness afforded us by my honourable colleague, M. de Broglie; permit me to say, that as regards the *prince* and the *constitution*" [what may we not include in these two spheres?] "our aim is not to cramp discussion, — our aim is entirely to *suppress* it."

ency,—Soult, Gérard, Molé, Guizot, all the world; then, his aim attained, undermining, upsetting in turn, Guizot, Molé, Soult, and Gérard; making the most of unlooked-for triumphs; bearing reverses philosophically; never despairing; changing, falling, rising from the Interior to Commerce and Public Works; then to the head of both, then to the Foreign Office, and then to the Presidency — having a horror of nothing but resignation; defending himself bravely; offering to agree with every body, and to make an alliance with every principle; never yielding but in extremities, and never quitting a ministry without having, to use the words of M. Capefigue, "manœuvred in ten different *coteries* to assure himself another portfolio; presenting himself as every body's implement, the nimblest of consciences, the most complying of souls:" all this gaily, off-handed, and adroitly, with full confidence in himself and his good star, even so far as to be willing to draw lots with M. d'Argout for situations.* It is pleasant, in following the strange course of all these evolutions, to see him change opinion, shape his pace, his plans, his speeches, in exact accordance with the spirit of the power above him, or the position of the moment; talking war, force, revolutionary energy, Napoleon reminiscences, under Lafitte; peace, the tranquillity of Europe, the treaties of 1814 and 1815, the danger of attacking them, recollections of 1793, and terror as inseparable from every war that might be undertaken, under Perier: to see him incline towards the alliance with England, or with Russia, according to the good or bad temper of M. Talleyrand; then, suddenly recovering, with exquisite *apropos*, his independence of 1828–9, see him, in the bosom of the council, oppose unceasingly the ideas of a minister already tottering; finish the official life of Marshal Soult by a reproach of ingratitude for the opposition he offered to the choice of Decazes for the government of Algiers, and that of Marshal Gérard by the most active resistance to his measure of the amnesty. Persons are astonished at the influence acquired by M. Thiers; they affect not to understand his presidentship of the council. The presidentship! he well deserved it. For four years, from 1832 to 1836, this man manœuvred in a fashion to deserve a crown; for four years he hoarded his secret, cloaking his powers, keeping himself down in order not to alarm, resigning himself to every inferior post — from the preparation of speeches which others were to deliver in the Chamber, down to the petty concerns of the household at the château, flattering, caressing, immortalising † *his excellent king*; submitting, without wearying of the pursuit of power, to the contemptuous protection of Casimir Perier ‡, to the stiff and exacting superiority of M. Guizot, the very military harshness of Marshal Soult §, the somewhat haughty virtue of M. de Broglie, and the nothingness of Marshal Mortier. Liking not the principles, and, partly from his own personal antipathies, partly from those

Thiers is swayed by *the love of power.* He is not, and would to God that he were!

The love of power solely for power, for the unintelligible satisfaction of exercising a certain dominion over one's fellows, without aim and without principle, can only exist in narrow minds and vulgar souls: it is then something deplorable and immoral, and the more base and degrading in a ratio to the vanity that it is destined to pamper. But in souls loftily set, and in intelligences really productive, it is rare, perhaps even impossible, that the love of power is not allied to a system of belief, — to a doctrine, to an idea sought to be realised, to be installed among society. Thus conceived, it may be a holy thing, if the soul that bears it be sufficiently tempered to have nothing to fear from the delusions of pride or individualism, and if the idea whose triumph is intended be useful and true; if it be not, the love of power is still something deplorable and immoral, but not degrading, and though immediately pernicious, not useless in its extended results. It ends by enlightening men on the defects of the idea to which it was subservient: at least a false system dies with it, and the reaction sooner

* "Permit me, gentlemen," — and we quote these words because they also define the sense in which M. Thiers understands the liberty of the press — "permit me to imitate the example of lofty frankness afforded us by my honourable colleague, M. de Broglie; permit me to say, that as regards the *prince* and the *constitution*" [what may we not include in these two spheres?] "our aim is not to cramp discussion, — our aim is entirely to *suppress* it."

or later brought about in men's minds is always noble and efficacious. M. Thiers is a man of too much talent and perception to be able to satisfy himself with the first kind; he is too sceptical, indifferent, and unsteady for us to award him the second.

We find in the "Journal des Debats"—for good things are sometimes to be found *even there* — a tolerably just estimate of the characteristics that distinguish *men of intrigue* from *men of government.* "Men of government (Feb. 4. 1837) have a certain and determinate aim, towards which they are incessantly tending: the aim of men of intrigue advances or recedes in accordance with the demands and conveniences of their ambition. The men of government have a will, which is accused, it is true, of not knowing how to bend — which is reproached with being intractable; but this very inflexibility is their strength — it ensures them the future. The men of intrigue have no will but that which is their slave; if it be useful to them to be lorded over, they become marvellously supple, and bend with a matchless docility to the will they set above them. Men of government have principles, a system; they have a flag which they acknowledge, which they are sworn to, — which leads them during the combat, which they follow in defeat, which they still respect after the victory. Men of intrigue have no flag; they adopt all the principles that favour them; they adore all the maxims that protect them; they follow all the standards that bear no inflexible motto, and that require no faithful oaths. Lastly, men of government have a regular and disciplined army, that has its chiefs, its organisation, that knows its destination, — an army intelligent and devoted. Men of intrigue wage a partisan war, with indocile allies, whose passions they have to controul, — as diversified as their ranks are confused, as unreasonable as they are unjust. The men of government compelled to quit power know how to wait: men of intrigue fallen from power are as impatient to regain it as they are impotent to rally themselves — they have need of alliances, and they are obliged to obey the law of their auxiliaries — they capitulate with all opinions, — with every discontent, with all passions whose alliance may raise their fortunes." As may be seen, the journalist has entirely left aside the morality of the question: his man of government may have a false principle, an erroneous aim, as likely as a good one; but it is certain that the love of power may often give birth to such a man, and it is equally certain that there is no necessity for the inscription of a name under the second portrait to identify it as the portrait of M. Thiers.

No; M. Thiers loves not power; his love is for its consequences and inseparable accessories. M. Guizot *can* love power; M. Thiers cannot. He loves the comforts, the resources, the blessings of power; beyond these too, the activity that it demands,—the intrigue to which, as times go, its pursuit opens the field, and perhaps also in some degree the strife that creates or maintains it. These excepted, M. Thiers loves nothing. He has not, he never had, he never will have a system or creed of his own. If, like it or not, he enlists, as we have said, in the great Doctrinaire phalanx, it is not from conviction,—it is because the France of the day that thirsts for power, or the fruits of power, *official* France, as it is called, is necessarily Doctrinaire. If his career be not, in a certain light, useless, it is because it refutes and discredits a system that is not his own, that he has not elaborated, that he has but accepted without believing in it. As for himself, he has nothing to prove, nothing to refute; no principle, for he is ready to take them all one after the other; no system or plan, for he seeks preferment by working out another's,—to-day that of the *tiers parti*, yesterday that of the pure doctrine, to-morrow perhaps that of the republic, that is

to say, of the president of the republic. He belongs to all and to every thing, according to time, place, and circumstance,—to *French* ideas, to Bonapartist maxims — "the Mediterranean is a French lake," and such like, when he perceived the English sympathies of the minister Polignac, whom it was necessary to oust; to *English* ideas, when M. de Talleyrand, a great favourer of the Anglo-French alliance prior to the retirement of Earl Grey, showed him a portfolio in the distance; to Russo-Austrian ideas, when M. de Talleyrand took it in his head to marry the daughter of the Duchesse de Dino to an Esterhazy, when the Duchesse de Dino herself, and the Princesse de Lieven opened to him the road to the ministry in 1836. M. Thiers is a grateful man.* Besides, what matter changes there, where at bottom they can be but nominal; there, where they imply no *action*, there, where the reality, governed from on high by an immutable will, is bound to an indecision and an inaction perfectly systematic? M. Thiers comprehended this from the first, and took his course accordingly. To devote himself to the *realization* of a plan, of an idea, must have appeared to him as the dream of a simpleton, and he became the man of prospectuses: a brilliant, vast, and imposing prospectus from his hands, is a guarantee to France for its non-fulfilment — in this art he excels. "Before two years (said he in 1833), we shall be stronger and more powerful than Napoleon, and that without war." This said, he thinks no more of it, and two years after France was busy with laws of intimidation. Immediately after the death of Ferdinand, he sends his friend, M. Mignet, into Spain to offer money and men; if, some days after, ambassadors in the sulks, the invisibility of M. Pozzo di Borgo, and a few words from Rothschild, compel the transmission of orders directly opposed to the first, what matters it to him? A little after, he attaches his name to the treaties of the 22d of April and the 18th of August, 1834, but refuses the fulfilment of this famous quadruple alliance when the English cabinet resolves on demanding it of him.† Thus too, in 1833, he announced that France would soon be furrowed into canals, roads, and railways; all that was wanting was a trifling credit of 500,000 francs, applicable to extensive investigations into the subject,—then *we should see*. We did indeed see him three years later, in 1836, ascend the tribune to declare that the immense foreign undertakings were not worth much, and that France would have done better by abstaining from similar enterprises. A great philosopher is M. Thiers — quietist, optimist, aware of the nullity of ideas, and laughing in his sleeve at those who take their application as serious; governing by words, and giving himself no trouble about

* Only, the way of manifesting it that he chooses is sometimes singular. One example from a thousand must suffice, for it is not with the private life of M. Thiers that we have to do. The conduct he observed after 1830 to M. Lafitte, the man to whom he is indebted for the beginnings of his good fortune, is current enough. It is known that M. Lafitte, no longer in the ministry, became a stranger to him, and that two years passed over almost without his seeing him. At the close of 1833, at the time of his marriage with Madlle. Dosne, he unexpectedly presented himself at his residence. Lafitte was then nearly ruined. His *hôtel* was that very day covered with placards, anouncing — "*L'adjudication definitive de l'hôtel de M. Jacques Lafitte, sis à Paris, rue Lafitte, No.* 19.; *aura lieu sur une seule publication*," &c. However he went up. "To prove to you," said he, on his entrance, "how I have preserved the remembrance of your kindness, I come to pray you to sign my marriage-contract." "*It is*," M. Lafitte is said to have replied, "*the only service that I can render you at this moment.*" And he affixed his signature.

Was there not a touch of Talleyrand in this? Is not the signature of M. Lafitte to his marriage-contract a fine refutation of all that men can write on the ingratitude of M. Thiers?

† It was in 1836, in the month of March, when he was made president of the council, that, being pressed by our government to occupy Passages and Fontarabia, he replied by a note of refusal that accumulated every possible argument against *intervention*. We know that he has since pretended to explain his conduct, and has maintained that it was on the condition of co-operation that he, in 1836, repudiated the proposed intervention. The affirmation of M. Molé, that there was not a word of this condition in the documents found by him in the ministerial portfolio, has always remained unanswered.

the value that others may attach to them. The "take whatever measures you please," with which he answered the embarrassment of M. Montalivet, in 1836, when he left him the empty chest of the ministry of the interior, influences his theory of politics equally with his theory of oratory. Good Heavens! is it then so difficult to take measures? Is it difficult — M. Capefigue thus defines his manner of conceiving power — is it difficult to account to a society, and to amuse oneself with the power of moral ideas, when a man has the police, the army, and the administration? Is it difficult to answer to a chamber — not, it must be confessed, the most forward or the most susceptible of chambers possible — when a man possesses the science of words, hardihood of assertion, prompt epigrams, quick repartee, and historical anecdote, all at his fingers' ends? M. Thiers possesses all these in an eminent degree; he is sensible of it, and is skilled in using them to the greatest advantage. He astonishes, he dazzles, he sways, he carries you away; it little matters to him by what means, all are good if they are successful. His famous statistics of the army of Prussia, and of the interior organisation of the administration of France, are well known. There was not a word of truth in it, but it was not till the day after that this could be proved; the triumph and majority of the day was sufficient for him. He is an improvisatore, not a poet. Do not fancy that he attaches to his speeches any great importance,— he makes them as he does his préfets *, to serve the purpose of the moment, at the urging of the man or the circumstance that happens that day to be predominant; never does he look to the future. Thus a collection of his speeches or writings, *before*, *during*, and *after*, might well be entitled *Le Pour et Le Contre;* somewhat of every thing is in them. His eloquence has more tinsel than gold,— it will not stand the test of the closet. One thing alone has the power of drawing from him true bursts of oratory — this is the *drapeau blanc*, Carlism. Whenever it appears before him, he grows animated, becomes impassioned, and gets furious in the pursuit; throws himself on it breast to breast; he brands it on the forehead, and thus marked hurls it back to the abyss from whence it should rise no more. His eyes glisten beneath his spectacles; his little form seems to swell; his voice, usually shrill, nasal, and monotonous, grows into a shout, as it were the cry of conscience. It is the shout of 1789, — the shout of the mighty revolution that he depicted and adored in his youth. On all these occasions M. Thiers is transfigured, — Walpole disappears beneath Danton. Still it is but the enthusiasm of an artist, a literary outburst,— harmless, and without consequences. Evil tongues assert that he is eloquent against Carlism, only because from that party, — a malice-bearing party, if ever one there were,— he has decidedly nothing more to hope. The Jew Deutz has thrown a gulf between them.†

* "My dear Thiers," — he was minister of the interior when Talleyrand wrote him this note — "I *very particularly* recommend to you M. ——, whom *I do not know*. I desire that you make a préfet of him. He has been sent to me by a lady of my acquaintance in whom I am exceedingly interested," &c.

† "Who rendered the revolution inevitable, unless it were the Royalists? Who brought about the dismissal of Turgot and Neckar? Who excited commotions among the people on the 14th of July by their guilty intrigues? Who, on the 5th of October, caused the population of Paris to pour out to Versailles, to give way to acts of tumult, and to form the project of carrying off the king? Who caused the death of the unfortunate Favras? Who counselled the unlucky journey to Varennes? Who resisted the pressing letters of Louis XVI.? Who drove him to compromise himself by refusing to sanction the law against the emigrants? Who dictated the fatal Brunswick manifesto? Who provoked the assault of the 10th of August? What were the Frenchmen who found themselves with the Prussians in the camp of La Lune in 1792; and who, in 1814, were with the Russians before Montmartres firing on the National Guards of France? Who massacred, who stopped the *diligences*, in La Vendée? Who was it filled the Rhone with carcasses in 1795? Who was it that cut the throats of our soldiers during the siege of Kehl, showed the points on which the enemy should fire, and loaded the French with abuse? Who was it that hired assassins

Loves he power then, this man? No, he loves the eldest daughter of power — wealth. M. Guizot, as was well said by M. Cormenin, has the pride of power, — M. Thiers its sensualism.

V.

"My dear friend, a grand futurity of money is preparing for us." Thus wrote M. Thiers a year after July to one of his friends at Marseilles.* This phrase says every thing; his whole conduct is perfectly explained by it. His retirement to the shades of Montmorency, to the house of M. Alexis Dumesnil, on the first of the days of July, when the danger and the responsibility had begun — when the moment was come for bearing a solemn testimony to the principles his pen had till then maintained — when a whole people, whom he had done his part to drive to that terrible necessity for action, rose as one man — when the youthful Farcy, his *collaborateur* of old, his friend perhaps, died in the ranks of the operatives — when, as says M. Loéve Veimar, the aged Benjamin Constant showed himself; — his hasty return, the combat ended, to go to Neuilly among the first to offer the crown — his proclamation of the 30th, a *chef-d'œuvre* † of impudent political jugglery, which assumed as established a matter that had scarcely been touched on, a proclamation prepared by the same hand that, in the "National" of the same date, had just penned the following avowal, extorted by facts, "In a word, it is the people that has done all in the three days; this people, excluded from the electoral colleges, and condemned to political Helotism, by

during the Consulate, and blew up the streets of Paris? And, in 1815, who massacred in the south? Who assassinated Brune? Who shot Labédoyere, Ney, Mouton Duvernet? Who has troubled France for twenty years, hindered the peaceable establishment of her institutions, sought first to destroy the Charter,—then, when to destroy it appeared impossible, to evade it? Those who call themselves Royalists!"

This was not spoken, but written, by M. Thiers, under the Polignac ministry. We could not resist the pleasure of quoting, from M. Loéve Veimar, this eloquent apostrophe, which may furnish a good specimen of the kind of oratory that Carlist royalism inspires in M. Thiers, and which has, moreover, a sort of historical interest. The sitting of January 12. 1838 (discussion on the address), was one of those that should have been seen to catch M. Thiers in his happiest inspirations of eloquence.

* This imprudent letter gave rise to an amusing incident, that made some noise at the time at Marseilles (where we then were), and which deserves to be related. By some complication of mishaps M. Thiers's letter never reached its address. It fell into the hands of a young man who called himself a republican, but who really had no political creed whatever,—a person somewhat of the poor devil order, of vulgar features, below the middle height, and, in short, a kind of double of M. Thiers himself. This individual saw the advantage to which the circumstance might be turned. He wrote to M. Thiers, informing him that he was the holder of his letter, and that he should leave it at the office of a patriotic journal, unless he would undertake to provide him a place at Paris with a certain salary, which he named; in this case, the writer would himself hasten to restore the dangerous MS. to his hands. The matter was serious. M. Thiers was not yet able to brave public opinion, and the publication of his letter might alone have annihilated all chance of his election to the Chamber. He wrote an urgent letter to the préfet of the department, M. Thomas, a resident at Marseilles. The préfet ordered the man before him, and demanded the surrender of the letter: he threatened him with the full rigour of the laws directed against those who violate the secrecy of letters, or obtain unlawful possession of them; but the young man had foreseen every thing: he, too, was disposed to carry on the contest as one who fights *pro aris et focis*, for his fortune. The letter, he coolly said, was placed in safe hands, and the moment of his arrest would be that of the dreaded publication. The préfet demanded fresh instructions. A few days after, the lucky culprit set out for Paris to deliver the letter and be installed in his place.

† It was M. Thiers who prepared the proclamation of the 30th; and his manner, his power of assertion, and the secret of his *effects*, are to be found in it entire. "Charles X. can no more enter Paris: he has caused the blood of the people to flow. The republic would expose us to frightful divisions; it would embroil us with Europe. . . . . The Duc d'Orleans is a prince devoted to the cause of the revolution. . . . . The Duc d'Orleans has never fought against us. The Duc d'Orleans was at Jemappes. The Duc d'Orleans is a citizen-king. The Duc d'Orleans has borne the tri-colours under fire. The Duc d'Orleans alone can bear them there again: we wish for no others. The Duc d'Orleans has declared himself. He accepts the Charter, such as we have always understood and desired it. He will hold his crown from the French people," &c.

the too cautious timidity of our institutions, has shown itself potential and sublime; the people it is who conquered, and for them should be the results of the struggle;" — his active practices under the supreme direction of M. de Talleyrand, and conjointly with Messieurs Mignet, Broglie, Louis, Sebastiani, &c., to *make safe* the citizen royalty — then his abandonment of his friends, of his past principles — his fury against the journalism that made him what he is, against the associations to which he had given his name before 1830 — his activity in putting in operation that system of demoralisation that has worked so much evil in France, and that springs from a source above him — all that we have said, all that we could add,— even his tenderness for the prohibitive system in chambers where the prohibitive interests predominate, — all is of a piece, and has nothing that can astonish us, coming from a man who, in the movement of a nation fighting for liberty and right three such days as those of July, can see no other future than a futurity of money for himself and those resembling him. This man values neither *men* nor *ideas*.

And when we think that for these eight years France has been in this case — that after so many sacrifices, and so much blood spilt, after the Constituent Assembly and the Convention, a demoralising race bears like a nightmare on her noble bosom, and withers her faculties of nationality and progression — when we think that the carcasses of some millions of men, martyrs to a holy cause, have effected no more than to make a stepping-stone for intrigue and venality; and then on the thrice fatal discouragement that seizes on worthy souls at beholding this spectacle, — on the scepticism that by degrees inoculates the most exalted minds, — on the inaction that becomes the common law, — on the immense influence that the example furnished by France exercises too powerfully on other nations, — on the interested sophistry that avails itself of every miscarriage to discredit the men of progression in the eyes of the people, and to isolate them, leaving the masses without leaders, unquiet and suffering; — thinking on these things, we feel ourselves overtaken by deep bitterness of spirit; we feel the necessity of separating, holding up to scorn, the cause of political immorality from that of political error; we better appreciate all the virtuous indignation, the concentrated grief, and avenging justice of that eloquent apostrophe that M. Cormenin puts in the mouth of the revolution of July, and which our readers will allow us to quote entire: —

"I had nothing to expect from those who followed fallen royalty to Ghent, and who always paraded the doctrines of the Restoration with an audacity as frank as it was unblushing. But you, the men of July, — you whom I drew from your obscurity, — you whom I took by the hand, and whom I carried, step by step, to the summit of power, — what have you made of my honour? Why am I become the laughing-stock of Europe? Why, when the indignant nations bend their looks on their oppressors, am I no more present to their hopes — nay, not even to their recollection? Why does my name no more tremble on their lips when they murmur sacred words of liberty? Have I shed my purest blood only to expiate the triumph of my principle by the bitter mockery of its consequences? Independence, liberty, country, honour, virtue, you have weighed them all in golden scales. You have infused your base cowardice into those assemblies of legislators who of old, to the sublime accents of the *Marseillaise*, poured our fourteen armies on the enemy, — among those tradesmen from whom sprang the heroes of our mighty wars,—among those ill-used operatives who will not have learned to know you till after you have ruined and undone them. You have been to the extremity of Europe to intreat a kingling to be graciously pleased to accept the money of our artisans and our labourers; and I have seen you pass the seas, tribute in hand, to beg at the knees of flouting America the pardon of General Jackson and oblivion for our victories. Continue to degrade your establishment. Muffle it round with glistening tinsel of police and stock-jobbing. Play the gentleman of the wardrobe with your petty princes. Play the Louis XIV.'s marquises, with hobnailed shoes and pothouse oaths. Play the heroes and conquerers, with the marabouts of Mahomet and the soldiers of the Pope, whilst the lance of an Austrian pandour shall strike you motionless with fright. Smile to

see petty Gotha, that begetter of children (a prince is a pleasant calling), trample under his horses' feet the majesty of the sovereign people. Have every where, and above every thing, the dread of every thing. Muster your principles under the care of your beadles. Suspend over our heads the latent and gloomy terror of your confiscations and your banishments beyond sea. Violate the sanctity and the modesty of our hearths. Calculate at the cost price on your downy sofas what may be the worth of a suborner of charters, or of a hireling pensioner; but in mercy to the virtue of the people, in mercy parade not before it the spectacle of your apostasies and the corruption of your examples.

"Go! the love of liberty which, under your impure breath, withers and sickens in its soul, must surely be reanimated when it shall be time; and whatever you may do to stupify this noble people, there will yet remain enough of intelligence to comprehend all the ill you have done it, and justice enough to punish you!"

THE MUSICIAN AT NORWICH.

THE NORWICH MUSICAL FESTIVAL.

Norwich, Sept. 15.

I NEED scarcely tell you, my dear * * *, that a festival season diffuses a general smile over at least forty miles of country. You, who illustrate the celebrated maxim of the poet, "To enjoy is to obey," and make festivity a part of your habit, and even of your religion, which it dignifies by a freedom from selfishness, and a hearty satisfaction in the enjoyments of others, rarely witnessed in social intercourse, will easily understand the effect produced upon life, or rather *vegetation*, in the provinces by the establishment of some common centre of pleasure. The benevolent man finds a "soul of goodness" in this estuary of feeling. From the green villages of aboriginal Essex, whose old grey church towers and quiet glebes work their way into the heart, despite the unpicturesque reputation of the county, to the stately Norwich itself, there is not a place where one is not all the better served for love of the festival. Coachmen, landladies, chambermaids, are inspired by an unusual desire of pleasing. Faces enter coffee rooms, that in the intensity of their brownness and aspect of rude health, are problems to the valetudinarian, and breakfasting and dining are without end. The magnates of the town entertain the more distinguished performers, and save them tavern charges. Spohr is feasting on the beeves of the mayor, and, as I hear, playing the guest and the violin in the most amiable and graceful manner possible.

But I have other things to tell. You have heard of the devil in paradise, and know, that though Michael Angelo, Burns, and some others, have tried to show the respectable side of Auld Nicky Ben, that he has the odious character of a "spoil-sport." Alas! that the "aspect malign" on a crowd of people gathered together to enjoy themselves innocently should not be a mere fiction; nay, more, that it should be the regular attendant on pleasure, and, indeed, its shadow. I have been used to attacks on musical festivals by atrabilious Methodists; I know the sin of being happy; I am aware that we shall all ..... in fact, I have heard Mawworm preach; but used as I have been to the expression of this vulgar sectarian feeling by the lower tribes of Dissenters, I never imagined till this present Sunday morning that it could be admitted into a cathedral pulpit, and find utterance in a building that owed every thing to the arts, and whose "embowed roof" is more up-

held by the imagination of mankind than even by the mighty pillars of the architect. Yes, a clergyman of the true Exeter Hall stamp thought fit in his sermon to fulminate a diatribe against the most interesting portion of the festival — to animadvert upon the orthodoxy of Professor Taylor's English version of Spohr's new oratorio — "Calvary," part of the words of which he quoted — words put into the mouths of the unbelievers; and finally proceeded to conjure his hearers that if they would not give their souls in exchange for a morning's pleasure — such was his charitable inference — they would mark their sense of the impropriety committed by staying away from "Calvary" on Thursday. This oratorio you know is precisely the greatest attraction of the festival. Now picture to yourself the choir of the cathedral, and see in the gallery opposite to this flaming divine, the great composer himself with a deaf *English* ear fortunately, but with a face and deportment so mild, so humble, so saddened with the humanity of years, that even its aspect reads a lesson to the heart: compare the two, and decide in which resides the *spirit* of that religion on which the true Christian is modelled. It is a hard thing that a celebrated composer who has undertaken the journey to England, out of love to the art and private friendship, especially to Professor Taylor, who has done every thing to make his works popular in England, should find a gratuitous and laborious attempt made to rob him of all the honours of the reception which is his due, and to affront him with an empty room on that morning when he should be reaping an ovation. As for the reverend gentleman's argument, he would find, were he to print it, that not only poets, painters, and musicians, but even the writers of the Bible themselves come into *his* category of blasphemers. Spohr is therefore still very respectably associated. There is an old Greek proverb, "Bad the crow, bad the egg;" and certainly it is a satisfaction to state, that the egg laid by this clerical crow proved so extremely bad, that the congregation, at least its musical part, revolted at it with *one nose*. Enough, however, of this repulsive subject.

Norwich Cathedral, among its other interesting antiquities, possesses one so highly interesting to musicians, that I cannot pass it over; — this is the painted monument of Thomas Inglott, the first Protestant organist of the cathedral, who is said to have been superior to every one in his voluntaries, and to most in his descant. There seems to have been a very nice desire to avoid a lie in this funeral eulogy, which gives it a value even beyond its quaintness. There, on his bier, the old monkish musician reposes; and there let him repose long centuries to come. Dr. Croft once restored the painting at his own expense; and the Rev. Mr. Elwin, a distinguished amateur of the art, has since rescued it from the perils of whitewash, which not long ago had overwhelmed it. Honour to the good taste of both! Musicians are passionate lovers of antiquities, and have not been backward in contributing from their own private purses to the support of the sentiment they cherish. The venerable Dr. Childe, with princely munificence, devoted the arrears of a long unpaid salary to the paving of the choir of the Royal Chapel at Windsor. The Doctor told the churchmen he would new pave the choir if they would pay him his salary; they paid him, and he commenced paving, not with "good intentions," as the pious Mr. Baxter hath it, but with solid marble.

I cannot describe to you the charm with which the cathedral close of Norwich affects the imagination. You enter it by a fine old Gothic arched gateway, of that exquisite grey colour that time paints ancient buildings; you have then before you the "smooth-shaven green," with the cathedral in one corner, and on the opposite side, the houses of the church dignitaries of

a deep-red brick, with latticed windows and trellised flowering shrubs against them, opening on lovely gardens and grass plots, charming retirements that seem the haunts of lettered ease and tasteful leisure. I never see one of these attractive clerical residences without being seized with a kind of poetical envy. What libraries, what pictures, what accommodation for friends, what charming women, what music, what excellent wine must they contain! O, it is worth something to get a sunny view of life, by merely gazing at such sights in a cathedral close. I was disposed for an older and more strictly ecclesiastical style of music than I found in the cathedral, as I afterwards frankly told Mr. Buck, the organist, on having the pleasure to make the acquaintance of that gentleman. I would willingly have heard something of Purcell, or Croft, or Gibbons; but the music here is in the trammels of a more modern and popular school, concerning the propriety of which it is not necessary to enlarge in this place. The choir is good, the boys sing well, and the unaccompanied parts of the service were frequently beautifully performed. If there be a sympathy in the arts and stained windows, and Gothic architecture have a language, it is certainly found in the cathedral responses. The litany utters the true supplicatory pathetic voice of the cathedral. The ascent of one tone by the reader, and the response by the choir in harmony, especially when they leave off on the dominant, of the minor of the key: in such simple effects lies the true eloquence of music. Spohr, as I afterwards discovered, was exceedingly gratified by the responses. The various manner in which the chaunt at the communion service was performed — sometimes by the voices alone, and sometimes accompanied — gave him much pleasure. Important alterations have been made in the organ within a few years by Bishop; the foundation of the instrument is by old Smith, but the new part, including some very good pedal pipes, is by the modern builder. The talent of Dr. Beckwith, formerly organist, whose remembrance is still cherished here with the highest regard, is described, both by Professor Taylor, Mr. Buck, and other competent judges, as being quite remarkable, especially in extempore fugue. But pleasant as it is to linger in cathedrals, I must not suffer collateral circumstances to distract me from the main business of the time.

Monday, Sept. 16.

This morning the first rehearsal took place in St. Andrew's Hall, the beautiful relique of a Benedictine monastery, and, as I really believe, one of the finest rooms for sound in Europe. Here painting, together with architecture, lends her softening and elevating influences to music: I must not trust myself to speak of chivalric remains (not on account of the recent umbrella tournament at Lord Eglintoun's, but because to treat of these matters there will be no getting to the music); therefore, I despatch Sir Thomas Erpingham, once for all, with many, many thanks for the beautiful gate erected by him in penance for thumping a naughty friar to death; said friar having been too free with my lady, "dreaming of love," &c., as Colman the younger, who hath versified the tale, informs us. Besides pictures of the Norfolk worthies, (I trust that the vera effigies of the grave author of the "Treatise on Urn-burial," whose style, to me, is always like a solemn voluntary on the diapasons, is among them) — beside these pictures, the Hall possesses an excellent organ, well adapted to the purpose of filling up harmonies, and furnished with a set of pedal pipes to F. F. F. of an admirable quality which do the highest credit to the mechanical science of their amateur builder, the Rev. Mr. Elwin. I will venture to back the reverend gentleman in this department against even John Gray of the New Road. Mr. Elwin

contends for thick pedal pipes as eliciting the effect of the true phonic principle, and he has certainly in this work given a practical demonstration that he is correct. Liberality in every respect must be the chief thing; out of niggardliness can come nothing but poverty; but give, and it shall be given to you a hundred fold. That is a sentiment which, if engraved in an organ-builder's workshop, would be better than a seven years' apprenticeship.

Professor Taylor displayed much judgment in that important part of the conductor's business, the management of the rehearsal; — it was not the desultory work that it generally is, in which time is wasted upon nothing, to the annoyance of the musicians, and the non-improvement of the music. By a proper economy of time, and by great firmness, promptness, and a gentlemanlike demeanour on the part of the conductor, pieces were thoroughly, satisfactorily, and pleasantly rehearsed, and the band dismissed earlier too than on some occasions when not half the music is gone through. Satisfaction reigns in every face, and Goodwin (the copyist), who in festival time has generally *a hell of a life*, lifts up his eyes, and blesses — not General Wade — but Professor Taylor.

I wish you could have heard the thundering peal of applause — the perfect storm with which all the musicians, the universal band, down to the choir boys — hailed Spohr. The reception given him must have sunk deeply into the heart of that great and good man, and it actually drew tears from the eyes of Madame Spohr. I shall speak more at length in due time of the oratorio of "Calvary," which formed the principal subject of the morning's rehearsal, and was directed by the composer himself in the most delightful and characteristic manner. Previously to the trial of this work I had the great pleasure to be introduced to Spohr; and having informed him that I had visited Germany, and ten years before had had the felicity to sit next to him in the theatre at Cassel, he made me again sit by him, and took me into his confidence. He inquired whether I had heard any opera at Cassel; but finding that I had only witnessed a drama taken from the French, he informed me that I had not then heard their excellent band. It is this band that he has always in view when he composes; it is used to his style, and renders his ideas in perfection. But he has no such solo singers as he finds in England. He is in particular delighted with Hobbs, as is also a young Polish violin player, his pupil; and Hobbs certainly deserves great praise, not only for his very beautiful voice, but for his musician-like good style. The ladies Madame Stockhausen, Miss Birch, and Miss Hawes, sung their trios, &c., with enchanting purity. Part-singing was never executed with more truth and beauty of tone. In addition to these, Balfe, Phillips, and Francis, lend their aid to the oratorio, and you may conceive how well the parts are filled. The most difficult and ungrateful solo in "Calvary" falls to the share of Professor Taylor, and we are sure of every satisfaction in the performance but that of a great audience.

Tuesday, Sept. 17.

This morning Spohr rehearsed a new Violin Concerto in A, as I believe, not yet printed, entitled "Sonst und Jetzt:" the design of which is to represent the old and new styles. The composition, if I dare trust my memory, consists of two movements connected — the first in A minor, written in a large and rather solemn style; the second, a rondo in the major, a little *a la Paganini*, having a military drum to mark the rhythmus at the opening of every bar of the theme. The greatest curiosity prevailed to hear what Spohr would accomplish as a player, the notion being very

general that he has given up violin playing. And, in fact, with respect to *public* performances generally, such is actually the case. But a musician and his instrument, especially when that instrument is the violin, which a man holds to his bosom like a wife, are not so soon parted.

The playing of Spohr at the rehearsal was much finer than it was at the performance. The custom of dining in Germany at one o'clock, leaves a performer ready for arduous duty in the evening; but however temperate one may be at the late dinners in England, there is something in our hours of refection unfavourable to brilliant excellence in the concerto at an evening concert. Spohr played so divinely in the morning, that he raised expectations of his evening's performance that were not altogether fulfilled. I take the rehearsal to represent his true powers; for it is to be considered that in the morning he played at ease, knowing that any mistake which happened in the orchestra could be instantly corrected, while, in the evening, any error which might occur in accompanying this new and difficult composition must be slurred over. Want of an entire confidence in his orchestra — with whom, however, in the main he was highly pleased — might in some degree detract from his full powers. The *début* of his concerto with trombones, horns, &c., in slow chords, was extremely fine. His first solo exhibited a tone, less remarkable for extraordinary volume and power than for sweetness. In that respect he is like Paganini. The sweetness of his tone is wonderful — you hear not the slightest scratch or scrape, such as the best fiddles now and then commit — all is *oiled*. His portamento is like that of a great singer: it is delightful to hear him swell and diminish a long note. He puts a soul into phrases of melody rarely heard, but his style is simple and large, and his ornaments are rare. His bowing has none of the piquancy of that of the modern French school, but it is various, and brings out the passages with effect. His shake is rather slow. The surprising purity of his intonation in arpeggios, passages of difficult modulation and enharmonic changes, was highly appreciated. With respect to his violin, I was informed by an amateur learned in such matters, with technical and even ludicrous brevity, that he played "on a Strad with a new belly."

A festival makes one acquainted, if not with strange bedfellows, with strange dinner companions. To-day I had the honour to meet Spohr and Madame Spohr at dinner, in private society. I shall endeavour, for the satisfaction of those who are unacquainted with this great musician, to give a slight sketch of him.

His figure, which is cast in a great mould, is redeemed from clumsiness by a native dignity of bearing, wholly free from affectation or assumption. His large face, when you get near it, is really very handsome. It reminded me of one of the old gods in the Elgin marbles, and I could not help somehow connecting it with Keats's "Hyperion." Eyes small, and rather deep set; high cheek bones, with the cheeks the reverse of full; a nose perfectly well formed; and a mouth that, at the corners, reveals traces of the emotion experienced in a rather arduous professional life, give the principal character to a countenance whose expression, on the whole, is that of entire calmness and benignity. I should say that a complete suit of black, relieved on occasions of ceremony by the cross of some order hanging from the breast, together with a plain brown wig, have their effect on the already reverend exterior of Spohr. His manner is perfectly simple, frank, and affectionate. Having the good fortune to know many members of his chapel, as well as private friends of his in London, we soon fell into the most agreeable track of conversation. He gave me a succinct history of his artist career.

Born at Brunswick, and educated in the *Hof-capell*, he was, at twenty

years old, established at Gotha as Kapell-meister; afterwards he had the same situation at Vienna, in the *Theater an der Wien*, where Beethoven became his most intimate acquaintance; he then travelled in Italy and to England, and since that time has been established at Cassel. At this last place his duties are numerous and arduous, and leave of absence for a sufficient time to make effective journeys is with difficulty obtained. He would have been glad, he informed me, if it were possible, to remain half a year in London. He possesses an absorbing but quiet enthusiasm for music, and a perfect indifference to professional gains. This is the reason why he has ceased to give concerts, and to play the violin publicly when he travels. He has, he told me, given up *practising* the violin; what he now possesses of execution is merely the remains of his early acquirement: when he has composed any thing he plays to show how it should go, and this is now his principal use of the instrument. When I reminded him of the fortune made by Hummel through solo playing, he said he was a different man: Hummel was known to be fond of money. He speaks most handsomely of the rising talent for composition in Germany, and did not omit to notice with applause the pleasing things composed by Sterndale Bennett. I found him a man ready to do justice to every branch of composition, perfectly liberal in his estimate of artists, and with a lively sympathy for all sorts of excellence. Madame Spohr, his amiable lady, is a good musician, and the second wife of the composer. She is considerably younger than her husband, and appears to possess many virtues. The most pleasing aspect of this lady to my mind was the deep interest which she evidently took in all the business of the festival, particularly that in which Spohr was concerned.

The first concert was as follows: —

PART I.

SINFONIA, No. I. — *Haydn.*

"God save the Queen." — Verses by the principal singers, and chorus.

QUINTET — Madame Stockhausen, Miss Hawes, Mr. Francis, Mr. Hobbs, and Mr. H. Phillips. "Blow, gentle gales." (The Slave.) — *Bishop.*

SONG — Mr. H. Phillips, "The Shepherd's Invocation to Orpheus." Violoncello Obligato, Mr. Lindley. — *Barnett.*

CAVATINA — Signora Placci, "A s'estino." Corno Obligato, Signor Puzzi. (Donna Caritea.) — *Mercadante.*

DUET — Madame Stockhausen and Mr. Hobbs, "Fairest Maiden." (Jessonda.) — *Spohr.*

ARIA — Mr. Balfe, "Madamina." (Il Don Giovanni.) — *Mozart.*

CONCERTO VIOLIN — Dr. Spohr. — *Spohr.*

RECIT. ED ARIA — Signoria Persiani, "Non mi dir." (Il Don Giovanni.) — *Mozart.*

FANTASIA — Grand Piano Forte, Madame de Belleville Oury. — *Thalberg.*

THE MUSIC IN MACBETH. — *Matthew Locke*, 1671.

The Solos by Miss Birch, Master Coward, Mr. Hobbs, Mr. Francis, Mr. Balfe, and Mr. H. Phillips.

PART II.

OVERTURE — "Prometheus." — *Beethoven.*

SONG — Miss Birch, "Rose softly blooming." (Azor and Zemira.) — *Spohr.*

ARIA — Signor Tamburini, "A rispettarmi apprenda." — *Carafa.*

TRIO — Signora Persiana, Madame Stockhausen, and Signora Placci, "Vorrei parlar." (Falstaff.) — *Balfe.*

QUARTETTO E CORO — Miss Birch, Miss Hawes, Mr. Hobbs, and Mr. H. Phillips, "Nettuno s'onori." (Idomeneo.) — *Mozart.*

NEW GERMAN BALLAD — Madame Stockhausen (the words by Matthison), with Harp accompaniment.

DUETTO — Signor Tamburini and Mr. Balfe, "Un segreto d'importanza." (La Cerentola.) — *Rossini.*

REIT. E CAVATINA — Signo Persiani, "Come per me sereno." (La Sonnambula.) — *Bellini.*

TRIO AND CHORUS — "The Chough and Crow." (Guy Mannering.) — *Bishop.*

The Solos by Miss Birch, Miss Hawes, and Mr. H. Phillips.

The effect of the beautiful Gothic hall, when lighted up, was startling in the extreme. The gay dresses and dazzling fairness of the complexions of the ladies,— this last, something I assure you quite peculiar in its kind —

> "Beauty truly blent, whose red and white
> Nature's own sweet and cunning hand laid on,"

surpassing any thing of the kind I ever witnessed. One could not desire a more genial atmosphere for the audition of symphonies, particularly their more tender and *adagiesque* morsels. Such a variety of charming claims to admiration was presented, that it was impossible to be in love with any one lady for more than a quarter of an hour; and as impossible to remain without some votive offering to the ideal of beauty for a quarter of a minute.

Methinks I hear you exclaim, "Out, hyperbolical fiend! Talkest thou of nothing but ladies?" To be sober, therefore: — Haydn's capital old symphony, though finely played, did not make much impression. It was curious to observe the progress made by the audience in the appreciation of instrumental music. The second night the symphony was better listened to, and the third positively enjoyed. Several pieces of no very great interest to the connoisseur succeeded the symphony. I was rather unfavourably placed to hear Spohr: the impression in the room was, that he was agitated in the performance; and I must confess that the playing was, on the whole, inferior to that heard in the morning. It was, however, not only without "botches or flaws," but would have been perfectly excellent, had he not before raised too high a standard of himself. Persiani sang the aria "Non mi dir" with much judgment. Her immense command of high notes permitted her to sing it in the original key of F, which is now rarely done. It is seldom that a modern Italian singer who possesses, like Persiani, a ready invention, does not commit some trespass on good taste in the execution of this class of music. Persiani was not only entirely free from the defect of redundance, but commanded, through a general sense of her desert, a universal encore. A daughter of poor Placci (once a buffo of merit at the Italian Opera) has appeared here successfully. Her personal resemblance to her father is striking; she also has considerable vocal talent which he never had. Her voice is a contralto, and she manages it with the skill of an experienced singer. Madame De Belleville Oury, who appeared at this festival as a pianist, is a young lady originally of Munich, who was married by Mr. Oury during his late sojourn on the Continent. Her performance of Thalberg's fantasia in G minor made no effect. The absence of some of the *arpeggios* in the right hand, which accompany the air in the left, was much to be regretted. Madame Oury appears to have no charm of touch, and to be generally deficient in expression. The chorus, in D major, from "Idomeneo," in the second part, was very delightfully performed; and the selection of this classical movement does much honour to the taste of the conductor.

Wednesday, Sept. 18.

The first morning performance consisted of the following interesting selection: —

PART I.

A SELECTION OF SACRED MUSIC.

"Jubilate," composed by Henry Purcell, for St. Cecilia's Day, 1692.

SOLO — Mr. Young, and Chorus — "O be joyful in the Lord."

DUET — "Be ye sure" — Mr. Francis and Mr. Hobbs.

CHORUS — "O go your Way into his Gates."

DUET — Mr. Young and Mr. H. Phillips — "For the Lord is gracious."

CHORUS — "Glory be to the Father."

ARIA — Signora Placci, " Amplius lava me," — *Ciampi.*
FULL ANTHEM — " We have heard with our Ears."— *Giovanni Pierluigi da Palestrina.*
SCENA — Signor Tamburini, " Torbido mar che freme." (La Passione.) *Paiesiello.*
CHORAL ANTHEM — " Have mercy, Lord." — *Beethoven.*
SCENA — Madame Stockhausen, " Here amidst these cool Recesses." (The Seasons.) — *Haydn.*

MOTETT FROM HAYDN'S MASS, No. 2.
CHORUS — " Give unto Jehovah."
SOLO — Miss Birch, " O be joyful in Jehovah."
SOLO — Mr. Balfe, " O Lord, rebuke me not."
SOLO — Miss M. B. Hawes, " Blessed be the Lord God of Israel," and Chorus.

PART II.
Handel's Oratorio, " ISRAEL IN EGYPT."

Purcell's Jubilate is a massive and glorious work. Being an entire novelty it was heard by the connoisseurs with high enthusiasm, resulting from a mixture of musical and national feeling. The Doric grandeur with which the choral part of the text is handled — every progression in the bass being planted on some fundamental harmony with the firmness of a giant foot — rendered evident the school of forcible expression in which Handel studied and profited. The chorus " O go your Way," and the " Glory be to the Father," with its close canonic points, are perfectly delightful. This ought, thanks to Professor Taylor, to be a standard work at festivals. The solos were sung in the best cathedral style by Messrs. Hobbs, Francis, Young, and Phillips. Signora Placci sung a charming aria by Ciampi, which we understand to be one of the first fruits of the Gresham Library. It is a composition to make acquaintance with. The arranged anthem from Palestrina, though a fine work, was sung too much out of tune to be fully enjoyed. Such an organ as they have in the hall does well to fill up, but not to accompany — the counter tenors, not getting the support they require, soon become flat. Spohr does not approve, any more than other foreign musicians, of men singing the contralto parts; the sooner we abolish this custom the earlier we shall signalise our good sense. The rest of the selection of the first part was highly classical and beautifully performed.

The same praise must be bestowed on " Israel in Egypt," with a slight allowance for the more scientific choruses, like " The People shall hear," in which difficult modulation is conspicuous. I have never yet found, at provincial festivals, that a due distinction between minor and major is made in the slow chords at the conclusion of choruses. One hears continually the two kinds of thirds going together; this calls for particular attention on the part of the chorus-master.

Professor Taylor brought forward a very interesting version of " Israel in Egypt," the monotony of a long-continued choral harmony in this oratorio having long called for such labour. The songs selected are some of the finest and the gravest of the opera songs of Handel, adapted to words which naturally belong to the position assigned them in the work. A song in E minor, performed by Miss Hawes (I forget the opera from which it is taken), appeared to me one of the finest things I ever heard. Songs of a very interesting and varied character were also sung by Francis and Hobbs. There is no doubt but that since the modification of " Israel in Egypt " has become one of the necessities of the time, an adaptation of it like the present is best calculated to satisfy the demands of all classes of hearers. In the last chorus of the first part, the treble chorus, with unpardonable carelessness, read quavers for crotchets, and rendered a new commencement necessary. This was the solitary blot upon an excellent performance; but I confess candidly, that a new beginning is always more desirable than

that a chorus should be pushed on through all its mistakes from the anxiety of a conductor to cover them.

The hall was again crowded at the second evening concert, of which I subjoin the programme:—

PART I.

SINFONIA in E flat. — *Mozart.*

SONG — Mr. Hobbs, "The Mansion of Peace." — *Webbe.*

GLEE — Madame Stockhausen, Mr. Young, Mr. Hobbs, and Mr. H. Phillips, "From Oberon in Fairy Land." — *R. J. Stevens, Gres. Prof. Mus.*

SONG — Miss B. Hawes, "I'll speak of thee." — *M. B. Hawes.*

TRIO — Signora Persiani, Signor Tamburini, and Mr. Balfe, "O Nume benefico" (La Gazza Ladra). — *Rossini.*

FANTASIA CORNO — Signor Puzzi. — *Puzzi.*

SONG — Mr. Balfe, "My Bark is bounding near." — *M. W. Balfe.*

TRIO — Madame Stockhausen, Miss Birch, and Miss M. B. Hawes, "Night's ling'ring Shades" (Azor and Zemira).— *Spohr.*

BALETTO — "Maidens fair of Mantua's City." — *Gastoldi.*

RECIT. ED AIR — Signora Persiani "Dove sono" (Le Nozze di Figaro). — *Mozart.*

SONG — Mr. Hobbs and Chorus, "Come if ye dare" (King Arthur). — *Purcell.*

PART II.

OVERTURE — "Oberon." — *C. M. Von Weber.*

ARIA — Signora Persiani, "Prendi per me" (L'Elizire d'Amore). — *Donizetti.*

DUETTO — Signora Placci and Mr. Balfe, "Senza tanti complimenti" (Il Borgomaestro di Sardaam). — *Donizetti.*

ARIA — Signor Tamburini, "Avviso ai fanciulli." — *Balfe.*

CONCERTANTE VIOLIN — Dr. Spohr and Mr. Blagrove — *Spohr.*

SONG — Madame Stockhausen, "Let me wander" (L'Allegro). — *Handel.*

SONG — Mr. H. Phillips, "Mad Tom." — *Purcell.*

SESTETTO — Madame Stockhausen, Miss Birch, Signora Placci, Mr. Hobbs, Mr. Balfe, and Signor Tamburini, "Sola Sola" (Il Don Giovanni). — *Mozart.*

RECITATIF ED AIR — Miss Birch, "Noble Seigneurs" (Les Huguenots). — *Mayerbeer.*

CHORUS — "Hail to our Monarch her People's Defender" (Der Freischutz). — *C. M. Von Weber.*

I shall not detain you with many remarks on this concert. Fair eyes glistened with pleasure at the sweet ballad of Webbe, sung by Mr. Hobbs. It was a perfect performance. To this Miss Hawes's song, "I'll speak of thee," formed a striking contrast. This *shoppy* nonsense in the conjugating love style — for instance: First person singular, I'll speak of thee; second person ditto, thou'lt speak of me; with the usual romantic rhymes of "moonlight sea," &c., is totally unworthy of a person of Miss Hawes's talent. With her perception of what is good and classical, she must be endowed with no slight powers of face to be able to go through such *humbugeous* stuff, in which there is no one particle of genuine feeling or sentiment. Balfe was afflicted with a sullen rheum, and began his "Bark" with a portentous snuffle, as if there were no overture to his nose. His first efforts to get out a tone were unsuccessful, but he succeeded better at last. The trio of Spohr was deliciously sung by Madame Stockhausen, Miss Birch, and Miss Hawes. The concertante for two violins, performed by Spohr and Mr. Blagrove, was executed by its author and the late Mori nineteen years ago. Age has not detracted from the charm of this composition, the effects of which are peculiar and beautiful. Blagrove played his solos in the best style he could assume; but though he has rather more force than Spohr, he has an equal smoothness of tone and polish of style to attain. The passages, with the exception of one, were executed beautifully together. The master and pupil were well associated. Spohr told me that nearly all the violin players on the Continent had been his pupils. Even Molique of Stutgard, the celebrated artist and composer, was his scholar during a fortnight. Such is the estimation in which the patri-

arch of the violin is held. If one would learn to make the instrument speak, he certainly is the best teacher of that eloquent art.

Thursday, Sept. 19.

This morning was big with the fate of "Calvary;" and to that fate, if unfortunate, hung the eternal disgrace of Norwich. Many speculations were afloat as to the extent of parsonic influence; and the benevolent patrons of the Festival trembled lest the genius of Spohr should be affronted by an empty room. But good sense and good feeling triumphed; and long before the opening of the doors of the hall the matter was decided. Of the vast concourse present, the major part certainly consisted of persons who had ridden from all parts of the surrounding country, and whose eager interest in the new Oratorio spread the contagion of enthusiasm throughout the assembly. Nor did this interest abate during the progress of the work; on the contrary, expectation was fully gratified, and a complete triumph achieved.

Having witnessed many errors in the rehearsal of this difficult composition, which could hardly be expected to be made quite correct in a second trial, it was not without some apprehension that I saw Spohr assume his office as conductor. The great attention paid to the composer by the band and chorus, however, operated wonderfully, and the passages which had over and over created stoppages and new trials at the rehearsal were now executed with smoothness. Spohr's conducting is delightful; at once prodigiously firm in the time, and illustrative by its motions of the effect intended. You see in him a man who well knows what he designed, and who is as familiar with the details of his work as with it entire. At rehearsal, if any instrument wanted a note, he sung it; no matter what the harmony was. His voice, by the way, is very agreeable.

The overture to "Calvary" consists in a pathetic fughetta in C minor $\frac{8}{4}$. During this fugue, before the changes of time, the band is kept almost always *sotto voce*, and here the expressive style of a great master in stringed instrument writing was obvious. Such immortal sighs were uttered by the orchestra, as I have not heard since an opera of Gluck's delighted my ears at Berlin. The passages exemplified what the poet has expressed in that fine verse —

"The music yearning, like a god in pain."

The brass instruments are used with majestic effect in the very original conclusion of this overture. The first chorus, "Gentle night, O descend!" in A flat, $\frac{3}{4}$, with solos by Miss Birch and Balfe, was full of sweetness. After some declamation by Hobbs, followed a recitative and *Aria agitato*, by H. Phillips, "Woe, horror, grief, despair," in A minor. This is wonderful music, but of an excessive difficulty, the modulation being often remote, and the accompaniments so independent as to lend the singer no assistance in attacking his note. The band wanted a little more *aplomb* in the time, but Phillips acquitted himself in a masterly way. Next came a pleasing solo in A $\frac{6}{8}$, sung by Madame Stockhausen, and accompanied by the chorus, "Though all thy friends prove faithless." The lady's voice is still of celestial purity, and the high A with which she concluded this piece was one of the most exquisite notes possible. Hobbs followed with an aria parlante, in F sharp minor, which he sung with much feeling. His style throughout the oratorio demanded high praise. The expressive aria cantabile, "Tears of sorrow," with its accompaniments after Gluck's manner, fell to the share of Balfe; who, though always a musician, wants that smooth and polished

style that so highly recommends Phillips in songs of this character. The chorus "Thou alone art our refuge," a fugue on a bass subject, proved an excellent specimen of the master in that style. After a recitative, affectingingly declaimed by Hobbs, followed a bass solo in B minor, $\frac{3}{2}$, "Father of our chosen nation," by Professor Taylor; in which, though the music is extremely difficult in the time, the rhythm, and the modulation, he acquitted himself with much success. The wandering harmonies of the violins *con sordini*, with the chorus of men's voices in unison interspersed, give an elevated character to this grand and dramatic scene. The fall of the octave in the chorus parts has all the solemnity of the Ghost scene in the finale to Don Giovanni. A quartett, unaccompanied, "Thou Lord art our refuge," sung by Miss Birch, Miss Hawes, Hobbs, and Phillips, was performed with a purity and smoothness, such as I think the composer never heard before. A truly demoniacal phrensy reigns in the chorus "Shame! shame! Would they the deceiver save?" Its originality of style, and the energy of the accompaniments, place it in the first rank of expressive choral music. The last chorus of the first part, "Upon us be his blood," in A minor, $\frac{6}{8}$, is the piece the least recommended by novelty. Here are again heard some of the modulations of "The Last Judgment."

The second part of "Calvary" is introduced by a beautiful symphony in F sharp minor, that recalls the instrumental style of Beethoven in "Fidelio." It is impossible for music to be more earnest. An affecting chorus, in plain counterpoint, and in the same key, "O, look not down thou glorious sun!" succeeds. We are now in the thick of the subject treated by Handel in the second part of the "Messiah." A chorus of Jews, "King of Israel, help thyself!" in G minor, $\frac{3}{4}$, is highly original and dramatic. The vigour of the exclamations, and the energy of the orchestra, paint the scene in an extraordinary manner. After this follows an exquisite recitative, "O Mary, what dying love!" This is the finest recitative in the work, and Hobbs delivered it with a high appreciation of its beauty. A recitative and air by Madame Stockhausen (the Mary Magdalen of the original), in A flat $\frac{9}{8}$, with violin, violoncello, harp, and corno obligato, though elegant and expressive, does not greatly quit the track of Spohr's peculiarities.

A friend whispered to me — "That character of Mary seems to me the divinest thing — how she clung to him to the last — for it is a love story you know," and his eyes filled with tears — "did you ever see the three Marys by Correggio?" It was a rapid and eloquent commentary, and beautifully in keeping with what we had heard. A trio E in $\frac{2}{4}$, by the three women, "Jesus, heavenly Master," was exqusitely sung by Madame Stockhausen, Miss Birch, and Miss Hawes. This is a perfect production — Spohr has never written any thing more beautiful. Another accompanied recitative by Hobbs, remarkable for its expressive instrumentation, leads to a chorus in the form of a round in D flat. This new model of chorus was very successful. To the end we have now a succession of beauties. A mild and pathetic quartett and chorus in E, "His earthly race is run," the solos by Misses Birch and Hawes, and Messrs. Hobbs and Phillips; a terrific storm chorus in C minor, which subsides into a simple choral phrase, sung by Francis, "He was the Christ," and repeated in chorus; and then after another recitative a soft closing chorus in $\frac{12}{4}$ time, "Beloved Lord, thine eyes we close," wind up the whole. The last chorus has an entirely new structure, and flows on with so soft and beautiful a motion that one would wish it to last for ever.

I assure you, my dear friend, that I believe the *divinus afflatus* to be discoverable in a production, which is poured forth more warm from the

heart than any thing that modern times have produced. It is a work that cannot be heard without tears. The subject is treated with the same earnestness and conviction that produced the master-works of the old painters. A greater simplicity and breadth of style prevails in the handling of the choruses than we have been accustomed to from Spohr, and there are fewer of his mannered closes. You may imagine how the work has profited by this. I must also praise the uncommon clearness, and force with which the sacred narrative is followed, and the succession of admirable pictures, which lead to the consummation. I must deprecate any final judgment on Spohr, formed apart from his orchestra. It is from an admirable colouring that his works derive their chief variety and interest.

The singers and band were highly excited and animated to unusual excellence by the presence of the Maestro, and the oratorio ended in a reverential silence. Many would gladly have heard no more music that morning; but the Rex tremendæ, the Recordare, the Sanctus, and Benedictus, &c. of the Requiem, together with some movements from Mozart's Litany, and a choral of Sebastian Bach might still follow without violating the sanctity of the feeling already raised. More exquisite part-singing than that by Miss Birch, Miss Hawes, Hobbs and Phillips, in the Recordare, was never heard. The good taste of filling up the morning's music by the oratorio of the "Redemption" is unquestionable; and it is the merest justice to Professor Taylor to observe that in *laying out* his concerts he has displayed the acutest foresight, and the most correct judgment. There has been nothing offensive — no clashing of heterogeneous styles, and the result of every morning's music has been a certain unity of impression with which we rarely leave the concert room.

The bill of the third evening concert ran thus: —

PART I.

SINFONIA IN D. — *Beethoven.*
SONG — Miss M. B. Hawes, "The Mermaid's Cave." — *C. Horn.*
CAVATINA — Signor Tamburini, "Lieti voci." (Zaira.) — *Mercadante.*
DUETTO — Signora Persiani and Signora Placci, "Lasciami non t'ascolto." (Tancredi.) *Rossini.*
SONG — Mr. H. Phillips, "The best of all good Company." — *Phillips.*
RECIT. ED ARIA — Miss Birch, "Non più di fiori." Corno di bassetto obligato, Mr. Willman. (La clemenza di Tito.) — *Mozart.*
QUARTETTO E CORO — Madame Stockhausen, Miss M. B. Hawes, Mr. Francis, and Mr. Balfe, "Alziam gl' evviva." (Euryanthè.) — *C. M. Von Weber.*
SONG — Mr. Hobbs, "I attempt from Love's Sickness to fly." (The Indian Queen.) — *Purcell.*
DUETTO — Signora Placci and Signor Tamburini, "Bell 'imago." (Semiramide.) — *Rossini.*
CAVATINA — Signora Persiani, "Porgi amor." (Le Nozze di Figaro.) — *Rossini.*
DESCRIPTIVE FANTASIA — Grand Piano Forte, Madame de Belleville Oury, with CHORUS — The Solos by Miss Birch, Miss M. B. Hawes, Mr. Young, Mr. Francis, Mr. Hobbs, and Mr. H. Phillips. — *Beethoven.*

PART II.

OVERTURE — "Faust." — *Spohr.*
SCENA — Madame Stockhausen, "Si lo sento." (Faust.) — *Spohr.*
SCENA — Signora Persiani and Signor Tamburini, "O guardate che figura." — (La Prova.) *Guglielmi.*
CONCERTO VIOLONCELLO — Mr. Lindley. — *Lindley.*
SONG — Mr. Balfe, "A Home in the Heart." — *Balfe.*
SCENA — Signora Persiani, "Ah non credea mirarti." (La Sonnambula.) — *Bellini.*
GLEE AND CHORUS — Mr. Hobbs, Mr. Young, Mr. Francis, and Mr. H. Phillips, "Fill me, Boy." — *T. Cooke.*
DUETTO — Madame Stockhausen and Mr. H. Phillips, "Dunque io sono." (Il Barbiere di Siviglia.) — *Rossini.*
MARCH AND CHORUS — "All hail our Queen Victoria." — *Mozart.*

You will see by this bill that though some compromise between the classical and the popular was unavoidably made at the evening concerts, good music was never neglected. The graceful quartett and chorus from Euryanthe was highly enjoyed and rapturously encored. Persiani reposed on the simple passion of the music in Porgi amor. This intelligent woman made her musicianship highly admired during the festival. Madame Ourv was again unfortunate in her Descriptive Fantasia. The force employed by her was any thing but grateful to the ear, and the pieces selected have neither developed in her any high degree of mechanical excellence, or of musical feeling. Spohr made his overture to Faust, which for a long series of years has been huddled off at the Philharmonic, completely understood by the orchestra. The fughetta in the middle was now perfectly rendered, and the difficulties of its time vanquished. I ought to mention that the newest works of Spohr are a violin concerto and an historical symphony. The first movement of this last, he told me, is in the style of Bach and Handel — for which he was obliged to make especial studies; the Adagio is in Mozart's manner, the Scherzo in that of Beethoven, and the finale is of the present date. This is a work that the amateurs may look forward to with interest. Persiani and Tamburini were "in excellent fooling" in O Guardate. Both of them showed immense comic resources, and their imitations of each other produced explosions of laughter.

Friday Morning, Sept. 20.

The music of the festival closed this morning with the "Messiah;" the solos by Madame Stockhausen, Miss Birch, and Miss Hawes; and Messrs. Hobbs, Young, Francis, Balfe, and Phillips. The finest solo singing in this performance was by Hobbs in "Comfort ye," and "Thy rebuke;" by Miss Hawes in "He was despised;" and by Phillips, in "The people that walked." Miss Birch, who is a very nice, improvable girl, with a splendid voice, is to be commended to a purer taste in her closes: one ill-chosen note destroys the character of Handel. The cadences of the singers were, on the whole, remarkably modest, thanks to the advice of Professor Taylor, and to the independence of Mozart's accompaniments. Balfe wants both the voice and the style necessary to this music. An unfortunate confusion of parts happened with respect to one of his songs, which rendered a new commencement necessary; in other respects, the oratorio was admirably performed.

On the whole, though I have heard much music in England and on the Continent, I must reckon the Norwich Festival among the greatest musical treats that I ever experienced. I attribute this pleasure chiefly to the judicious management of Professor Taylor, who has performed his arduous duties with inflexible nerve and courage. No one can fully understand what that gentleman deserves, not only at the hands of his fellow citizens, but from the friends of music at large, who does not know what he has undergone; first, in arranging and preparing a vast deal of new and elaborate music; then, in bringing over Spohr to add to the weight of the responsibilities of the festival; and, lastly, in carrying out his design through strenuous opposition, and in the midst of the harassing fears of friends, and the undisguised malice of enemies. Indeed, to extract music out of such a tumult of opinion — to make everything go satisfactorily and well, could only be accomplished by a man of indomitable nerves, and the coolest head; willing to sacrifice all personal considerations to the object of the time. Such has been Professor Taylor, who we sincerely believe has here given an impulse to music which will not subside at Norwich.

A truce now with this long gossip upon music, for which the hurry of the time must excuse me in the pages of the *Monthly Chronicle*. In essaying to give a complete and rapid history of my impressions, I must not omit the Fancy Ball. The English do not excel in these amusements; either they drink no champagne, or the wine does not conquer their intense consciousness and *mauvaise honte*. They put on dresses, and indue none of their life and spirit; and thus their exhibitions of *character* become nothing but elaborate tom-foolery: they are so many walking clothes-horses. Then in their quadrilling and waltzing, what a horrid *noli me tangere* system prevails! The partner gets not the favour of a look, and may consider the first joint of the two middle fingers as a boon of high consideration from the lady. Dancing, which is the pantomime of love, is here conducted on the principle of repulsion; indeed, it is to be feared that girls who thus comport themselves in the ball-room, must be great rakes at heart. Innocence is generally more confiding. I entered the Hall with a friend, long before it began to fill with beautiful women, when a Roman senator, who was hiding behind a pillar, slunk off, as if much ashamed of his thin legs, and cowered down into the smallest possible space on a settee. It would be tedious to notice the attempts at character; the best of the whole was a Jew clothesman, whose threadbare hat was inimitable and most expressive. The view from the gallery about twelve o'clock, when the Hall began to be crowded, was very sparkling and animated.

It was about this time, in quitting the dancers, when the glare of light, the throng of people, sounds of waltzing, and a general hubbub made the scene at its highest, that I passed through a Gothic chapel that serves at these times as a sort of anteroom to the Hall. I can hardly describe the romantic effect on the imagination produced by suddenly entering this ancient building, dimly lighted, and in which the stillness of death reigned; where some few attendants alone sat mute and immovable, wrapped in their cloaks. It was like a dream of chivalry, or a scene out of some old romance suddenly realised.

We have had races, too, at Norwich, of the most animated description: the performances regularly ending in showers of rain, we have had to run for it most devoutly. We have dashed down Post Office Street, and scudded along the market place to the admiration of half the girls in Norwich. Every thing tended to keep up the animation of the time, and to make us "tear our pleasures" with the greater eagerness during this fierce but balmy week of existence.

I have left Norwich, half persuading the Rev. Mr. Elwin to write the life of Malibran, and publish some drawings of hers which he showed me, that display amazing natural spirit and genius. I am persuaded that an entirely new aspect of the genius of that extraordinary woman is yet to be made known, in the expressive, though wild talent of her pencil. On Saturday morning, Spohr and Professor Taylor proceeded to London outside the coach, and encountered one of the roughest days for cold and wet that can be imagined. The relative position of the two was, however, in some respects enviable. Spohr came over here expecting nothing beyond his bare expenses. The committee, with gentlemanly feeling, and not to be outdone in generosity, sent him back with 150*l*. Such a spirit, in the intercourse with a man of genius, does honour to the national character, and makes one proud of being an Englishman.

THE PROSPECTS OF THE WINTER THEATRES.

Mr. Macready has bequeathed to his successors in Covent Garden a task which can be accomplished with success only by great talents and great resources. Two seasons of an elaborate experiment for the restoration of the legitimate drama with all the advantages of modern art, must be followed by some grand efforts of a high order, both in conception and execution, or no hopes of satisfying the natural demands of the public can be entertained. It was always a matter of extraordinary difficulty to manage our overgrown patent theatres: — it is now more difficult than ever. The popular taste has been instructed to a certain extent; the light has been let in upon the magic cavern, and people will not be content to explore it hereafter in the dark. The obvious consequence, as all experience points out, of every acquisition made to our intellectual luxuries is a craving for more, and for still loftier and purer enjoyments. It is in the very nature of improvement to advance.

But we are far from thinking that it will be necessary to the successful issue of Madame Vestris's undertaking that she should advance in the same direction; nor do we think that the system developed by Mr. Macready could have been much longer sustained with advantage to himself or the drama. Other tracks must have been beaten up; or the audiences, accustomed to the most profuse and gorgeous pageants that our stage has ever witnessed, must have ultimately risen in their desires to such a height of extravagance as to render the satisfaction of their expectations incompatible with the obvious interests of the theatre: under any circumstances, other means must have been cultivated. The attractions of scenic splendour, however chaste and fascinating, are the soonest exhausted; and a long succession of entertainments, in which we are accustomed to look for the most costly embellishments and the most striking pictorial effects, have the inevitable tendency of generating anticipations which the wealthiest manager would find it impossible to realize. This is merely the pecuniary side of the question; but it presents other aspects which are still more deserving of consideration.

It is much to be regretted that every attempt to discuss this subject simply in reference to the interests of the national drama, and independently of all personal suggestions, should be made to appear like an act of ingratitude to Mr. Macready; just as if the real merits of his management — which are of a kind to entitle him to the most honourable panegyrics — could not be fully and most gratefully acknowledged without at the same time admitting every part of his system to be faultless. We very much doubt whether the most sincere, as they are certainly the most judicious, admirers of Mr. Macready's managerial labours, are not to be found amongst those who have discovered in his revivals an inclination to give an ascendancy to artistical effects over the poetry and passion of the drama; yet any critic who should venture frankly to assert so much would run the risk of being charged with want of sympathy in the great object to which Mr. Macready so assiduously devoted his experience and his skill, it being assumed that the modes and forms in which the plays of Shakspeare were reproduced, and not the reproduction of those plays, constituted, in truth, the paramount claim put forward by Mr. Macready to the support of the public. We do not hesitate, notwithstanding, to deny the correctness of this assumption. We maintain that the revival of a select few of Shakspeare's plays — the careful restor-

ation of parts hitherto sacrificed to a coarse and vulgar taste — and the rejection of all those incongruous patches of character and dialogue which had from time to time been foisted into the acting editions, was a work of much higher and nobler aim than all the triumphs which the most consummate art could reap from the grandeur of scenic decorations. When Mr. Macready is applauded for the manner in which he *got up* Shakspeare, it almost seems as if the poet were forgotten in the enthusiasm with which honours are showered upon the riches of the wardrobe, and the beauty of the attitudinal pictures which the accurate genius of the manager conjured upon the stage; but surely we may be allowed to discriminate between the statue and its draperies without derogating a particle from the applause which is due to him who has given us both.

That these revivals have contributed largely to refine the tone of our audiences, and to renew the zest for legitimate representations, is the abiding glory of Mr. Macready's arduous and hazardous experiment. Every individual who had a true faith in the power and influence of our elder drama anticipated this result. It never could have been doubted that Shakspeare in his original shape would have been welcome to all play-goers, and that the success of such a trial would have been in proportion to the pains bestowed upon the cast and study of the plays. In these reproductions, therefore, that which was chiefly sought by those who entered earnestly into their spirit, was to see the passionate pith of their marvellous scenes drawn out; the entire force of their deep truth exhibited in eloquent action; and their just proportions, their profound traits of life, and the consecutive progress of their manifold combinations restored in all their vital lineaments to the stage. To execute this comprehensive project in a becoming and appropriate spirit, it was essential to render the representation as perfect in all its parts as existing means would admit; and, keeping in view the imperative necessity of subduing all other effects so that they should be subsidiary to the development of the drama itself, to shed over it such graces of embellishment as would throw into the clearest and most striking relief the fine humanities with which the creations of Shakspeare abound. Now, without descending into details, there can be no great difference of opinion about this fact, that while Mr. Macready's restorations were distinguished by a most careful observance of the text, and a minute attention to all the points essential to the due release of the dialogue from the captivity in which it had long been held, they were, at the same time, so magnificent, regarded as mere spectacles, that the admiration of the audience was for the most part diverted from the intense moral interest of the scene to the gorgeous machinery through which it was articulated. The eyes of the multitude are more easily fascinated than their feelings; and when the senses are thus pre-occupied and engrossed, it is impracticable to turn one's thoughts and imagination steadily towards the sublimer action which is humbly wending its course through a labyrinth of stars and beams. The effect of this artificial world of splendours is to obscure and overcome nature. It is wholly irreconcileable with the aim of tragedy to load it with scenery, which, distracting and confusing the spectator, and carrying him away into a mist of disturbing suggestions, can produce no other result than that of leaving behind a dreamy and indistinct impression of the mighty passions and emotions which labour darkly under the burst of dazzling lights and colours. It is true that the accessories were in pure taste — that there were no gaudy devices or fantastic illuminations; but it is not the less true that the soul of these plays was quite as much bewildered by the scenery and the costume as if they had both been of the most meretricious description. It is nothing to the

purpose that the embellishments of a play are correct, if they be so numerous and so captivating as to become an object of greater attraction than the play itself: and this was precisely the case in Mr. Macready's revivals. Night after night people went to see the triumphal procession in "Coriolanus," and the pictorial illustrations of "Henry V.;" and if the real opinions of the audiences could be ascertained, they would resolve themselves into this, that Shakspeare had never before been — not so well acted, but so prodigally and sumptuously exhibited. To the honour of having brought out Shakspeare more grandly than ever he was brought out before, Mr. Macready is fully entitled; but we must at the same time hazard a doubt whether this is the way in which Shakspeare is most likely to be truly estimated, — whether this is the way which is most likely to bring the public into a familiar contemplation of those subtle channels of observation in which the mind of the poet worked, — and whether, in the end, the cultivation of such artistical expedients would not be likely to produce new and anomalous shapes of dramatic poetry, in which Character and Passion would be seen only in glimpses moving through a net-work of stage effects.

It is, perhaps, on the whole, therefore, not so much a matter to be deplored as it may appear on the surface, that the progress of this expensive pageantry should suffer a slight interruption, and that time should be given for the public to pause over its lingering influence before it had taken still more costly forms. It must be evident that to work out these extensive designs long preparation and considerable means would be requisite; and that this very process of occupation and expenditure, and the kind of demand it would produce on the part of the public, would gradually extinguish contemporary dramatic literature. We are afraid it must be allowed that this has been already felt; and that the management of Mr. Macready, whatever may be claimed for it in other respects, cannot be said to have held out much encouragement to the cultivation of dramatic poetry. That the power exists to produce new works of the highest class, will scarcely be questioned by those readers who are acquainted with the fine productions that have of late years been consigned to oblivion in the warehouses of the publishers; but how that power has been overlooked, or suffered to employ itself in more grateful labours in other departments, is sufficiently proved by the paucity of novelties in those theatres where alone such pieces could be adequately presented. The legitimate province of the stage is to afford a medium for dramatic genius, which, denied that outlet, must decline and perish. Were the stage to be dedicated exclusively to the apotheoses of its past glories, there would be an end for ever to the further development of a national drama, which would thus be petrified in the very temple erected for its encouragement.

A great field — wider than that occupied by Mr. Macready, and still more conducive to the progressive and extending influence of the stage — lies before the new lessees of the Winter Houses. This field has never, in our time, been either liberally or judiciously cultivated. A few authors, forced into spurious popularity by a system of persevering favouritism, have generally blocked up the avenues to the green room; so that the first difficulty which a fresh candidate for the perilous honour of a hearing had to encounter — the difficulty of getting his play read — was, in nine cases out of ten, insurmountable. The stock playwrights held possession of the management by the exercise of a certain diplomatic tact in the adaptation of their productions to the actors and the scene-shifters; and the pieces which were thus manufactured with an eye to the immediate capabilities of the house, however contemptible in design, and flimsy in treatment, were in-

variably preferred to all other dramas, however profound and elevated, in which these local and mechanical points were not duly consulted. It is high time that the doors of the national theatres should be thrown open, and that the patents which ensure to them a monopoly in the performance of the legitimate drama should cease to represent a monopoly of illegitimate dramatists. If the new lessees resolve to act upon this principle — to produce new works of merit, from whatever quarter they may be derived — and to be guided in the selection by intrinsic excellence alone, they may calculate upon results alike gratifying to the public and beneficial to themselves. Nor would this course be incompatible with a constant effort to keep the old drama fresh in the affections of the people. Under the brilliant management of Garrick there was a more rapid succession of novelties than the theatre has at any time since produced; and yet there is no period in the records of the stage which presents such a triumphant series of revivals. Garrick not only inspired a taste for the noblest forms of dramatic poetry, but imparted a vigorous impulse to its advance.

It is understood that Covent Garden is to be chiefly devoted to comedy. We should almost despair of such a speculation in any other hands than those of Madame Vestris. The age of comedy seems to have gone out with the Lewises, the Emerys, the Jordans, the Ellistons, and the Faucets; and rich as we are in materials, the want of actors to give them effect in representation has long rendered the public indifferent to their production. But the taste for high comedy is dormant, not extinct; and great expectations are excited as to what Madame Vestris may be able to accomplish in Covent Garden from what she has already done with restricted means in the Olympic. Her exquisite skill in the art of dressing the stage, so essential to the life and illusions of comedy — her rigid attention to all the minor details of the scene — the ability with which she brings the habits and conventions of society to bear on a multitude of slight points, each and all contributing to an *ensemble* perfect of its kind, justify the most flattering anticipations that may be formed of her project. The spirit with which she crowded upon her miniature stage in Wych Street a group of distinguished artists — the penetration she exhibited in bringing to light talent that had not previously achieved distinction — and the judgment with which she trained and distributed her corps, afford guarantees that if she fail it will not be from a deficiency of those qualities which are indispensable to success. In Mr. Charles Mathews a line of characters that has for many years been a desideratum on the stage is not unlikely to find a competent representative. He is the only actor of the day who can aspire to fill those mercurial and graceful parts which so frequently occur in the lively comedies of Hoadley, Farquhar, and the elder Colman. With an inexhaustible fund of animal spirits, he moves in an atmosphere of perpetual vivacity, and contrives, apparently without effort or fatigue, to communicate to his audience the same tone of exhilaration which seems to animate himself.

The library of modern comedy is abundantly fruitful of resources for the stage; and the researches of the manager might be extended with advantage even to a more remote age. We have some curiosity to ascertain how one of Etherege's plays would act in our time — those versatile and witty productions which so faithfully mirrored the frivolous refinements of the society they depicted as to acquire the familiar appellation of "conversation pieces." In these productions the sparkling fancy of the writer — exhibited in the brilliant repartee of the dialogue, and the incessant flutter of the characters — is paramount over all other qualities. They would make a large demand on the sprightliness of the performers; they would require to be represented

in a high flow of enjoyment; they should be accurately toned and costumed; and all the accessories ought to be chosen and adapted with the most critical precision. But thus filled, embodied, and illustrated, we suspect they would be found to operate like champagne on the audience. Etherege may be said to have been the inventor of what is called genteel comedy. He evidently had no notion of the vast capabilities of the region he had thus, as it were, accidentally discovered, but which he wanted perseverance to explore. He had no philosophical or permanent purpose in view, and merely amused himself with these light and transient pictures of manners and eccentricities: he was not a dramatist, but one who delighted in dramatizing. There is hardly any attempt in his plays to trace a character through a history of emotions;—you get a flickering gleam of nature here and there, apart from the artifices of fashion, but it is no sooner seen than it is lost in the flurry and trifling of the crowd of figures that come in at the very height of a most enviable frivolity. All Etherege aimed at was to seize externals, and to exhibit them vividly in brisk and reckless masquerade. The satire is never deep, but always true to its mark — sharp, pungent, and glittering. He shot the follies of the court with needles which were sure to strike and pierce, but wanted weight to penetrate. They indicated, however, the prevailing foibles of that superficial age, and the spectators supplied the rest. Some of his pieces have been denounced for their immorality, but the criticism was labour in vain. It would have been more useful and sagacious to point out their incongruities and absurdities. Whenever he ventured upon a plot involving much action, he became entangled in the most extravagant and unlikely predicaments. It is only where the plot was a mere pretext for dialogue — a thin filament barely strong enough to sustain an embroidery of wit — that Etherege reached the height of his genius. Whether one of these aërial plays — these evanescent fire-fly entertainments — would become attractive in this mechanical era, is perhaps questionable; but it would cost nothing, and would be worth the trial. A genuine comedy of the days of Charles II. would at all events be a novelty such as none of our play-goers have ever witnessed; and if it were acted with delicacy, — if all its shifting varieties were distinctly tinted, and the whole were exhibited in a congenial atmosphere of perfume, we do not think its reception would be very doubtful.

Then there are Steele's comedies — Steele, who was so severe upon the vices of Etherege that we have a right to look to him for something of a better and sounder order. We confess to some misgivings, notwithstanding, about Steele. His wit is not to be gainsayed, nor his knowledge of human nature, nor his mastery of the dramatic art. But Steele had too much of the constitution of a critic not to betray it even where it was most out of place. The tendency to raise questions for discussion, to detect frailties and errors, and dislodge prejudices, is always breaking out in his writings, — it lurks even in the pleasantest and sunniest places; and hence his comedies, instead of giving us life exactly as it is, have a sort of admonitory tone in them, as if they were written to delineate life as it ought to be. The consequence of all this is a certain uneasiness that never allows us to fall into a state of complete enjoyment. When he is carrying us into scenes enlivened by the most agreeable excitements, he is constantly stopping us on the way to remind us of the shortness of life, or the vanities of fashion; and thus we are never permitted to indulge fairly in the banquet of mirth he spreads so provokingly before us.

Cibber has left us some pieces that might also be advantageously revived, lopped and adroitly adapted to our advanced age; and, if the strength of

the company at Covent Garden admitted such a bold attempt, a few of Shirley's plays — which stand in the hues and lineaments of humanity, between the muses of tragedy and comedy — would be highly relished by the public. Shirley was the last of the great race that cast such a lustre upon the reigns of Elizabeth and James; and justice has never been done to his merits in the theatre. His works sunk into oblivion immediately after his death, and continued a dead letter, even to the reading world, until they were restored to print by the joint labours of Gifford and Dyce; yet there are few amongst the elder dramatists whose plays would be more likely to succeed on the stage. They possess the most felicitous elements of action, which constitute, perhaps, their highest merits. The plots — which in almost every instance were invented by the poet, and therefore yielded the more flexibly to his purpose — are remarkable for the ingenuity and fullness of the incidents; and although there is not much profundity exhibited in the development of individual character, the general impression is vivid and natural. Taking into consideration the age in which Shirley wrote, his productions are singularly free from licentiousness in design or expression. He is rarely prurient, but sometimes coarse and sensuous. But as there is very little in the texture of his plays which would require excision, the excesses into which he occasionally runs might easily be got rid of without injuring the interest of the subject.

If an effort were made to rescue Shadwell from the obscurity to which the withering and ungenerous satire of Dryden condemned him, and out of which his name has never been lifted, it would be worthy of the functions assigned to a great national theatre. Some of Shadwell's pieces are exceedingly meritorious — as gay as the songs of larks, and not destitute of truth and wisdom. He had the happy art of making his pictures popularly effective, and at the same time infusing into them the lasting colours of nature, that will be intelligible long after the fleeting habits they pourtray shall have become a dim tradition.

In the province of Minor Comedy, including the productions of Foote and Garrick, our treasures are richer than the whole dramatic literature of Europe can boast. The petite comedies of France are admirable of their kind, and much more numerous than ours; but their quality is more fragile, and their interest of a more temporary nature. They occupy the moment like a burst of rockets, and are forgotten; while our farces contain touches of life, and little pictures of humour, that might be transplanted with propriety into the most elevated walks of comedy. We allude — not to the farces that are night after night presented to our audiences, but to the pieces that are buried in the volumes of the theatrical library. Many of these exquisite bits of enamel have been laid aside from the sheer inability of the actors to instil into them the genuine gusto they demand. Others have been shelved out of a mistaken notion that the portraits they contain are antiquated; and thus the truthfulness that is in them, and their perennial wit, have been superannuated by a monstrous compound verdict of incapacity and ignorance. We hope to see some at least of these pieces revived by Madame Vestris. If she have the inclination, we believe she will have the power, to confer by such judicious restorations a new pleasure upon the town. In these suggestions we have simply desired to point out a few veins of the hidden ore; but those whose province it is to search farther cannot be at a loss in tracing out still more precious deposits, if they only take the right direction.

The programme of Drury Lane has not yet transpired; nor has it, we believe, been ascertained into what channels the enterprise of the lessee is

likely to be drawn. Every thing of course will depend on the company he is able to collect; and, from what we have heard, the prestige is favourable. At all events the stage will no longer be turned into a menagerie; and we may calculate on escaping, for one season at least, from unmeaning tinsel, riotous masks, and buffoonery. Mr. Hammond is well qualified for the undertaking by his experience and his talents; and the example which has been already given by Mr. Macready — an example which, in its final results, has abundantly vindicated the public from the suspicion of indifference to the legitimate drama — holds out a cheering encouragement for the maintenance of the dignity of art. Our audiences are now prepared to appreciate and reward excellence; and we are satisfied that managers in future will find it the wisest policy, as it is assuredly the most creditable, to abandon altogether the mummeries and expedients that have so long disgraced the boards, and dedicate their resources exclusively to the production of none but works of the first order of merit. The intelligence of the multitude is educated up to this point, and cannot return to the tricks of the showman.

REVIEW OF NEW BOOKS.

In a recent paper on the writings of George Sand, we touched generally on the grand attributes of her genius, and endeavoured to show that criticism in this country had hitherto either wholly neglected her, or, which is still worse, treated her with the most rank injustice. That it is not possible to pronounce finally upon the works of such a master mind, without entering elaborately into their details, and exhibiting their ultimate tendency through a philosophical and comprehensive estimate of their general spirit, is, perhaps, one of the most prominent reasons why George Sand has been tried and condemned in this country by a false test that not only fell short of her majestic powers, but was in all other respects wholly inapplicable to them. We do not measure the winds as we measure the waters; and no man can sound the depths of metaphysics by the illumination of Della Cruscan sensibilities: we must rise to the height of the subject if we would survey it on all sides, for we may be assured the subject will not sink down to our level. The fault is not in George Sand, if she be not truly understood; but in the want of sympathy and capacity in those who understand her falsely. Not to understand her at all is certainly less censurable than to understand her wrongly. Her publications are not all adapted to this country, or perhaps to this age. They are addressed, not to the conventions of a particular society and a particular time, but to mankind and posterity. Her triumphs will be in the future, when a long interval of experience shall have developed the wisdom of her writings, and long contemplation shall have rendered men familiar with their shape and expression. Then whatever is doubtful and vague will be readily separated from the clear and true, and the sound ore will be treasured at its real value.

Her last work is in the dramatic form; and as it is the first time she has thrown her invention into that track, we will give a few specimens of it, closely and plainly translated. It is entitled, "Les Sept Cordes de la Lyre[1],"

[1] *Les Sept Cordes de la Lyre.* Par George Sand. Paris. 1839.

and has been only recently published in Paris. The subject of this drama is a profound and beautiful allegory of the soul, in which the author exhibits the gradation of our nature from its lowest appetites to its loftiest intellectual development, and conducts us gradually through the agency of a most spiritualised succession of scenes to the final reunion of the soul with the divine nature, from which it was divorced on earth. The framework of the plot is simple and effective. Helene, an orphan of great beauty and accomplishments, is the ward of Albertus, a philosopher. She is possessed of a certain wonderful lyre, of antique workmanship, and this lyre is inhabited by her father's spirit. Mephistopheles tries to obtain possession of it, but it cannot be taken except by the purest hands; and although he brings a poet, a maestro, and a critic to seize it, they are all foiled, and each, after his own fashion, runs mad. This part of the allegory is exceedingly curious, and full of a sort of wit in which the writer has rarely before indulged. Such is the beauty of Helene, that all Albertus's pupils fall in love with her, and Albertus himself is unconsciously in love with her too. Mephistopheles takes advantage of all these circumstances, and weaves his meshes round the philosopher and his ward. The following passage tells the story of the lyre, and exquisitely developes the character of Albertus.

ALBERTUS *and* WILHELM.

Albertus. — Wilhelm! hold, look at this lyre. Do you know what it is?

Wilhelm. — It is the famous lyre of ivory invented and constructed by the celebrated manufacturer Adelsfreit, the worthy ancestor of Helene Meinbaker. He finished it, they say, on the very day of his death, about one hundred years ago; and the good Meinbaker preserved it as a relic, without permitting his own daughter even to breathe upon it. It is a precious instrument, master, whose equal is nowhere to be met with. The ornaments are in such exquisite taste, and the figures of ivory which surround it are of such admirable workmanship, that amateurs have offered immense sums for it. But though a ruined man, Meinbaker would rather have died of hunger than have parted with this incomparable instrument.

Albertus. — Nevertheless, this incomparable instrument is mute. It is a work of patience and an object of art, which serves no purpose, and from which it is impossible now to draw any sound. Its strings are relaxed or rusted, and the most skilful artist fails to make them speak.

Wilhelm. — And what would you infer, my master?

Albertus. — This, that the soul is a lyre whose every chord should vibrate, sometimes together, sometimes one by one, according to the rules of harmony and melody; but that, if we leave to rust or to neglect these chords at once so delicate yet powerful, in vain we would preserve with care the exterior beauty of the instrument; in vain the gold and ivory of the lyre remain pure and brilliant; — the voice of heaven inhabits it no longer, and this body without a soul is but useless furniture.

Wilhelm. — This might apply to you as well as to me, dear master. You have played too much upon the golden strings of the lyre, and whilst you have confined yourself with your favourite theme, the strings of brass are broken. For me, it will be the reverse. I break most willingly the celestial strings which you have touched, to revel, with enthusiastic impetuosity, amongst the passionate chords which you too much despise.

Albertus. — And we are both unskilful, blind, incompetent. We should know how to play with both hands, and on all modes.

Wilhelm (*without listening*). — Master Albertus, you have such influence over the mind of Helene! Will you take upon yourself the renewal of my suit, that she may accept me for her husband?

Albertus. — My child, I will employ my whole heart and power for you, for I am persuaded she could not make a better choice.

Wilhelm. — Bless you! and may Heaven crown your efforts! Good night, my good master. Forgive my being so poor a philosopher. Forget the ungrateful disciple who abandons you; but remember the devoted friend who remains for ever faithful to you.

Albertus (*alone*). — Oh, sublime philosophy! 'tis thus that they desert thine altars! With what readiness they abandon thee for the first passion which seizes on the senses! Thy empire is then null, and thy ascendency a mockery. Alas! what is then the weakness of the chains with which thou bindest us, when, after years of immolation, after the half of a life consecrated to heroic perseverance, we yet feel with so much bitterness the horrors of solitude, and the anguish of ennui! . . . . . .

Sovereign Spirit! Source of all light and all perfection! Thou whom I have wished to know — to feel, and see more nearly than other men have done; thou who knowest that I have immolated all, and myself above the rest, to purify myself and approach more nearly to thee! — since thou alone knowest the greatness of my sacrifices, and the immensity of my sufferings, why is it that thou aidest me not more efficaciously in my hours of misery? Why is it that, a prey to a slow agony, I consume within, like a lamp whose light throws out a brighter ray at the moment when the oil is just exhausted? Why is it that, instead of the sage, the stoic, whose serenity all admire and envy, I am really the most uncertain, the most wasted, the most miserable of men? (*He approaches the balcony.*)

Eternal Principle, Soul of the universe! oh, Great Spirit! oh, God! thou who shinest in this firmament sublime, and who livest in the infinite of those suns and sparkling worlds! — thou knowest that it was not the love of vainglory, nor the pride of futile knowledge, which has led me on in this path of renunciation of all worldly things. Thou knowest that if I desired to raise myself above other men by virtue, it was not to esteem myself above them, but to approach nearer to thee, Source of all light and all perfection. I have preferred the delights of the soul to the enjoyments of perishable matter; and thou knowest, oh Thou who readest all hearts, how sincere and pure has been my own! Why then the mortal faintness that now seizes me? Why the cruel doubts that end me? Is the road to knowledge, then, so rough that the farther we advance, the more we meet with obstacles and perils? Why, when I have passed with honour the half of my career, and victoriously struggled against the most stormy years of youth, — why, in my riper age, am I exposed to temptations that are increasingly terrible? Shall I regret now, when too late, that which I despised when I might have possessed it? Is the heart of man so constituted that pride alone can sustain it in its power? They say that philosophers are proud: if it should be true; if I have regarded as an acceptable offering to the Divinity privations which he rejects, or which he views with pity as proofs of our weakness, and of our blindness; if I have lived without profit and without merit; if I have suffered in vain! — my God! such lengthened sufferings — struggles so poignant — nights so desolate — days so long and so heavy! No, it is impossible. God would not be good, God would not be just, did He take no account of so much labour. If I have been in error, — if I have made a bad use of my power, the fault lies in the imperfection of my nature, in the weakness of my intelligence: and the excellence of my intentions should absolve me. . . . Absolve me! Am I then a devotee, a mystic, to believe that the Divinity welcomes to his bosom alone the ignorant and poor of spirit? Am I a monk, to place my faith in a blind master, the friend of idleness and degradation? No! the Divinity I serve is that of Pythagoras and Plato, as well as Jesus! It sufficeth not to be humble and charitable to render Him propitious; it is necessary to be also great, to cultivate the high faculties of intelligence as well as the mild instincts of the heart, in order to commune with that Infinite Power which is perfection itself—which preserves by its goodness, but which reigns by its justice. . . . . It is by thy example, oh, boundless Perfection! that man should make himself just; and there is no justice without knowledge. If thou hast not this knowledge, oh, my miserable soul! — if thy toils and thy efforts have only led thee on in error; if thou art not in the path which should serve as a highway for other souls, — thou art accursed, and thou hast only to seek refuge in the mercy of God, which pardons criminals, and raises the abject. Abject! criminal! — I, whose virtue affrighted gentle hearts, and made the envious despair! . . . Proud! proud! It seems to me that from the height of the stars a piercing voice exclaims, "Thou art but a proud one!"

The first appearance of Mephistopheles immediately after Albertus terminates his soliloquy is striking, and assists in discovering still farther the plan of the work.

MEPHISTOPHELES, *springing from the Lamp as it is extinguished* — ALBERTUS *asleep.*

Mephistopheles. — What a melancholy and insipid employment is that of watching a philosopher! Truly I am become as dim and as obscure as the flame of that lamp through which I amused myself in shadowing across his paper the outline of Helene and her lovers. These logicians are suspicious animals. One works like a spider about their cold brains to entangle them in the net-work of dialectics; but they turn restive, and take the devil in his own snares. They employ their cavilling against the master who taught it to them. This one employs demonstrative reason to attain faith, and that which has lost others saves him from my talons. Mystical pedant! thou givest me more trouble than Master Faust, thy grandfather. Thou must have in thy veins some drops of the blood of the tender Margaret, for thou mixest the desire of knowledge with a heart. But truly we know not what humanity may come to! Now we have philosophers who want at the same time to know and to feel. If we allow man to do this, he will quickly escape us. Hollo! my masters, believe and be absurd, we consent to that; but do not strive to believe and to be wise. That will never be as long as the devil shall hold the lease of this pitiful farm which you are pleased to call your world.

We must proceed differently with these dear philosophers than with Dr. Faust. He

wanted neither violent instincts nor pompous egotism; and at the moment of being enfranchised by death, the fool, losing patience, and regretting that he had not used his life to better purpose, I was forced to make him young again, and launch him in the storm. His cold intelligence would have led him straight to the truth had I not healed his passions in time, and lighted within him a flame which devoured Madam Conscience in a twinkling. But with this one it is to be feared that his passions will turn to the profit of faith. He has more conscience than the other; pride has so little hold upon him — vanity none. He has so kept down lust, that he is capable of conceiving the angelic voluptuousness of saving himself with his Margaret, instead of taking her to perdition with him. It is then with thine heart that I have business, my dear philosopher: when I shall have destroyed that, thy brain will work my pleasure. Let us see, and torture a little this heart, which chooses to be sympathetic; and instead of making it young again, let us bury it under the icicles of premature old age. We must begin by degrading Helene, or brutifying her, by marrying her to a blockhead; but the idiots will still find means of poetising her domestic virtues. The best would be to debase her by consigning her to those young apprentice philosophers who infest the house from morning till night. In seeing her polluted, this fine thinker will take a horror to youth, beauty, ignorance. All that touches upon the romantic will to him seem criminal; he will become a thorough pedant, and there I shall have him .... Let us go and find the girl. I have some capital evil spirits whom I shall promenade over her forehead whilst she sleeps .... But there is one obstacle between her and me which I must destroy. I reckoned upon her, to corrupt the philosopher by enthusiasm. If I proceed by contraries, I ought to annihilate the talisman which would kindle the flames of the heart. Hollo! spirits and fairies! hither, my brave crooked sprites! Take the lyre — break it in pieces with your talons — reduce it to cinders with your breath. Quick! quick!

Chorus of Infernal Spirits. — Quick! quick! Let us break the lyre! A spirit rebellious to the decrees of hell inhabits its mysterious bosom. A spell retains him captive. Let us break his prison, that he may return to his master, and converse no more with men. Quick! quick! Let us break the lyre!

Spirit, who wast formerly our brother, and who now flatterest thyself in the hope of being reinstated by expiation, and replaced amongst the ranks of the celestial powers, thou must leave thy present abode. May thy master take thee in hand, and chastise thee! Thou shalt not purge thy fault in working for the salvation of mankind. Quick! quick! Let us break the lyre!

The Voice of the Lyre. — Back, cries of hell! You have no power against me. A hand that is pure can alone deliver me. Accursed! It is in vain that thou excitest thy legions against me with thy hoarse voice. One single note of heaven overpowers all the roarings of hell. Back, and silence!

Mephistopheles. — What do I see? My legions in terror take to flight; and this power enchained is stronger than I in my liberty!

Chorus of Celestial Spirits. — God permits thee only to excite to evil: thou canst accomplish nought thyself. Thou canst not remove a straw in the universe; thou sheddest thy poison in human hearts, but art not able to destroy an insect. Thy seed is sterile if man's malice brings it not to life; and man has power to nourish either an angel or a demon within his bosom. [ALBERTUS *awakes.*

From amidst a great variety of exquisite passages, take the following fragment of a conversation between Albertus and one of his pupils. In order to estimate truly the grandeur of this production it ought to be read thoroughly; all that we can do is to show it in gleams, such as the following: —

Hanz.—The beautiful is infinite; it is the ladder of faith which reaches to the clouds of heaven; each step that you ascend reveals a splendour still more glorious at the summit. Those who are near the foot have only a confused idea of that which is clearly distinguished by those above them; but what these see the others understand not, and refuse to believe. It is true, that there are various modes of climbing this sacred stair; some grapple slowly and painfully with hands and feet, — others have wings, and lightly mount aloft.

Albertus. — You are always metaphorical. You would say that you artists are the doves, and we logicians beasts of burden. Well, if human nature is composed of vulgar beings, and if poets, by a divine intuition, can penetrate the councils of God, let them reveal them unto us; but first of all let them make themselves intelligible.

Hanz.—They tell it to you by all the tongues of art and poetry; but the more they tell, the less you understand, because you obstinately close your ears. They have heard, and they remember still, the songs of angels, which they would willingly translate for you; but their expression still retains something exalted, which to you appears mysterious, because your organisation refuses to go beyond the bounds of demonstrative reason. Well, then, modify this imperfect organisation by serious attention to the works of art; by the study of

the arts; and, above all, by a lofty and entire adherence to the development and to the triumphs of the arts and of poetry. Philosophy will gain by it; for, I repeat, she is as much the daughter as the mother of poetry; and if you had never seen the masterpieces of ancient statuary, you would never so well have understood Plato.

Albertus. — It is because these are in truth chef-d'œuvres. No one contests it: the beautiful is then appreciable by all.

Hanz. — You have seen them without comprehending them; but as their perfection has been consecrated by the admiration of past ages, you have not set yourself upon your guard against the natural instinct which would have revealed to you also this perfection. Nevertheless, there exists in ages the least fruitful of genius men who are worthy of succeeding Phidias: the world disowned and stifled them. It was because men are content to glance upon the works of Phidias without believing it is needful to study them. Surely, master, the distributors of rewards and distinctions, created by princes, are by nature and by education enemies of the beautiful. The duty of the logician should be to search after the beautiful, to discover it, to proclaim it, and to crown it. In passing it aside with indifference, you do as great an injury to man as if you left to perish a monument of science. All men have a thirst for the beautiful; their souls must either drink of this source of life or perish. The organisation of men is different; some aspire to the ideal by the mind, others by the heart, others by the senses. If you would wish the human organisation to be perfect, and that arriving at a precise equilibrium it should conceive the ideal at once by the mind, the heart, and the senses, you must extinguish none of those faculties; for do not hope to bring all men to the truth by the same means. Where ideal beauty can only be manifested through the senses, you may give, as a preservative against licentiousness, the sacred nudity of the Venus de Milo. See the error of you moralists, who turn away with fear from this material beauty as from an immodest object likely to trouble the senses. If you could enter into the spirit of the art, you would know that the beautiful is chaste, because it is divine. The imagination wanders from the earth, and ascends to heaven in contemplating the production of a divine inspiration. This production is the ideal.

In another dialogue the enthusiasm of Hanz breaks out again, and is checked by the sober wisdom of philosophy.

Hanz. — Well, master, I would almost say there is a madness of which it were a misfortune to be cured. The exaltation of a poetic brain is, perhaps, to be preferred to the calm of frigid judgment. Do you not think that Helene was happy when her eyes, animated by fever, seemed to contemplate the wonders of the invisible world? Oh, yes! she was even more lovely with her look of inspiration, and the strange smile that played around her half-opened mouth, than she is now with her downcast eye and chastened melancholy! She has become more sad, or, at least, more serious, as she has felt her heart beat more slowly.

The body may make an effort to resume its material life, but the spirit loves not to descend from the throne it has built in the skies to lose itself here below midst dark and painful struggles. Master, what do you think? Do you not believe that Helene, in recovering her physical health feels her soul chilled, and sinking into pitiable languor? Do you think that she regrets not her ecstasies, her dreams, her dances with Titania at the rising of the moon, and her concerts with the king of the gnomes at the setting of the stars? Who amongst us would not give up half of his rude vulgar health in exchange for the gilded visions of poetry?

Albertus. — Hanz, you do not speak my sentiments. Are you a poet, or a follower of wisdom? If you are a poet, make verses, and quit my school. If you are my disciple, do not mislead the minds of your brethren by your romantic paradoxes. All these inspirations of fever, all these delirious metaphors, constitute a state of purely physical malady, during which the brain of man can produce nothing true, nothing useful, and, consequently, nothing beautiful. I comprehend and I respect poetry; but I admit it only as a perspicuous and brilliant form designed to soften the austere truths of science, of morals, of faith,—in a word, of philosophy. Every artist who proposes not to himself some noble end, some social aim, fails in his work. What signifies to me that he should pass his life in contemplating the wing of a butterfly or the petal of a rose? I would prefer the smallest discovery useful to mankind, or even the most simple aspiration towards the happiness of humanity. According to your theory, the insane are inspired Sibyls, ready to reveal their celestial mysteries. It is possible that, under the influence of a strange exaltation, they may have a more extended sense to feel the exterior beauty of things; but, if they cannot find a language sufficiently intelligible to associate us in their enthusiasm, this concentration of mind in one single thought can only be a state dangerous to themselves, and useless to others.

In the following passages, Helene is under the influence of the mighty spirit which opens to her the secrets of the world, and shows to her pure

and exalted nature the grovelling character of earthly ambition, and its train of miseries and wrongs. As we cannot give much space to our extracts, we have adopted the alternative of taking only fragments of the scene.

Spirit of the Lyre. — Is not this a magical picture? Behold the greatness and power of man! Admire his riches, so dearly bought, and the wonders of his indefatigable industry! Behold those majestic temples erecting their proud heads like giants amidst the innumerable masses of elegant or modest dwellings crouching at their feet! . . . . . Listen and rejoice; for this earth is magnificent, and this race ingenious and powerful.

* * * * * * * *

Helene (playing on the Lyre). — Oh, Spirit! where hast thou conducted me? Why hast thou enchained me to this place, to see and hear that which fills my eyes with tears and my heart with bitterness? I see before me only an immeasurable abyss of despair, and I only hear the groans of a misery without remedy and without end. The world is a sea of blood, an ocean of tears!

* * * * * * * *

I see palaces, armies, fêtes, a lavish expenditure, a noisy glee, — in effect I see and hear gold gushing forth upon the tables and in the coffers. 'Tis the tears of the poor, the sweat of the labourer, the blood of the soldier, which flows o'er those tables, and which they inclose in those coffers! Each of those pieces of money should be stamped with the effigy of a man of the people; for there is not one of those pieces of metal which has not cost the health, the honour, or the life of a man of the people!

* * * * * * * *

I see majestic assemblies, and I hear what they discuss. Some talk of relieving the misery of the people, and all reply that the people are too rich, too happy, too powerful; and I hear the immense mass of hypocrites who slowly rise, and say, with serious air, "Let them perish!" And I see the powerful of the earth, who perfume their hands, and say, with a smile upon their lips, "Let them perish!"

* * * * * * * *

Spirit of the Lyre. — Daughter of man, why dost thou thus despair? Hast thou forgotten Providence? Does he not permit these things to bring man, by hard experience and slow expiation, to the knowledge of truth, and to the love of justice? Behold, there are already pious men, and hearts really pure. The crime of the one, does it not bring out the virtue of the others? The iniquity of tyrants, does it not develope the patience or the boldness of the oppressed? See! what sublime devotion, what noble efforts, what apostolic resignation! See the hands firm and patient which arm themselves for deliverance; whilst, to encourage them, the captives stifle their groans behind the grating of their prisons! See! those friends embrace! Dost thou understand the last grasp of him who accompanies the other to the scaffold? dost thou understand the parting look of him who, smiling, lays his head beneath the axe?

Helene. — I see virgins whom they profane, infants whom they strangle! I see old men whom they suspend on the gibbet! I see a woman whom courtiers drag to the bed of a prince, and who expires with shame and grief within his arms! I see the husband of this woman, who receives gold and honours to keep silence, and who kisses the hand of the prince! I see a young girl whipped by soldiers on the public place for having sung "No, our country is not lost!" and who lost her reason! I see children separated from their mothers, isolated from their families, and whom they wish to teach to curse the name of their father, and to renounce the heroism of their blood! I see heroes proscribed — patriots with a price upon their heads! I see young martyrs, whom they drag from their prisons because they expire too slowly, and whom they banish to the ices of the pole, lest their last sigh should pierce their dungeon walls, and reach the ears of their brethren! I see peasants whose flesh is torn with iron hooks, because they neglected to trim their beard, and to wear the livery of the conqueror! I see a nation whom they wish to raze from the face of the globe, as though she had never existed. They take away her chiefs, her patriots, her priests, her institutions, her wealth, her costume, and even her name, that she may perish; and the whole world looks on, and says "Let her perish!"

Even from the slightest fragments of the allegory something thoughtful and of a deep and wide signification is extracted. The allegory of the artist who made the lyre, and whose soul dwelt in it, is thus drawn out: —

Mephistopheles. — Have you never heard from Master Meinbaker, the father of your Helene, and the direct descendant of the famous Adelsfreit, that this magician, the day of his death, having put the last finish to the lyre, took so violent a love for his *chef-d'œuvre*, that he prayed to Mons. the Most High, the pope of the stars.

Albertus. — What follies are you recounting to me? Meinbaker had his head full of

fairy tales. He maintained that Adelsfreit prayed the Almighty to put his soul into his lyre; and God, to punish him for having thus trifled with his celestial inheritance, condemned him to live enclosed within the instrument, till some hand pure from all sin should deliver him.

Mephistopheles. — And the same instant that he pronounced this rash desire he suddenly expired.

Albertus. — His mind had been astray some time, and he destroyed himself.

Mephistopheles. — All this contains a charming allegory!

Albertus. — What?

Mephistopheles. — That the scholar, like the artist, belongs to posterity. The moment that the love of art, or of science, becomes an egotistical enjoyment, the man who sacrifices the benefit of others to his own pleasure is punished even in his own works. They remain hidden, forgotten, useless for ages; his glory is lost in the clouds with which superstition environs it; and having disdained to reveal himself to his contemporaries, he is doomed to be brought from the dust by some ordinary mind, who profits by his discoveries, and usurps his renown.

From these passages the reader may glean a slight notion of the character of the work, which is full of brilliant and wise things; and which, in the shape of prose, is a most charming specimen of dramatic poetry. In our rapid outlines of current literature, we must be content with brief sketches, even of such productions as "Les Sept Cordes de la Lyre;" but the extracts we have given will serve better than even a longer analysis to show the tone and character of the work.

The second part of the "Mabinogion[2]," translated by Lady Charlotte Guest, sustains, even with additional claims upon all true lovers of antique romance, the interest of the former part. In our notice of that publication we entered at some length upon the character of these literary remains of a remote age and peculiar people, and the affinities discoverable in them to the poetical relics of other countries: we also explained the nature of Lady Charlotte Guest's labours, and the munificence with which she has rescued these curious fragments from obscurity. As mere specimens of art, these books are amongst the most beautiful and costly productions of the press. The typography is exquisitely clear, and worked with exceeding care; and the facsimiles of old MSS. in various libraries are executed on tinted paper, with remarkable accuracy and skill. That such volumes should proceed from the principality of Wales, where printing is not understood to be cultivated to so great a height of refinement, is highly creditable to Mr. Rees, to whose superintendence we are indebted for the elegance with which they are brought out. The part before us contains the conclusion of the legend of Le Chevalier au Lion, followed by a body of notes, in which the author abundantly illustrates all the historical and picturesque points of the poem by explanations and references that greatly enhance its interest. The story of Peredur ab Efrawe (we quote the original title) concludes the number; and in this instance, as in the former, we have the text and the translation. Peredur is a more elaborate and marvellous narrative than its predecessor, and contains the wonderful adventures of the son of a certain earl of the north on his journey to the court of King Arthur, his exploits at the Castle of Wonders, and a variety of strange matters concerning knights, sorceresses, and other creations of the times of chivalry and superstition. We cannot venture to thread the maze of this involved history, but we can assure the reader that it is full of most entertaining enchantments and dramatic escapades. The simplicity with which it is related — the quiet air of almost scriptural gravity with which the most extraordinary events are dwarfed into a few pithy words — and the fertility of invention displayed in the rapid succession of startling circumstances, nearly every one of which is

[2] *The Mabinogion.* Part II. Containing "Peredur, the Son of Evrawe." London: Longman & Co. 1839.

susceptible of some occult moral commentary, cannot fail to delight those to whom such narratives present materials of entertainment. Very frequently there occur some passages of great tenderness, indicated rather than expressed in single touches. The resolution formed by the "scheming and thoughtful mother" of Peredur to abandon the inhabited places, and dwell in the desert with her only son, after her husband and her six sons had been slain in wars, tournaments, and combats, is not destitute of pathos, although it is hardly visible in the treatment. But it is clear that this "thoughtful" mother devised this plan for the sake of bringing up her last son, then an infant, in total ignorance of the world generally, and of that knighthood in especial which had already desolated her house. The plot, however, does not succeed. The blood of Peredur is not to be so kept down; and he no sooner falls in with a company of knights than his genius breaks out, and he takes to horse, after taking some wise advice from his "scheming" mother, and sets out on his travels. The whole of this is given with the requisite spirit; and the translation must be commended alike for its fidelity and its power.

The desperate state of the drama in this country does not wholly deter some experimentalists from venturing upon the publication of plays, the only vent open to living dramatic poets. The stage is literally closed upon them. No man, with the genius to conceive and execute a great work for representation, could submit to the humiliations and perplexities he must undergo before he can succeed in obtaining a hearing. The labour of getting a play performed is infinitely greater than the labour of constructing it. A poet may write a play with pleasure, but he cannot get it acted without enduring a much larger measure of pain. The popularity of established authors, instead of influencing the public taste to the further encouragement of dramatic literature, seems to have the effect of repressing its development. The only writers who have any chance of succeeding (not before, but behind the curtain) are those who have succeeded already. The sole question which our managers believe themselves required to consider is, not the merit of a new drama, but the authorship. The matter is determined by the fashion of the workmanship, as we purchase boots from Hoby, or fowling-pieces from Manton. The label is the grand test and guarantee of excellence. There is no admission of young blood and fresh spirit into the theatre, which is ruled by a life-oligarchy; and until the oligarchs who are in shall have died out, and left vacancies for new candidates, there is no hope of reviving either a just or a general appreciation for this lofty and ennobling class of Poetry.

The remaining alternative is to print and publish. Here the prospect is, if possible, less cheering. Unless a play has received the *imprimatur* of an audience, it falls still-born from the press. We have no notion of buying a drama for the sake of its intrinsic qualities. We are tempted wholly by extrinsic circumstances — by the excitement it has occasioned in the acting — by the region of perfume in which the author moves — by the eclât of a name. It must, in short, come recommended to us by some accidental charm, over and above its merits, whatever they may be, before we will take the trouble of looking at it. Thus we invert the natural order of things, and sentence to oblivion, because they have not been represented, all those pieces (and they are generally of the very highest order) which were never intended for representation. In France and Germany there are no such hinderances to the cultivation of the dramatic forms of poetry. The applause of an audience is not necessary to ensure a perusal in the closet. The distinction is better understood, and the judgment of the reading public is more refined and cultivated. The drama by George Sand, which we have

just noticed, "Les Sept Cordes de la Lyre[3]," has, in an incredibly short period, without the aid of lamps, scenes, music, or *claquers*, penetrated into every part of Europe. Such an event would be a marvel in England. We might as reasonably speculate upon one of Cuyp's skies in Bishopsgate Within.

Nevertheless, there are two or three dramas before us, which have been cast upon the dark and stagnant waters by writers whose courage deserves a better recompence than it is likely to receive. Walter Savage Landor publishes two pieces—"Andrea of Hungary," and "Giovanni of Naples[4];" and somewhat maliciously announces that the profits of the sale are destined for Grace Darling. It is lucky for Grace that she has had some more substantial testimonies of approbation than she is likely to derive from the circulation of these plays; but it may be doubted whether, amongst all the tributes that have been paid to her, she can refer to one of which she ought to be so proud. Neither of these pieces is adapted for representation, nor do they seem to have been written with a view to the stage. The subject is illustrative of a striking passage in the history of Naples, and the treatment is remarkable rather for incidental beauties than for continuous power. The dialogues occasionally present some captivating snatches of poetry — some exquisite pictures of Italian scenery, costume, and character; and in the delineation of the tenderer emotions, some most touching and spiritual creations. The portraiture of Giovanni is noble, gentle, and heroic. The Fra Rupert is the complete incarnation of a subtle, unforgiving, and ambitious priesthood; and the figures he draws round him to tempt them into his toils are discriminated with the bold and unerring hand of a master. The interest of these dramas does not consist in the intensity or variety of the action, which is single and obvious: it is in the depth of the colouring, the truthfulness of the passions, and the elevation of the sentiments that the fascination lies.

"Catiline," by Mr. Reade[5], gives us a new dramatic version of a subject which Ben Jonson is supposed to have exhausted. For the purposes of the theatre, however, Mr. Reade's play is more skilfully constructed. The narrative is distributed through the scenes with considerable tact, and a variety of striking effects are produced which could scarcely fail to be successful on the stage. The characters are forcibly drawn; nor has the author fallen into the common error of suffering the false Roman sternness of the schools to extinguish the humanities in his *personæ*. Whatever was great in the Romans was great only so far as it was reconcileable with nature and circumstances. To describe them as demi-gods, beyond the reach of human sympathies, is to deprive them of the grandest of their attributes — the conquest of self. They were Titans in fortitude if you will — but they were still men. History is carefully followed in this play; and the art with which the story is conducted enhances the poetry by which it is illustrated.

One of the most remarkable publications of the day is the "Life of the Countess of Huntingdon[6]," which has just appeared. It is written from

[3] *Les Sept Cordes de la Lyre* has been already pirated in Brussels, where the traveller may procure a very pretty copy of it for two francs and a half. This system of piracy is now carried on to a greater extent than ever by a company which assumes the title of Société Typographique Belge; and all the popular and important works in French and English literature — including even such productions as Hallam's Middle Ages — may be had in Brussels for something less than a third of the original prices.

[4] *Andrea of Hungary*, and *Giovanni of Naples*. By Walter Savage Landor. London: Richard Bentley. 1839.

[5] *Catiline; or the Roman Conspiracy*. An Historical Drama, in Five Acts. By John Edmund Reade, Esq., Author of "Italy," &c. London: Saunders & Otley. 1839.

[6] *The Life and Times of Selina, Countess of Huntingdon*. By a Member of the Houses of Shirley and Hastings. Two vols. London: W. E. Painter. 1839.

materials collected by a member of the families of Shirley and Hastings, and presents on the whole one of the most curious and eminently instructive narratives that has ever been laid before the public. That a woman of high rank and princely fortune should have devoted herself to the task of diffusing Christianity through the country, of establishing missions, and constructing elaborate and costly machinery for the effectuation of her object, is not in itself a very extraordinary fact; but that she should have carried out this design with such complete success,—should have exhibited so much acute judgment and practical knowledge of human nature in its progress,—and that she should have addressed herself with such singular skill to that part of the character of the men with whom she corresponded and treated, which in almost all instances proved to be the most vulnerable, is a fact perhaps without any parallel in the history of the Gospel. All other women who distinguished themselves in the dissemination of religious doctrines, were enthusiasts alone. Lady Huntingdon superadded to the highest enthusiasm great purity of intention and clearness of mind: she saw not merely what was to be done, but the best way to do it; and she applied herself with such energy and discretion to the gigantic undertakings in which she engaged, that where others must have failed amidst sneers and ridicule, she succeeded amidst the wonder and admiration even of her opponents. All this was to be attributed to the mental strength of her character — to the firmness of her resolution — and, above all, to the serenity and perseverance of her temper. She was, perhaps, the only religious enthusiast of her own or any other age who reckoned amongst her intimate associations some of the most licentious of her contemporaries. Possibly the atheist was abashed in the presence of so much real virtue; possibly he was staggered in his dark faith; and she may have thus hoped to reclaim him by free and unsuspicious intercourse. That she who laboured in common with Wesley and Whitefield should also have been the friend of Bolingbroke, is an evidence alike of her moral supremacy and her good sense; yet it is not to be denied that there are strange things in her life — things which worldly people will be disposed to treat with scepticism, and into the spirit of which nobody can enter except those who are "re-born," like the Countess herself. One character that stands out prominently from the canvass is exceedingly beautiful; but some of the accessories are grotesque, and full of painful distortions. The little anecdotes of the grace that fell in certain quarters; the odd mixture of the earth and the heavens that now and then comes in where one is least prepared for such curious unions of the social and the spiritual; the strange instances of punishment and conversion; the agonies of sin and the hyperbolical bliss of godliness; and the language of the conventicle which is scattered prodigally, and perhaps ostentatiously, through the volumes, — have the effect of taking away something from the quiet power of the principal figure. But it must be borne in mind that these were the elements upon which, and through which, the Countess of Huntingdon worked; that her life, without these embellishments, would be the vase without the flowers; and that, whatever effect such passionate and flighty images may have upon the reader who is unaccustomed to this species of inspired diction, Lady Huntingdon could not have dispensed with them and have achieved her ends. The biography is rich in materials of personal interest, apart from all sectarian considerations; and may be justly regarded, in every point of view in which it can be taken, as a very original and remarkable work.

THE MONTHLY CHRONICLE.

MARTIN LUTHER AND THE REFORMATION.

"Os homini sublime dedit cœlumque tueri."

The Protestant Reformation was unquestionably one of the greatest revolutions that ever occurred in the world; for it did not treat of overturning one throne for the purpose of erecting another, — of substituting the dominion of one for the dominion of a class, or the dominion of a class for that of one; but its object was to proclaim the inherent equality of all men in the sight of God, notwithstanding the inequality of the essential and primordial gifts or faculties which they may have received from Nature; and, as a consequence of this, its fundamental doctrine, a new organisation of temporal society founded upon an equality of social rights. Nor is this contest yet decided, since even now the struggle, both in the laical and priestly world, is but the vibration of that mighty convulsion of which the French Revolution itself was a bastard offspring; and it is at the basis of all that divides society, whose destinies will, in the event of the triumph of one principle, be developed in the path of liberty and equality, — in that of the other in the direction of privilege and authority. The Reformation is thus a double phenomenon social and religious. Luther, on his advent, found the elements of that movement which was to agitate the world within, around, and beneath the society then existing. He did not, as has been said, create them, — he only availed himself of their previous existence; for the soil of intelligence resembles the terrestrial soil, which bears no fruit unless it has first been sown with seed. The Samson of the Reformation who wound his arms around the pillars of the temple in order to overturn it, was not so superior in his knowledge of the Divine Word, nor in his intuition of it so much beyond all those Catholic geniuses who had drunk of the living waters from which Terutllian, Cyprian, Lactantius, Jerome, and Augustin had drawn their stores of imagery and poetry, that his mission should be transformed into an apostleship, and his work compared to a revelation. We see in his dispute with authority that the Augustine monk was but a man, and a man not devoid of the weakness and misery of our nature. We see the champions of the Reformation, to whom Luther had once decreed crowns on earth and in heaven, anathematising each other and appealing to the feet of the supreme Judge — Luther to demand account of Munzer of all the souls whom he had intoxicated with his poisons, and Munzer to cast in his teeth the blood of the Anabaptists; Karlsbadt to accuse Luther of having perverted the Divine Word, and Luther to mock at the visions of the Archdeacon; Œcolampadius to explain to Luther the sense of the words of the Last Supper, and Luther to anathematise the interpretation of Œcolampadius; Zuinglius to reproach Luther with having, in defiance of the Scripture, made man a slave and a child of darkness,

powerless of himself to choose the path of light; and Luther to thank God for the stroke of the sword which mortally wounded Zuinglius at Kappel.

The mission of the Catholic church was accomplished in Europe when Paganism was destroyed; and the doctrine of antiquity, which Aristotle parades with a kind of pride, in the first book of his "Politics," — that there are two natures in man, a slave nature and a free nature, constituting an inherent and radical inequality of different men in the eyes of God, and consequently sanctioning their inequality with regard to each other, and the whole system of Pagan society built thereupon, had been overturned by the doctrines of Christianity, when woman had been liberated and the Gentile admitted into an equality of rights. Christian unity, in other words a bond of common sympathies, then united a vaster portion of the human race, and made a step in advance towards a more harmonious development of the world. As the Roman jurists had completed, on the small scale of a few privileged citizens, the most complete code of rights and duties which freemen had yet reasoned and organised, in like manner Catholicism had taken one step in advance by enlarging the horizon; but in her work of emancipation in the middle ages, having always had to encounter with the weapons of moral supremacy feudal power, or the element of barbarism, it had become necessary for her to seek for auxiliaries in the supreme rank. When the empire of the East departed from her, she allied herself to the chief of a new dynasty — to a Pepin, a Charlemagne, or to the emperors of Germany, who gave her their treasures, their soldiers, or their arms, and thus established the temporal empire of the Papacy. The church thus became a queen, and had her crown of gold, her palaces, and her ambassadors. Her kingdom necessarily became a kingdom of this world; for, deprived of the attributes of human royalty, what would have become of society, the moral world, and Christianity? Without going very far back, what, for example, would have been the fate of the human intellect, if, in the time of Luther, Leo X. had had nothing to protect it but the garb of the apostle when Luther cried aloud to the people to allow the Turks, who threatened Germany, to come freely, under pain of eternal damnation? We know not, for example, what would have saved humanity from slavery, into which an ambitious emperor might sooner or later have cast it, if faith had deserted Charlemagne, and the fear of an all-powerful Judge had deserted Frederick II. Who shall say that the Christian world would not have returned to Paganism and slavery? The theology of the middle ages, however, ended with the fifteenth century. The separation of the contemplative or religious life from the real or sinful life, the condemnation of the present world, sentenced with man on account of original sin, had reigned supreme for ten centuries, — the reign of grace, and the power of the church therefrom, were the fixed tenets of its Christianity.

With Luther commenced a new phasis — his era marks the beginning of philosophy. By conquering the rights of conscience which are referable solely to God as the author of the moral law, which all rational beings are equally bound to love and obey, and by enfranchising man from all spiritual dependence upon or controul over his fellow-man, he made the equality of all men in the presence of their fellow-man an admitted right. God has given us a power of action which no one has the right to restrict or infringe. But here arises a great and celebrated question, the arena in which for ages the destinies of nations have been disputed, — Within what circle shall this liberty be developed? Who shall trace a boundary to man's passions? evidently Justice. But who shall define Justice? Who shall be sufficiently

wise to unveil its origin? Who shall be sufficiently great not to degrade it in its application? If human virtue and intellect have hitherto always failed, and no society has yet been perfectly organised, it is not, acccording to Luther, that "*living judicial arbiter*," as O'Connell calls him, the Pope of Rome, who is to solve the problem; for there is no absolute type upon earth, and all that humanity can do is to make successive approximations towards one.

Luther had fancied that the shadow of the Vatican ought to have extended itself like a mantle over all human nature. The poor German monk had expected a miracle from the Papacy. When, therefore, he travelled into Italy and saw the reality, humanity appeared to him poor, contemptible, and degraded, deprived of its ancient and noble instincts, astray from the paths of God. In the capital of the world all his illusions of joy and hope had crowded upon him, and he saluted with every term of admiration and respect that sacred Rome "thrice sanctified by the blood of her martyrs." He had scarcely passed through the *Porta del Popolo* ere his dreams vanished.

The young student, in fact, only knew mankind from books. He knew the ancient Romans, whose soil he trod, — their mythology, their gods, their heroes, and a few other things, which both friars and laics had learned at school; but modern Rome, the Rome of the Popes, was to him a sealed book.

His thoughts did not wander to the days when the German emperor came with his innumerable soldiers to extinguish the very name of the ancient city, and was arrested in his steps at that very gate by fear of the spiritual sword which a pontiff held in his aged hands. He saw not the shades of Philip Augustus of France and of John of England stand trembling before the patriarch. The past was dead for Luther; he knew not what Rome had done for humanity; he was ignorant of the titles to admiration and gratitude of many of the occupiers of the chair of St. Peter. He had left a country threatened by the Turk, and he knew not that if the Koran was not the gospel of the North that it was owing to the Pope that its triumph had been stayed. He had seen brutal force reigning in Germany, and its barons placing their iron gauntlet upon every intellect rebelling against their will, and he never suspected that intellect would have had no earthly protector if the papacy had not vanquished physical force by forcing it to succumb to the laws of morality.

Imagine a raw Scotch Dissenting minister fleeing from poverty and cutaneous complaints, or an Irish priest, the child of privation, rigid and austere, devoted to a b eeding cross from his youth, placed in the midst of London for the first time, in view of the Bishops' luxury, and you have an idea of poor Martin, who had journeyed 400 leagues on foot, eating black bread on his way, transported all of a sudden into the midst of a city of wonders, voluptuousness, music, and paganism, — "*pulverem strepitumque Romæ.*" He who had never before been accustomed to any noise save that of the little fountain in his convent, — to any amusement, save the sound of his flute: how vastly he must have been astonished and scandalised! He had dreamt of an austere religion, whose brow was cinctured with griefs, sleeping on the rock, resting itself beneath the sky of heaven, clothed like the apostles, journeying across roads of stones, staff in hand, and gospel under arm. He beheld cardinals in their litters, on horseback, or in carriages, blazing with jewels, their heads shaded from the rays of the sun by canopies formed of the peacock's plumes, and marking their passage by clouds of dust that often obscured the view of the *cortege* which on their knees demanded their benediction. His imagination carried him back to those days of Christianity

when the chief of the apostles, a pilgrim like himself, had nothing but a staff to support him. He, a poor scholar, brought up so hardly, who in his infancy had often no pillow but the cold floor, passed before palaces of marble, columns of alabaster, gigantic obelisks of granite, gushing fountains, — exquisite villas, embellished with gardens, flowers, cascades, and grottoes. Did he wish to pray? — he entered a church which seemed to him an actual world, where diamonds sparkled upon the altar, gold upon the walls, marble on the pillars, mosaics in the chapel, in place of one of those rustic temples of his own country, ornamented by a handful of flowers deposited on a Sunday on its altar by some pious hand. Was he thirsty? — instead of one of those springs which run along their wooden troughs at Wittenberg, he had fountains of white marble larger than a German house. Was he tired? — he found on his road, in place of a modest bench of wood, a seat of antique alabaster recently disinterred. Did he look for a holy image? — he encountered nothing but pagan fancies, Olympic divinities, — Apollo, Venus, Mars, Jupiter, — upon which the hands of a thousand sculptors were at work. There were the gods of Demosthenes and Praxiteles — the feasts and pomps of Delos — the motion of the Forum — the foolishness of the Pagans; but of that foolishness of the Cross of which St. Paul speaks he saw no remembrance, no representation. And because Rome was not made after his own image he was ready to condemn it. Of the marvels which Rome displayed in the time of Julius II. he saw nothing. No ray of the crown of Raphael or Michael Angelo dazzled his looks; he remained cold and mute before all the treasures of painting and sculpture assembled in her churches, and his ear was shut to the strains of Dante which the people sang in his path. The name of Rome, and his recollections of it, were often in his mouth in after years; but all that struck him most — next to the licentiousness of some priests, the triumphal pomp of the pontiff, and the naked shoulders of the Roman ladies — was the extent of the city, which "equalled the distance from Wittenberg to Polersberg." Luther, indeed, was a man of facts and figures, not a poetical soul. Thus he declared that Saint Jerome's salvation appeared to him so uncertain, "that he would not for 10,000 guilders take the risk and stand in his place before our Lord God*, in the next world." He entered Rome like a pilgrim, he left her like a Coriolanus.

> "Vivere qui sancte vultis, discedite Roma;
> Omnia hic licent; non licet esse probum."

The fault with all these minds lies in themselves, not in the objects. Their minds require time to expand, and take in the vast whole, which wounds their pride at first by the sense of their own littleness.

Leo X. was to Luther an ass or an Antichrist. How different is the impression made upon another great man by the same sight! Erasmus was ravished with the sight of Italy. The classical scholar, nurtured with the muses, was in his native element at Rome. We figure to ourselves the Dutch philosopher, snatched all at once from his foggy skies, his old books, and the narrow streets of his native town, transported into an atmosphere brilliant with sun and light, and entering, for the first time, a palace of gold and marble — traversing vast halls sparkling with mosaics, arabesques, paintings, and sculptures, vast museums which could scarce contain all the masterpieces which the earth gave forth every day — wandering under ceilings decorated by the hands of Raphael and Julio Romano — mingling with

* "*Ich wollt nicht* 10,000 *gulden nehmen und in der gefahr stehen fur unsern Herrn Gott, da Sanct Hieronymus inne stehet.*" — Table Talk, in fol. 413.

cardinals whose robes shone with jewels — in the midst of those artists marching along surrounded by their pages! Imagine him placed face to face before the handsome figure of Leo X., the object of the love and homage of all who surrounded him — of Ariosto, come to thank him for his excommunication directed against the pirates of his poem — of Celio Calcagnini, who taught, long before Copernicus, the rotation of the earth (*Quod cœlum stet, terra autem moveatur*) — of the Dominicans from the New World, to thank him for having, in the name of the Gospel and of nature, anathematised the shameful traffic in slaves — of Castiglioni, the courtier, who has so well depicted the comic side of his court, of whom Charles V., on hearing of his death, said, "*Yo os digo que es muerto uno de los mejores caballeros del mundo!* — of Raphael — Raphael the great lord, greater than Chigi himself — before whom the guards of the pontifical palace made their obeisance, and who always went surrounded by his troop of pages in all the flower of youth and beauty! Imagine Erasmus placed amid all this court, where poetry, history, painting, sculpture, eloquence, music, theology, and all the liberal arts had their representatives.

We figure to ourselves two men so similarly situated for the first time, and admire the effect of letters and elegant studies, which caused Erasmus, the child of the muses, to be at his ease in the same circumstances which confounded Luther, from his inability to comprehend them. We perceive, in short, how the taste for classical literature made a gentleman out of a Dutchman, and the want of it made a Mucklewrath out of a great genius. We can judge also whether Erasmus or Luther were right in their views of the pontifical court; and if Leo and his cardinals were the true Antichrist, — Leo, who even at table could not suffer the time to pass away "in the luxury of gold and silver, and the miracles of exquisite genius, but with his guests and bystanders discoursed blandly and courteously as of wont, not on vain and light subjects, but on God, nature, sanctity, right, life, morals, the deeds of other men, and other things which of his consummate erudition and perspicacity of genius were deemed worthy" — "*Sed cum convivis et circumstantibus lepidè comiterque habitis sermonibus non de inani, levique materia sed de Deo, naturâ, sacris, jure, legibus, vitâ moribus, aliorum gestis, cæterisque rebus, quæ summæ eruditionis ac perspicacis ingenii dignæ visæ fuerint;*" — if this account of the subjects of Leo's habitual discourse be correct, it gives us a high opinion of his intellect. They resemble the favourite topics of Napoleon's table talk, as reported by Monge, Berthollet, Denon, and the scavans, when on board the man-of-war which conveyed him to Egypt. Leo's mind loved to dwell upon the grand and the beautiful. "I have always loved both learned men and letters," writes he to the King of England, Henry VIII., on recommending Erasmus to him: "this love is born with me, and age has only increased it; because I have always seen that those who cultivate letters are the ornament and glory of the Christian church." Such were the flower of the Catholic geniuses.

But these scholars and grammarians, — lights of the Greek and Latin languages, — depositaries of a civilisation that was spent and worn out, added nothing to the elements of social life, by which the sympathies of Luther were vividly excited. Living in a past that was dead, their thoughts were more fixed upon reviving an idol of their imaginations, the civilisation of antiquity, than of comprehending the living reality, and of adding any novelty to the synthesis of the new life Christian and philosophical. Their world was a world of extinct ideas vainly sought to be resuscitated, — their life a life of castes, where the great element of the people, or laical class, was counted as nothing before the sacerdotal or devout class. The revolutionary genius

of Luther saw and comprehended (which is the greatest merit and proof of genius) the *relative* worth of this species of knowledge, and knew exactly what it would count for when the vast problems which he brought into discussion came to be agitated in the field of life. "Brother Martin has a fine genius" — "*Frate Martino ha un buon ingegno*," — said Leo of Luther; and truly it may be said, when we reflect on the strength of mind which was necessary to attack a power so vast, so time-honoured, and so traditional, which had fixed its foundations for ages in the very roots of the human intellect, that a Titanic energy, a new Enceladus, was required to dethrone the Omnipotent Fate so long reigning in the name of Immobility. In reality, neither the idolatries of superstition nor the absurdities of theology would have enabled Luther to have overturned it, had not physical oppression first aroused opposition. When the material interests were awakened, reason followed; but she did not precede: the truths of geometry, as has been well said, would not be admitted, if the interests of mankind were concerned against them. The organisation of that great corporation, the Church, has in all ages too been considered as inimical to the welfare of society; and the objections which Hume has brought against it in his Essays have not ceased to be reproduced in every country.

When this tremendous engine of oppression is taken into consideration, truly might Luther sing, on reflecting on his triumph over it in that noble Hymn which Heine has well designated as the Marseillaise of the Reformation —

"Ein feste Burg ist unser Gott."

In his war against Erasmus and the scholars, well might he say, *Cedite Graii!*

From contemplating the powers and principles, spiritual and temporal, that were arrayed on the side of Catholicism, let us turn to the instruments whose mission it was to shake to its foundation the rock against whose base the Lollards, the Wickliffites, the Vaudois, the Albigenses, the Hussites, and so many other human surges had for ages broken in vain. Foremost of all these, not so much from the vastness of his learning as of his human sympathies — not so much from the amiability and refinement as from the indomitable moral courage, the manly vigour, the energetic reason, and the shaping mind, — all the qualities that constitute the heroic soul, — which the poet Lucretius has so nobly described in Epicurus, the "chaser of spectres," the sage of his idolatry, who slew the monster Superstition, and restored to man the dignity of his nature, — stands Luther.

"Humana ante oculos fede quom vita jaceret
In terris obpressa gravi sub Religione;
Quæ caput a cœli regionibus obtendebat,
Horribili super adspectu mortalibus instans;
Primum Graius homo mortaleis tollere contra
Est oculos ausus, primusque obsistere contra;
Quem neque fana Deûm, nec fulmina, nec minitanti
Murmure conpressit cœlum; sed eo magis acrem
Inritât animi virtutem, effringere ut arta
Naturæ primus portarum claustra cupiret.
Ergo vivida vis animi pervicit, et extra
Processit longe flammantia mœnia mundi;
Atque omne immensum peragravit mente animoque:
Unde refert nobis victor, quid possit oriri,
Quid nequeat: finita potestas denique quoique
Quânam sit ratione, atque alte terminus hærens.
Quâ re Religio, pedibus subjecta, vicissim
Obteritur: nos exæquat victoria cælo."

Like Themistocles, who could not play the lute, but could make a small town a great state, Luther could not, like Erasmus, write a thesis in the Latin of Cicero; but, in his own German, he could electrify the multitude by the greatest mastery over his language of any man of his day. The barbarisms of their Psalter were not such an agony to his refined ear as to make him pray for the Pope's bull of remission of the task of reading it in church, as Cardinal Bembo did of Leo; but he listened, fearless and unawed, to the bull of excommunication which frightened monarchs, and hurled, in his turn, his excommunication against the grand excommunicator. For the first time for two thousand years his voice

"Could point to Heaven and lead the way;"

and summon his fellow-man to look towards his native skies, in the consciousness of his nature, and of the lofty destinies which Providence has in store for all those who are worthy of them. In the expressive language of Scripture, "he touched the mountains and they smoked!"

The portraits of the great men of that day, *nulli ævo perituri*, have been drawn by the hands of many masters. Albert Durer and Lucas Kranach have worthily depicted their outward forms; of their minds, a few characteristics may be gathered from the archives of the past. An infancy of tribulation passed in poverty as a singing boy, educated upon charity — a youth of study, maceration, and conventual misery — a manhood of agitation, and a death of universal fame, — such was Luther's career. His glory, as Napoleon said of the French Republic, when recognised by the Austrian legate, "is like the sun in heaven. Woe to those who cannot see it!"

"Nature," says a contemporary writer, in a sketch worthy of Bossuet, "had sufficiently favoured him both in body and mind; for, for a man born in Germany, a nation ordinarily heavy and stupid, he had a spirit prompt and active — a happy memory — much facility in expressing himself — and was eloquent and skilful in his own tongue beyond any other man of his age. When he was in the pulpit, transported with ardour and passion, he knew easily how to impart life to all he said, and, like a torrent, to carry along with him the minds of his audience,— a charm which is not natural to the people of the North, a massive race, who deliver their lectures and sermons without action, nailed to their chairs, their hands fastened before them as if they had been motionless statues. He was, moreover, indefatigable in all sorts of labour, which with him served for repose; always at his books, with his pen in his hand, if he was not in the arms of his nun, who was to him a heavy burden, and a grievous impediment to his studies. A man of great courage, and bold in undertaking and executing whatever his hatred or his passion instigated. In his ordinary intercourse familiar and affable, but knowing, notwithstanding, how to reassume his dignity, even in presence of the greatest, whenever he acted the prophet. He was a man of much reading, having made tolerable use of the best books during the fourteen years he passed in the cloister; so that there was not a sophist who did not give way before him if he dared wait his attack, either in philosophy or in theology. But all these great qualities were spoiled and outweighed by great and grievous faults; for he was for the most part gross, haughty, insolent, and insupportable. He had his tongue generally tempered in wine, and evil-speaking for ever in his mouth; as little regulated in his morals and manners as constant and fixed in his doctrine, which he changed and changed as long as he lived, almost as many times as the sun recommenced his course; the mortal and capital enemy of all subjection, austerity, and penance which softened the wrath of God." Luther knew the secret

of the gifts which God had granted him. His language agreed admirably with the fascination of his external form; sometimes floating in a prophetical disorder, or feeling the intoxication, according to Erasmus's expression, of his audience: sometimes availing himself of the allegory; sometimes natural as the parable or lyrical as the ode; the eagle in his daring flight, or the dove in her snowy plumage, according to Menzel. The Catholics themselves were seduced by his oratory and attributed it to the influence of evil angels. (*In ejus oculis nescio quid dæmoniacum relucere solitum.* Prateolus, 272.) Born in the era of the Gracchi, he would have carried with him the senate and the people; in the time of the Crusades he would have wrought the miracles of St. Bernard; in the Constitutional Assembly he would have been greater than Mirabeau. In courage he was superior, perhaps, to all; whether we consider his journey to the Diet of Worms, or his second return to Wittenberg to put down the Anabaptists, where, deprived of his priestly dress, he threw aside his pilgrim's staff to mount on horseback, and assume the cuirass of iron, the great sword, the casque, the spurs, and the boots of the man-at-arms of the sixteenth century,— such as the painter, Lucas Kranach, has represented him making his entry into that city.

The particulars of his domestic life are not less exactly recorded. His friend, Lucas Kranach, has painted him in his preacher's robe with large sleeves, open at the breast and showing a black vest, with a little collar of white linen at the throat. This was his usual garb. The Elector, previously to his assuming it, sent him a piece of Prussian cloth, with a note to this effect, — "To make yourself a preacher's robe, a monk's dress, or a Spanish cloak;" for Luther was, for a time, undecided which to adopt. His lodgings in his convent consisted of three rooms,— a bed room, a room for study, which served him as a room for receiving visitors, and a dining room. In these he received the envoy of the King Ferdinand, who came to Wittenberg to ascertain the truth of the report that Luther had a numerous guard of armed men with him. He found him alone amidst his books, and did not even perceive the legion of demons which the Anabaptists placed at his service, nor the devil himself, at whose head Luther had thrown his inkstand, although he might have perceived upon the walls of the room the evidence of the Reformer's vision. The walls of his bedchamber were written over with sentences in charcoal, extracted from the Scriptures; as, *Verbum Domini manet in æternum*, which he had even embroidered on the sleeves of his domestics' dresses; or lines from the profane poets, Homer especially, as, "He who watches over the destinies of a people or a country ought no longer to sleep all night." His closet for work, plastered with stucco of milky whiteness, was ornamented with portraits in oil of his dearly beloved disciple Melancthon, and of the Elector Frederick, by the hand of Lucas Kranach, and with some caricatures against the Pope, the subjects of which he had himself furnished in the course of his table talk to some wandering artist, who had afterwards carried them to Nuremberg, the great manufactory whence issued vast numbers of engravings on wood. From the frames of these caricatures hung pasteboard slips with ascetic sentences in German. Lastly, the eye was filled with a clumsy shelving of wood, on which stood or lay a few volumes, forming what he called his library. The Bible, like the divine word in his mind, occupied the place of honour, — the Bible, in Latin, Greek, and Hebrew; the Psalms by Melancthon; the New Testament by Erasmus; and, side by side with these, the writings of Eck; the theses on the Indulgences; the bulls of Leo X.; the *Epistolæ Obscurorum Virorum*; various works of John Huss, Virgil, Columella, and some ascetical books printed at Mayence, of which presents had been made

him. Coloured glass, soldered together with lead, let in the light of all shades on his table, which has been carefully preserved, and resembles a sort of desk, in the middle of which is a crucifix of ivory, which is its best ornament. This crucifix, the work of some Nuremberg artist, has an admirable expression. His dog usually lay at his feet whilst writing or composing, and of which he used to say, when laughing at the theologians who boasted of having seen many books, "My dog has also seen many books, more, perhaps, than Faber, who is all fathers, fathers, fathers, — councils, councils, councils." Near the door of his house was a turning machine, which he had got from Nuremberg, in order to gain his livelihood by his hands if ever the word of God failed to support him. We must not also forget that in place of those pipes which one sees now-a-days in the room of every German student, there hung a flute and a guitar on the wall of his room, on both of which instruments he played. Luther was devotedly fond of music, the language of angels in Heaven and of the ancient prophets on earth. Next to theology, it held the second place in his estimation. "Who loves not music," said he, "cannot be loved by Luther." He was charitable to excess; and often borrowed from his parishioners when he had nothing of his own to give; and at times was unable to meet his obligations when they fell due; on which occasions his practice used to be to give in pledge some of the silver goblets, the gift of the elector, which stood on his mantelpiece.

Another portrait yet remains to be drawn, — that of the morning star of the Reformation; borrowing all his light, it is true, from the Saxon sun, and who, without Luther, would have been extinguished in the deepest night, but from the conquest of whose soul, so meek and amiable, which no man could reproach with having abjured his faith for carnal interests or for pride, the Protestant cause gained more than from the action of a thousand other men who had received from heaven the faculties which move the moral world, — we speak of Philip Melancthon. Summoned to Wittenberg as a professor of Greek at the age of twenty-two, at the recommendation of two of the greatest scholars of the age, Reuchlin and Capnion, he astonished the inhabitants, who had heard of his great fame, with his appearance. "Fancy," says one of his contemporaries, "a slender youth, who kept his eyes fixed on the ground, with a beardless chin, a pale complexion, and a voice so weak as to be scarcely heard, — fancy this youth, so thin and shy, buried within the ample robe of a professor, with its enormous hanging sleeves; a scholar who, at the side of Luther, appeared to be scarcely fifteen years of age, and who, in walking, scarcely reached to the shoulder of the doctor; but a real giant in learning and linguistical science, — a poor little body, which enclosed unspeakable treasures of wisdom and erudition."

At Wittenberg he pronounced his opening discourse, — he was fluent and eloquent. Luther, who listened, interrupted him frequently with murmurs of approbation. Melancthon announced himself a reformer, — he desired to reform the scholastic learning, the form of teaching, and the traditions of the past. From that day a secret sympathy attracted towards each other these two souls, so well suited to understand each other, — a friendship which was to end only with the tomb. At the conclusion of his infancy, his imagination all fresh and odorous with Greek and Latin, this youth, so tender and dreaming, inclined by nature towards mysticism, was easily gained. The language of the schools could not please him; that of Christ, so allegorical, effusive, and impressed with melancholy, was much more fitted to charm him, and Luther happily availed himself of it at once. If we picture to ourselves a handsome youth of twenty-two years of age, with the

flowing locks of a seraph, a bashful air, and an unalterable sweetness of temper, enhancing a lively piety by acquirements of knowledge and science difficult to be found, even in that era, among the oldest scholars, we must own that Luther had reason to congratulate himself upon counting him among his disciples. No one was better adapted than Melancthon to extend the reign of the new Gospel. Catholics and Protestants both agreed in saying that on seeing him they were almost conquered to the cause of the Reformation.

The vast hall of the university was soon insufficient to hold all the audience who pressed to hear the master, — counts, barons, marquises, princes, and other dignitaries. Melancthon explained, one after another, the comedies of Aristophanes, the orations of Demosthenes, Hesiod, Homer, Theocritus, Thucydides, and Apollonius. He was proud of his title of professor. "The life of a professor," said he to Sturm, "is not as brilliant as that of a courtier, but how much more useful is it, — how much more worthily does it serve humanity! Oh, holy profession! which teaches how to know the nature of God, the duties of man, and the wonders of intellect!" After their first interview, which lasted some hours, Melancthon, seduced and fascinated, belonged to Luther for the rest of his days, body and soul. The progress of Melancthon in the path of Luther was so rapid that Luther could soon flatter himself that even death would not interrupt the work he had commenced. "Though I die," said he, "yet my work will not perish; for my dear Philip will resume it, and with God's help, will know how to terminate it gloriously." "I was born," says he, in another of his letters, "to struggle with the devil; thus my writings are full of wrath and tempest. My lot is to make rocks and blocks roll away, to rase the briars and the thorns, to fill the quagmires, and to cut out the paths; but Philip has another nature; he marches in meek silence, he builds, he plants, he waters, he sows in peace and joy of heart." (*Reformation's Almanach.*) How well their own words describe them! It is best to let these men speak themselves. Let us now listen to the dearly-beloved disciple touching his master.

In 1540 Melancthon departed for Hagenau. He fell sick at Weimar. Before leaving Wittenberg he had consulted the stars: the stars had remained silent; but he had had a dream, and dreamt that he was to die on the road. He thereupon made his will: Luther was not forgotten in it. "I thank the worthy Doctor Martin Luther," says he, "for having taught me the evangelical doctrine. I thank him above all for all the proofs of love with which he has not ceased to overwhelm me to this day. I desire that all mine may honour him as a father, for no one knows better than I with what heroical courage, what strength of soul, with what wonderful virtues, God has endowed him. May they all love, honour, and believe in him with all their heart, as I have always done." This is a characteristic passage in the will of Melancthon; there is also one in the will of Luther. "Lastly, I request," says that document, "that if I have not employed in this testament the forms of law, that the world may acknowledge here the hand of a man sufficiently known in heaven, in earth, and in hell, and to whom more faith and credence is due than to any notary. If God has deigned to trust in me, poor creature that I am, soiled with the dregs of my sins, — if he has vouchsafed to me to announce the Gospel of his dear Son, — if he has blessed me in my fidelity, — if, thanks to me, many souls have embraced this Gospel, and have esteemed me their apostle in spite of the excommunications of popes, emperors, kings, princes, and monks, and the wrath of the devil, they may well believe in my testimony in these dis-

positions of so little importance; above all, when my signature is known. I hope that it will be enough that one can say, this is the hand of Luther, the notary of God, and the witness of his Gospel."

The passage in which he speaks of his renown with such pardonable pride recalls to mind the words of Napoleon in his last will, when bequeathing to his son his personal effects. "*Comme lui traçant les souvenirs d'un père dont l'univers l'entrêtiendra.*"

To the eternal disgrace of the Protestant princes of Germany, his wife, whom he had anxiously recommended to their care in memory of himself, was permitted by them, despite the unceasing appeals of the faithful and affectionate Melancthon, to lack the necessaries of life a few years after her husband's death. Flying from Wittenberg to avoid the plague, she was thrown with her children into a marsh, from the cold and effects of which she died, and was buried at Torgau, with a public appeal to the charity of its inhabitants affixed by its pastor to the door of its cathedral. She had been forced, previously to her death, to part with her marriage-ring for bread.

Two effects were produced upon society by Luther and the Reformation, the one material and the other spiritual. If there be a law of Continuity and Progress in the spiritual as well as in the visible world, according to Leibnitz and Pascal, it must result that Protestantism was but the necessary manifestation of anterior causes. What was the task allotted by Providence to the Reformers; what judgment are we to pronounce upon their existence; why have they been; why have they ceased to be; and what is the philosophical idea which we ought to form after having studied their history?

In reality, the questions which agitated the religious world in the sixteenth century were, under different names, those which have occupied the human mind since the beginning of the world. The search after Happiness, or the Sovereign Good, the problem first stated by Socrates and the Greeks, is not less existing at the basis of all those disputes about free will, grace, election, and predestination, which divided the Christian community, and which so many empty minds regard as vain and frivolous, than it is at the present day in liberty, equality, and the rights of the people. It has been so in all ages; and, in proportion as the solution to it was more or less shallow or defective in creating within us a living force which should be to man a rule and guide of conduct, and render him superior to the action of the surrounding world upon him, the human race has improved. Cicero has truly said, that they who are not agreed on the sovereign good are at variance on all the fundamental points of philosophy. "*Qui de summo bono dissentit, de tota philosophiæ ratione disputat.*" (*De Fin. Boni et Mali*, c. 5.) Those, therefore, who reproach dissentients from Catholicism with endeavouring to find in the words of Jesus nothing but the philosophy of the Greeks and Romans, do wrong. It is one of the glories of Christianity that it is founded on the eternal and unchanging instincts of the mind. For what was the great duel between the Church and the Reformers, according to Catholics, but the duel between Faith and Reason; or, translated into the language of antiquity, between Idealism and Materialism? The human mind, like Luther's drunken peasant on horseback, is no sooner set right on one side than it falls on the other: and, in different eras of the world and of society, it seems as if idealism and materialism succeeded each other alternately. In the days of Luther, the ideal or contemplative life had taken possession of human society, by virtue of exaggerated asceticism; and the life purely devout was universally regarded as the type of human perfection. The reaction of a more Epicurean philosophy brought with it juster notions of our

nature and position in the world. The reign of grace was the doctrine maintained by the Catholics; or, in other words, the free will of man, and the efficacy of his good deeds in this world in respect to his salvation in the next. Luther, on the contrary, boldly denied the free will of man, making him wholly dependent on God. Singular to say, this doctrine which, at first sight, would seem to degrade man into the tool of fatalism, had the very opposite effect, and was found, by making man solely dependent upon the will of God, wonderfully to favour the development of liberty, and to enfranchise him from all power, spiritual or temporal, in this world. By virtue of this doctrine, the man who was a worm in the eyes of his Creator was the equal of the pope or the emperor, from whose power he was the more emancipated the more he was dependent upon a King not of this world. Plato, the greatest master of philosophy in antiquity, had created a phasis in the spiritual world which the great fathers and doctors of Catholicism, the Anthonies, the Bernards, the Cyprians, the Jeromes, the Augustins, the Benedicts, the Tertullians, and the Chrysostoms, had revived in the middle ages, with omissions which, as we shall hereafter see, greatly modified the essentials of his creed.

To the question — What is our condition in this life, and how ought we to conduct ourselves with respect to the good and the bad which we meet in it? —

Plato answers, — Endeavour to resemble God as much as lies in your power,— ὅμοιος Θεῷ κατὰ τὸ δυνατόν.

We may look upon this maxim in two lights — either like the mariner, who follows his path by the stars, and contemplates the heavens, to direct himself; or, like the astronomer, who looks only to the heavens, and never dreams of the earth. We may seek the beautiful in the world; through the world, and by means of the world, extract it from the world and render it back to the world. We may also consider its object alone, which is God, or the Infinite Beauty, and believe that we may place ourselves immediately in connection with it, independently of the world, and pray for it so passionately that every thing may disappear before that ecstatic flight.

Plato had said, "Endeavour to resemble God *as far as that is in your power*." The churchmen cut off this restrictive condition, which preserved nature and life. They desired, like the Stoics, a salvation, prompt, rapid, and instantaneous; they said to the world, like Seneca's sage, *Non placet; liceat eo reverti unde venio* — "It pleases me not — let me return whence I came."

Catholic Christianity and Platonism, in this point, differed profoundly from each other. They differed also on another point; which deviation is a consequence of the first. Plato had said, — "We have two means of ascending to God, reason and love." The Catholics, separating themselves from the world, were obliged to neglect free will, and recognised only grace. It is the doctrine of St. Paul and of St. Augustin; and whatever effort may be made to preserve free will, it is the true doctrine of Christianity.

Socrates, Plato, Zeno, Epicurus, and the two great doctors of Christianity, St. Paul and St. Augustin, are then, in brief, the successive terms of the development of the question. Socrates commences in our western world philosophical antiquity, which St. Augustin terminates by opening the religion of the Middle Ages. This sublime dialogue has lasted ten centuries, and nevertheless we may thus sum it up in a few words: —

Socrates. "Let the sophists cease, — let the wise cease to glorify themselves, and to pile together foolish hypotheses to explain the world, — let artists learn that Art, without a scope, is childishness, if not poison. The only knowledge worthy of man, which will give to science

and art a true destination, is the knowledge of the Good and the Best, and that knowledge can only be got by the study of ourselves, — Γνῶθι σεαυτόν."

Plato. "From the study of ourselves it results that man is a force originally free, but, at present, united to matter which appears to be co-eternal with God. We strive to return to our source by the natural effect of life, which is an aspiration, a love continual and without end: but we can only truly return thither by attaching ourselves to the rays of divine beauty perceptible by us. It is, then, towards God that science, and art, and all human life ought to tend. O Greeks, you are children! I have travelled among those who have given you all that you know, and this is what your masters have taught me."

Zeno. "If, as Plato says, man be originally a free force, why should he not emancipate himself at once, and reassume his true nature, by separating himself rationally from the world?"

Epicurus. "You are dreamers — I am the first of sages. Do you not see that you are under the yoke of Nature, who has created you in one of her infinite combinations? Then, all wisdom consists in obeying Nature in her inevitable prescriptions, and in placing yourself beyond the reach of her blows, as one would do with a fierce animal if he wished to make use of it."

Saint Paul. "I feel myself both free and a slave at the same time. I am carnal — sold unto sin. I do not the good that I love, but the evil that I hate. Wretch that I am! — Who shall deliver me from the body of this death? It will be the grace of God, through our Lord Jesus Christ."

Pelagius. "At least let us remain free in something; and if we ought to strive solely towards God, at least let it be by virtue of a force which is within us, by virtue of our liberty and our own proper merit."

Saint Augustin. "No! Sin has invaded all things, and left us nothing. The love which saves us is not from ourselves: of ourselves we have no trace — no vestige of it. It is given to us by God, when he pleases, and how he pleases; — we are free in nothing. O, my God! thou commandest that I should love thee. Give me what thou commandest, and command me what thou willest." (*Confessions.*)

Luther. "The Christian baptized cannot lose the kingdom of heaven, with whatsoever sins he may be stained, provided he believes; for faith takes away the sins of the world. Free will! a chimera — nonsense! It is necessity that drives and rules us. Man can only work iniquity: I have proved it. The Pope is heretical, schismatic, and idolatrous. Avaunt, Satan!" (*Opera, passim.*)

The echo of this controversy, continued from age to age, gave birth to the religion of the middle ages, and then to reform. Contempt of this world, — a life devout, dedicated to a vain aspiration after an ideal type of perfection founded upon an incomplete notion of man's nature, as if he had been a being solely made for veneration, had so far gained the ascendency, that the superiority of the church, and of the men of purely contemplative life, had deeply fixed it roots in the minds of the people, who bore on their shoulders all that heavy pantheon of saints on earth and in heaven. To such a degree had contempt of the world influenced the Catholic mind, that it was universally believed the end of the world was at hand; and society lived in this world as if it had been a purgatory or passage to another, inalterable, incorruptible, and definitive. That world, however, has not yet come; and, after centuries of waiting, it has followed that we no longer believe either in Paradise or in Eden, in the old sense; for the action of the external world on man causing the succession of his thoughts, a state wherein the things around him were always the same, would be one of immobility to the world, and of moral death to man, leaving no room for his choice or his virtues, his vices or his personality. "Man," says Pascal, "is neither a beast nor an angel." Luther comprehended this truth well; but unable to deny expressly that the end of man's duty was to imitate an ideal type of perfection which the books of so many saints and fathers had for ages inculcated, he sought indirectly to bring back man to nature and the world, by boldly attacking the doctrine of grace, and by making man dependent for every faculty upon God, to destroy the merit of his special gifts and virtues, by reason of which the devout class were thought to have an inherent superiority, and a right to lord it, over the laical or common

class. The Church of Rome, also, while asserting the doctrine of grace and the free will of man; by referring his equality solely to heaven, but retaining his inequality on earth, was more favourable to despotism than the Protestant doctrine, which at first sight would seem to inculcate a fatality pregnant with it, and drove the world to dispense with the church's symbols and power upon earth.

It was inevitable that Catholic idealism had to suffer a modification of materialism—that faith had to yield a few steps to reason. Luther arose to overturn all that lofty hierarchy in earth and in heaven. The vindication of man's individual conscience, as the supreme judge of truth for himself, enlightened by a direct ray from heaven itself, dethroned the pope on earth; the denial of man's free will swept away the merit of the saints and other militia of the skies. To them Luther said, as Figaro says in summing up the merits of the man of privilege in the play, "he has taken the trouble to be born." As for their devout practices, their penances, their celibacy, their mortifications, their spiritual perfections, his sole answer was, "the merit of these gifts is due to God alone."

The poets and metaphysicians of modern days have not, as Dante and the Christians did with the Pagans of antiquity, placed their deluded progenitors in the pains of purgatory, but only in the agonies of hope deceived. The German poet, Jean Paul Richter, has written a sort of vision or allegory, like Shelley's "Triumph of Life," which we may appropriately term a triumph of death, wherein he fancies the dead to have awoke, and cried in vain for the realisation of that Paradise and New Jerusalem upon which they had built their hopes. More properly it may be regarded as a vivid expression of the soul's abhorrence of the idea of annihilation. We have formerly amused ourselves with versifying in terza rima a work which, from its Dantesque view, is admirably adapted to a poetical form. Bayle has somewhere said, that atheism itself should not place us beyond the dread of eternal suffering. This dream seems a commentary upon his words.*

* Methought I slept within a churchyard old,
Beneath a baleful yew one eventide,

Where to the silence of his region cold
Death had long gathered man's ephemeral race;
And on my sleep a frightful dream was rolled.

As I lay dreaming in that charnel place
The steeple clock, with downward rolling wheel,
And iron tongue, Time's slow and heavy pace

Tolled forth, and I awoke at that dread peal,
Then vainly looked aloft in the night heaven
For sunlight: — but eclipse did quite conceal

Its glory with the moon: all graves were riven,
And charnel doors were swung by hands unseen,
And o'er the walls were flitting shadows driven,

Though no corporeal forms did intervene.
And others upwards stretch'd in the pale air,
And none lay sleeping now but babes serene.

The cope of heaven in folds immense did weat
A grey and sultry mist — a giant shade
Was drawing down like vapour closer there.

Above I heard a distant fall, as made
By some great avalanche; whilst in earth's womb
A boundless earthquake's steps did retrograde

Afar, and then anon would near entomb
The wavering pile, which up and down would rock,
From Dissonances, which did fight for room

We have seen works in which Christian poets have lamented the destruction of that Pagan mythology which had invested the earth with so many

---

In anarchy's interminable shock,
And vainly sought to mix in unison.
At times a glimmer hover'd near that clock,

And under it the molten lead did run.
The net of mist and tottering earth then led
My steps towards a hideous skeleton,

Which near the temple-door as I did tread,
Methought I passed, with glittering basilisks,
Brooding within a poison-bush their bed.

Through unknown circles next, upon whose discs,
Gone worlds were graven, passed I; and each shade
Stood round the altar trembling at their risks.

Not heart, but breast did beat, so much dismayed
All seemed.— One dead man only, who had been
Just buried there, in quiet still was laid;

And on his smiling countenance was seen
A happy dream: but when the living came
He smiled no longer, but did change his mien,

And lifted up his eyelids, but no flame
Within their sockets burned; and high his hands
He folded, as to pray had been his aim.

But lo! each arm first lengthens and expands
Into the night, and then dissolves away;
And next the folded fingers thin, like sands

ithin an ebbing hour-glass, dim and grey,
all down; and there, on the church dome on high
Eternity's great dial did display

No number; — as its index drearily
A finger black as night did point thereon,
And the dead sought to see the time thereby.

A noble Form sank from aloft anon,
With looks of speechless sorrow; and all cried,
"Is there no Paradise?" He answered, "None!"

The shadows of the dead, then shuddering, sighed;
Each shuddered, but not with the breast alone;
And one by one, to pieces smitten, died.

Then, said that messenger, "Through worlds has flown
My towering wing, and each bright galaxy
Through sun, and star, and heaven's empyreal zone,

But there is none; and through the boundless sea,
Far as its shadow Being casts, I sank,
And downward gazed in the immensity.

Father! I cried, where art thou? still the Blank
Was dumb. But everlasting Desolation
Howled in its guideless track, and Ether drank

Tears trickling from the Rainbow of Creation,
Without a parent Sun, that gleaming hung
Above the Abyss — the dark Gulph of Negation

When for the Eye Divine I upwards flung
These orbs of light, the immeasurable world
Glared black, nor spoke its inorganic tongue;

And Chaos in Eternity was hurled,
Eating and ruminating it. Cry out,
Ye Shadows, soon into oblivion whirled.

of the bright hues of fancy and peopled it with so many forms of grandeur and beauty. The theological poet of our era has placed in the mouths of

---

Cry on, ye Dissonances, — He is not!"
The ghastly shadows flitted like the white
Vapour by frost, in the frore air begot.

And all was void. Then came, O fearful sight!
The children dead, who in the churchyard lay,
Into the temple, through the dismal night,

And cast themselves in piteous array
Before the high Form and sweet Glory, — cried,
"No father have we then to be our stay!"

And he with streaming eyes to one replied,
"We all are orphans, — I and thou, alas!"
Then shrieked the Dissonances far and wide,

Louder and louder — and the shuddering mass
Of ghosts departed — temple children fell —
The sun, too, sank into the earth — nor was

The universe a moment more to dwell,
But passed with its immensity before
The noble Form at that tremendous yell.

Then tried he from the summit to explore
The universe, with thousand suns inlaid,
And sparkling as a mine, which Indians bore

In far Golconda's diamond-chequered shade.
And, as he saw the grinding press of poles,
The torch-dance which celestial wildfires made,

How world on world shook off its glimmering souls,
As water bubbles on the Sea of Death,
Cast swimming lights upon its rocky shoals,

He looked towards the void with sighing breath,
And cried, "Necessity, cold frantic Chance!
O say what sight is this lies here beneath?

When will ye crush, in your eternal dance,
This universe and me; and each bright star,
One after one, extinguish in the expanse,

When, charioteered by hurricanes, your car,
That sparkling dew of heavenly lights rides o'er
In its fell course of ages secular?

How must each breast its solitude deplore
In this wide grave of all. I am alone!
O Father, Father, have I then no more

Thy bosom infinite to rest upon?
Ah! if each soul doth its own life create,
Why can it not moreover be its own

Destroyer too? Lives there beside me yet
A man? Unhappy one, your little life
Is but the sigh that Chance doth animate.

A mirror casts its rays upon the strife
Of atoms, and the cloudy phantoms rise.
Look down on yon abyss, where clouds are rife

With motion, and the ashy mists suffice
To reek up worlds from yonder death-like sea;
The Future now is mounting to your eyes;

The Present like a falling mist you see.
Sweet earth! that once was thine, knowest thou? Look down."
Here filled his eye with tears. "Alas!" cried he,

the dead his lament for the departure of those visions which the discoveries of Galileo had for ever dissipated. We would prefer to sing with our own Wordsworth —

——— Paradise and groves
Elysian, Fortunate Fields, like those of old,
Sought in the Atlantic main, why should they be
A memory only of departed things,
Or a mere image of what never was?
For the discerning Intellect of man,
When wedded to this goodly universe,
In love and holy passion shall find these
A simple product of the common day.

And now adieu to the theology of the Middle Ages! adieu to its monastic visions, to its raptures of pious love, and its excesses of ascetic devotion! Adieu to its mystics, who believed that the Divinity welcomed to his bosom alone the ignorant and poor of spirit, — to its friars, who fixed their faith in a blind master, the friend of idleness and degradation, — and to its doctors, who interpreting rather sentimentally than metaphysically, "Blessed are the simple in mind!" elevated nullity and idiotism above the high faculties of Intelligence. Adieu to its spiritual life and its code of holiness altogether incompatible with the necessities of the real world; and adieu, finally, to its temporal or mundane life, delivered over both in the past and future to the fatal empire of fact, to the dominion of Satan,—to a world proclaimed by Superstition beyond the pale of justice, stricken with irremediable sin!—a fallen society sustained by the supernatural intervention of Providence which by its hand organised and dispensed all ranks and enjoyments! With Luther commenced a return to Nature and Life. The Deity we adore is that of Pythagoras

---

"Once was I there, and felt the thorny crown;
Yet had I still my Father infinite,
Within whose breast my sorrows I could drown,

And in death's bitterness could yet delight.
Ah! happy mortals! still in him ye trust;
E'en now perhaps your sun is sinking bright.

And midst bright tears and blossoms kneel the just;
And, with joy-streaming eyes, the Omnipotent
Invoke, and know not they, alas! are dust.

Ah, when the sorrow-laden in content
Rests from his galling load, and hopes for morn,
A fairer morn of virtue, his lament

Will rise once, to see no light adorn
The everlasting chaos, nor a hand
To heal his woe, but midnight still forlorn.

Mortal beside me, if thou livest, stand
Aloft and pray, or He is lost for ever."
And as I rose, I saw the serpent-band

Of giant-like Eternity dissever,
And round about the All of worlds aye toil,
Therewith innumerable wings to weave her,

Sweeping the crashing worlds in the turmoil,
Within the walls of that low burying-ground:
And all grew fearful from the dread recoil,

Void, dark, and dismal: then the thundering sound
Of Time's last hour was, by the shivering stroke
Of an immeasurable hammer wound,
The universe to shatter. — I awoke!

and Plato as well as of Jesus: for there is no justice without knowledge. The reprobation of nature, and the complete substitution of a different life, which they called virtue, was the basis of the system of the church. Luther's theology did not in any manner lead to that overthrow of the world into which the Stoics in antiquity and the churchmen in the Middle Ages precipitated themselves. His doctrine was always in his eyes a sort of introduction to practical life. Admitting that the Christian perfection was the type towards which all our efforts ought incessantly to aspire, he was yet sensible that, with the weakness of human nature, to desire to attain to it immediately was little better than folly and suicide. For these reasons Luther appears to us the greatest master of sociality who has appeared in modern times. The Reformation was also indirectly the cause of all that multitude of improvements which the human mind has discovered in the properties of matter,— in a word, the parent of physical philosophy; for it is evident, that if the life which we have in common with the animals had not found a reasonable and religious justification by means of Luther's doctrines, the human mind would have plunged farther and farther into that purely contemplative path in which Catholicism marched with such ardour, and which even now-a-days rears its head anew in the numbers of converts and spiritual bodies new to British society. If *utility* had not been shown to be *moral* by Luther, it would not have existed. Luther was the man who sanctified our devotion to the laws of nature. He said to proud Idealism, "thus far shalt thou go, and no farther!" Catholicism, by means of contempt of this world, had liberated woman, enfranchised the slave, and equalised the Gentile all over the earth; Protestantism, by its sentiments of sociality, has made nations of thirty millions of inhabitants live in a sort of equality, whilst the nations of antiquity and the Middle Ages knew only the *regime* of castes: and when its doctrines shall have received their full application on earth as well as in heaven, privilege and hierarchy will be known no more; nor that series of inequalities, or decreasing chain of rights, of which the first term is the supreme authority of one or of some, and the last the more or less profound slavery of the rest.

The antipathy which the generality of readers feel for theology, that queen of sciences as say the schoolmen, is truly surprising. It is evident that they dislike it and mock at it, or only look upon it as an idle tale to dream about. Of what then does this theology treat? Precisely of that which is the constant object of one and all of us, viz. the grand question of destiny. Its end is to know something of man's future destinies,—of his reasons of action in this world,—of God, of duty, of the future,—and of the laws of that invisible world in the bosom of which we "live, move, and have our being." Most men catechise themselves upon these points sooner or later. Theology has for its matter the object of all study, which, in the elegant language of Sir James Mackintosh, is "to inspire the love of truth, of wisdom, of beauty, especially of goodness, the highest beauty, and of that Supreme and Eternal Mind which contains all truth and wisdom, all beauty and goodness. By the love or delightful contemplation and pursuit of these transcendent aims for their own sake only, the mind of man is raised from low and perishable objects, and prepared for those high destinies which are appointed for all those who are capable of them." (Discourse on Ethical Philosophy, *Encyclo. Britan.*) Where is the man who has traversed life and never debated these things with God, with himself, or with other men? Who is he who has never reached forth his head on the brink of that abyss to listen to the vague sounds that issue from it — to view the confused lights that play through its depths?

The loftiest and the meanest of intellects, alike instinctively feeling the

existence of a law governing their spiritual existence, can never be at rest until they learn what it is; for they feel that so long as they are ignorant of it, they wage a senseless war against nature. No being can violate with impunity the law of its own being without being brought back to it by suffering. But this law of our being, though apparent to the sage, is not so to the mass of mankind, who apply to authority for relief, from the same principle of human nature that they go for the cure of an inscrutable disease to a quack. Fontenelle has truly said of almost all men,—"Incapable of discernment and choice; urged by a blind impetuosity; attracted by objects which they only see through a thousand clouds; led on one by another without knowing whither they go, they compose a confused and tumultuous crowd, which seems to have no other design than that of agitating incessantly. If, amidst all this disorder, some favourable accidents render a few of them happy for some moments, good and well: but it is very certain that they can neither prevent nor moderate the shock of all that can render them miserable—they are absolutely at the mercy of chance."

If this be a true description of mankind's worldly condition in their march towards a future state, it is no wonder they hate theology, or whatever gives a serious or philosophical account of it; they must necessarily be led to take upon the credit of the church their rule of life and happiness. The prayers that are murmured from the depths of churches, the poets that sing the popular superstitions, relate at botton the problems that torment philosophy. What faith is so complete, what scepticism so absolute, that have not their moments of doubt and solicitude?

So far it is so much the worse for the men who merely, because theology has termed herself a science, view it with hatred or disgust. Truth is bought at the price of labour, and philosophy renders back tenfold to weak and mocking spirits all the contempt they profess for her. It is not on account of the metaphysical jargon of the sixteenth century, and the lore of the schools, which popes and emperors, fathers, doctors, jurists, and councils, paraded in their disputes on orthodoxy and heresy, election and grace, free will and predestination, the efficacy or inefficacy of good works, &c., that the historian who would desire to form a just estimate of the part played in the providentail scheme by the Reformers would shut his eye to the real questions agitating at the basis of these disputes. Theologians, like all men who devote themselves to one special pursuit, not only lose sight of every thing else, but end by even forgetting the true end of their own reflections and researches. "In fact," says a contemporary, "whether we consider man in himself, and under the relation of his moral liberty and destiny as an individual, or whether we consider mankind under their social and political relations, we are struck with an incontestible and primordial fact, to wit, the inequality of the gifts which they have received from God. What a difference between a Newton and a peasant, between a Napoleon and the meanest of his drummers! For a long time, mankind, from this inequality, have only been led to infer inequality itself." Woe to the weak, woe to inferior natures, woe to the vanquished of all kinds! Such was the law of the world during a period almost incalculable. The world of humanity savoured almost entirely of the world physical and brutal, from which it toilfully emerged, and which had served it as swaddling-clothes. Antiquity itself parades with a sort of pride this law of inequality, which appeared to it the law divine *par excellence:* and ancient legislations are merely the religious confirmation of an invariable distribution made by the Deity among the various species of mankind.

It is three thousand years since Buddhism arose to overturn the castes of India, and three hundred since the Reformation began to propagate a similar

revolution in our West. "All men are predestined," said Luther; in other words, all men are equal, in spite of the inequality of the gifts which they have received from God. The reign of grace was the dogma maintained by the Catholics, — a future world where the weak shall be freed from the bondage of the strong, and from the chains of the physical world. But as this future world could not but appear for fifteen hundred years a mysterious prophecy, the realisation of which could only be hoped for in the end of time, as it was then said, it happened that a great portion of the world abandoned active life for the contemplative, and, struck with the prophecy, lived upon the earth without regarding the earth, and in a continual expectation of the future life. Thus a separation was made between the real world and the world purely spiritual; and hence two different lives — the vulgar or laical life, and the devotee life. So deeply had this opinion fixed its roots in the human mind, that religion consisted essentially in believing the real world as absolutely nothing, and in sacrificing it to the mystical world of prophecy. Hence the despotism of the church. Luther appeared and elevated the world of reality to a level with the world of grace and intellect. He taught that man had a body as well as a soul — and that his abode was earth as much as his destiny was heaven. By denying the virtuality of mental gifts as a ground of merit or superiority in the eyes of God, Luther denied, by implication, the legitimacy of an earthly superiority of one man over another in consequence of those natural inequalities. Superior knowledge and superior faculties bestow no right to subjugate inferior natures, according to him. The strict application of his doctrines would lead to a new organisation of society, in which the relative rights of the individual and of the association would be otherwise defined than they are at present; inferences which it is not our place to discuss here, but the instinct of which, in one instance at least, is clearly seen at work in the agitation against the new poor laws.

A time will come when, from the height of another philosophy, Catholicism and Protestantism will have to be judged.

Jesus, in that prayer which so many generations during so many ages have repeated after him, said — "Lord, Eternal Father of things, grant that the harmony which reigns in heaven may reign also upon earth!" Now what is the harmony that reigns in the heavens? The stars lean upon each other, and from their mutual action results the celestial harmony. We have had until now war upon the earth; we have had, not the equilibrium resulting from a mutual action — a mutual influence similar to that of the stars, but war. Men have been at war with men, families with families, nations with nations; and, in the same manner, minds have been at war with minds, schools with schools: and, amidst all these wars, an incessant war, the result of all others, the war of what is called Protestantism against what is called Papacy.

But can we never then change this war into peace by the conquest of the truth that spirits are necessary to each other, that they rest like the stars one upon another, and that thence ought to result harmony and not war?

Now if spirits are necessary to each other, they have always been so. And if in the past the liberty and fraternity of spirits did not exist — if they were neither recognised in right nor established in fact; — if they do not even exist at the present day — if the human race be still divided into tyrants and slaves, it must infallibly be that there is war.

This gives us at once the reason of the war that has existed and still exists among spirits, and of the harmony that some day ought to replace it.

War existed. Jesus came, who preached the doctrine of fraternity — the

doctrine of communion — the doctrine which unites together in God all men as members of the same body: — *Unum corpus et unus spiritus: unus Deus et pater omnium, qui est super omnes et per omnia et in omnibus nobis.* (Ephes.) This is the doctrine of St. Paul, the great interpreter of Jesus. It is the doctrine of all the fathers of Christianity. It is the doctrine included in those words of the Gospel, "Ye are all brethren," which have no sense except in raising them to the collective idea of humanity, and to the idea of the universal life.

It is time that the republic of minds should be established; that is to say, that the unity of the human mind should be felt across time and space. Ideas of monarchy and individuality have too long reigned. Thought has been represented as a domain which belonged to one man, and which could only belong to one. It is rather like the air which belongs to all; like a river which passes through your field because it has passed before through a multitude of others. The one principle has introduced or suffered the absurd distinction between Cæsar and the Church, and has ended finally in the Papacy and Monarchy; the other goes to establish the religious Democracy of the future.

Tantæ molis erat HUMANAM *condere gentem.*

THE WALPURGIS NIGHT.

TRANSLATED FROM FAUST. — BY JOHN EDMUND READE.

SCENE — *Hartz Forest.*

MEPHISTOPHELES.

Dost thou not wish a broomstick to bestride?
Far from our mark are we! scarce come half way:
I wish I had the stoutest ram to ride!

FAUSTUS.

While I feel strong upon my legs, the stay
Of this good thorn suffices my support.
For what avails it making the road short! —
To creep along the labyrinth of the vales,
And climb, at last, where pathway fails,
The rocky precipices' walls,
From which the ever-plunging fountain falls,
Makes the true spice which seasons paths like these.
Spring waves among the budding trees;
The very pines already feel its breath,—
Should it not also warm us into youth?

MEPHISTOPHELES.

I perceive nought of it in very truth!
My body is all wintry, and beneath
I would have frost and snow for ever strewn.
But see, how mournfully doth rise
Through mists th' imperfect disk that magnifies,
The blank red orb of yon belated moon!

And glows so dimly, that each step we take
We run against a rock or prickly brake!
I 'll call a Jack o' Lantern here — presuming
Your leave! I see one merrily there fuming! —
What, ho! — may we request you here, my friend!
Why dost thou blaze away there for no end?
Be kind, and light us upward!

JACK O' LANTERN.

From the due
And perfect reverence I feel for you,
I trust I shall restrain my volatile nature;
'T is our propensity, our common feature,
To go a crooked course!

MEPHISTOPHELES.

Come — guide us then!
He thinks in this to ape the ways of men.
Straighter move forward in the Devil's name!
Or I will blow out thy false flickering flame.

JACK O' LANTERN.

You are of quality from the house I see,
And I will introduce you willingly.
But pray reflect! The mountain is to-day
Witch-mad — and spells and sorceries all entice:
So when a Jack o' Lantern guides the way,
You really must not be so over nice!

FAUSTUS *and* MEPHISTOPHELES (*in alternate Song*).

We have entered, then, it seems,
In the magic realm of dreams;
All is now enchantment here.
Guide us well, thou phantom friend!
That our journey soon may end,
And the desert wastes appear.
But see how rushing come, and fly,
Trees behind trees whirling by!
The living crags and mountains how,
As we shoot them past, they bow
Their giant foreheads! — how they blow,
Snarling, snorting, as we go!
Over stone and turf o'erthrown,
Stream and brooklet rush along.
Say, from whence those sounds unknown?
Is 't the magic choir of song?
Do I hear the graceful lay
By the soul of passion wove, —
Voices of that heavenly day
Which we hope for, which we love,
While, like traditions heard of old,
The echo back to us is faintly roll'd?
Tu whit, tu whoo! hark, how the crew
Of owl, chough, plover, round us flew!

Through the night do they awake?
Is 't a salamander there
I see — long-limb'd, long-paunch'd, and spare —
Coiling in the brake?
See the moving roots! their lithe
Bands, like coiling serpents, writhe,
To the rock and sand-hills clinging —
Their strange, long-stretching feelers flinging,
To entrap us, to affright:
And round the live trunk's swelling veins,
The polypus, myriad-footed, strains
To hold the wanderer's flight.
The thousand-coloured mice beneath,
Trooping, variegate the heath:
While o'er the entangled crowd the glow-worms fly,
Thick swarming, like a glimmering canopy!
But say, whither do we tend?
Where shall be our journey's end?
The world of life seems spinning round us!
Trees, and nodding rocks that bound us,
What gibbering gestures do they make,
As we pass them, and o'ertake!
And the lantern-spirits now
Their multitudes increase, and how
Their phantom flames are magnified!

MEPHISTOPHELES.

Grasp stronger here this corner by my side!
Here, from this central point, one sees below
How Mammon lights his mountain up! Look down ——

FAUSTUS.

How marvellously through the grounds doth glow
Hues such as dye Aurora's morning gates:
A melancholy splendour, whose faint crown
To yon profoundest chasms penetrates.
Here clouds the smoke, there rushes forth the steam;
And here a glowing fire of vapour shines, —
Now, to the finest lessening thread refines;
Now, bursts a fountain of volcanic fire!
Blasting all round it — a devouring stream —
Here shoots its thousand arteries o'er the waste;
Now in yon corner, massing and compress'd,
Dividing, ere it doth again expire.
Sparks glittering and flashing o'er us,
Like golden sands, far scatter'd, fall;
See, starring to its height before us,
How gloriously shines the rocky wall!

MEPHISTOPHELES.

Doth not Sir Mammon well illuminate
His palace for the festival to-night?
To have beheld it thou art fortunate:
The riotous guests already come in sight.

FAUSTUS.

How the winds howl and rage along the air!
With what fierce blows they strike my neck!

MEPHISTOPHELES.

Beware! —
Seize fast this old rock's ribs, lest if thou warrest
'Gainst the first wrath of this their thunder fit,
They hurl thee into yonder bottomless pit!
The mists thicken the night: —
Hark! — what a mighty crashing in the forest!
The scared owls flee forth in affright:
Hear! — how they creak and split the dark-green trees,
The pillars of the forest palaces!
The sighs, the deep-heav'd breathing of the boughs,
The mighty groans that issue from the trunk —
The yawning root that agony avows!
In one wild havoc sunk —
Borne unresisting down to earth, they all
Mix in one vast and intertangled fall;
While, through the ruins of the caverned mountain,
The fierce airs hiss and howl!
Dost thou not hear — how far, how near —
Voices — that drown the fountain,
Or the wolf 's hoarser growl? —
Yes — the mountain's sides along,
Streams the maniac magic song!

Witches' Chorus.

Up to the Brocken the witches are flocking,
The stubble is yellow, the corn is sown:
Above presiding, the witch-crowd guiding,
Great Urien sits on his throne.

Voices above.

Old Mother Baubo cometh alone,
Bestriding a farrowed sow:

Chorus.

Honour to her to whom due is the honour!
Mother Baubo comes first, and mounted too!
A stout swine with the mother upon her;
See how she's followed by all the crew.

Voice.

Which way camest thou?

Voice.

O'er the grey Ilsenstein.
In the owl's nest I peeped as I hurried past;
How glittered her eye in the grey moonshine
As she stared at me aghast!

Voice.

Oh, go to hell then! — what rid'st thou so fast?

Voice.

It is she my limbs who flayed, —
See the gashes she hath made!

Witches in Chorus.

The road is wide, the way is long:
Were ever abroad such a riotous throng?
The fork's prong pricks, the broom-stick scratches, —
The child is choked, and the mother snatches —
Her blows in the din unheard!

Sorcerers' half-chorus.

We creep as the snail creeps on to its shell,
When we troop, as now, to the palace of hell:
The women always before us run,
Taking a thousand steps to our one.

Other half-chorus.

There's less of truth in that than jest:
Since, when to rival ye we do our best,
Man with a single bound can gain
What we a thousand took to attain.

Voices above.

Come on — come on from the Felsensee

Voices from beneath.

How gladly beneath would we join with ye:
For ever we 're washed without a stain,
But ever in vain — ever in vain!

Chorus of both.

The wind is hushed, the faint stars fly:
The moon her face hides willingly.
In revelry round the magic choirs
Flash forth like the sparks of a thousand fires.

Voices below.

Stay! oh stay!

Voices from above.

From the caves below,
From the clefts who calls us as we go?

Voices from beneath.

Take us — take us with ye! — wait:
Thrice a hundred years we've striven
To reach yon top, and gain our heaven,
And cannot — let us with you mate.

Chorus of both.

The broom-stick carries ye to-day, —
The fork, the staff, the he-goat may:
If of yourselves ye rise not, ye
Are lost to all eternity!

Half-Witch, below.

How long I have been tripping after! — are
The rest gone on before us far?
I have no peace at home, and fear
I come in vain to seek it here.

Chorus of Witches.

Anointed, the witches all things dare: —
A rag is a sail that mounts the air!
A trough is a bark that cleaves its way! —
He shall fly no more who flies not to-day.

Chorus of both.

And when we meet old Brocken's crown,
How the witch-crowd then go plunging down!
And covering, far and wide, beneath
Hide with their swarms the living heath!

[*They descend.*]

MEPHISTOPHELES.

What pressing, pushing, rushing, clattering, —
What whizzing, twirling, pulling, chattering, —
What lighting, burning, sparkling, warming, —
A true witch element round us storming!
Where art thou? —

FAUSTUS (*in the distance*).

Here!

MEPHISTOPHELES.

What! forced away already?
Place for young Poland here! sweet rabble, place!
Order, here! — I must keep my house more steady.
Here, Doctor, hold! — now spring and clear the space.
Let us escape their riotous revelry,
It is too mad even for the like of me.
Look! how that marvellous thing attracts us near
By its strange lustre, shining there so clear.
Come — come! in with me through the bushes here.

FAUSTUS.

Thou Spirit of Contradiction! well, lead on.
Yet, after all, right sensibly 'twas done:
On the Walpurgis night o'er Brocken's waste
One comes to play the hermit to one's taste.

MEPHISTOPHELES.

Only behold what variegated flames!
There are a lively club met of pied dames.
We shall not be alone here, though we strove.

FAUSTUS.

I would far rather be up there above!
Lo, yonder whirlpool of smoke rising! — where
The wild crowd rush impetuously on
To the red fire where sits the Evil One! —
Full many a riddle must be solved there!

MEPHISTOPHELES.

And many a one more closely rivetted.
Let the great world rejoice, — we will, instead,
Keep house ourselves in quietness. 'T is a known
Established rule, that, 'midst the great world thrown,
One creates smaller worlds within our own.
Young witches naked as when born I see,
And older ones cloaked up more sensibly.
Be friendly! stay here for my sake:
'T is no great task, and ample space within.
Hark! how those instruments their twanging make!
But one gets used to it — this cursed din!
Come — for it cannot now be otherwise:
I forward pass, and lead thee in,
And bind thee yet with closer ties.
What say'st thou, friend? no paltry kingdom this!
Look! thou see'st not the end of the abyss.
They dance, they chat, they cook, they drink, they play:
Where wilt thou find a better than this — say?

FAUSTUS.

Dost thou reveal thyself to gain admission
As sorcerer, or devil turned precision?

MEPHISTOPHELES.

Oh, I must often go *incognito:*
But men on gala-days their orders show.
A garter's not sufficient designation:
The horse-hoof here gains honourable station.
Dost see that snake? [He enters from without:
His groping face already makes me out.
I could not here disguise ensure,
Even if I set about with the intent.
Come on — from fire to fire! I represent
The officer recruiting; thou a wooer.
[*Speaking to some who sit over glimmering coals.*]
Old gentlemen! why sit you poking thus?
We praised you when we found you there with us,
With youth and revelry around you thrown, —
It is enough at home to be alone.

A General.

Let those in nations put their faith who choose!
For though one toils one's heart out for their use,
As with the women, so the common herd —
Youth, youth is all in all — alone preferred.

A Parvenu.

'T is true we were not dullards in our places,
And often played the devil with two faces:
But all is changed now — evil and the good;
We could not cling to either if we would.

A Minister.

How every thing on earth seems going wrong!
My praises for the good old times belong:
Truly when we were first — the all in all,
That was the golden age's interval.

An Author.

How universally the crowd devours
All works alike, of high or lesser powers!
And writings for the rising world professed
Never before so impudently pressed!

MEPHISTOPHELES (*who, all at once, appears very old*).

The world was waxing old even in *my* prime;
Ay, since I climbed the Brocken the last time:
As flows my barrel muddily away,
So also speeds the world in its decay.

A Rag-vending Witch.

Do not pass by so quickly, gentlemen!
Such bargains you may not meet again.
Only examine carefully my wares,—
All, various sorts, not found at common fairs:
No — for the world has nothing it can show
Like my shop, which you carelessly pass so:
Nothing which has not mortal evil wrought.
No dagger here which dealt not bloody death!
No cup from which into the healthful man
The burning, wasting poison hath not ran!
No gem that hath not woman's virtue bought!
No sword that hath not broken plighted faith,—
That hath not stabbed behind the mortal foe!

MEPHISTOPHELES.

Good aunt! our times thou dost not rightly know:
The done is past — the past is done! —
Get novelties in hand, or none:
'Tis novelties to tempt us thou must show.

FAUSTUS.

If I forget not my own nature, I
Should say that is a fair I see on high.

MEPHISTOPHELES.

Upward the whirlpool of life struggles still!
Thinking to push, thou'rt pushed against thy will.

FAUSTUS.

Who is she there?

MEPHISTOPHELES.

Regard her to the life!
For she is Lilith!

FAUSTUS.

Who?

MEPHISTOPHELES.

'Tis Adam's wife.
Do thou beware of her beautiful hair,
And that gem so brightly glittering there!
The youth she doth entangle, he
Shall never — never again be free!

FAUSTUS.

Yonder sit two — the old one and the young;
Away to the right they already have sprung!

MEPHISTOPHELES.

Such as they wish for no peace to-night!
They dance! — come along — let us both invite!

FAUSTUS (*dancing*).

Once I had a beautiful dream!
I saw an apple-tree: two sweet
And beauteous ones shone there with reddening gleam:
They tempted me to climb and eat.

The Beautiful One.

You long still for those apples! — they
Are here — fresh plucked from Paradise.
How overjoyed am I to say
My garden holds as lovely to entice!

MEPHISTOPHELES (*dancing*).

Once I had a dream more mad!

The Old Witch.

My thanks, I beg! — one would not stand aloof
When wooed by the Knight of the Horse's-hoof.

Broctophantomist.

Accursed creatures! — Why yourselves expose?
Have I not proved as clear as a church steeple
A spirit stands not upon common toes,
Yet there ye dance like ordinary people!

The Beautiful One.

What *does* he want at our ball, teazing us?

FAUSTUS.

Oh, he is always thus;
And everywhere the same:
While others dance, he loves to blame;
Judging each step, although the very best.
When we dance forward, then he 's most annoyed;
If you would only circling twirl,
As he in his old mill-dam's whirl,
Then he'd applaud us both with zest,
And if we asked his judgment be o'erjoyed.

Broctophantomist.

What! still there? ho! — consummate impertinence!
Begone — we have explained in full;
The devil's revellers do not need a rule:
How long this error, in despite of sense,
Is still uncleared — a most unheard-of case!

The Beautiful One.

How he does go on teazing! only hear,
As if he could be angry with us here!

Broctophantomist.

I tell it to you, spirits! to your face:

[*They dance on.*]

I see that nothing answers here to-day:
Yet I will still bear with you, and essay
Each step I take, in journeying or revels,
To conquer both the poets and the devils.

MEPHISTOPHELES.

Him in a puddle presently you'll find;
That is the mood he takes for consolation:
And when the leeches fix on him behind,
He starts up — cured of spiritualization!

[*To Faust, who has seceded from the dance.*]

Why leavest thou yon fair girl so suddenly,
Who, dancing, sang to thee so lovingly?

FAUSTUS.

Why, in the midst of it, and while she sang,
A red mouse from her mouth out-leaping sprang.

MEPHISTOPHELES.

That is all right, my friend; for here
One must not show oneself too particular.
That the mouse was not red — let that suffice:
Who, in a shepherd's fête like this, is nice?

FAUSTUS.

Then saw I———

MEPHISTOPHELES.

What?

FAUSTUS.

Mephisto! see'st thou there,
Standing afar, alone, that child so fair?
How slowly now she glides off from that spot,
And, as her feet were bound, moves languidly!
Strange though it be, she doth appear to me
Like my own Margaret, the unforgot!

MEPHISTOPHELES.

Let her alone, or ill will come to thee.
'Tis lifeless, and an imaged sorcery!
An idol — to confront it is not wise:
It benumbs mortal blood those stony eyes;
And would stone thee, that petrifying stare! —
Medusa's story thou hast heard — beware!

FAUSTUS.

They are a corpse's eyes, that hollow void —
Eyes that no fond and loving hand hath closed!
That is the lovely form that I enjoyed —
That is the bosom where I once reposed!

MEPHISTOPHELES.

All witchcraft, fool! thou still so easily moved! —
To every one she seems like his beloved.

FAUSTUS.

What thrilling joy I feel, what fond regret!
I cannot break from her — our eyes have met.
How strangely does one single red line deck,
Yea, and adorn, her fair and lovely neck! —
Like a knife's edge, the finest, nor more wide!

MEPHISTOPHELES.

I see it too: she can herself unhead,
And carry it beneath her arm instead!
Since, the two, Perseus helped her to divide.
What! hast thou still this longing, this desire
For error? — come up to this ground — 'tis higher,
And pleasant as the Pratu* here. I see,
If I am not myself bewitched, nor err,
I should pronounce this were a theatre.
Friend, what is that?

Scene Shifter.

We open instantly;
'Tis a new piece — the seventh: it is our rule
To give that number always in the full.
This one is by a Dilettante made,
And by the Dilettanti also played.
Excuse me, gentlemen! in leaving you:
To raise the drop-scene is my special cue.

MEPHISTOPHELES.

When on the Blocksberg we shall meet — 'tis just
I give that part, so well filled, to your trust.

---

* The grand promenade at Vienna.

POLITICAL STUDIES OF THE FOREIGN STATESMEN OF OUR TIME.

No. I. — M. Thiers.

SECOND PART.

VI.

For new measures new men: to every revolution a general, positive, and organic principle; and believers in that principle, free from all antecedent engagements, sprung from the breath of the Revolution itself, owning no influence save that. Such is the corollary of the preceding spectacle: these are the two necessaries for every lasting revolutionary movement, hitherto perceived but by few of the people, misunderstood by France, and the two which her intelligent and well-meaning patriots have now to teach her. The evil done her by the men of whom M. Cormenin is speaking the people in France already understood, when in 1831 they hooted and *charivaried* M. Thiers at Marseilles, he being then in the south of France preparing for the elections; whilst at the same city, notwithstanding Carlism was the predominant element, Carrel was welcomed a little later with testimonies of admiration and respect. But what the people did not understand — what, perhaps, they understand not even now — is, that by these men they were in part expiating their own faults; that at the bottom of all this was a great political error; that from the beginning they themselves had substituted faith in the men for the adoration of the principle; and that the combatants of July, not themselves well understanding what they had done, and what character they were called on to fill, threw their glorious Revolution, with an almost unpardonable carelessness, into the hands of men who had fought under the banner of the ancient principle, — whose education, theories, and tendencies, do what they would, were united by one link or other to the traditions of the Restoration,— and who, left behind a thousand rood by a revolution in which the people, *having effected all*, had a right to *all the results of the contest*, would necessarily seek to cause it to retrograde, in order to bring it down to their level and their guidance. This, we say, was a great political error, the *practical* bearing of which is incalculable, and to which sad experience ought ere this to have done justice, but which we still see periodically reproduced at almost every effort made by the people towards better things. A revolution is a programme: why then confide the care of its filling up, of its application, and of the deduction of its consequences, precisely to those men who have not only lived under an antecedent programme, but who have submitted to its influence, imbibed its spirit, and accepted its principal bases? Yet this is what the people generally do,— what France did do in 1830.

Either the Revolution of 1830 was in right and in aim, as in fact, only a kind of triumphant *emeute*,—a mere act of resistance, as Perier defined it, without any bearing on the future; and in this case, the immorality excepted, which it is ever righteous to stigmatise, recrimination is uncalled for; what is is well; the first fault is on their side who have sought to outstep its bounds, and make it yield them more than was in its power: or either, as we thought, and as entire Europe thought, governments and people, it was called by the instinct of the masses to set an idea in the world,— to cause the

social institution to advance one step,—to bring into play an element till then excluded from the organisation of the country; and in this case, the accomplishment of these matters ought not to have been left to the men of the fifteen years' opposition, — for to them, at least, Perrier's definition applied exactly.

The fifteen years' opposition had no principle; and the very name of *opposition*, self-conferred, and which posterity will confirm to it, says enough on this point; thence it was that it had the means of successively uniting in its bosom men of tendencies entirely distinct, nay, sometimes opposite, — Guizot, Foy, Perier, Constant, Manuel, Lafayette, and Lafitte; thence, also, it was potent to pull down — impotent to build up. The fifteen years' opposition had no principle; it possessed only reaction, — a noble and useful reaction doubtless, but more than that is required when men desire to go forward, and not to turn in a circle. It was radically wanting in all power of the initiative, and knew nought but negation. It had at bottom more of hatred than love, more of fear than hope, more of repugnance towards attempts at retrograding than of zeal towards progression. This last word was suspected from its very first appearance; they were all alarmed at it, as if from the fear of being compelled to formula something; and Benjamin Constant, their leader in all things, attempted its expulsion from the nomenclature of politics in an article he inserted in the "Revue Encyclopedique." A little later, and this was somewhat modified: they felt the necessity of fraternising with the young ideas that were making their way in the world. The final period of the struggle was approaching; and as though to pay a forced homage to the law of things, they perceived that to overturn a dynasty the name of a principle at least was necessary. They adopted it, and this was the epoch of the famous lectures of Messieurs Villemain, Cousin, and Guizot. Unhappily, they had no more than the name: we now know it; the *substance* was not in them. Progression was a vague expression, taken rather by way of countersign than of motto. In what did it consist? What could they make of it? What was to be its next formula of application, political and social? Of this they knew nothing; nothing they wished to know. Moreover, it was to the extra-parliamentary subdivision that they left the working of the word; the great mass of the parliamentary opposition had it not even in their thoughts: great principles were not their business; their *forte* was detail. They carried on a partisan war, annoying, skirmishing with, and tiring out the enemy. Their thoughts were not at all employed on what they should put in the enemy's place, when once they had driven him out. They advanced to a revolution unawares, and blindfold. Having neither any real plan nor position of their own, they accepted that given them by the enemy; they left him master of the choice of ground, and the choice was the *Charter* and *Legitimacy*, and they accepted both, though they believed in neither. They fought in their name, they invoked them on every occasion, contenting themselves with following the steps of the government in its minutest acts, and of assailing it in its too frequent deviations. As they themselves said after the victory, they were playing a comedy; and they found it so good, they clung to it so closely, that when Manuel, not the most forward but the most sincere of them all, once permitted himself to let out the secret, they punished him — Thiers at their head — by no re-election.

We know to what this famous secret was reduced: it was a profound hatred vowed against the Bourbon dynasty; and with a certain number of them, amongst whom Manuel himself must be reckoned, to one of the branches of that dynasty. This was not the secret of the people; something

more was wanting at the bottom in the masses, and in that youth who were accustoming themselves to death in the persons of Bories and Pommier. But who amongst the renowned of the epoch then thought — Berenger the poet excepted — of the people? Who made that so simple reflection, that after Richelieu and the Constituent Assembly, after the organisation of *villes* and *communes*, then of royalty, then of the *bourgeoise*, by the revolution of 1789, there was no longer room in a revolution but for the organisation of the people, of the whole power of the nation?

None thought on this, and it was a fatal omission. It was also — it is time to say it, notwithstanding the brilliant colours in which this fifteen years' opposition still decks itself to our eyes — it was a very mischievous system of tactics that presided over the contest. Little by little it substituted a war of names for a war of things; it falsified the direction and the point of sight of the national spirit; it degraded the important suit that had been going on in France since 1789 into a paltry and trivial question of form; it confined the soul of the Revolution in the slender and consumptive breast of the charter of Louis XVIII.; and by concentrating the combat of ideas around this scrap of paper, exalted into the ark of the covenant,—by hurling this word *charter* at the head of the people and the government as a universal *apropos*,—by habituating the former, who sought a far different thing, to take it as their rallying cry in the combat, it prepared the way much more than is supposed for the mystification of July, for the monarchy of the 7th August: it did more; — by this sour, uncertain, and in some sort hypocritical manner of combating, it introduced a kind of jesuitical spirit into the essentially frank and honest course of principle; it made progression a sort of guerilla *tirailleur* by depriving it of all that it naturally has imposing, solemn, and religious; it threw over political France an upper stratum of demoralisation on which Louis Philippe has since worked; it implanted the spirit of diplomacy in the heart of the popular party. Now diplomacy may be valuable to governments; but it has been, is, and ever will be, according to our individual way of thinking, excessively pernicious to the people. Error and class-interests may well diplomatise; right and truth cannot, without losing their strength and their sanctity.

The fifteen years' opposition was then eminently reactionary; taken in the mass, and correctly speaking, it was not *revolutionary*. With us, this word has no value, but as far as it represents a man or a party believing in the existence of an element unrepresented in the organisation of society, though ripe for being so, and striving to give this element life, activity, development, emancipation, and the rights of citizenship. It implies then a *positive* principle of organisation, whilst the parties purely reactionary look only to destroy,—have no other potency but to expel from the city an element decayed, diseased, useless, or pernicious. We have no need to add, that in France, as elsewhere, and more than elsewhere, this neglected element that demands to be admitted to act and to be functionary in the social body, is, *at this day*, in our opinion, the element of the people, the generality, the NATION, as opposed to the system that concentrates the exclusive exercise of sovereignty in any particular minority, in a patrician or middle-class caste, based on hereditary privilege or on the possession of wealth. But, whatever may be thought of our opinion, and of the extent to be given to the principle, we say, — and we refer our readers to history for the verification of that which, from the limits imposed on us, we can but here enunciate, — that a principle is indispensable to every party that assumes to be revolutionary; and that if it have none, as soon as victory shall have done away with the necessity of union, it will sink into vacuum and decomposition;

and then, at the close of a series of deceived hopes, two courses will present themselves, — a misanthropic isolation, a despairing and sceptical death; or a relapse into individualism, and a life egotistical and immoral. Benjamin Constant, aged and austere as he was, in his latter days leaned towards the first; M. Thiers, young and fickle, gaily took the second.

Like the opposition, of which he was one of the members most distinguished for activity, talent, and acuteness, M. Thiers was without a principle. Why then did persons persist in expecting from him in 1830 the firm, honest, and progressive course belonging only to those men who have a principle? A bold combatant, —full of the traditions of the empire,— loving bustle, life, and agitation,— plebeian and poor, but conscious of intelligence and address,— impelled also by circumstances, he threw himself into a contest which he found to be vigorously waged, on the side of the only party that could reckon on victory,— of the only party, too, that could make his fortune. He brought to it suppleness, ardour, sometimes eloquence, a certain youthful aspiration of national pride, and a peculiar and almost inexplicable rancour, which has never yet abandoned him*, against those Bourbons who, without strength of their own, had, by the aid of foreign bayonets, once more planted their white flag on the soil of France. Why would men recognise in all this the elements of a statesman? By what fatality were they bent on looking for guarantees in his talent, without adding an inquiry into his morality? And how could they pretend to discover a conscientious apostle of a popular revolution in a man in whom nought bespoke a comprehension of, and love for, the people; but, far from that, whose most brilliant works, had they taken the trouble to study them, would have revealed a distrust — a marked disdain for them?

This leads us to say a few words on his "History of the Revolution," a work on which is based two thirds of his reputation as a politician and a revolutionist†, and which, even after the progress made in later years in the science of history, and after the important publications of Messieurs Buchez and Roux on the Revolution, the world continues to admire, to reprint, and to translate; and of which, however, we believe, a not very profound examination would suffice exactly to foretel the part M. Thiers would play, once launched in public business.

We are far from denying the eminent qualities that distinguish the performance of M. Thiers; but they are but literary qualities; and though they are requisite in every writer who undertakes a similar task, they must yet be looked on as only secondary. The historian's is a severe and grave department, and it sufficeth not to bring to it the talent of the artist. The responsibility of historians is great; their works are a nation's institutes; and it is from their pages that statesmen are formed, and the systems that make power a scourge or a blessing to the people. No test, therefore, can be too severe with regard to them. In the present day, and therefore are we urgent, we read quickly and think not. Hardly do we give ourselves the time to remark talent, much less to appreciate the moral; and yet the moral is everything, the capacity alone nothing; it is not even the sign of a

* To such a degree that being about, in 1837, to hire from Madame du Cayla the chateau of St. Ouen, the cradle, as is known, of the Charter, he entered into a long dispute (which put a stop to the negotiation, we believe) with the lady proprietress, who, faithful to her ancient patron, insisted that M. Thiers should permit a full-length portrait of Louis XVIII., hanging in one of the apartments of the chateau, to retain its position. M. Thiers, consistent to his *juste milieu* habits, proposed to conciliate his antipathies and his acquired interest by covering it with a curtain.

† As a writer, some articles inserted in the *Globe*, a very insignificant journey to the Pyrenees and the South of France in 1823, a pamphlet on the system of law, which we have not seen, and some miserable political pamphlets, make up all we have of his; the History and his *collaboration* in the *Constitutionnel* and the *Globe* excepted.

moral: and this it is, be it said, *en passant*, that condemns the *doctrinaire* system supported by M. Guizot and his pupils.

That which is true of all history must be eminently so of that which relates to an event the most important, the most fruitful of consequences, the most complicated in its elements, and perhaps as yet the least understood of our modern times. If the Revolution of 1789 be not a grand manifestation of the human mind in the political and social system — if it be not the triumph of the great principles of Christianity, *liberty*, *equality*, *brotherhood*, applied to the civil world — if it be not united, either as a grand abstract, or as a new programme, to all the antecedent acts constituting the tradition of humanity; — then is it nothing: it is a tumult of the giants, wonderful and terrific in its effects, but stained with too much blood and dirt for us to bow down before it and reverence it. But if it be what we have just before said, then is it from an especial point of view, far more elevated than that from which we scan the ordinary events of the world, that we must place ourselves to *judge* its deeds; and from this point of view there will be a striking and redeeming character in our estimate of those deeds that we should but hold up to reprobation, were we limited to their contemplation as isolated and in their immediate material effects, — a redeeming change in our estimate, be it understood, as past, and without any reference to the future: the future will not have the same necessities.

This character of an event resulting from the scheme of humanity, — of a providential event, if we may so express ourselves, — doubtless exists in the French Revolution, and takes it source from the very bowels of the nation. In fact, during the progress of the event, the nation was often in advance of power — the inspiration, the initiative arose from below. The recognition of this made the strength and the might of the mountain; and that which made the strength and the grandeur of the Revolution was the having presented to the world the spectacle of a great idea incarnate in a great people. Every historian who sits down to his work without a consciousness of the two extremes of the series, the action and the agent — the European mission of the French Revolution, and the people, the armed missionary, — will belie his part, and will furnish to his readers an altogether incomplete view of the event. But on a subject such as the French Revolution every incomplete view cannot fail of being mischievous. There will happen to the youthful minds who may form the audience of this vast spectacle of strife and of terror, of energy exalted to frenzy, of force carried even to the scaffold, who may not possess a belief in the creed we have indicated, that which happened to the Revolution itself: they will end by falling, seized with vertigo, at the feet of this consuming energy, without asking themselves why; they will end by paying divine honours, for its might alone, to that force which is no longer sacred than when employed in the service of sacred ideas. Thus did the Revolution become absorbed in an emperor.

In that way sins Thiers's history: thence also do we hold it dangerous to the great portion of his readers.

Without consciousness of the law that directs and explains the historical events, with a marked disdain for the people, with dispositions such as those we have pointed to, M. Thiers, with the vicissitudes of the Revolution spread before him, could come to but one goal — the adoration of power. This he has done. He explains nothing, — for the simple reason, that nothing has he explained to himself. He sees in the Revolution only a great fact — a material and gigantic fact, accomplished under and against immense obstacles: that he admires. With right he meddles but little; with him right is in the fact itself; let it but triumph, and that with him is sufficient for its

legitimacy. Glory to the conqueror! Woe to the conquered! Never do we surprise the writer excited, panting, swelling, at the manifestation of one of those great truths that give to the French Revolution that monumental character that must ever remain. If he admires the decree by which the Convention offers the aid of France to every people that desired to regain liberty, it is not because there is in it an instinctive revelation, a presentiment — which it must be admitted the Revolution did not realize — of that great dogma of the future, the association and the solidification of the people: no; it is that there is in it a vast manifestation of strength and audacity. If he permits himself a burst of true enthusiasm, it is on the state of things at the close of the year 1797, — "when the taking of Mantua liberated Italy; when France, at the summit of power, was mistress of all the soil that extends from the Rhine to the Pyrenees, from the sea to the Alps; when Holland and Spain united their fleets to hers; when, according to the expression of Mallet-Dupau, the half of Europe was at the feet of the Directory; when (this refers to the interior) a government composed of *bourgeois*, our equals, ruled the republic with moderation." And yet at this very epoch corruption was already in the republic, — she was seated in the cabinet with Barras, — she was bringing the germs of the Restoration with the clubs of Clichy, — she was rapidly preparing the footing for a *bourgeois* aristocracy, swayed by military ascendency: at this epoch unblushing lies were enacted against the great principles proclaimed as respected the people; — the combat was no longer carried on for the liberty of nations, but for the glory and the power of one nation; and patriotism was in the camp, because everywhere else it was defaced. But what matters that, — what matters right to the historian who, in speaking of the changes which the Directory made in the Cisalpine constitution by a simple ambassador (Trouvè) commissioned from Paris, thus writes, — "Moreover, the mode employed was of slight importance. It would have been absurd in France, who had created these new republics, and who maintained their existence by her support, not to have profited by her power to establish the order that she deemed best." And can we be astonished when this writer, the idolater of all that is power and success, after having re-exalted the mountain, throws himself on his knees before the 18th Fructidor, the 18th Brumaire, — before the consulship, before the emperor? In all these cases they are not ideas that he re-exalts, but victories. To re-exalt ideas the historian must have a principle, a presiding rule, a criterion for morality; and M. Thiers has it not. "It was a war (he says, speaking of the pillage of the wardrobe and the appropriations committed by the *commune* of Paris) — a war made on the ancient society, and *every war* is stained by murder and pillage." Of such passages there are hundreds. Neither has he, failing a moral criterion, a philosophical one wherewith to unravel causes and show the reason of events. To the passages cited by Loève Veimar in support of the proposition we are advancing, — and which may be seen faithfully extracted in "Blackwood," — we might add a crowd of others not less significant; but we shall content ourselves with producing one that M. Loève Veimar has neglected, and which wonderfully sums up the whole of M. Thiers's historical philosophy. "Thus (says he, speaking of the time of the Dumouriez ministry) — thus, by a kind of fatality, the supposed intentions of the Château excited the distrust and the fury of the people, and the howlings of the people augmented the disquiets and the imprudences of the Château. Thus despair reigned without and within. But why, we ask ourselves, did not a frank explanation put an end to so many ills? Why did not the Château perceive the fears of the people? Why did not the people perceive the disquiets of the

Château? But why are men men? . . . . At this last question we must pause, submit and resign ourselves to human nature, and pursue our sad recital." Oh, M. Thiers! have you nothing better than this to teach us? Verily, in these *epiphonemata* there is a simplicity bordering on fatuity, coming as they do, be it observed, one page after the account of a conversation in which the queen said to Dumouriez, "*You ought to be aware that neither the king nor myself can suffer all these novelties, nor the constitution. I frankly declare this to you: make up your mind.*"

We have just said that M. Loève Veimar has, before us, passed an analogous judgment on the "History of the Revolution:" and we entreat our readers to add this analysis to the little we have said. We wished to place them on their guard against the eminently materialist tendency of the historian, who could find in the Revolution of 1789 only materials wherewith to erect a monument to FORCE, and to dedicate it to Victory. But what M. Loève Veimar has passed in silence, what we regret not to be able now here to develop, is the profound contempt for the people that pervades the pages of M. Thiers, — the fury with which, in the midst of his habits of systematic justification, he reserves all his anger for what he several times calls in the course of his work the *vile populace*, the *barbarians** burrowing at the root of society, and we know not what more, — the spirit that is revealed in passages like the following: — "Doubtless we behold with disgust (speaking of the fêtes of the goddess Reason) these reckless and unmeaning scenes, in which a people changed its worship without comprehending either the old or the new. But when has the people meaning? When is it capable of comprehending the dogmas that are given it to believe? What do the people usually look for? Great meetings, that may satisfy its cravings for being assembled, — symbolical spectacles, that incessantly recall a power superior to its own, — and lastly, festivals, that render homage to men who have approached nearest to the good, the beautiful, the great, — in one word, temples, ceremonies, and saints. Here there were temples,

* The phrase took, and calls to mind the declarations of M. Guizot, and the famous cry of alarm of the *Journal des Debats* — "*The barbarians are at the gates*" — applied to the operatives. It is in speaking of the ill treatment that Bailly suffered on the day of his death that M. Thiers hits on the appellation of *barbarians*: it is preceded by these lines, — "The vile populace has not changed since the time that Tacitus beheld it applauding the crimes of the emperors. Always sudden in its movements, sometimes it rears the altar of patriotism, sometimes it erects scaffolds; and is a beautiful and noble spectacle only when, drawn up in arms, it is hurled on the ranks of the enemy. Let not despotism impute its crimes to liberty, for, under despotism, it was always equally guilty as under the republic," &c. We might say a great deal on this passage, on the theatrical circumstances added by M. Thiers to the historical reality of the execution of Bailly, and on this generous burst against *the vile populace* compared to the silence that he observes as regards power, — as if these cruelties were not the echo of those of power; as if the men who sent Bailly to death were not in any case as guilty as the men of the people, who, after his arrest, believing him a traitor to the country, insulted him on his way to the scaffold; lastly, as if a year of proscriptions, coolly issued by *power*, must not have demoralised the masses below. But all this would lead us too far; and we just now prefer quoting a passage from the excellent and conscientious "History of the Revolution," by Messrs. Buchez and Roux, vol. xxxi.: — "The greatest of all the revolutionary excesses witnessed by the capital was, doubtless, the massacre of the prisons. Well, by a singular chance, the names and professions of all those who consented to be the instruments of this butchery have been preserved; and we find that they all belong to what was then called *la petite bourgeoisie* — they are master shoemakers, master tailors, people in trade. . . . . The atrocious circumstances that accompanied Bailly's death form perhaps a fact of this kind, the cause of which is the most grossly evident. His death was a reprisal taken by men who had to reproach their former mayor with having assailed, under the very wing of the law, their wives, their relatives, their children, their friends. They who insulted him in his last moments were the very petitioners of the Champ de Mars who had been fired upon by Bailly's order. One of the subscribers to the petition, Richard, from the section of the Invalides, made himself remarkable amongst the most furious, as we learn from the minutes of the sitting of the Jacobins of the 26th of December. The historian who designs to draw from this event a moral lesson, ought without doubt to brand those who thus avenged themselves; but he ought also to condemn the proved criminality that provoked a vengeance so frightful. The lesson is for power."— P. 135.

Reason, Marat, and Lepelletier. It was assembled, — it paid its adorations to a mysterious power, — it celebrated two men. All its wants were satisfied, and it yielded to them no otherwise than it always does yield." We may be wrong; but such passages, thoroughly considered, appear to us so significant, so full of matter, that our efforts are vain to understand how men who had read the "History of the Revolution," could see in M. Thiers an apostle of progression and liberty, and could fancy that he had in him the stuff for a statesman, a legislator, and administrator of the concerns of a people.

There are, however, amongst us, as we said at the commencement of the article, some profound politicians, who think that the accession of M. Thiers to power would be a very propitious event for England. We bow our wretched head in the most profound humility before a sagacity so mysterious and lofty.

VII.

We have attempted, as far as in us lies, to illustrate by the example of M. Thiers an essential distinction, and yet one almost always forgotten, between the men properly called *revolutionists*, and the men who are simply *reactionists*, and who have usurped, especially in later years, the former designation, and have thrown on it discredit and distrust. This we urge, and shall continue to urge; for even though we might, through a lofty disdain, submit to be unjustly charged with the faults of those who do not belong to us, we are at least bound to endeavour that the people may be spared the sad consequences of the error they commit when without inquiry they confide the future to men, competent indeed to lead them in the struggle, but without love for them, without faith in them, — from a thirst for renown, for power, or for wealth. For if it be the law of the providence of humanity that it is to accomplish laboriously and painfully its conquests in the path of progression assigned to it, the more grievous it is that by an ill choice of those called to take the lead it is seen continually compelled to retrace a road already gone over.

The *revolutionist* — he at least whom *we* call by that name — has a creed: the *reactionist* has none; he has instincts, passions, often generous in their origin, but easily corrupted whenever they meet with disappointments or the seductions of power, — whenever years come to cool the enthusiasm that kept them up to the height of disinterestedness. The *revolutionist* is he to whom observation has shown the existence of a grave social grievance or immorality — to whom intelligence has shown a remedy — to whom the cry of a conscience enlightened by a religious conception of the human mission here below has shown the inexorable, the untiring duty of devoting himself to the extirpation of the evil, to the application of the remedy: the *reactionist* is he whom a sentiment of rebellion against injustice innate in minds gifted with any power, very often its own suffering and the irritation of not finding its place in the existing social order, impels to a search for support in the equally suffering majority. The first then will pursue his forward march, whatever may be his individual position, so long as the social evil endures; ten to one but the second will cease from the struggle as soon as injustice shall cease in regard to himself, — as soon as the overthrow of the power attacked shall have satisfied his self-love, and softened the sentiment of reaction that animates him. The *revolutionist* may be deceived as to the remedy to be applied; he may anticipate too much from the future, and substitute his individual intuitions for the common sense of the masses; but then at least he will not produce grave disorders in the bosom of society: without echo to a conception

superior to the time, he will perish in the struggle almost alone; whilst the *reactionist*, contented with inciting to action all the passions of war and activity that are fermenting in the bosom of the youth and the suffering multitude, leaving unsettled the solution of the problem, and thence permitting to each the hope of seeing his own adopted, will always find a powerful response to his appeal. The aim of the one is always to found, of the other to destroy. The first is the man of progression, the second the man of opposition. The former then argues from a law, the latter only from a fact; and whilst the first seeks to enthrone universal reason, the latter ends, in the last analysis, but in the consecration of force. With the *revolutionist* every question resolves itself into a question of principle; he takes up his position decidedly, proceeds in a straight line, neglects what are called tactics, renounces many elements of success, trusts to the power of truth, commits a thousand petty errors, but redeems them by the proclamation of some general maxims sooner or later useful: with the *reactionist* details are every thing; in them he excels; he represents the analysis of decomposition in its highest expression; in his hands every question becomes a question of men; he is thoroughly master of all the secrets of a petty war. His eloquence is lively, supple, and brilliant; that of the *revolutionist* is often dry and monotonous, but always logical, and inexorable if an opportunity be once given it: it may for a long time fail in its effect; but if it but once attain it, it is for ever; whilst the victories of the *reactionist* may be splendid without being durable. The man of revolutions prefers to invoke duty, the man of reaction invokes right. A strong religious tendency influences the acts of the first, even when by a contradiction of intelligence he will not recognise it himself; the second is irreligious and materialist even when he is speaking of God: with him the present ever tops the future; material interest takes precedence of moral progression. The men of the first class, accustomed as they are to count sacrifices as little, labour less for the generation that lives around them than for generations to come; the triumph of the ideas that they cast on the world is more slow, but assured and decisive: the men of the second class often win victories for their contemporaries; but their children will enjoy none of the fruits. The former are the great prophets of mankind; the others are but the agitators, and bitter disappointments await the people that commit their future to their care.

And yet in these the people still confide; and such is still their blindness as amply to justify the urgency of our warning. Within this year the parliamentary agitation that, under the name of a *coalition*, overthrew the Molé ministry in the beginning of 1839, has shown us France ready to forget the past that we have just depicted,—hailing the possible return to power of M. Thiers as a day of triumph for her liberty. In this wretched bickering of men disputing for power too recent for it to be necessary that we should carry our readers over the narrative, we have seen M. Thiers abridge as it were the tactics of his whole life. We have seen him in bold and violent reaction against all the irrevocable acts of a ministry he aimed at supplanting, and jesuitically trimming on all those that still unsettled might fall to his own decision; we have seen him, highly and puritanically susceptible as to the past, avoiding any declaration as to the future, and insinuating to the power that alone disposes of portfolios that, once a minister, he would renounce the defence of Belgium, electoral reform, the conversion of the *rentes*, Spanish intervention: and yet a whole excited country looks up to him for salvation!

VIII.

There are still many things to be said touching M. Thiers — his life prior to 1830 — his introduction to Manuel, Lafitte, and a little later to Talleyrand — the forgotten kindness of the former, the accepted counsels of the latter — his share in the *Constitutionnel* — his connection with poor Sautelet — his labours on the *National;* but in truth we have had enough of him, and we rather prefer recommending the curious to the sketch by M. Loève Veimar, — the more so that our design has been completed.

Blackwood — that is to say, M. Loève Veimar — has quoted the curious passage of M. Thiers on Mirabeau, that applies so well to his own life. By adding to it, to quote in our turn, the passage in which M. Mignet, the intimate friend of M. Thiers, draws the portrait of Dumouriez, in his "History of the Revolution," we shall get a nearly complete outline of the man we have been exhibiting to our readers.

"Ere the Revolution began, he had lived in intrigue; and he too often bethought himself of it at a period when petty means should have been employed only to aid great ones, and not to supplant them. The first part of his political life was passed in seeking by whom he might rise, and the second in looking by whom he might retain his station. A courtier before 1789, a Constitutionalist under the first Assembly, a Girondist under the second, a Jacobin under the Republic, he was eminently a man of circumstances. But his character was enterprising; he possessed an indefatigable activity, a prompt *coup-d'œil* . . . . . an impetuosity of action, and an extraordinary confidence in success; and he was besides . . . . . quick, keen, bold; an apt partisan . . . . . full of expedients; astonishingly ready, and knowing how to submit to circumstances in order to alter them. He was adventurous, fickle, and highly inconsistent in thought and action, on account of his continual life of activity and intrigue. But the grand defect in Dumouriez was the absence of all political conviction . . . . . After having been the servant of parties, he thought he could conquer them all by intrigue."

God be thanked, England may have Guizots—perhaps has them already; but — at least we hope so—she cannot have Thierses.

One word here on M. Thiers's system of political economy. "Nations have an irresistible tendency for making industrial conquests over each other. To attain them they prohibit or raise the price, by means of a tariff, of certain foreign products, so as to give their own citizens an advantage in their production. This is a universal instinct. Custom-house duties (that is to say, prohibitions and restrictions) are an instrument that no nation ever could or can do without." (Exposè of the Reasons for the *Projet de Loi de Dovanes* of 3d February, 1833.) . . . . . "The object of the government is to conciliate the liberty claimed by commerce with the protection demanded by the manufacturing interest." (Speech of 1833 before the Meeting of the Delegates of Agriculture, Commerce, &c.) The entire theory of the minister of commerce rests on these two bases, reminding us of Mr. M'Culloch's "as much as to say, that he proposes to himself to marry good sense with folly." (Edinburgh Review, 1833.) Besides, Switzerland does very well without prohibitions and restrictions: Prussia does without them: Flanders did without them in the 14th and 15th century, and prospered. In France the extensive and beautiful manufacture of shawls, the trade in paper-hangings, cabinet-work, that in fashions and articles of *galanterie*, in optical instruments, bronzes, and porcelains, &c., all do without and flourish the more.

The woollen trade prospered in France by a free interchange with Spain, but declined from the day that a protecting duty was applied. Above all, the duty on foreign iron has been of service only to the proprietors of forests (of whom, let it not be forgotten, Louis Philippe is one); that is to say, to men who carry on a branch of industry the easiest, the idlest. On these facts and many others our readers should consult an excellent essay, "*Sur la Reforme Commerciale, par M. Stephane Flachat*, 1833." In France there was an unanimous outcry against the minister's exposè. Five hundred and eight Bordeaux houses signed a protest against it. Havre also protested. The Commission of the Chamber of Deputies did not adhere to it.

"No one is now ignorant that France has been outrun for some years in her fabrics of silk and cotton stuffs by various countries (Switzerland, Prussia, Saxony), who have never in these branches been protected by any duty, others by very light ones; — that notwithstanding all the impediments thrown in the way of transit, very considerable quantities of silk and cotton goods daily arrive from those countries at Havre, there to be shipped for various parts beyond sea, where they have to compete with French and English merchandise of the same kind; — that Belgium, who when she formed part of France was protected in the manufacture of cottons by the prohibitive system, soon after she passed under Dutch rule sustained in this fabric the competition of English manufactures under very moderate duties; and now that she is separated from Holland, and has lost the advantages that she derived from her privileged connection with the Dutch colonies, she still pursues this branch of industry with no less success." (Havre Commission.) "The *projet de loi* of M. Thiers, a negation of all principles and all systems, in place of setting all the interests of matter at liberty, hands them over to the most absolute arbitrary power by exalting the blindest empiricism into a system of public economy." (Commerce of Bordeaux.)

THE IDEAL.

TRANSLATED FROM SCHILLER.

"How much is lost, when neither heart nor eye
Rose-wing'd Desire nor fabling Hope deceives;
When boyhood, with quick throb, hath ceas'd to spy
The dubious apple in the yellow leaves;
When, springing from the turf, where youth repos'd,
We find but deserts in the far-sought shore;
When the huge book of faery-land lies clos'd,
And its strong brazen clasps will yield no more." — *Spenser.*

THOU, — and wilt THOU for ever leave me,
False as yon blush of eastern skies?
And didst thou smile but to deceive me,
With all thy tender phantasies?
Will nought detain, nought overcome thee,
O, golden season of life's glee?
In vain; — thy waves are sweeping from me
Into eternity's dark sea.

The sun-smiles, the fresh blooms have perish'd,
That bright around my morn-tide shone ;
And all within this heart most cherish'd, —
Life's sweet IDEAL, — all is gone !
The faery visions, the gay creatures,
To which my trusting soul gave birth, —
Stern reason dims their angel features,
And Heaven is lost in clouds of Earth.

As erst, with fiercest, tenderest anguish,
Pygmalion clasp'd the senseless stone,
And taught the death-cold breast to languish
With blood, pulse, transports, as his own :
Thus I, around my heart's dear treasure —
Round Nature — twin'd my wooing arms,
Till, giving back the throb of pleasure,
She glow'd, alive in all her charms.

Then, then with mutual instinct burning,
The dumb caught rapture from my tongue,
And kiss with sweetest kiss returning,
Responsive to her minstrel rung :
With falls more musical the fountain —
With brighter hues flower — tree — were rife
The soul-less breath'd from lake and mountain,
And all was echo of my life.

My bark, with wider sails unmooring,
Stretch'd boldly forth o'er depths unknown,
With eager prow Life's coast exploring,
Her realms of thought, sight, feeling, tone.
How vast the world there — how elysian
Its prospects — in dim distance seen !
How faded now ! on nearer vision,
How small ! and oh, that small how mean !

With soul by worldling care unblighted,
With brow unblanch'd by fear or shame,
Forth sprang, on wings of hope delighted,
The Youth into the lists of fame.
Far, far beyond Earth's cold dominion —
High, high as Light's exultant sphere ;
No realms too distant for his pinion,
No worlds too bright for his career !

How swift the car of rapture bore him !
No toils seem'd hard, no wishes vain ;
How light, how gladsome, flash'd before him
Imagination's sparkling train !

High Truth, in sunbright morion glancing,—
Young Glory, with his laurell'd sword,—
Fortune, on golden wheels advancing,—
And True-love with its sweet reward.

But ah! as ocean's breast unsteady,
These visions fade — these joys decay;
And, faithless, from my path already,
Friend after friend, they've dropp'd away.
False Fortune hails some happier master;
The thirst of lore survives my youth;
But Doubt's chill clouds are gathering faster
Around the sunny form of Truth.

I see the holy crown of Glory
Polluted on the vulgar brow;
And Love — ah! why so transitory?—
E'en Love's sweet flowers are withering now;
And dimmer all around — and dimmer
Fades on the sense Life's west'ring ray,
Till Hope herself scarce leaves a glimmer
To light the pilgrim on his way.

Of all the crowd that once were near me,
To court, soothe, flatter, shout, carouse,—
Who now is left? Who comes to cheer me,
And follow to my last dark house?
Thou, Friendship! gentlest nurse, that bearest
Balm for all wounds and woes around;
Who, patient, every burden sharest,
Mine earliest sought and earliest found.

And thou — with Friendship still uniting,—
Exorcist of the stormy soul,
Employment, *all* its powers exciting,
Though weakening *none* by thy controul;
Who grain on grain, with fond endeavour,
Add'st to Eternity's vast day;
Yet from Time's debt, unwearied ever,
Art striking weeks, months, years, away!

W. P.

FUEROS AND PRIVILEGES OF THE BASQUE PROVINCES.

THE *fueros*.*, rights, privileges, and ancient customs of the Basque provinces, have been at length recognised in the most formal manner, not only by the Spanish government, but by the cortes; and now, indeed, we may freely indulge the hope of seeing, before any lengthened period shall have elapsed, perfect tranquillity established throughout Spain. A right is still reserved on the part of the chamber to suggest, in accordance with the Basques themselves, whatever modifications may be necessary to reconcile those privileges with the improved state of legislation of the present day, as well as with the constitution by which the remaining portion of the empire is administered. We had, in our last Number, expressed a fear that impediments would have been thrown in the way, in order to cause as long a delay as possible in the settlement of this important question; and the difficulty experienced by ministers in procuring a sufficient number of deputies to entertain the subject verified our forebodings. We are not quite sure that these obstacles would have been so soon overcome, had not the discontented and impatient *urbanos*, as well as the other inhabitants of Bilbao of all classes and of all opinions, Christino as well as Carlist, manifested very unequivocal signs of unwillingness to have their endurance tampered with. The existence of several insurgent bands both in Navarre and Biscay, and the atrocities even still perpetrated by the Carlist chieftains, Tendido, Mozo, and Matias in the Borunda and the Carascal, and the ravages committed by Orquieto of Maneru in the Amescoas, have doubtless given a very significant hint that the present is not the moment to indulge in the favourite passion of intrigue, or to practise those tricks of diplomatic dishonesty and dissimulation, which usually distinguish Spanish officials of every class. The period was a most critical one. The contributions levied by Espartero since the treaty of Bergara, had excited discontent, and their collection had been effected with much difficulty. Hardships of this oppressive nature, which are generally inflicted on a newly conquered country, should have been, in the present case, softened in their rigour, and without delay, by the benefits which the government was pledged to impart, and which formed the conditions of the submission. The Basques demanded the complete recognition of their *fueros;* and the first symptoms of treachery, or hesitation, on the part of the government, to which they are now subject, would have been followed by an outbreak of vengeance, such as it would have been scarcely in the power of even the Duke of Victory to quell.

The discussion in the cortes on the privileges of the people of the north of Spain must afford material for curious and interesting speculation, and may well attract the attention of politicians. During the period of the struggle of legitimacy in Spain, frequent mention has been made of the *fueros* of the provinces; but we are not aware that the public, generally,

* The term *fuero* is applied either to the laws, rights, privileges, and immunities of the Basques, or to the code in which they are detailed and set forth. It means, literally, a law. It is generally supposed to be derived from the Latin word *forum;* but many good Castilian scholars deduce it from the Spanish word *fuera* — *without*, or *outside:* designating, thereby, the independence of the provinces, and the difference of their administration from that of the other constituent portions of the Spanish monarchy.

possess much information on the topic. Without entering very minutely into the history of these celebrated privileges, we shall content ourselves with giving a general idea of their nature and design, to such of our readers as may not have particularly interested themselves in the affairs of the Peninsula for the last six years.

The Romans found no where an enemy more difficult to subdue, nor subjects less disposed to submission, than the natives of Navarre. The same spirit of fierce independence which had impeded the advance of the eagles of the Eternal City on the northern bank of the Ebro, equally baffled that vast multitude which, in the fifth century, was spreading itself over the fairest countries of Europe; and when, after a hundred defeats, the Goths effected the doubtful conquest of the lowlands, the hardy and impatient Navarrese at once abandoned the plains, and retired within the recesses of their high valleys. In these fastnesses they were found at the period of the Mussulman conquest, and their position preserved them from the scourge of this second invasion. The crescent, however, was planted on the abandoned territory; the plains about Saragossa, Tudela, and Huesca fell into the hands of the conqueror; and the dominion of the unbeliever was soon extended over that tract of country which lies between the Ebro and the high Pyrenees, as far as the river Ega.

One of those accidents, trifling in themselves, but by which the destinies of empires are not unfrequently swayed, occurred to establish two independent states in the north and east of Spain. The death of a venerable hermit at San Juan de la Peña, in the year 735, brought a vast assemblage from all the high valleys in the French as well as Spanish Pyrenees. His successor, whose eloquence and sanctity are declared in the ancient chronicles of Logroño to have been superhuman, addressed the multitude, after the celebration of the obsequies of the departed saint, and drew a fearful, though doubtless exaggerated picture, of the sufferings of their Christian brethren, who were groaning under the yoke of the infidel in the low country. The hearts of the simple, but devoted, barbarians were melted; and, pity giving way to wrath, the slumbering fierceness of their spirit was soon aroused. A crusade was organised against the children of the Prophet. The lords of the thirty-four valleys united themselves with the rude chivalry of France; and the knights of Bigorra, of Bearn, and of French Navarre became the chosen leaders of the expedition. The time and place of meeting were fixed on; and, in the first engagement which ensued, Inigo Arista, at the head of 100 knights, and 3000 Gascons, then and afterwards esteemed the finest infantry in Europe, obtained a decisive victory over the Mussulmans at Arashuet. The symbol of Christian piety and triumph, which had effected so much for the politic Constantine, aided on this occasion also the worldly ambition of the Navarrese chieftain. The victory was sanctified by a miracle; and the appearance of a cross suspended above the tree, under the branches of which Arista was reposing, at once manifested the favour of the Deity, and assured to the general the highest reward that his conquering followers could bestow. He was proclaimed on the spot, king of the country lying about Jaca, and on which the miracle itself bestowed the appellation of Sobrarbe.

It will be supposed that those efforts, so successful in the commencement, did not stop here. The successors of Arista continued the work of conquest, gradually advancing their possessions along the banks of the Aragon, until the assistance rendered by the presence of Charlemagne enabled them to extend their territories even to the Ebro. In the ninth century,

the kingdom of Sobrarbe was divided into the earldom of Aragon *, and the kingdom of Navarre. The country to the south and east of Pampeluna was soon reconquered from the Moors; and, after the battles of Huesca, and Saragossa, in the commencement of the twelfth century, the result of which was the taking of Tudela, the princes of the newly-founded kingdom obtained possession, not only of the whole of the present Navarre, but also of Alava and Guipuzcoa.

From its earliest origin, the kingdom of Sobrarbe enjoyed privileges which were much celebrated, and which were extended by its kings to all their conquests. Though never reduced to writing, and only existing, like our own common laws of old, in the traditions of the people, those *fueros* were mutually and religiously observed both by the monarch and the people. The accession to the crown of Navarre of a French house, in the person of Thibault, Count of Champagne and Brie, became the occasion of the first misunderstanding as to these privileges. The dispute arising between the prince and the representatives of the nation, in the cortes of Estella, in 1235, as to the nature and extent of certain immunities, created the necessity for a regular compilation; and it was therefore agreed that the scattered laws of the country, heretofore handed down orally from father to son, should be embodied in one code, and that the authority of the Pope should decide on the contested points. This collection was accordingly made in 1236 by the *ricos hombres*, thirty deputies of towns, and ten of the clergy. It is still preserved in the chamber of finance at Pampeluna, and is known by the title of *los Cartularios del Rey Thibault.*

By the provisions of this code it was determined, that, in the relations between the prince and the people no law, nor any measure of importance, could be adopted without the participation and consent of the *ricos hombres*, the *infanzones*, or lords of manors, the deputies of towns, and the prelates. The laws on which the constitution of the realm was founded were preserved undiminished, until the period of the incorporation of the kingdom with the crown of Castile; and when the throne of Navarre was offered to Ferdinand the Catholic, it was bestowed under the condition, and accepted with the promise, on his part, not only of recognising, but of defending against all encroachments, the rights, privileges, and immunities of the nation. Ferdinand observed the contract religiously; nor did his successors ever manifest the slightest inclination to disregard the pledge thus given and exacted.

This form of constitutional government, originally established in the mountains of the north, may be said to belong to three distinct periods; namely, 1st, from the formation of the kingdom of Sobrarbe, to the period when the laws were collected in a written code; 2d, from that epoch, to

* Navarre has taken the principal part in the affairs of the north of Spain from a remote period. But for its identification with the crown of Castile, this part would have belonged to Aragon. The independence of Aragon was destroyed by the influence of Austria. The institutions of the Aragonese were extremely liberal; and nothing can be more beautiful than their oath of submission to the monarch. The grand judge pronounced, at the inauguration of the king, the following words in the name of the states: — "Nos que vâlemos tantot como vos, y que podemos mas que vos, os azemos nuestro Rey, y señor, con tal que guardeis nuestros fueros; si no, no." — *Ouvres Choisies de Mirabeau. Essai sur le Despotisme*, p. 65.

The absurd barbarity of the torture practised by all ancient Europe, and which, in spite of her excellent institutions, disgraced even England herself, was never permitted in Aragon. Their reasons for rejecting this mode of inquiry are noble, and worthy of being quoted. "L'inquisition condamne sans confronter l'accusateur et le coupable, sans écouter la défense; elle met les hommes libres à la torture; elle arrache l'aveu des accusés par un supplice qui précède la sentence; elle confisque les biens des coupables: tout cela est contraire aux lois Aragonaises, et détruit les libertés que nous avons reçues de nos pères: *nous ne voulons pas l'Inquisition!*"—*Littérature Française de M. Villemain*, tom. ii

the incorporation of Navarre with the Spanish dominions; and 3d, from its union with the Castilian monarchy to our own times.

It was during the period referred to first that the cortes were originally assembled. In the early session of this assembly, the formula of the royal oath was settled; by which, each prince, on his accession, was obliged to swear to preserve inviolate the *fuero de Sobrarbe*, as the ancient Navarrese constitution was named. The expulsion of the Moors from the plains, and the efforts incessantly made to reconquer the soil, had not allowed the monarch sufficient leisure to attend to the internal, and more pacific, measures of civil administration. The duty of perfecting the social organisation of the kingdom depended solely on the citizens (the *paisanos*) themselves; and the establishment of the government on the basis we have referred to above was owing to the patriotism and wisdom of the *ricos hombres*, in accordance with the clergy.

During the second epoch, the laws were reduced to writing, and the cortes were first regularly and formally established. The periods of their meeting were marked out; and the three branches of which they were, as a body, composed were determined. The form of the oath to be taken by the monarch was drawn up; by the terms of which, as we have already observed, he was forbidden to perform any act of importance, without the consent of the representatives of the people. The nature of these important measures was not left vague, or uncertain; and the same resolutions which dictated the oath defined the extent of its obligations. The acts which, without the accordance of the general council of the nation, became impossible to the prince, were the making war, concluding peace, entering into a treaty, and establishing imposts of any kind.—The third epoch brings us to the incorporation of Navarre with the crown of Castile — from the time of Ferdinand the Catholic to that of Ferdinand VII.

We have made some remarks elsewhere on the nature of the constitution of Navarre, and have noticed the construction of its government, and its division into three *estamentos*, or estates. The viceroy, who, as the representative of the monarch, has the command of the troops, is, in virtue of his office, governor of Pampeluna, and enjoys the right of presiding in the cortes and the grand council of Navarre. The deputation, or cortes, is composed of three estates, — the ecclesiastical, the military, and the representatives of the towns. This branch of the administration is assisted by a certain number of law advisers, who are selected, in equal numbers, from Castile and Navarre, for the purpose of explaining all matters that may be rendered difficult by legal technicalities, and who perform the functions of attorneys-general. They do not, however, possess the right of voting, or of being present at the discussions.

The cortes meet every year; but the elections are triennial. By a wise regulation, they are forbidden to entertain any new subject of debate, until all the *agravios*, or wrongs, under which the country has previously been suffering, are redressed. The viceroy, as representative of the crown, opens and closes the sessions of parliament, presides in it, but cannot interfere in the debates. The members alone enjoy the exclusive right of discussing the affairs of the kingdom; of regulating the taxes, and the custom-house duties; of prohibiting, or permitting, the import and export of merchandise; and, in fine, of deciding on all matters affecting the important interests of the nation. The decrees of the crown have no effect in Navarre without the consent of the cortes; and a solemn oath obliging him to regard this particular privilege is exacted from the viceroy, both for the king, and for himself personally. The grand council of Navarre, which in its nature

closely resembles the ancient French parliaments, forms the third branch of the government; and the fourth comprises the chamber of finance, to which must be rendered the accounts connected with the national expenditure, as well as the payment of all contributions for the purposes of the state.

With regard to the internal economy of the kingdom, justice is administered, in the first instance, by the alcaldes of the towns. An appeal may be made from the decisions of the local magistrates to the superior tribunal of Pampeluna, and, in the last instance, to the royal council of Navarre. No taxes can be imposed except by the authority, or permission, of the deputation; and there are no governors allowed to command, in any part of the kingdom, except at Pampeluna, and in the vicinity of certain mountain passes (*puertos*). The king of Spain receives no tribute whatever beyond a sum of 180,000 reals (1800*l.*).

The municipal institutions, though tending to the single object of the benefit and well-being of the community, are not uniform, but vary according to the nature of the different localities. Each municipality is composed of an alcalde and regidors; and, in some instances, these offices are held by an hereditary tenure, but they are for the most part elective. In addition to these corporations, each of the valleys, amounting to thirty-four in number, is administered by an alcalde, who is assisted by two deputies. There is, besides, attached to each locality a multitude of particular privileges, more or less important to the places interested, and to which the population is most ardently devoted.

The descendants of the ancient Cantabrians boast that they are amongst the few who offered a successful resistance to that engrossing spirit of conquest which so characterised the Romans; and the chronicles of the Biscayans, the Austurians, and the Guipuzcoans, abound with descriptions of the immense difficulties sustained by the Goths in their efforts to penetrate within the recesses of their mountains. In these respects the Biscayans claim a superiority even over the Navarrese. The hateful presence of the unbeliever never contaminated their Christian soil; and, if we may trust the chronicle of the holy Bishop Sebastian, Alphonso the Catholic had no necessity to impart the *fuero de poblacion* to Biscay, inasmuch as the Saracens had never conquered it. During the period of the Gothic rule, the principal authority was entrusted to a Duke of Cantabria, who was freely elected by the people, assembled together in the manner and in the order which we shall detail below. The last of these chiefs, Andrea de Gomez, rendered important services to the King Rodriguez of Navarre, when that monarch struggled for the recovery of his territories. The earldom of Biscay was founded by his son and successor, Eudes. In the commencement of the eleventh century, this earldom became united with the sovereignty of Navarre; and the succeeding age beheld the Count of Biscay become the feudatory of the King of Leon. In the year 1250, an attempt made on the part of Diego Lopez, the twelfth lord, to violate the *fuero* to which he had sworn fidelity, excited an insurrection; and the Biscayans, assembling together at Guernica, to the number of 14,000, abandoned, like the Romans of old, their homes, and retired as far as Liqueitio. The wife of the despotic count, a beautiful and accomplished lady, according to the chronicle we have already quoted, went out, alone and unattended, from the city of Bilbao, for the purpose of inducing the revolted multitude to return. She addressed the fierce mountaineers; she assured them of the sincere repentance of her lord; and, on his part, promised, for the future, the most constant and inviolable regard for their laws and privileges. Her eloquence and her loveliness prevailed. They threw aside the sword, became reconciled to their chief, and returned

to their homes. The fidelity and honour of their worthless ruler were not of long endurance: his oath was again violated, and they came to besiege him in the city of Bilbao; where, after a blockade of four months, the countess became again the minister of peace, and her husband took once more the oath of fidelity to the *fueros*. From this last event may be dated the origin of the meetings under the ancient oak at Guernica.

The *fueros* of the lordship of Biscay were first reduced to writing in 1373, by Don Juan, the nephew of Don Pedro the Cruel. The code, composed of thirty-seven laws, was presented to King John I., and was confirmed by him at Olmeda, in 1375. As a body of law it continued in force until 1452, when Don Gonzalo Mora, corregidor of Biscay, drew up a code of a still more complete and more general kind, and in which are contained all the *fueros*, privileges, liberties, usages, and ancient customs of the lordship. This new collection was approved of, and confirmed, by Charles V., and by it the province of Biscay is still governed.

The form of government, which prevails in Biscay, is essentially and purely republican in all its branches. The corregidor, the highest officer in the state, is named by the crown; but subject to the approval of the deputation, in whose assemblies he sits and votes. He must be a man of letters; well acquainted with the history of his province, and perfectly conversant with its laws and customs, from the most remote periods; and, above all, he must prove himself to be of pure Biscayan blood. He is assisted by three deputies, whose office is to adjudicate in civil and criminal affairs in some instances, and in matters of appeal in others.

The deputation is composed of two members, elected by the general junta, and the corregidor. The place where its deliberations are held, is Bilbao. Its principal duties are to administer the affairs of the commonwealth; to collect the taxes; to provide for the protection and defence of the country; to nominate the official servants of the government; and to form, of itself, a court of appeal from the decisions of the corregidor.

The *regimiento* is composed of the deputation, the corregidor, and six regidors, who are chosen in the same manner as the deputation itself. It meets once a year; and sometimes oftener, if the deputation judge it necessary. Its duties in the general management of affairs are various and extensive.

The general *junta* assembles every year on the summons of the corregidor, in virtue of a previous accordance between the deputation and the regimiento. It is composed of representatives, sent from the whole of the towns, who are chosen by electoral juntas; in which every man, without exception, who possesses a domicile, has the right to vote. The qualifications demanded are, to be of pure Biscayan blood; to have attained the majority determined by the law; and to possess, as already remarked, a domicile in the lordship. The deputies, thus freely elected, proceed on an appointed day to the ancient oak of Guernica. The deputation, seated on a bench beneath the branches of the tree, call, by public summons, on each *pueblo*, according to a distinctive ritual in existence from time immemorial. Each deputy submits his credentials, which are approved or rejected by the deputation. All the necessary forms being concluded, the general *junta* is constituted; and, after taking a solemn oath in the hermitage of Don Gonzalo Mora, at twenty paces from the tree, the deliberations are commenced in the hall of the archives adjoining, and are continued with open doors. The subject matter of debate is put from the chair in the Castilian, but the discussion is carried on in the Basque, tongue.

The general affairs of the lordship occupy the attention of the junta.

It decides on all matters connected with the administration for the next two years; and examines, with severity and strictness, the management of affairs during the anterior period. It nominates to public offices. For this purpose each *pueblo* is divided into two sections, the Onezimo and Gamboyno.* Three electors are drawn for each; and these, in turn, propose for the offices a certain number of candidates, whose election is determined by the ballot. A deputy, three regidors, a syndic, and a secretary are thus chosen by each section. These, taken collectively, form what is called the lordship (*señorio*) of Biscay; which is consequently composed of two deputies, six regidors, two syndics, and two secretaries, who are all elected for two years. There is no special fund set apart for the purposes of the government; but, in order to meet the public expenses, an impost, voted by the general junta, is levied on each house, of which a strict account must be rendered both as to the receipts and the disbursements. An *alcalde* is chosen by each town in the lordship to administer local affairs; and his jurisdiction in civil suits resembles, more or less, that of our courts of requests, and, in criminal matters, may be compared to that of our magistrates at quarter sessions. The deputies, or assistants, of the corregidor, alluded to above, adjudicate in civil as well as criminal actions; from their decision an appeal may be made to the provincial *junta;* and, in the last instance, to the judge royal of Biscay, whose court is established at Valladolid.

The principal privileges and immunities of the province are,—Freedom from paying any imposts but those due from the inhabitants to their own lordship, and which are fixed by themselves, and, additionally, whatever gratuitous contributions may be deemed necessary to meet the extraordinary emergencies of the state;—the enjoyment of the privileges of nobility in the Castilian dominions on merely proving a descent from pure Biscayan blood;—not to appear before any tribunal, either civil or criminal, without the limits of the lordship, except in the cases of appeal to be decided before the judge royal of Biscay;—to allow, within the province, no royal intendant or comptroller;—to permit no *estanco*, or royal monopoly, as in the rest of Spain;—to pay no duty on imported merchandise;—to have no royal administrations except that of the post-office;—to admit no Spanish troops within the territory;—to furnish no recruits for the royal army;—to defend, with their own means, and their own blood, their territory;—and to visit with summary punishment the agents of the king who may be convicted of extortion, or of any attempt to injure, or even to interfere with, the constitution of the lordship.

The proud recollections of the Biscayans, that they are exempt from the contamination of the Mussulman yoke, are shared by the Alavese; who carry their pretensions to a still higher point, and maintain that even the Goths tried, but never were able, to subdue them. Whatever may be the grounds on which this very justifiable vanity depends for support, and whatever may be the amount of credit attached to the traditions, and the chronicles, on which it is founded, it is at least certain that the standard of the Prophet was never planted on the soil of Alava. The expiatory edicts, by which the unclean touch of Moslemism became purified, were never applied to this province; and, as in the case of Biscay, the chronicle of the Bishop Rodriguez declares,

* The two factions of the houses of Oñaz and Gamboa disturbed by their disputes the tranquillity of the lordship. In order to reconcile their rival claims, it was at length agreed that *double* authorities should be appointed to each *alcadia* and town; and that, consequently, both families should have the privilege of being named to the offices. Though the parties have long ceased to exist, the usage is still retained; and for this reason it is that we find in Bilbao, &c. *two* deputies, *two alcaldes*, &c.—See *Memor. Justificativa*, p. 67.; *Histoire des Provinces Basques*, p. 521.

that Alphonso the Catholic had no necessity to impart the *fuero de repoblacion** to Alava. Notwithstanding these claims of exemption from almost universal conquest, it is more than probable that Vardalia, the modern Alava, formed a portion of the duchy of Cantabria, which has been alluded to above, and which became a grand fief of the Gothic kings; and that, at the period of the dismemberment of their vast empire, it was found, equally with a part of Navarre, tributary to Don Pedro, first king of Oviedo,—this prince in 739, having inherited, at the same time, the kingdom of Oviedo, and the duchy of Cantabria. The general features of the early history of this province do not very much differ from that of Biscay and Guipuzcoa. It became incorporated, about the year 1020, with the kingdom of Navarre. Miranda del Ebro and Vittoria were founded in the year 1181; and these cities, together with Guardia, and some other towns of the province, received the *fueros* of Logroño, which are amongst the earliest records of the legislation of this country. The establishment of certain associations, or, as they are called, *hermandades*, presents a novel feature in the history of Alava. Exposed, from its peculiar situation, during the space of nearly two hundred years, to the rival and vexatious pretensions of the kings of Castile and Navarre, its inhabitants were obliged, for their own protection, to organise these associations, according to the manner and the means most conformable to their habits and their local necessities. The first regular notice of the *hermandades* is in a privilege granted by Ferdinand IV. to the city of Vittoria. The *hermandades* of Alava were federatively united to those of Castile, and particular regulations were established for their preservation. In 1417, they became generally recognised; and Juan II. published an edict by which the *hermandades* of Alava became united to those of Vittoria, and placed under the protection of the same laws. This form of constitution was confirmed by Henrique IV. in 1458; and was recognised by Ferdinand the Catholic in 1488, and by Charles V. in 1537. Alava is divided into fifty-three *hermandades*, each of which has either one or two *alcaldes*, who are elected in the *junta* of the *hermandad*, on the first day of each year. On the 4th of May, and 18th of November, the *procuradores* of these associations assemble in general *juntas*, in which a deputy in chief is named for three years. This officer is the first dignitary in the province. He represents the authority of the king, and presides in the public assemblies, but has not the right to vote; and his powers cease during the sitting of the *juntas*, to which he is obliged to submit a detailed account of his administration. The *alcaldes* of *hermandades* possess jurisdiction in their respective localities, and are judges, in right of office, of the five cases of robbery, arson, murder, violation, and attempts against property. From their decision an appeal lies to the tribunal of the deputy in chief.

The principal magistrate is assisted by two secretaries,—one for justice, and the other for the civil administration—and a treasurer general; all of whom are named by the *junta*. A second deputy is elected; and he is assisted in his duties by a deputation, which is, itself, composed of six representatives of each of the six districts into which the *hermandades* are distributed, with whom he consults when necessary. This assistant and these deputies are, like the deputy-general, elected for three years by the *junta* during its last sitting.

* We may trace the former presence of the Mussulman yoke by these edicts of *repoblacion*. They were only applied to those localities which had submitted to the sway of the infidel. The *repoblacion* means the repeopling a town, the inhabitants of which had been Mussulmans. The invaders were expelled, and a new and Christian population was summoned from the mountains to occupy their place. In many cases, the option was given to the unbelievers to remain, on condition of submitting to baptism. "*Alphonso el Catolico no tuvo necessidad de dar a la Vizcaya los fueros de repoblacion, porque los Saracenos no la habian conquista.*"—*Las Cronicas del Santisimo Obispo Sebastian.*

The *alcaldes* are elected in the juntas of the *hermandades*, at which all the heads of families assist. In the general *junta*, fifteen electors are chosen for the public offices of the state, who are still further reduced to three in number by the operation of the ballot; and these are named to the proposed offices. The only authorities recognised by the province are, the deputy-general; his assistant; his two secretaries; the treasurer; two commissioners of police; and a company of gendarmes, named *celadores*.

The province of Alava possesses distinguished and valuable privileges. The *ayuntamiento*, or corporation, of Vittoria is composed of two *alcaldes*, two *regidors*, a *procurador-general*, two representatives of the people, and twelve deputies. This deputation serves for the city and *hermandad*, or county. A similar administration is provided for each *hermandad* in the province.

The elections are of two sorts. The *habilitados*,—those qualified by being members of noble families,—can only become candidates for the first five employments. The competitors for the other offices are taken from amongst those citizens who are heads of families, and who assist at elections. The five members of the *ayuntamiento*, who are selected from amongst the nobles, draw lots for their respective employments, which are distributed according to the following order — the first and second *alcalde*, the first and second *regidor*, and the *procurador-general*. The remaining twenty-four candidates draw lots, in like manner, for their respective places. The *ayuntamiento* being thus constituted, take the oaths in the cathedral of the city. When the *procurador* performs his part in the ceremonial, he grasps the handle of an ancient knife inserted in the wall by the high altar, and, swearing, prays that by its blade his throat may be severed, should he neglect or refuse to protect, with all his might and power, the *fueros* and privileges of his province. These privileges resemble, almost in every respect, those of Biscay.

Without entering into the remote history of Guipuzcoa, or attempting to decide between the rival claims of the ancient historians of the province,—one of whom, Pierre de Marca, a Frenchman, contends that a considerable portion of the province belonged to the bishopric of Bayonne, and that the remainder formed a part of that of Calahorra,—it may be sufficient to observe, that it participated generally in the destinies of Alava. From the period when it became a distinct power, we find it attached, until the eleventh century, to the kingdom of Leon. It subsequently entered into an alliance with the monarch of Navarre, which lasted during two hundred years; at the end of which period the ancient *fueros* of the province were collected in a written code, and confirmed by the monarch.

In the year 1200, Guipuzcoa became incorporated with the crown of Castile. This union is maintained, by almost all the historians of the Basque provinces, to have been entirely voluntary on the part of the provinces, and to have been effected on conditions dictated by the natives themselves. The best proof of the truth of this assertion, even if there were serious authority to contradict it, is to be found in the recognition of the voluntary nature of this gift, on the part of the monarchs of Spain, without excepting even those of the French dynasty. The *cedula*, or royal decree, of Ferdinand VI., promulgated in October 1752, declares, in its preamble, that the province was incorporated with the dominions of Alonzo VIII., in 1203, of its own free will, and under the guarantee of the recognition of its ancient *fueros*, privileges, and rights.*

* "Al tiempo que nos teniamos cercada la nuestra ciudad de Algeciras per el grand menestro en la goarda de la mar que nos vinisteis a servir con naos."—*Despacho espedido en Burgos à 23 de Mayo*

The devotedness of the Guipuzcoans to their new ally is illustrated in their archives by a thousand deeds of valour; and each succeeding monarch rendered his reign remarkable by the confirmation of its usages, and the grant of new privileges. The annals of the different princes who swayed the destinies of the Spanish monarchy, from Alphonso VIII. to Charles III., are replete with proofs of the loyal services of the Guipuzcoans, and are expressive of their gratitude. In a thousand instances the importance of the towns of the provinces, but more particularly San Sebastian, is insisted on, and the services to the crown acknowledged with grateful emphasis.* The superiority of San Sebastian is recognised by papal authority; and the pontiff Calixtus III., in his bull, dated at Rome in 1456, appoints that locality as the place of residence for the supreme judge of the ecclesiastical courts of the province, on account of its being the principal and most important town in Guipuzcoa.† The most convincing proof, however, of the interest taken in this fortress by the princes of Castile, is to be found in the edicts of Saint Ferdinand, in which that monarch seems to consider it as of equal value with the kingdom of Navarre.‡

The reputation of the Guipuzcoans as light infantry was not surpassed by any other nation, not even excepting the Gascons, who were esteemed the best in Europe. As seamen, they contributed, in common with the Biscayans, to maintain the pretensions to maritime sovereignty put forward by Spain; and in the action which took place in August, 1350, between the Spanish and English navies, the Guipuzcoan sailors destroyed the fleet of Edward III. of England, in consequence of which a most important commercial treaty, in favour of Spain, was wrung from that monarch.

The natives of this province have been in the enjoyment of their privileges from time immemorial; but they were, like those of Navarre, handed down by oral tradition, until the fourteenth century. The services rendered by them to the house of Castile, during the many and lengthened wars between the French and Spaniards, in the reigns of Charles VIII., Louis XII., and Francis I., caused by their rival claims to the throne of Navarre, procured for them, not only the repeated confirmation of their ancient usages, but, an extension of new ones. The reconciliation of the rival factions of the houses of Oñaz and Gamboa, whose contentions had so much distracted the internal administration of Biscay, was followed by a general assembly, at San Sebastian, of the provincial deputies of Guipuzcoa. The most material point to which this congress directed itself was the reduction of the *fueros* to a tangible and legal form; and, in the year 1379, they were, for the first time, collected into a regular code, which, with the other transactions of the convention, were solemnly confirmed by Don Juan I. In consequence of pretensions advanced by certain powerful houses of the provincial community, it became necessary again to remodel the digest in the reign of Henrique IV. Don Gonzalo de Mora, whose patriotism and legislative talents had already effected so much for Biscay, collected anew the fueros

d 1345. "Declarando el Rey en la misma cédula que estos servicios no abian sido forzosos, y que para lo sucesivo, no sirviesen de ejemplar ni parasen perjuico."—*Apendice de la Mem. Justificativa*, p. 54.

* "Otro sí per cuanto la dicha villa de San Sebastian es] la mejor villa que nos habemos en el nuestro señorio Guipuzcoa, y que mas pertenece á nuestro servicio que este bien poblada," &c.—*Sentencia del Rey Enrique II., sobre la jurisdiccion y el puerto de Passages.*

† "Tanquam in loco insigniori ejusdem Provinciæ."

‡ In the *cedula* of Saint Ferdinand, appointing Gomez Bruton and Martin Ruiz de Abendaño to take command of the troops destined to proceed to the succour of San Sebastian, then besieged by an army of 15,000 Frenchmen, under the generalship of Charles of Bourbon, these words occur,—"*Que no importaba menos aquella que todo el reino de Navarra.*"

of Guipuzcoa; and published a code, in which those of the former digest, as well as the latest, were embodied. This recapitulation of legal rights, formed in 1457, and confirmed by every succeeding monarch, and particularly by Charles II. in 1696, became the rule of law by which Guipuzcoa is still governed.

The general *junta* of the province meets on the 2d of July in every third year. It is composed of representatives sent from each township, or *alcadia*, to the number of fifty-seven, who are elected by the principal proprietors assembled together in the public hall of each locality. The *junta* names four deputies in chief, who must be elected from the towns of San Sebastian, Tolosa, Aspeitia, and Ascoitia. This deputation holds its sittings during three years in each of these places; and the president for the time is the deputy of the town where the deputation meets. He is assisted in his office by four persons — an *adjunto*, two *capitularios*, and a secretary. Those authorities constitute the ordinary deputation. The *extraordinary deputation* is composed of four deputies, and four assistants, or *adjuntos*, similarly elected. The current business of the province is administered by the former; whilst the latter takes cognisance of all matters of an extraordinary nature, not anticipated, nor provided for, by the existing regulations. Their meetings take place twice in every year, in the months of December and July.

There are, besides, particular *juntas*, which assemble in eighteen principal towns designated by the constitution. Their jurisdiction extends over the *partidos*, or districts. A corporation, or *ayuntamiento*, exists in each locality, of a nature corresponding to its extent and importance in the province. Justice is administered by the principal *alcalde* in the first instance, in civil and criminal matters. The title of *alcalde mayor** is bestowed on eight of these magistrates, who possess a more extended jurisdiction. An appeal from their decision is made to the corregidor, or supreme judge of the province, who is named by the king, and who resides with the deputation. Amongst his various duties, the principal are, to preside at the *juntas*, to be present with the convention, and to audit, and approve of, the public accounts; — but he does not possess the right to vote.

The rights, privileges, and immunities of the Guipuzcoans are the same as those of the Biscayans; and by them, also, the presence of foreign, that is, of Spanish troops, is forbidden, except in the garrisons of Irun and San Sebastian.

Notwithstanding the watchful jealousy always evinced by the Basques for the protection of their privileges, a modification of the *fuero* relating to the importation of foreign merchandise has been, more than once, sought for by the principal mercantile men of Guipuzcoa. The mountainous character of this province, and the insufficiency of its soil to maintain its inhabitants, render the pursuits of commerce an object of paramount importance. During the period of the trade with South America, the poverty of its natural resources was abundantly supplied, and the town of San Sebastian, as well as the other seaports along the Cantabrian coast, participated in no small degree in the general advantages. The superabundant population found a market for enterprising industry, and the youth of this narrow

* The terms *alcalde*, and *alcayde*, or *alcade*, are frequently confounded, even by Spaniards. The former means a civil magistrate, or justice of the peace; whilst by the latter expression is usually designated the military commandant of a castle, or fortified place. The term *alcayde* is Moorish, whilst *alcalde* is Castilian. "Lorsque la conquête Mussulmane s'etendit sur l'Espagne, les Arabes n'eurent-ils autre chose à faire que d'établir un gouverneur et un cadi Mussulmans dans les villes qui se soumirent, en laissant un cadi chrétien, d'où vient le nom d'*alcade* en Espagne." — *Essai sur la Constitution des Provinces Basques.*

and sterile province sought wealth and fortune in the vastness of the New World. The separation of the colonies from the dominion of the mother-country put a stop to these advantages; and the evil consequences resulting from this event were no where felt with so much severity as in the Basque provinces. Guipuzcoa, in particular, had few or no resources to enable her to bear up against the evil. Attempts were made, previous to the decease of Ferdinand, by the trading classes, to effect a species of compromise, or rather to alter the particular *fuero* regarding the establishment of custom-houses along the French frontier. The portion of the community alluded to came into frequent, and, not rarely, angry, collision with the landed proprietors of the interior, by whom they were accused of evincing a readiness to sacrifice the independence of the entire province to the profit of a few. The contest was carried on for some time energetically; and it seemed to approach a crisis favourable to the mercantile interests (a memorial of a strong nature having been drawn up, and published in 1832), when the death of Ferdinand, and the breaking out of the civil war, put an end to all negotiations on the subject.

We are, as yet, unacquainted with the particulars of the modification contemplated by the Spanish government in the settlement of the question of the Basque privileges, or whether the intended changes will interfere with the municipal administration of the province; but, from our knowledge, the result of much experience, of the feelings of the leading members of the mercantile community, we are convinced of the necessity of an alteration of the *fuero* relating to commercial interests, by which the maritime towns of the province are regulated. Such a change, adapted to the wants and wishes of a large and influential portion of the inhabitants, would by no means derange the privileges of the interior, where no such necessities exist.

If the government, however, desire that tranquillity should succeed the scenes of bloodshed and anarchy which have been exhibited for so many years, they will only obtain this consummation by observing a frank and unequivocal line of conduct; and by interfering as little as possible with the municipal institutions which are so endeared to the Basques. In this manner they will avoid the danger of again alienating the yet unsettled allegiance of the provinces. The slightest symptoms of hesitation or dishonesty will not fail to awaken a contest even of a fiercer and more sanguinary nature than the one which has just terminated.

IRELAND — EMIGRATION, EMPLOYMENT.

M. Auguste de Beaumont, the companion of De Tocqueville in America, has lately published a work on the state and prospects of Ireland, which is by no means flattering to our character for wisdom and humanity, and which develops an extent of social misery in that country with the existence of which foreigners have been hitherto totally unacquainted.* If they credit his statements respecting us, the truth of which we fear cannot be questioned, they must regard with suspicion our pretensions to be hailed as the guardians of the rising liberties of nations, who keep our own free subjects in a

* Ireland, Social, Political, and Religious. By Gustave De Beaumont. Translated by W. C. Taylor, LL.D. Two Vols. London: Richard Bentley. 1839.

state far worse than that of any other people in the world — infinitely worse than that of the savage of the American desert, or the negro slave of the American plantation. With both these he compares the Irish peasant, and declares him unquestionably entitled to the pre-eminence in misery. His views of the past and present state of that kingdom are really surprising for the extraordinary acquaintance they exhibit with the history of a land of which few Englishmen know any thing, and with which he seems as familiar as one of its own children. We have not seen any work on the state of that part of the realm which can be compared with it in the accuracy of its historical retrospects, its admirable delineation of the relative positions of the various political and religious parties, and its seerlike analysis of the manifold evils under which that country suffers, and the measures which have been proposed for their removal. The misery of the peasantry he attributes to the cruelty of the landlords, and the general misery of the country to the existence of an anti-national church and aristocracy; the abolition of both of which he proposes with all imaginable *naïvetè*, merely so far as it might be effected by depriving both of the privileges which distinguish them from other parts of the community, and the former of the property which it has so long and so uselessly enjoyed. The principal remedy which he suggests for improving the state of the great mass of the population is, the abrogation of the law of entails and primogeniture, and the adoption of other measures tending to make the people landed proprietors. His views on this subject are just and rational, but we fear that they cannot receive the adoption of our legislators for some generations. As what he advances with regard to emigration — as a relief to Ireland — is both new to the public, and calculated to change the opinions hitherto formed on the speculations of political economists, we imagine that we shall "have done the state some service" if we shall be able to convince our readers of the correctness of his arguments.

After observing on the apparent feasibility of emigration to afford some relief to that wretched country — on the contrast between the notions of the moderns and of the ancients on the subject of population — on the prohibitions of our former governments against emigration — and on the means which the Irish poor have adopted for sustaining the greatest number of inhabitants on the smallest possible territory and the worst possible food; he says —

"It seems, at the first glance, that for a population which derives subsistence from the soil with so much difficulty, every diminution of number would be an immense benefit; still, if the question be investigated, it will be found that the emigration of four or five millions of Irishmen would not necessarily produce for the four or five remaining millions better or more certain means of subsistence. In fact, whence does it arise that the agricultural produce of Ireland does not appear sufficient for the support of the population? It is not because the country does not supply sufficient food for eight millions of men; everybody knows that this fertile country could easily support twenty-five millions of inhabitants. Why then does the third of that number live so wretchedly? Because, before asking from the land and its produce what is necessary for his subsistence, the Irishman must first take what is necessary to pay the rent to his landlord. This explains why, in a land capable of giving bread to twenty-five millions of persons, eight millions with difficulty find support from the cultivation of the worst kind of potatoes. If these eight millions of Irishmen wished to feed on corn, nothing could be more easy, for the land furnishes far more than their necessities require; but then they could not pay their rents to the lords of the soil. Now see how the Irish cultivator is obliged to act: he sows a part of his land in corn to sell the harvest, and he plants a small spot in potatoes, on the produce of which he lives. In the first case he hopes to derive from the land the best kind of harvest, with the price of which he will pay his rent; and, in the second, to obtain the more abundant produce capable of supplying his more imperious wants; and as the rent which the landlord requires from him is constantly raised, he constantly enlarges the space on which he raises the articles that he sells, whilst he as constantly narrows the space on which he produces the

potatoes that support him. Now suppose that the landlords of Ireland see nothing but what is natural and regular in this distress of the agricultural population; suppose it one of their familiar principles, that the tenant should derive no profit from the culture of the soil, but just so much as is absolutely necessary to his support; finally, suppose that this principle should be so rigorously applied by Irish landlords, that every more economical mode of life discovered by the tenants necessarily leads to the augmentation of their rents. In this hypothesis, which to everybody who knows Ireland is a sad reality, what would be the consequence of a diminution of population?

"The soil of Ireland having to feed a less number of inhabitants, would they hereafter be maintained in a better position? Not at all. For if, instead of continuing to eat potatoes, they began to feed on bread, the landlord would see in this change an increase of prosperity and a sign of fortune, which would at once induce him to raise the rent. In order to pay this larger sum, the poor tenant should at once revert to his former system; if he delayed, he would be soon ejected for non-payment of rent, and his miseries would begin again as before. Thus, after millions of Irishmen were removed from Ireland, the condition of the remaining population would not, perhaps, be at all changed, but would remain equally miserable. Hence we can understand why Ireland a century ago, with only a third of the present inhabitants, was just as indigent as she is now, and subject to the same causes of misery, independent of number."

In illustration of the correctness of these judicious observations, we shall glean a few facts from the history of that country. To those who have considered the reasonings of political economists, it must be obvious that the question whether an increase of population is injurious or otherwise to an empire, is one of those on which men may for ever theorise to no purpose, and on which a person gifted with a little ingenuity, and disencumbered of a heart, may to the end of time

"Confute, change hands, and still confute"

all adversaries, who would be content to speculate only on the future, entirely forgetful of the past. Facts are the only weapons which can bring the *feelosophers* from their stilts, and with these we shall ply them. The population of Ireland for the last two centuries and a half stands as follows, according to the most approved estimates which we have been able to discover: — At the close of the last war in the reign of Elizabeth the total of souls left did not exceed 700,000. They were estimated previous to 1641 at 1,466,000; in 1672 at 1,100,000; in 1695 at 1,034,102; in 1712 at 2,099,094; in 1726 at 2,309,106; in 1731 at 2,010,221; in 1754 at 2,372,634; in 1777 at 2,690,556; in 1788 at 4,040,000; in 1792 at 4,088,226; in 1805 at 5,395,456; in 1814 at 5,937,856; in 1821 at 6,801,827; in 1831 at 7,767,401. They are said to be now over 8,000,000.

If the doctrines of the political economists be right, Ireland must be at the present moment eight times more miserable than it was at the beginning of the last century; and as we trace back from this instant, we must find its happiness and its comforts increasing in a ratio inverse to the numbers of its population. This is the theory. What saith history? Of its state prior to the last century it is needless to say more, than that from the Restoration to the Revolution it was pronounced to be "the most improved and improving spot of ground in Europe." A change "came o'er the scene;" and, in the reign of Anne, Swift, in his "Maxims Controuled in Ireland," states, among other instances of misery, that "*half of the souls in that kingdom were then supported by begging and thieving, two thirds of whom would be able to earn their bread in any other country upon earth.*" In a work published in 1780 we find that from the reign of Anne to 1779 that country had been never free from scarcity — that in several years during that period thousands had died of famine, or of disorders occasioned by bad provisions — and that so great was the distress at one time, that they were obliged to pass an act of parliament to stop the distilleries. Up to 1762 a

great portion of the inhabitants lived on imported corn. In the year and six months ending the 29th of September, 1729, the imported corn amounted in value to 274,000*l.*; "an amazing sum," says the writer, "compared with the circumstances of the kingdom at that time." * During all the period that a population varying from one eighth to one third of the present numbers was thus living on imported corn or starving without it, the country was not visited by war, plague, or pestilence. From 1762 the importation of provisions ceased — the severity and frequency of famines gradually diminished — the country soon began to export: it now, with its eight millions, annually exports twice more provisions than would have been necessary for it while it was importing and starving. For the last fourteen years, during which its numbers have reached the most alarming state of "superabundance," fewer have died of hunger than in any similar space of time from the accession of Anne to the present moment; and the great mass of the people have been in every respect "better off" (to use a homely intelligible phrase) than at any former period since the close of the seventeenth century. They are still wretched, but less so than when they were one eighth of their present numbers. How then can any one, with these facts before him, pretend to say that draining off one million, two millions, or six millions, would improve the state of that kingdom, — unless he should be such an extravagant Malthusian as to deem the absence of human beings alone a sufficient indication of improvement?

This subject, from its extreme importance, deserves a little further consideration. Almost every one who prattles on Irish affairs seems so satisfied of the truth of the common notion as to the redundancy of the population, that we deem ourselves in duty bound to remove the "erroneous impression." Mr. Revans has already done much in his very clever little work towards demonstrating the fallacy of this "vulgar error." He shows that the population is much less dense in the agricultural counties of Ireland than in those of England, and consequently much less dense than the Irish soil, which is, in general, so much richer than that of England, could maintain, if it were cultivated on a right system. He compares the purely agricultural counties of Ireland with the purely agricultural counties of England, and the following is the result: — "Galway, the population of which is the most wretched in Ireland, contains as many acres to each individual as Berks, Bucks, Devon, Essex, Monmouth, Norfolk, Hampshire, and Suffolk; half an acre more to each individual than Bedford and Sussex; and an acre more to each individual than Hertford, Kent, and Wiltshire. Meath, which is a purely grazing county, contains three acres to each individual, while Herefordshire, also a grazing county, has only two acres to each individual; yet there is scarcely a more wretched peasantry in Ireland than that of Meath, and scarcely a better conditioned peasantry in England than that of Herefordshire. Kildare, the population of which is as wretched as that of any county in Leinster, has a larger proportion of land to its inhabitants than any county in England, with the exception of Dorset, Hereford, Lincoln, and Oxford. *In making these calculations I have deducted the unprofitable land.*" †

If, in addition to this, we consider that the population of Armagh, which is the densest in Ireland, is the most comfortable; that there can be no comparison as to the density of the respective populations in the manufacturing counties of England and in any counties of Ireland; that one fourth of the

* The Commercial Restraints of Ireland, considered in a Series of Letters to a Noble Lord. Written by the celebrated John Hely Hutchinson.

† Introduction, p. 3.

entire land in the latter is now lying waste, though easily reclaimable *; that two thirds of that which is said to be *cultivated*, lying in natural pasture, does not produce one fourth what it would if properly cultivated †; that the remainder in tillage does not produce half what it would under the modern improved system of agriculture; and that, notwithstanding, it can afford to export nearly two thirds of its entire produce ‡, — can we doubt for a moment its ability to support a much larger population than its present one?

But no one pretends to say that the population exceeds the means of supply, or that it is denser in proportion to the profitable land than that of this country; but that the number of labourers exceeds the means of employment, — so say the political economists and the Irish Poor Law Inquiry Commissioners. We feel a peculiar pleasure in tripping up the stilts of folks of this kind. Now the whole matter is very, very simple.

Ireland is an agricultural country, in which employment is to be had by the cultivation of the land, or not at all. When lands are in pasture, one man may be sufficient for a hundred or hundreds of acres, according to the sort of cattle and fences he has to attend to. When they are in tillage, there will be from ten to thirty men, or more, required for a hundred acres, according to the nature of the ground and the system of agriculture pursued. In the barony of Coshlea, in the county of Limerick, it appears from the report of the Irish Poor Inquiry Commissioners, "that the labourers employed cannot be far from one man to every seven statute acres ploughed, and one to every twenty-five or thirty acres in grass." § This is a larger proportion of men to the acres in grass than in more purely grazing counties, as Meath, &c. We may take thirty acres as the average to a man throughout Ireland. Hence it follows that if there be 200 acres of land this year in tillage, there will be more than twenty-eight men required to cultivate them; and if they be changed next year to pasture, there will not be seven men required; or if they should belong to one proprietor, one man may be sufficient for the 200 acres, and the remaining twenty-seven be cast off as "superabundant." There lies the whole art and mystery of the relations of labour and employment in Ireland. It is, no doubt, very simple, just what any one must see who knows any thing of the past and present state of that country, who makes use of his common sense, and is not a knave, fool, philosopher, or commissioner. If he belong to either of the two latter classes, he cannot of course dedignate himself, by condescending to notice any thing so vulgar and obvious; but must, like the learned alchymists of by-gone days, exhibit the profundity of his genius and scholarship by searching for some magic panacea hidden in the womb of — nonsense. Well, our theory is this; we shall state it again: — Let an Irish gentleman till his estates as he ought this year, and he has scarce labourers enough; let him graze on them the next year, and the empire is alarmed with tales of the superabundance of labourers above the means of employment. Let us test this on the touchstone of history.

When, in consequence of the destruction of the woollen manufactures of Ireland, the passing of the penal laws, and a variety of other circumstances

* Cultivated land in 1831, 14,603,000; waste 5,340,736, of which 5,000,000 were reclaimable.

† This is the general estimate of practical agriculturists. Mr. Blacker says, that in Armagh, the best cultivated county in Ireland, half the land remains "*nominally* in grazing, but in reality producing nothing."

‡ The entire agricultural produce of Ireland for 1831 was estimated at 36,000,000*l*. The importations of it to Liverpool alone in 1838 exceeded 10,000,000*l*. See Report of Select Committee on Agriculture, 1838.

§ Irish Poor Rep. App. F. p. 406.

which it is needless to recapitulate, as they must be remembered to the end of time by every lover of our glorious Protestant constitution, as imperishable monuments of the disinterested "wisdom" and tolerant "piety" of our ancestors, pasture became more profitable than tillage, the lands which had been under cultivation were converted to pasture, the labourers were thrown out of employment, and became "superabundant;" two thirds, in the reign of Anne, were reduced to begging and thieving; others were obliged to emigrate, and others to die of hunger. Tillage was then particularly discouraged, as by its affording food and employment to the Papists, it was considered, and very justly, calculated to retard the honour and glory of the Lord, and to promote popery and infidelity. Such were the reasons assigned by our pious ancestors, when, in 1736, in addition to all the preceding discouragements to tillage, they freed pasturages from tithe, for the purpose of making that on tillage more harassing to the wretches who attempted by its aid to eke out a subsistence.

Of this truly benevolent and godly system of legislation the emigration of those who could emigrate, the importation of corn for those who could buy it, and the destruction by famine of those who could not, were the necessary results. So things continued up to 1762, when other and pecuniary motives combining to induce the landed proprietors still more to change tillage to pasture, the people could bear their afflictions no longer, and the Whiteboys appeared for the first time. Their first act was to dig up twelve acres of fattening land in the county of Limerick, for the purpose of making the proprietor change it to tillage. It is remarkable that every agrarian insurrection which has taken place since, down to the last in Clare and Kilkenny, has been commenced in the same manner, and apparently with the same object; as if instinct taught these wretched people that tilling the land was their only means of procuring an honest subsistence. Honest subsistence we are disposed to call it, when we consider that they do not demand the ground for a trifling rent, but offer the highest sum that any one can reasonably require, being willing, throughout the south of Ireland, in almost every instance, to pay the enormous sum of 8*l.* or 10*l.* per acre. There were some laws passed in 1762 to encourage agriculture, which had the immediate effect of checking the importation of provisions, and laid the foundation for the present extensive cultivation. Still the evil was not completely removed, — tillage did not obtain a sufficient preponderance over pasture; and whenever the latter became more profitable, the peasantry were thrown out of employment, became "superabundant," and when driven to extremities rose in insurrection, and dug up the pastures. Hence, of late years, because tillage has been somewhat more profitable than pasture, there has been a greater degree of tranquillity than at any preceding period since 1762; and when we heard last spring of outbreaks in the counties of Limerick and Clare, what was the declared object of the poor famished wretches? — to compel the extensive graziers to break up some of their pastures. Their first act? — to dig up the pastures. In fact, the entire theory of Irish insurrections depends on the marketable relations of pasture and tillage; and any one, by studying the "Mark Lane Express," may foretel quiet or turbulence with as much certainty as a Herschel can calculate an eclipse. Let him who doubts our theory examine the history of each and every of those insurrections; and if he do not find us infallible, we will never again put pen to paper.

Here we would willingly examine the deductions drawn by the Irish Poor Law Inquiry Commissioners from the information gathered by their subordinate assistants, had not their clumsily elaborated crudities been so

utterly undeserving of attention, and been so justly cast aside as mere rubbish by the men who employed them, that it would be a very unworthy pass at arms to enter the lists with such recreants. We will therefore break a lance with the successful champion of this national tournament — Dr. Nicholls. He coincides to some degree in the emigration proposals of the commissioners, though he does not speak with the same confidence of the superabundance of labour. He more doubtingly observes, — "The Irish population *seems to be excessive as compared with the means of employment* which the country affords; and the effects of this excess would, I think, be much more felt, was it not for the opening which England presents for migration. Still, however, notwithstanding this relief, Ireland now exhibits all the CHARACTERISTICS *of a superabundant population; but to what extent can scarcely be determined, as a small excess will operate prejudicially on the whole mass.*" Though he is opposed to emigration as "*an ordinary resource*," because as "in general the most active and enterprising emigrate, leaving the more feeble and less robust and resolute at home," such "a continual drain of its best elements lowers the tone, and reduces the general vigour of the community;" yet he considers that when any considerable number of labourers remain in a workhouse, subject to its discipline, "it may be taken as a proof of their actual inability to provide for themselves, and of the consequent excess of labourers beyond the means of employment. Under such circumstances, emigration must be looked to as the best, if not the only present remedy." *

According to this theory, if the landlords were universally to eject all their tenantry, to convert all their lands to pasture, and not to leave an inhabitant to the square league, there would be still a *superabundant population;* i. e. *an "excess of labourers above the means of employment.*"

Such, then, John Bull, are the theories on which political economists and Poor Law Commissioners call upon you to open your breeches-pockets, and "shell out" 40,000,000*l.* of your hard earnings for the purpose of completing the measure of your iniquity, by expatriating from the loved land of their sires 2,000,000 of people who have never done you an injury, and to whom you have hitherto proved yourself the fellest tyrant that ever cursed a country.

For the last twenty-five years emigration and ejectment have been carried on to a greater extent than was ever before known, yet they have produced no amelioration in the condition of those who have been left behind; neither are the lands thus cleared of inhabitants better cultivated, or in any manner improved. As soon as the tenants are turned off, the extensive farmer, who takes the lands, sets some corn crop in such parts as are under cultivation, cuts it, and then leaving them entirely to the beneficence of nature, lets them *run out.*† Such things as scattering some grass seeds, top-dressing, draining, &c. are agricultural luxuries, in which they are seldom tempted to indulge. Thus, the land, instead of being improved, is reduced to a state much worse than its former one: the landlord does not receive higher rents by driving a body of honest industrious people to beggary or starvation; and the "land-shark" has his career frequently terminated by the hand of the assassin. M. De Beaumont tells us that it has been established by official inquiries, that the extensive voluntary emigration for years past has produced no sensible effect on the condition of the remaining population, or increased in the parishes and counties whence it was greatest the wages of the labourers by a single farthing, or their employment by a single day's work. Emigration, even according to the statement of its own advocates, to be of any effect,

* Rep. p. 32. † *Anglice*, Become pasture.

must be extended to millions; and those who wish to understand the cost and difficulty of removing two or more millions, we refer to De Beaumont's book.

As the *mania* for depopulating Ireland seems almost incurable, and small farms the objects of the greatest abhorrence to all our weakly-minded philosophers, we may perform a benefit to society by attracting attention to what was the consequence to the Roman empire of the very system which is now being carried into effect in Ireland on the philanthropic principles of the Malthusian political economy. The similarity, nay, the identity, of the courses pursued in ancient Italy and modern Ireland, will, on examination, appear really remarkable.

The great attention paid by the ancient Greeks and Romans to agriculture is well known to every tyro in classical literature. From the number of writers who devoted themselves to the subject, it would seem that treatises on husbandry were among the staple commodities of the ware-rooms of the bibliopolists of antiquity. Varro enumerates fifty-one Greek prose writers on agriculture; beside Hesiod, and Menecrates of Ephesus, poets; and Mago, the Carthaginian, whose twenty-eight books were translated by order of the Roman senate, for the use of the people.* Columella mentions fifty-six eminent Greek and Latin writers on the same subject, from Hesiod to his own day, or fifty-one from Hesiod to Virgil.† This number will appear very considerable when compared with the number of those who wrote on any one other subject during the same period. Among the earlier Romans, to declare a man a good husbandman seems to have been the acmé of eulogy,— *Et virum bonum, quem laudabant, ita laudabant. Bonum agricolam. Bonum colonum. Amplissime laudari existimabatur qui ita laudabatur.* As good husbandry was a source of praise; so, on the contrary, bad husbandry was a source of severe animadversion, to be noticed even by the censor, — *Agrum malè colere censorium probrum dicebatur.*‡ From this source the distinction in the honourable character of the privilege of citizenship arose:—" *Jam distinctio honosque civitatis non aliunde erat. Rusticæ tribus laudatissimæ eorum qui rura haberent. Urbanæ vero, in quas transferri ignominia esset, desidiæ probro.*" § Pliny and Columella enumerate at some length the honours bestowed in those early days on agricultural pursuits, and mention as the necessary result of it the excellent cultivation of the entire country, and the consequent plentiful and incredibly cheap supply of provisions ‖, flour being frequently sold for a farthing a bushel. Pliny states, on the authority of Marcus Varro, that at one period of the republic, A SINGLE FARTHING was the purchasing price of a bushel of flour, a flagon of wine, thirty pounds of dried figs, ten pounds of oil, and twelve pounds of meat ¶; and this, he observes, was supplied NOT from the immense farms of individuals who ejected their neighbours, — "NEC E LATIFUNDIIS SINGULORUM CONTINGEBAT ARCENTIUM VICINOS." ** All the Latin writers of the empire notice this abundance of the early days of the republic. Columella says, that in consequeuce of the *ancient* love of agriculture, the more primitive Sabines and Romans raised greater supplies of provisions amidst the fire and sword of hostile incursions, than were produced in after times, when a long continuous peace enabled

husbandmen to pursue their avocations without danger or interruption. "Though," he says, "Italy supplied itself in the former period, she was obliged in the latter to import corn from the transmarine provinces, and wine from the Cyclades, Bætia, and Gaul." * It would be superfluous to accumulate evidence on a point which no one has the ignorant hardihood to question.

The necessity of limiting every individual to a possession of only a few acres seems to have been deeply impressed on the elder Romans. This is lauded by all the later writers as the principal source of the populousness and plenty of early times. The "*angustus agellus eximie cultus*" seems to them to have been the cause of all the *ancient* prosperity; and the "*latifundia arcentia vicinos*," the source of the ruin and wretchedness of THE EMPIRE.

"The ancients," says Pliny, "thought that moderation in the quantity of land should be particularly attended to, as they considered it better to *sow less* and to *till better;* of which opinion Virgil also seems to have been. And, to confess the truth, LARGE FARMS HAVE RUINED ITALY AND ALSO THE PROVINCES. Six lords possessed half Africa, when Nero slew them. Nor is C. Pompey to be deprived of this his own greatness of character, *that he never purchased the lands of a neighbour.*"†

Columella, in eulogising the earlier system, says that Virgil in his

> ——— *Laudato ingentia rura,*
> *Exiguum colito,*

only reduced to verse some ancient proverb. The "Μετρον αριστον" of one of the seven sages, he declares to have been designed to apply to those acquiring lands as to others. He contends that there can be no doubt that a large farm badly tilled produces less than a small one well cultivated. "Nec dubium quin minus reddat laxus ager non recte cultus quam Augustus eximie;" and thence concludes — "Ideoque post exactos regis Liciniana illa septena jugera, quæ plebis tribunus viritim diviserat, majores quæstus antiquis attulere, quam nunc nobis præbent amplissima *veterata.*" ‡ The moral inference which he deduces from the several instances of self-denial in the acquisition of land by the older Romans is so humane, so philanthropic, so truly Christian in its spirit, though coming from a Pagan, and so pertinent to the present position of the landed proprietary of Ireland, that we cannot refrain from giving it entire: —

"Therefore moderation is to observed in all things, and especially in acquiring land. For we must take only so much as we want — that *we may seem to purchase in order to enjoy, and not to be overburthened ourselves, and to wrest the means of enjoyment from others, after the manner of those very rich individuals, who possess what were formerly the lands of entire nations; which they are never able even to go around, but abandon to be trampled by cattle and*

‡ Fallows. Just the very system we have shown to be pursued by the Irish farmer on expelling a body of cottiers.

devastated by wild beasts, or occupy with work-house slaves and citizens reduced by debt to bondage. The measure to every one should be his will and his ability; for it is not enough, as I have already said, to desire to possess, unless you can also cultivate." *

Prior to the expulsion of Tarquin, two acres was the amount assigned to each individual. After that event seven acres became the limit, and continued so for a considerable period. Even after the addition of a vast territory to the republic, the man was declared a dangerous citizen, who was not content with this measure. The admirers of Roman virtue cannot forget Curius Dentatus's refusal of the gift of fifty acres, as being "supra consularem triumphalemque fortunam." At length it was raised to fifty acres, then to 500, and at last every limit was removed.

We cannot take leave of Columella and Pliny without bringing under the notice of the reader the good sense and kindly feeling displayed by them, on the subject of the treatment of tenants and neighbours. Would to Heaven that the Irish landlords would learn the first principles of Christianity from these "benighted Pagans!" According to the Apostle of the Gentiles, *Charity is greater than Faith;* and if those gentlemen desire to learn the practical application of the former in their conduct towards their dependants, they would acquire it in a purer and more rational spirit from these Pagans, than from some of the very evangelical characters who forget it in their fanatical hate of imaginary errors in dogmatic theology.

"Love thy neighbour" is the first principle of Christianity. Let us hear Pliny and Cato. "In primis," says the former in his advice to the agriculturist, "*Catonis humanissimum utilissimumque* ID AGENDUM UT DILIGANT VICINI." †

With what accuracy of judgment does Columella trace out the conduct of the landlord to the tenant: — "Nor should the landlord be tenacious of his right in every particular to which he has bound the colonist; as in days of payment, or in exacting timber and other little matters, the attention to which is productive of more annoyance than cost to the husbandman. Nor should we insist on every thing which the law allows us; for the ancients regarded the excess of law as the excess of cruelty." ‡

What a contrast we find between the modern Christian "*clearers of estates,*" and the philanthropic Pagans! "Sed ipse nostra memoriâ veterem consularem virumque opulentissimum P. Volusium asseverantem audivi FELICISSIMUM FUNDUM ESSE, QUI COLONOS INDIGENAS HABERET ET TANQUAM IN PATERNA POSSESSIONE NATOS JAM INDE A CUNABULIS LONGA FAMILIARITATE RETINERET." §

But Malthusians may be disposed to say that the great plenty of early times in Italy was owing to the paucity of inhabitants. Happily on this also history contradicts their geometrically demonstrable truisms. The population was greater in the days of small farms and plenty, than in those of aristocratical luxury and popular indigence. According to Polybius, be-

* Modus ergo in omnibus rebus et in parandis agris habebitur. Tantum enim obtinendum est quanto est opus, ut emisse videamur QUO POTIREMUR non quo oneraremur ipsi: ATQUE ALIIS FRUENDUM ERIPEREMUS, more præpotentium, qui possident fines gentium quos ne circumire quoque valent, sed proculcandos pecudibus et vastandos feris derelinquunt, aut occupatos nexu civium et ergastulis tenent. ‡ "Sed nec dominus in unaquaque re cum colonum obligaverit, tenax esse sui juris debet: sicut in diebus pecuniarum: ut in lignis et cæteris parvis accessionibus exigendis: quarum cura majorem molestiam quam impensam rusticis affert: nec sane *vindicandum nobis quicquid licet.* Nam summum jus antiqui summam putabant crucem." — "Property has its duties as well as its rights."

§ Colum. c. vii.

tween the first and second Punic wars, the Romans on mustering all their own forces and those of their allies, to oppose a threatened invasion of the Gauls, found them to amount to 700,000 men able to bear arms. To this great number had they increased, notwithstanding the perpetual wars in which they were engaged; yet afterwards, in the most flourishing period of the empire, when the states of Italy had been free from invasion for centuries, and had enjoyed nearly half a century's continuous repose from civil discord and hostile incursions, they had diminished so much in numbers as that the levies could not be raised from this once populous country. When the Romans were confined to narrow limits in their empire, and each individual to a few acres, the state was able to send forth men to conquer the world; but when the empire became boundless, and individuals monopolised as much land as was previously sufficient for thousands, the empire became a solitude, and the wealthy and luxurious few, who had expelled from comfort and independence their poorer neighbours, became the prey of the hardy barbarians of the North. All the Roman writers agree in attributing the depopulated state of Italy under the empire to the system of the large farms or estates, called *Latifundia.* The wealthier Romans bought up, or were put in possession of, it matters not how, the farms of all their poorer neighbours. The "*superabundant*" labourers and petty proprietors were gradually removed. Extensive tracts were thus "CLEARED," and then "IMPROVED," by being converted into pleasure grounds, or pasture, or forest, or wastes for animals, *feræ naturæ*, or wretchedly and partially cultivated by the slaves of usury or war. The "*superabundant*" paupers were compelled to congregate in the towns.

The entire country was thus depopulated of those who alone could defend it from foreign foes — a hardy peasantry, who valued the blessings of home and freedom. The slaves, who replaced them, had not the inclination or the spirit to fight for their brutal taskmasters. The country by degrees became less and less populous. What was first tilled by a body of slaves was next converted into pasturage or forest, according as the selfish owners thought that either would be more profitable. We admit that these worthy predecessors of our modern Malthusians thereby effected the object which seems to be sought by the latter class of politicians: they — we mean the individual landholders — made or cleared much more by this system than the several former proprietors could have collectively saved from their farms. Thus the state might be said to have cleared more net actual profits by these lands than before, as the consumption by those cultivating or attending to them was so much diminished. But let us look at the result. When levies of Roman citizens could no longer be raised to defend the empire, barbarians were enlisted, and Rome was ruined.

The Roman poets are, as every body knows, full of deprecations against the practice of *clearing* estates — so are also the historians and philosophers. The elder Seneca inveighs against it, and says that in his day a single slave possessed tracts of country which in earlier times had been cultivated by entire nations. "*Arata quondam populis rura singulorum ergastulorum sunt: latiusque nunc villici quam olim reges imperant.*" * Pliny denounces this system of cultivating the lands by means of slaves or *other desperate wretches*, as the worst possible that could be adopted, — "*Coli rura ab ergastulis pessimum est, et quicquid agitur a desperantibus* †;" and observes, that the retired domestics of Nero had fishponds of greater extent than the two acres which had been formerly sufficient for each member of the republic. ‡ He draws a

* Ex Controversia V. lib. v. Ergastula may mean a *workhouse* of slaves.
† Natur. Hist. lib. xviii. c. 7. ‡ Id. c. 2.

most poetic contrast between the extraordinary fertility of Italy in earlier times and its barrenness in his day, which he attributes to its having been tilled by honourable citizens, and generals who had triumphed in those times, and by slaves in his day; "yet," he says, "we wonder that the lands are not as productive in the hands of slaves as they were in those of generals," — "*Sed nos miramur ergastulorum non eadem emolumenta esse quæ fuerint imperatorum.*" Tacitus describes the scarcity of provisions, and the general misery arising from this practice, as being so great that it touched even the heart of Tiberius, who frequently proposed to the senate to restore things to the ancient system.* The historian, contrasting the state of Italy, then dependent on foreign countries for the support of its inhabitants, and the abundance of earlier days, when, instead of importing provisions, it supplied its armies in the most distant provinces, says, "*At Hercule, olim ex Italia legionibus longinquas in provincias commeatus portabantur: nec infecunditate laboratur, sed Africam potius et Ægyptum exercemus, navibusque et casibus vita populi permissa est.*"† How applicable this is to the present state of Ireland! The "*præpotentes*" of the latter think only of improving Canada and Australia, and committing the unhappy people to the protection of fortune and emigration commissioners.

We shall close our notice of this inhuman and impolitic system by an extract from Sismondi's admirable History of the Fall of the Roman Empire.‡ This is so lucid a summary of the effects of the *latifundia*, or "*cleared estates*," on the power of that once invincible people, that we cannot but request particular attention to it. "But it was during this same period that peace and prosperity fostered the colossal growth of a few fortunes; of those *latifundia, or vast domains, which, according to Pliny the elder, were the destruction of Italy and the empire. A single proprietor gradually became possessed of provinces, which had furnished the republic with the occasion of decreeing more than one triumph to its generals.* While he amassed wealth so disproportionate to the wants of a single man, he CLEARED *all the country he got within his grasp of that numerous and respectable class of independent cultivators hitherto so happy in their mediocrity. Where thousands of free citizens had formerly been found ready to defend the soil they tilled with their own hands, nothing was to be seen but slaves. Even this miserable population rapidly diminished, because its labour was too expensive; and the proprietor found it answer better to turn his land into pasture.* The fertile fields of Italy ceased to supply food for their inhabitants. The provisioning of Rome depended on fleets, which brought corn from Sicily, from Egypt, and from Africa: from the capital to the uttermost provinces *depopulation followed in the train of overgrown wealth; and it was in the midst of this universal prosperity, before a single barbarian had crossed the frontiers of the empire, that the difficulty of recruiting the legions began to be felt.* In the war against the Quadi and Marcomanni, which was preceded by so long a peace, Marcus Aurelius was reduced to the necessity of enrolling the slaves and the robbers of Rome. The frontier provinces, those most exposed to the attacks of the barbarians, those which suffered the most from the presence and military vexations of the legions, did not suffer so much from the rapid decline of population and of the warlike virtues as the more wealthy provinces of the interior. The levies of troops were no longer made in Rome: they were raised almost exclusively in Northern Gaul and along the right bank of the Danube. This long Illyrian frontier, in particular, for more than two centuries preserved the reputation of furnishing more soldiers to the empire than all the

rest of the provinces combined. *This border country had offered little temptation to the cupidity of Roman senators. They cared not to have their property in a province constantly harassed by the enemy. The land which the senators would not buy remained in the possession of its old proprietors: there consequently a population numerous, free, robust, and hardy, still maintained itself.* It long furnished the army with soldiers; it soon supplied it with chiefs." *

Thus we see the fatal effects of allowing a few individuals to engross all the property of a country, and of exterminating its population, or reducing them into two classes — of extensive and dominant proprietors, and poor and abject slaves. But lest our national vanity may induce us to imagine that we may experiment on what cost the Romans the empire of the world and their own independence, let us see what has been the conduct of our own governments with respect to this very practice.

In the reign of Hen. VII., pasture began to be regarded as more profitable than tillage — the landlords proceeded to CLEAR their estates, and to turn the lands which had been in tillage to pasture. The "superabundant" tenantry, thus thrown idle and pennyless on the surface of society, soon attracted by their misery and turbulence the attention of the legislature. Had these then adopted the silly notion that the population was superabundant merely because those, who *could, would* not give them employment, England would be now a desert, or the inheritance of some foreign and less Malthusian generation. They having to legislate for their own people, for their own friends and neighbours, in whose welfare they were sincerely interested, saw at once the cause of their misery and turbulence, and honestly proceeded to remove it. How? By compelling the landlords to rebuild the houses they had thrown down, to restore the tenants, and to reconvert the pasture to tillage. Mr. Lewis, the Poor Law Commissioner, has been witty on the *Whiteboy Code;* but were he to look into the "Statutes at Large," he would find that *Captain Rock* never so eloquently set forth the grievances arising from the grasping cupidity of "landsharks," as the several princes of the House of Tudor from Hen. VII. to Elizabeth.

The identity between the present proceedings in Ireland and those which these sovereigns so earnestly endeavoured to suppress is so remarkable, the very statement of the grievances — of the expulsion of the tenants from the lands where they and "their ancestours oute of tyme of mind were daylie occupied and lyved," of the avarice of the wealthy, who had "*inhanced the old ratis of the rentis of the possessions of this realme, or els brought it to such excessive fines that no poure man is able to medell with it*," — is so surprisingly applicable to Ireland, and so little notice has been hitherto paid to these statutes, that they must prove the most interesting political and legislative curiosities which it is possible for us to offer to our readers. "'Tis strange, 'tis passing strange," that this country should have been in the same state three centuries since that Ireland is now and has been for the last century and a half, and that the Tudors and Captain Rock should have had precisely the same views of political economy.

The first statute on the subject of converting pasture to tillage was passed in the reign of Henry VII. The great extent to which the system of "*clearing estates*" had been then carried will be best understood from the preamble to this enactment: — "The king, our sovereign lord," &c. &c., "remembereth that, amonge all othre thinges, great inconvenences daily doth encrease by desolacion, and pulling down, and wilful waste of houses and townes within his realme, and *leyeng to pasture*

* Vol. i. p. 345.

londes which custumeably have been used in tylthe, wherby ydelness, grounde and beginning of all myschaefs, dayly doo encreace, for where IN SOME TOWNES TWO HUNDRED PERSONES WERE OCCUPIED, AND LIVED BY THEIR LAWFUL LABOURS, NOWE BE THERE OCCUPIED TWO OR THREE HERDEMEN, AND THE RESIDUE FALL IN YDELNES; the husbondrie, which is one of the greatest commodities of this realme, is gretly decaied, churches destroyed, the service of God withdrawen, the bodies there buried not praied for, the patrone and curates wronged, *the defence of this land ageyn owre ennemyes outwardes febled and impaired.*" * To meet these manifold evils it was provided, that every person who had any houses that at any time within the preceding three years had been, or thereafter should be, let to farm with twenty acres of land or more in tillage or husbandry, should maintain "houses and bildings upon the seid ground and lond necessarie for mayntenyng and upholding of the seid tillage and husbandrie," or forfeit half the issues and profits to the next lord of the fee till he had complied.

This statute not having sufficiently checked the evil, in the seventh year of Henry VIII. another passed, the preamble of which recites also the great inconveniences, which were daily increasing, "by desolacion, pollyng downe and destruccion of houses and townes within this realme, and *leyng to pasture londes* which custumably have been manured and occupied wyth tyllage and husbandry, whereby idelnes doth encrease; for WHERE IN SOMME TOWNE CC PERSONS, *men, women, and children, and their ancestours oute of tyme of mynde were dayly occupied and lyved by sowing of corn and greynes, bredying of catall, and other encrease necessarye for manys sustenance, and now the said persons and their progenyes be mynysshed and decreasyd, whereby the husbandry, which is the greatest commodite of this realme for sustenance of man, ys greatly decayed, churches destrued,*" &c. &c.; "*cities, markett townes, brought to great ruin and decaye, necessaries for mannys sustenance made scarce and dere, the people sore mynysshed in this realme, whereby the powre and defence therof ys febled and empayrid, to the displeasure of God and agenst his lawes, and to the subversion of the common weale of this realme and the desolacion of the same.*" This statute provided, that wherever any towns, villages, boroughs, hamlets, tything houses, or other habitations, "in any paryshe or paryshes wythin this realme, whereof the more part the first day of this present parliament was or were used and occupied to tillage and husbandrye," should by the owners be allowed to fall down and decay, "wherby the husbondry of the seid townes, vyllage," &c. &c. should be "tourned from the seid use and occupacion of husbondry and tillage into pasture," the owners should again within one year, at their own cost, make them "*mete and convenyent for people to dwelle and inhabite in the same,*" and "therein to exercise husbondry and tillage" as before, "after the manner and usage of the countrey where the lond lyeth;" and that all tillage lands which since the first day of that parliament had been, or thereafter should be, "enclosed and tourned only to pasture," should within one year be restored to tillage, under the penalty of forfeiting half the value of the yearly profits of the lands and houses so neglected to the next lord of the fee. †

What better precedent could the gallant Captain find for a preamble to any of his enactments than the following?

"For as moche as dyvers and sundry persones of the kynge's subjectes of this realme, *to whome God of hys goodness hath disposed greate plentie and abundance of movable substance,* nowe of late, within fewe years, have dayly studyed, practised, and invented ways and means *how they myght accumulate and gather*

* 4 Hen. VII. c. 19. An Acte agaynst pullyng down of Townes.
† 7 Hen. VIII. c. 1.

together into few handes as well great multitude of fermes as great plenty of catall, and in especial shepe, putting such londes as they can get to pasture and not to tyllage, wherby they have not only pulled down churches and townes, and *inhansed the old ratis of the rentis of the possessions of this realme, or els brought it to such excessive fines that no poure man is able to medell with it*, but also have raysed and enhansed the prises of all maner of corne, catall, woll, pygges, geese, hennes, chekyns, egges, and suche other, almost doble above the prises which have been accustomed, *by reason whereof a mervaylous multitude and nombre of the people of this realme be not able to provide meate, drynke, and clothes necessary for themselves, their wyfes and children, but be so discouraged with misery and povertie that they fall dayly to thefte, robberie, or other inconvenience, or pitifully die for hunger and colde:* And as it is thought by the kynge's most humble and loving subjects *that one of the gretest occasions that moveth and provoketh those greedy and covetous people so to accumulate and keep in theire handes suche greate porcions and parties of the grounds and landis of this realme from the occupying of the poure husbandmen, and so to use it in pasture and not in tyllage*, is only the great profette that commyth of shepe, *which now be commyn to a few persons handes of this realme in respecte of the holle number of the kynge's subjectes*, that some have xxiiii thousand, some xx thousand, some x thousand, some vi thousand, some v thousand, and some more and some lesse, by the which a good shepe for vytall that was accustomed to be solde for iis. iiii*d.* or iiis. at the moste, is now solde for vis., or vs., or iiiis. at the leaste," &c.* By this statute it was provided that no man should have more than 2000 sheep on any farm, or more than two farms, and these only in the same parish. Two years afterwards, in consequence of the preceding acts having been enforced only on the lands held of the king, the forfeited moiety of the rents and profits was transferred to him from the lords of the fee.

The system continuing, notwithstanding these statutes, the people were driven to such a state of misery and desperation in the reign of Edward VI. that they rose in open rebellion, and broke down the pasture enclosures in several counties. The government was not content with repressing them, but immediately appointed a commission to inquire into the cause of the insurrection; and a proclamation was soon after issued, which set forth — "That his majesty and the rest of the privy council were put in remembrance by divers piteous complaints of the poor subjects, as well as by other wise and discreet men, THAT OF LATE, BY ENCLOSING ARABLE LAND, MEN HAVE BEEN DRIVEN TO EXTREME POVERTY, AND COMPELLED TO LEAVE THE PLACES WHERE THEY WERE BORN AND SEEK THEIR LIVING IN OTHER COUNTRIES, INSOMUCH AS IN TIMES PAST WHERE 10, 20, YEA IN SOME PLACES 200 PEOPLE HAVE BEEN INHABITING, THERE IS NOTHING NOW BUT SHEEP AND BULLOCKS: ALL THAT LAND WHICH WAS HERETOFORE TILLED AND OCCUPIED BY SO MANY MEN IS NOW GOTTEN BY THE INSATIABLE GREEDINESS OF MEN INTO ONE OR TWO MEN'S HANDS, AND SCARCELY DWELT UPON BY ONE POOR SHEPHERD, SO THAT THE REALM IS THEREBY BROUGHT INTO MARVELLOUS DESOLATION."

This was followed by an act by which it was provided, that so much land should be annually tilled in every parish as at any time since the 1 Hen. VIII. under a penalty of five shillings "for everie acre not putt in tillage, used and occupied according to the fourme and effect of this present acte."† The evil still continuing, in the reign of Mary another act was passed "for the re-edifying decayed houses of husbandry and the encrease of tillage;" which empowered certain commissioners to hear and determine all offences against the preced-

* 28 Hen. VIII. c. 13. † 5 & 6 Ed. VI. c. 5.

ing husbandry acts, and to inquire of warrens made, and lands converted from tillage to pasture, since the 20th year of Hen. VIII.; to take security for the re-edifying of the decayed houses, the re-conversion of the land to tillage, "and for the diminishing and destroyeng of conies;" or to adopt such other means for effecting these purposes as to them should seem proper, being authorised to assess tenants for life and others with particular estates to contribute to the expense of repairing the decayed houses, to abate the rents of all the lands which should be converted from warren or pasture to tillage according to the intent of that act, "*if they bee greater then the grounde turned into tillage or the grounde by reason of the destruccion of the conies is worth,*" *notwithstanding any lease or other indenture to the contrary;* and if the owners should not within three years let to farm the repaired houses, with the grounde which before belonged to them, *to let them themselves to any person in the same parish, for seven years,* "*for suche reasonable rent and upon suche reasonable covenants as the said commissioners shall thinck meete for both parties.*" Few of the men of the present day who think it a calumny to tell them that "property has its duties as well as its rights," and cannot believe that every man has not *a right to do what he likes with his own*, would wish to see commissioners invested with such powers for checking the system of *clearing* estates.

Stringent as this was, it was repealed by Elizabeth, as "being in some parts thereof unperfecte, and *in some places to milde and gentle* *," and other remedies provided. Till the passing of the Poor Law this practice of converting the tillage to pasture and ejecting the tenantry continued to be complained of, and Elizabeth's government was three times compelled to endeavour to repress it by legislative enactments. Just contrast the political economy of "Good Queen Bess" and Burleigh with that of Martineau and Malthus. The following is the preamble to the last of those enactments. By it the penalty for converting tillage to pasture was raised to twenty shillings per acre — which must have been near the full value of the land, and would be equal to more than 3*l.* of our present currency.

"Whereas the strengthe and florishinge estate of this kingdome hath bene allwayes and is greatly upheld and advanced *by the maintenaunce of the ploughe and tillage, being the occasion of the increase and multiplyinge of people both for service in the wars and in tymes of peace — being also a principal meane that people are sett on worke, and thereby withdrawen from ydlenesse, drunkenesse, unlawful games, and all other lewde practises and conditions of life: And whereas by the same meanes of tyllage and husbandrie the greater parte of the subjects are preserved from extream poverty in a competent estate and maintenance, and meanes to live, and the wealthe of the realm is kepte dispersed and distributed in manie handes, where yt is more ready to answere all necessary chardges for the service of the realme: And whereas also the saide husbandrie and tillage is a cause that the realme doth more stande upon itselfe without dependinge upon forraigne countries either for bringinge in of corne in tyme of scarcitie, or for vente and utterance of our own commodities beinge in over greate abundance:* And whereas," since the discontinuance of the husbandry acts in the 35th year of her reign, "*there have growen many more depopulacions by turning tillage into pasture than at any time for the like number of years heretofore,*" &c. &c.

Such were the views of the wisest government that ever blessed this country on the progress of an evil that drove our peasantry to the same lawless violence to which it is still driving the peasantry of Ireland. To the different conduct of their rulers is the difference in the state and habits of both now attributable. Our paternal government sought out and remedied the

* 5 Eliz. c. 2.

evil; while the novercal despotism of the Irish oligarchy, feeling no sympathy in the sufferings of the victims of their heartless rapacity, contented themselves with hanging and transporting the unfortunate insurgents, and refused to inquire into the cause of their discontent; thus, in the language of Grattan, "referring the poor to the hangman for regulation and to Providence for relief." They had no occasion to inquire. They knew the cause of the misery and discontent, and were resolved not to remove it. They found it cheaper to plunder the poor, to keep them in such a miserable state of famished existence that death by the sword or the gallows was preferable to it; and, when their numbers began to make them formidable, so to drive them to desperation as to obtain by their revolt a feasible opportunity of diminishing them. To give them employment, food, and justice, would lessen their own rentals and influence; while to sabre, hang, and transport them, not only cost nothing, but was a profitable amusement. They first gratified their avarice by the very system which drove the poor to insurrection — they next gratified their malignant *piety* by denouncing them as Irish papists, and incarnate monsters, whom no treatment could civilise or reduce to the state of loyal subjects; secured the sanction of this country to the perpetration of their own enormities, by showing that they were necessary for securing the permanence of the "British connection;" and finally made a profitable *job* of each insurrection, *John Bull* being always made to pay for the the sabreing, torturing, transporting, and hanging. While they had thus every possible motive for continuing their oppressions, why should they attempt to relieve the wretchedness of their victims? They were true to their own interests, as the history of Irish insurrections from 1762 to the present day proves. Ingenuity has been exhausted in devising means for the punishment of the insurgents. Statute has been heaped on statute — the ordinary modes of trial, and occasionally all modes of trial, have been dispensed with — executions have been carried to an extent at which humanity shudders; yet all to no permanent purpose. Scarce has insurrection been suppressed in one county when it raises its hydra head in another; and from 1762 it has not left that kingdom two years' complete consecutive repose. Having now, after seventy-seven years' experience, found the sabre, the gibbet, and the transport-ship as inefficient as they are costly, might we not at length have recourse to the measures which the Tudors adopted for eradicating the same insurrectionary spirit from among the people of this country? Having so long sacrificed the interests of a nation to the avarice and jobbing piety and persecution of a contemptible mushroom aristocracy, and been swindled out of millions to enable them to perpetrate their atrocities, might we not at length think of the interests of the Irish people, of our own finances, and of humanity and justice?

As "the suffering avarice to convert the tillage to pasture"* is the primary cause of insurrection, we would remedy this evil not by the severe measures of the Henries, Edward, Mary, and Elizabeth, but simply by taking from the farmers and landlords the inducement to convert the tillage to pasture, and inducing them rather to convert the pasture to tillage. This could be very easily done by allowing foreign beef, mutton, cheese, and butter into our markets on the same terms as we admit the Irish. The immediate consequence would be, that the Irish graziers, finding that they could not supply those provisions at as cheap a rate as the Dutch or other foreigners on their present system of agriculture, would be compelled to adopt the improved methods of cultivation. They should then convert their pasture into tillage, and introduce the *green crop* system, by which every well-

* Campbell's Philosophical Survey of the South of Ireland, p. 293.

informed agriculturist knows that they would make their lands *four times* at the least more productive than they are at present. Thus, though the prices of those provisions might be reduced to half what they are at this day, the profits of the producers would be nearly doubled. We shall offer a few practical proofs of the relative advantages of the present and proposed systems.

In 1831, the cultivated land of Great Britain amounted to 34,254,000 acres, that of Ireland to 14,603,000 — the supposed annual value of the agricultural produce of the former was estimated at 150,000,000*l.*, of the latter at only 36,000,000*l.** Thus, though the cultivated land of Great Britain is only a little more than double that of Ireland, the produce is four times greater; and as the fertility of the Irish soil is universally admitted to be far superior to that of this country, the difference in production must be attributable to the difference of the mode of cultivation. Ireland is in fact declared by all travellers to be the worst cultivated country in the world. Hear then the opinions of those agriculturists who have suggested means for her improvement. And here we cannot avoid expressing the pleasure we feel in turning from the mass of mawkish *feelosophical* trash which has been obtruded on the public under the name of political economy, to the works of practical philanthropists, who devote their attention not to devising schemes for diminishing the numbers of their fellow-countrymen, but to increasing their numbers,—not to driving them through the world as outcast superabundant nuisances, but to pointing out the means of making them industrious, independent, and happy at home. The first whose authority we shall cite is Mr. Blacker. This gentleman having been appointed some years past agent to an estate in the north of Ireland, found *the farms very small*, and the tenants in misery and debt. A heartless Malthusian would of course have at once exhibited his knowledge of political economy by casting the nine tenths of the poor wretches off the estate; but Mr. Blacker kept every man of them on — encouraged them properly, and instructed them in a good system of agriculture; and in a few years had the satisfaction of being enabled to declare before a committee of the Commons that they had paid off their arrears to the landlord, and that they were then as industrious and comfortable a tenantry as there was in Ireland. He published a work in 1834, entitled "An Essay on the Improvements to be made in the Cultivation of Small Farms by the introduction of Green Crops, and Housefeeding the Stock thereon," in which he says, that the only way which he can devise for enabling small farmers to support themselves and their families with greater comfort and respectability than they had hitherto done, was "by introducing such a system of agriculture as would bring the entire of the farmers' holdings into a productive state, in place of allowing nearly half of them to remain nominally *in grazing, but in reality producing nothing.*" †

He recommends the green crop system, and thus speaks of its superiority over the present practice of farming: —

"Now, by referring to the experience of all good farmers in all countries, and under all circumstances, it is ascertained beyond dispute that by the practice of sowing green crops, such as clover, rye-grass, winter and spring vetches, turnips, mangold wurtzel, &c. &c., the same ground which in poor pasture would scarcely feed ONE COW IN SUMMER, WOULD, UNDER THE CROPS MENTIONED, FEED THREE, OR PERHAPS FOUR, THE WHOLE YEAR ROUND, by keeping the cattle in the house, and bringing food there for them." ‡

"I refer you with confidence to the EXHAUSTED MISERABLE PASTURE upon which your cattle are now universally fed, TWO TO THREE ACRES OF WHICH

* Report of the Irish Poor Inquiry Commissioners, App. H

† P. 5. ‡ P. 6.

ARE OFTEN BARELY SUFFICIENT TO KEEP ONE COW ALIVE for the summer months, but by no means to afford her a sufficiency of food." *

Mr. Doyle, a well-known writer on Irish agriculture, says, that if this system were introduced, "one fourth of the present quantity of land would be sufficient." † It is needless to multiply authorities, as all scientific and practical agriculturists agree in this superiority of the green crop system over the present. This is the system which prevails in Holland and many other parts of the Continent. It has been adopted to a great extent in this country, and is spreading fast. If it should be adopted in Ireland, it is obvious that it would make that country four times at least more productive than it is at present. Then, what would be its effect on the condition of the labourers?

In 1831, the occupiers of land not employing labourers, and therefore considered in the class of labourers, amounted to 564,274; labourers not occupying land, to 567,441 — total of labourers, 1,131,715. According to the Irish Poor Inquiry Commissioners, there are 585,000 out of work and in distress during thirty weeks of the year, which is equal to 337,500 out of work for the entire year; thus leaving, of the 1,131,715, only 794,215 occupied in the raising of agricultural produce. We believe that of all the *cultivated* land of Ireland three-fourths are in pasture; at least two-thirds are; and one-third only in tillage. Taking our former estimate of one man employed for every seven acres in tillage, and for every thirty in pasture, we find that the two-thirds of the country in pasture employ only 324,444; while the one-third in tillage employs 469,761, the remainder of the 794,215. Hence were another one third reduced to tillage, it would employ more than the 337,500 who are now constantly out of work. But were the green crop system introduced, as it would require far more labour than is now necessary, there would not be sufficient hands in the present population.

By the report of the Committee of the House of Commons of 1830, there were in Ireland 3,000,000 Irish acres, equal to 5,000,000 Statute measure, of waste lands, which were considered to be almost all reclaimable. This is more than the entire land now in tillage. The Irish Poor Inquiry Commissioners recommend its reclamation. Were the government to expend the same amount of money for this purpose as they seem willing to expend in promoting emigration and improving Canada and Australia, the most rabid Malthusian would be speedily cured of his *Lao-phobia*.

The effects of the measures which we have suggested on the interests of this country may be briefly stated. At present beef, mutton, lamb, and pork, in every form and state, are absolutely prohibited. On butter there is a duty of 20*s.* per hundred weight, and on cheese a duty of 10*s.* 6*d.* Yet, notwithstanding these heavy duties, the Dutch send these provisions to our markets, thus giving them for nearly half the price they cost the consumer. The repeal of these duties, and the prohibitions, would at once give us all those provisions at half their present cost, and would thus prepare the country for a repeal of the corn laws. If these last be repealed before this measure be adopted, the agriculture of Ireland will be ruined; all the lands will be turned to pasture; the entire population will be thrown out of employment; and we shall have the pleasure of returning once more to the ancient and *constitutional* system of starving, sabreing, transporting, and hanging. In all prudence we should commence with giving the Irish a fair start. Let them first become as good agriculturists as the Dutch and French; and then, if it be necessary, abolish the corn laws. We offer no opinion on the propriety of repealing them, particularly as we feel satisfied that for a

* P. 8. † Hints to Small Farmers, p. 5.

few years at least their retention is necessary to securing the success of the measures which we have propounded. These are considerably less harsh towards the proprietors of the soil than those which the Tudor princes deemed necessary; but lest even they should, by their too sudden adoption, produce consequences injurious to the agricultural interests, we would recommend that the government should gradually introduce them by letting into operation an act, which passed some nine or ten years back, for permitting vessels going out on voyages of a certain length to take foreign meat out of bond duty free. This has remained a dead letter, in consequence of the Irish graziers having raised an outcry against it. But were it called into operation, they should cultivate their lands as well as those who, they fear, would drive them from our markets, and should give the poor an opportunity of earning their bread by the sweat of their brow. The existing laws directly reward bad cultivation, and hold forth a bribe for depopulating Ireland, and thwarting the intentions of Heaven.

If the encouragement which we propose be given to a good system of tillage, Ireland will be soon raised to a level with this country in the excellence of her agriculture. This improvement will be effected without the slightest expense to the empire, which will immediately feel the salutary influence of the change in every direction, as we shall no longer have Irishmen underselling our poor in the labour market here, or starving and rebelling at home, or aiding revolts in the colonies. The poor law will have a fair trial, as the now unemployed labourers will have no occasion to enter the workhouse. Ireland will become four times more productive than at present; her landlords will have higher rents, her farmers greater profits, her labourers better wages and more constant employment, and our manufacturers cheaper provisions. Such will be the results, if we have the sense and spirit to despise the theories of misanthropical empirics, and to pursue that course of practical benevolence, the real wisdom of which is proved by its having made "merry England" the happiest and the first amongst the nations.

We feel that we have dwelt at too much length on this subject; but our solicitude to correct a practice which has been the cause of so much misery, and which seems to admit of so easy a remedy, has tempted us far beyond the bounds which we had originally prescribed for this article. On a question directly involving the happiness or misery of millions, and misunderstood by almost all whom we have heard offering an opinion respecting it, a little detail may be pardoned.

Those who may desire to see other arguments against the propriety of expatriating two millions of people, may be referred to the work which has called forth the preceding observations. Indeed, so complete and correct are its views of the past, present, and probably future state of Ireland, that as Abernethy's standing recipe was to order his patients to read *his book*, so we shall henceforth recommend De Beaumont's to all who may wish to thoroughly comprehend the present or any other question of Irish politics.

COMMERCIAL POLICY OF ENGLAND.

THE GERMAN COMMERCIAL LEAGUE. — THE ENGLISH CORN LAWS.

A COMMERCIAL congress was sitting last month at Berlin, for the purpose of settling the yearly accounts, and of giving effect to the changes in the duties which had been previously decided on in that very considerable portion of Germany, which constitutes the Commercial League. At that congress, England, France, and the United States of America were represented by envoys deputed for the purpose; and the courteous manner in which those gentlemen were received, naturally leads us to infer, that there is a perfect disposition on the part of the most influential members of the congress, to extend the hand of friendship to such foreign nations as may manifest a wish to cultivate their good will.

The German Customs' League, assembled to deliberate, is a confederation of very recent origin. The merest scholar who casts his eye over a map of Germany is immediately struck by the eccentric manner in which that country is parcelled out. Not only is the ancient empire divided into no less than thirty-eight states, but many of these states are composed of detached portions of territory, insulated one within the dominions of the other, so that it is frequently impossible for the subjects of the same prince to visit one another without passing through the dominions of a foreign potentate.

Each of these states, however, till within the last few years, had its own separate custom-house establishment, its own tariff, together with the whole paraphernalia of duties and restrictions. It not unfrequently happened, indeed, that the revenue derived from the customs of some of the smaller states was completely swallowed up by the cost of its collection: still there was a certain pride of sovereignty connected with the maintenance of the system, and a powerful influence was placed in the hands of the respective governments, by the distribution of a multitude of petty appointments. Nevertheless, the general inconvenience occasioned to all classes by the existence of these innumerable barriers to every thing like a free intercourse between the different parts of Germany, soon became a subject of loud and almost universal complaint; and, while they operated as a heavy and most vexatious tax upon the population at large, they led to the formation of numberless bands of smugglers over the whole face of the country, a state of things that exercised a baneful influence on the morals of the peasantry, occasioning with the military almost daily collisions, which not unfrequently ended in bloodshed and murder.

Shortly after the general peace of 1814, the statesmen of Germany began to turn their attention to an evil of so serious a magnitude. The remedy that most naturally suggested itself was, that those states whose respective territories were most closely connected, or most intricately entangled, should agree to break down the custom-house barricades by which they were divided, and adopt a general system for their mutual government. In this way, Hanover and Brunswick united in a custom-house league: Bavaria, Wurtemberg, and Baden did the same in the south-west, and a number of the smaller states in the central part of Germany. The principle having once been acted upon, and the advantages resulting from its adoption on a small scale having become apparent, a wish naturally arose in many quarters to give to it greater extension. The Prussian government, taking advantage of this feeling, became the advocate of a scheme for the

demolition of all custom-house lines in the interior of Germany, by the adoption of one general tariff for the whole country, according to which the customs' duties of the whole league should be collected on their extreme frontiers, while no impediment whatever was to be placed in the way of the most free and unrestricted intercourse between the several confederated states. The net proceeds of the whole of the customs, it was proposed, should be divided among the several governments, in proportion to the number of inhabitants subject to each.

Simple as this plan seems, and fraught with the most manifest advantages to the country in general, it was far from being received with general favour when first proposed. The small states of Central Germany, indeed, entangled in the sinuosities of the Prussian frontier, and cut off from all direct communication with the rest of the world, were not slow in recognising, that for them, at least, there could not be a doubt as to the course which it would be their policy to pursue. Not so, however, with the larger states. The kingdom of Saxony long resisted the solicitations of the Prussian government; while Bavaria, Wurtemberg, Baden, Hesse, and Nassau, jealous of the political preponderance which Prussia could not fail to derive from the formation of the league, displayed for a long time a determined hostility to the principle of the confederation, a feeling to which the people gave an expression even more unequivocal than their rulers.

The jealousy of Prussian influence, at that time openly avowed by all the states bordering on the Rhine, was so strong, that had the French government taken advantage of the feeling, France might, by the concession of a liberal commercial code, have detached nearly a fourth of Germany from the national league, and might thus have once more extended her political influence far beyond the Rhine, to the imminent danger of German independence. Fortunately for Germany, the narrow-minded policy of French statesmen prevented so perilous a national division. While a hope remained that France might yet consent to modify her anti-social tariff, Baden, Nassau, and the free city of Frankfort persisted in keeping aloof from the union to which they were invited; and it was not till the last vestige of that hope had vanished — not till there appeared every reason to apprehend that they would find themselves completely isolated from the rest of the world, by the customs' line of Prussia on the one side, and by that of France on the other — that they reluctantly consented to enter into a confederation from which they have since derived unquestionable advantages, and from which there is, probably, not one of them who would now wish to be severed. After long and patient negotiation, conducted with admirable skill, temper, and perseverance, Prussia succeeded in persuading every state of Germany to join the proposed league, with the exception of Austria, Hanover, Brunswick, Mecklenburg, Oldenburg, and the free cities of Hamburg, Lubeck, and Bremen. Holstein, forming a portion of Denmark rather than of Germany, continues, of course, to hold itself aloof, and will probably always continue to do so, while the other states just mentioned, enjoying a ready access to the sea, have fewer inducements for joining a confederation, which to them is comparatively unimportant, however beneficial it may be to the country at large.

A very erroneous impression prevails in England that this commercial league has originated in hostility to British commerce. Had Prussia, indeed, in the regulation of her tariff, been animated by such a principle, she would only have acted in a spirit of retaliation, for there is scarcely any country the produce of which is less fairly treated by our custom-house laws than that of Prussia. Her staple articles of export are corn, timber, and wool. "Of these" it has been observed, by Mr. M'Culloch, (v. "Supplement to Commercial Dictionary," p. 65.,) "we admit only the last on any

thing like fair terms: in ordinary years we entirely exclude corn; and we lay a duty of no less than 55*s.* a load on Prussian timber, while we admit the inferior timber of North America on payment of a duty of 10*s.*! Had, therefore, the Prussian tariff been levelled against us, we should have had but slender grounds for complaint." But, in point of fact, the tariff now in force in Prussia, and which will continue in force to the end of the present year, manifests but little resentment on the part of Germany in return for the provocation we have given her: whence it may fairly be inferred that, whenever we display a willingness to act with liberality ourselves, there will be no want of readiness on the part of Prussia, and the other members of the German league, to act towards us in a spirit of perfect reciprocity. It is deeply to be regretted that, at so important a moment as the present, the unfortunate delusion under which the British legislature labours should make it impossible for the British government to put the liberality of the members of the German Commercial League to the test.*

The branch of our commercial policy that has more particularly excited the resentment which Prussia unquestionably does feel against us is that by which we have regulated our duties on the importation of foreign corn. To this part of our subject, we propose, in the present article, to devote our chief attention. We shall first lay before our readers a brief history of the origin of the present corn laws; we shall then proceed to show the ruinous effect which they exercise upon our manufacturing and agricultural interests; and we shall close our remarks by calling attention to the present embarrassing position of our financial relations, brought about exclusively by the operation of the corn laws; an embarrassment from which we shall scarcely be able to retrieve ourselves for several years, and which, it is by no means impossible, may yet lead to social and political changes closely bordering on revolution.

All our early legislation on the subject of corn was dictated by a wish to promote abundance and low prices. From the Conquest down to the reign of Henry VI. the exportation of corn was absolutely prohibited. In the year 1436, however, an act was passed authorising the exportation of wheat, whenever the home price did not exceed 6*s.* 8*d.* (equal to 12*s.* 10¾*d.* of our present money) per quarter. The motive that dictated this system of legislation was, at all events, of a more benevolent character than that acted on in more recent times, when it has been sought, by creating an artificial scarcity, to give an unnatural value to the produce of land, and thus to enable its owners to raise a very large indirect tax upon the great mass of the population. Both systems, however, opposite as the motives are to

* The existing duties, as we have already observed, are now under revision; but those at present in force, which most nearly concern England, are as follow: — beer, 6*s.* per cwt.; cotton manufactures, 7*l.* 10*s.* per cwt.; fancy articles, 1*s.* 6*d.* per lb.; cut glass, 18*s.* per cwt.; common hardware, 3*s.* per cwt.; finer hardware, 30*s.* per cwt.; silk manufactures, 3*s.* per lb.; ditto, if mixed with wool or other materials, 45*s.* per lb.; tea and refined sugar, 33*s.* per cwt.; tobacco, in leaf, 16*s.* 6*d.* per cwt.; ditto, manufactured, 33*s.* per cwt.; woollen cloths, 90*s.* per cwt.; carpets, 60*s.* per cwt. Every article here enumerated is charged by weight. The consequence is that the duty amounts almost to a prohibition on all the coarser descriptions of merchandise, but falls with comparative lightness on the finer descriptions. This is shown by Mr. M'Culloch to be the case in a remarkable degree with cotton manufactures. The duty is 7*l.* 10*s.* per cwt., or, rather, per quintal of 113lbs. Now it appears,

1st, That a quintal of *coarse shirting*, worth 4*d.* a yard, contains 497 yards; it consequently costs 8*l.* 6*s.*, which makes the duty charged by the Prussian tariff equivalent to an *ad valorem* duty of 90 per cent.

2d, That a quintal of *superior shirting*, worth 1*s.* a yard, contains 457·65 yards; it consequently costs 22*l.* 17*s.* 7*d.*, making the Prussian duty on such goods 32½ per cent.

3d, That a quintal of *printed cottons*, worth 1*s.* 6*d.* a yard, contains 633 yards; it consequently costs 47*l.* 9*s.*, making the Prussian duty on such goods 15¾ per cent.

4th, That a quintal of *fine printed cottons*, worth 2*s.* 6*d.* a yard, contains 678 yards; it consequently costs 84*l.* 15*s.*, making the Prussian duty on such goods 8¾ per cent.

which they owe their birth, are equally impolitic, and equally certain, in the long run, to produce an effect the very contrary to that sought to be attained. By prohibiting exportation, cultivation is discouraged, and the abundance sought to be obtained is, in fact, prevented: for a country which exports corn requires, in case of a deficient harvest, only to retain for its own consumption what in ordinary times is sent away, and famine, at all events, is guarded against. Had no impediment ever existed to the exportation of corn in the earlier periods of our history, the distressing scarcities of which we so frequently find mention made, would probably never have occurred. In a subsequent part of this article, we shall endeavour to show, that the existing corn laws, though conceived in so opposite a spirit, produce a very similar effect.

Our early parliaments were frequently occupied with plans for the regulation of the corn trade. In 1562, the prices at which exportation might take place were extended to 10*s.* for wheat, and to 6*s.* 8*d.* for barley. In 1571 an act was passed authorising corn to be exported on payment of a duty of 2*s.* a quarter on wheat, and 1*s.* 4*d.* on barley and other grain, whenever the home price of wheat did not exceed 20*s.* a quarter, and barley and malt 12*s.* At the Restoration, the limit at which exportation might take place was greatly extended; but the duty on exportation was made so high that it operated as a prohibition. In 1663 an *ad valorem* duty was substituted for the prohibiting duties then in force.

In 1670 the first approximation was made to the present system. An act was then passed extending the exportation price to 53*s.* 4*d.* a quarter for wheat, imposing, at the same time, prohibiting duties on the importation till that price was attained, and a duty of 8*s.* between that price and 80*s.* "But the real effects of this act," says Mr. M'Culloch, ("Com. Dict." p. 404.,) "were not so great as might have been anticipated. The extension of the limit of exportation was rendered comparatively nugatory, in consequence of the continuance of the duties on exportation caused by the necessities of the crown; while the want of any proper method for the determination of prices went far to nullify the prohibition of importation."

On the accession of William and Mary, the duties on exportation were altogether repealed (1689), and a bounty of 5*s.* was offered for every quarter of wheat exported, so long as the price did not exceed 48*s.* Importation continued to be regulated by the act of 1670. The object of this measure was to enhance the price of agricultural produce, an object which it completely failed in attaining, for during the first half of the eighteenth century prices were greatly depressed in England. There have been many disputes as to the causes of this depression. Some have attributed it entirely to the immense quantity of waste lands brought into cultivation by the unnatural stimulus of the bounty; others, to the improvements in agriculture, and the gradual consolidation of farms: this, however, is a point that would detain us too long if we attempted fully to investigate it, and, therefore, we will content ourselves with simply stating the fact. The largest exportation under the operation of this law took place in 1750, when the wheat exported amounted to 947,602 quarters.

In 1773 a new act was passed, allowing wheat to be imported at a nominal duty of sixpence a quarter, whenever the home price reached 48*s.*, and the bounty and exportation ceased as soon as the home price was at or above 44*s.* This act was considered hostile to the agricultural interests; but the most certain proof of the contrary will be found in the fact, that under its operation, the quantity of corn grown in the country must have been very materially increased, since, from the accession of George I. till the year 1797, than 3,140,000 acres of waste lands were enclosed.

The clamour of the agriculturists, however, continued; and, in 1791, they succeeded in carrying a measure which they deemed more favourable to their interests. By this act the price, when importation could take place at the nominal duty of 6*d.*, was raised to 54*s.*; under 54*s.* and over 50*s.* an intermediate duty of 2*s.* 6*d.* was imposed; and under 50*s.* a prohibitory duty of 24*s.* 3*d.* The bounty continued as before, and exportation without duty was allowed to 46*s.*

In 1804 farther concessions were made to the agriculturists. A prohibitory duty of 24*s.* 3*d.* was imposed on all wheat imported when the home price was at or below 63*s.* a quarter; the intermediate duty of 2*s.* 6*d.* was put into force when the price was between 63*s.* and 66*s.*; and the nominal duty of 6*d.* when the price exceeded 66*s.* The bounty on exportation continued till the price reached 50*s.*; and exportation without bounty till the price reached 54*s.* While this act was in force the great depreciation took place in our currency, in consequence of the suspension of cash payments, and the continental war operated at the same time as a material impediment to importation. In 1813, however, in consequence of the destruction of Napoleon's power, the free intercourse with the Continent was re-established, and a large quantity of foreign corn was poured into the kingdom. Alarm was excited among the agriculturists, and two bills were introduced into the House of Commons, one to do away with the bounty and all restrictions on exportation, and one to establish a high graduated scale of duties on importation. The keen opposition of the manufacturing classes defeated the latter of these two bills, but the former passed into a law.

The struggle between the two parties, however, continued, and in 1815 the celebrated act of Mr. Robinson (now Lord Ripon) was carried, in spite of the vehement opposition which it encountered. By that act, the importation of foreign wheat was entirely prohibited until the home price reached 80*s.* a quarter, that of colonial wheat till the price reached 67*s.*: when the importation did take place it was to be free from all duty. The authors of this measure seem to have believed that they would thus succeed in obtaining a stationary price of about 80*s.* for wheat. Experience has shown how entirely fallacious their calculations were; for at no period of our recent history have such ruinous fluctuations of prices occurred as since the passing of the act of 1815. In 1822 an act was passed even more favourable to the mistaken views of the agriculturists; but, as it never came into force, we will not stop to explain it. The impolicy of the whole system was made sufficiently obvious to all, by the necessity in which ministers found themselves in 1826, in consequence of a deficient harvest, of issuing, on their own responsibility, an order in council, suspending the existing law, and allowing a large quantity of foreign corn to be entered for home consumption. For this bold step, which alone averted the horrors of a famine, an act of indemnity was obtained in the ensuing session.

The more intelligent portion of the agriculturists, says Mr. M'Culloch, "began at length to perceive that the corn laws were not really calculated to produce the advantages that they had anticipated; and a conviction that increased facilities should be given to importation became general throughout the country. The same conviction made considerable progress in the House of Commons, so much so, that several members who supported the measures adopted in 1815 and 1822 expressed themselves satisfied that the principle of exclusion had been carried too far, and that a more liberal system should be adopted." These sentiments having been taken up by ministers, Mr. Canning, in 1827, brought forward a measure founded on the principle now in force of a graduated scale of duties, ascending as prices fell, and descending as they rose. Mr. Canning's bill proposed that when

wheat was at or above 70*s.* a quarter, the duty should be only one shilling, at 69*s.* two shillings, at 68*s.* four shillings, and an additional duty of two shillings was to be added for every shilling that wheat fell below that price. The duty on colonial wheat was to be sixpence a quarter when wheat was at or above 65*s.*, and five shillings whenever it was below that price. This bill passed through the House of Commons, but was lost in the upper house, in consequence of the Duke of Wellington's opposition.

In 1828, Mr. Canning having died in the interval, and having been succeeded in office by the Duke of Wellington, the latter succeeded in carrying a bill, apparently founded on the same principle, by which the corn trade of this kingdom is still regulated. The following table will show the different spirit of the two bills: —

Price of wheat.	Duty according to Canning's bill.	Duty according to the Duke of W.'s bill.
73	1*s.*	1*s.* 0*d.*

54	32	32 8
53	34	33 8

By the scale proposed by the Wellington ministry, and adopted by parliament in the session of 1828, the importation of foreign corn still continues to be regulated; and it becomes our task now to inquire to what extent the existing law has satisfied the anticipations of its authors. On this subject we shall be exceedingly brief. The question was amply discussed about the beginning of the present year, when a swarm of pamphlets appeared, chiefly on the side of the agriculturists. Of all these publications, none tended to throw greater light on the whole subject than one published by Messrs. Longman and Co., under the title of "Influences of the Corn Laws." By James Wilson, Esq. Most of those who have written in favour of a free trade in corn have done so chiefly on the ground of the extreme injustice of enhancing the price of an article of universal consumption, in order to swell the revenues of an already wealthy class. Mr. Wilson, admitting the full force of this argument, demonstrates that the restrictions on the trade have proved as ruinous to the agriculturist as to the manufacturer and merchant; and the facts which he has industriously collected fully make out the position which he seeks to establish, namely, that, after all the inconvenience to which the population at large has been subjected by the existing law, there is every reason to believe that, with a completely free trade, the average price of wheat, during the last twenty-two years, would have been very little, if any thing, below what it really has been. The following table, which we borrow from Mr. Wilson's pamphlet, will show the effects which he considers the corn laws to have produced: —

FIRST PERIOD, — 1817 to 1822.

(Increasing Supplies and Falling Prices.)

Years.	Quarters of wheat, British and Irish, arrived at Mark Lane.	Average price in Great Britain.	Quarters of foreign and colonial wheat and flour entered for consumption in Great Britain.	Average price at Dantzig.	Average price of Southdown wool.
		s. *d.*		*s.* *d.*	*d.*
1817	290,479	94 0	1,020,949	75 8	19
1818	205,907	83 8	1,593,518	64 7	24
1819	257,951	72 3	122,133	43 9	24

1835	468,338	39 4	28,483	23 0	18

FOURTH PERIOD.— 1835 to 1839.

(Diminishing Supplies and Rising Prices.)

1835	468,338	39 4	28,483	23 0	18
1836	414,145	48 6	30,554	28 7	19
1837	321,735	55 10	244,619	29 0	14
1838	296,500	64 7	*1,853,048	—	17½

By closely examining this table, it will be seen that a constant and regular fluctuation is taking place in our whole system of agricultural relations. The farmers, relying on the fallacious promises of the corn laws, grow a larger quantity of wheat than is at all necessary to meet the demands of the home market. The consequence is a supply much larger than there is any demand for, which necessarily leads to a depression of price, with its usual attendant, agricultural distress. The average price of wheat in 1835, it will be seen, was as low as 39*s.* 4*d.*; and most of our readers must re-

* It must be borne in mind that these quantities include the colonial imports, which in many years constitute by far the greatest portion.

member the bitter complaints so general in that year among the farmers and landholders. Wheat became a perfect drug in the market, and no longer paid the expense of raising. Immense quantities of land were in that and the two ensuing years converted to other purposes; and this circumstance, together with the deficiency of the last two harvests, has made it necessary to import, since the beginning of last autumn, an immense quantity of foreign wheat—a quantity more than twice as large as any previously imported within the same space of time—a quantity considerably larger than it could ever have been necessary to import, had a free trade existed.

Alluding to the parliamentary inquiry of 1814, which preceded the enactment of Mr. Robinson's act of 1815, Mr. Wilson says —

"The evidence given before this committee of the House of Peers, by Mr. Arthur Young and several eminent agriculturists, went to show that, in order to retain the cultivation of Great Britain in the extent in which it then was, it would be necessary that the average price of wheat should be 90*s.* to 100*s.* per quarter, barley 40*s.* to 45*s.*, and oats 30*s.* to 35*s.* On this evidence the corn laws of 1815 were founded, which entirely prohibited the importation of foreign wheat until the aggregate average of the whole country for three months had reached 80*s.* per quarter. The low prices, comparatively, for that period, 1814 and 1815, had the effect of materially discouraging production; and this cause, followed by the unparalleled bad season of 1816, produced the high price of 1817, with which we commence our periods of fluctuations. In this year the average price, for the whole kingdom, of wheat, was 94*s.* This extreme price, supported by a law which was intended and supposed would at least have the effect of preventing wheat from sinking below 80*s.* per quarter, could not fail to have an important effect in stimulating a general increased production. This was effected in all possible ways. A larger breadth of land in cultivation was diverted to wheat, new lands were called into cultivation, moors and morasses were reclaimed, and capital was in every way most lavishly expended to secure the glittering advantages of such high prices. To use the expression of an eminent person of the day, the surface of the land was strewed with guineas to reap wheat. Eighty shillings per quarter was the standard of all calculations, and, therefore, every piece of ground which could be brought into cultivation to raise wheat at this price was submitted to the plough. At this period a similar process was going forward on the Continent, caused by the high prices which resulted from the extensive supplies to this country in 1817 and 1818.

"We cannot, therefore, be surprised that each year succeeding these efforts we should find a rapid increase of supply. J. H. Von Thuenon, of Tellow, an eminent continental agriculturist, in a letter addressed to Mr. Jacob, and presented in his report to the Board of Trade, in 1827, states—'The harvests of 1821, 1822, and 1823 were so abundant, that history scarcely records the like for a single year, much less for a series of three years: the increased production of the soil by the application of marl, combined with the fertility of the seasons, yielded such rich harvests, that the cost of production was much less than in former years.'

"This increased production and supply could not fail to affect prices materially; and, consequently, we find that a gradual decline took place, until the whole average price of 1822, with a supply at Mark Lane of 512,152 quarters, was only 43*s.* 3*d.* per quarter, less than half the price in 1817, when the supply was only 290,479 quarters. It is extremely worthy of remark, that this change was caused only by the competition amongst our own home growers; as it will be seen that from 1818 forward, for some years, the most trivial quantity of foreign wheat was imported. And it is impossible, therefore, to say that the great depression had any connexion with foreign supplies or competition.

"It is evident that the influence which induced such an extended and forced cultivation, viz. the high prices of 1817, and the prohibitory law, which had for its only object the maintenance of these high prices, was the real and only cause of the ruinous prices which ensued in 1822; and it is as evident that great loss must have been sustained by those who, in the delusive hope of reaping the advantages promised by these prohibitory laws, had been thus induced to expend so much capital and labour in the improvements which took place; and who thus found that, just when the invested capital began to show its fruitful results, the prices began proportionately to diminish, until, at length, they did not receive one half of the rates which had induced them to expend so much money, notwithstanding the promise of protection which the law held out.

"But no article can long remain below the cost of production: we accordingly find, immediately after this year, evidences of the contrary tendency. We see that low prices did not fail to produce the exactly opposite tendency of the high prices—a curtailment of cultivation in every way in which it had previously been extended. Many of the inferior soils,

which had been dragged into cultivation, were now abandoned for this purpose; and we consequently find that the supply diminished every year, and the average price gradually improved. This process went forward until 1829, when we find that the quantity of home-grown wheat brought to Mark Lane had fallen from 512,152 quarters, in 1822, to 188,150 quarters in this year; and the price had, in the same time, risen from 43*s*. 3*d*. to 66*s*. 6*d*. per quarter. There can be no doubt that this change was only the natural reaction which followed the glut at the former period. Such a course was quite imperative, by the fact that over supply had pressed prices below the cost of production. The cause, therefore, which influenced the over-production must necessarily be deemed the original cause of the ensuing scarcity. We now find that we have, consequently, three years of high prices; but, unfortunately for the home-grower, he had an extremely limited quantity to sell: his large bulk, 512,152 quarters, was sold at the minimum price, 43*s*. 3*d*.; and now his minimum bulk, only 188,159 quarters, secures the maximum price, 66*s*. 6*d*.; and it will be seen that, during these three years, nearly double the quantity of foreign wheat was imported and retained for consumption of that in the whole preceding ten years — the quantities being 4,559,736 quarters in 1829, 1830, and 1831, while only 2,440,229 quarters had been thus imported in the whole preceding ten years — showing an average of 1,519,245 quarters annually in the former case, and only 244,022 quarters annually in the latter case."

The high price which wheat has now reached, in consequence of the combined effect of decreased cultivation and deficient harvests, will probably lead in the next few years to a large reduction of price, from the greater quantities which the farmer will be induced to raise; and should the present law, which subjects the country to a greater loss, perhaps, than would the expenditure of an army of 100,000 men, — should the present law, we say, continue in force for ten years longer, we may safely anticipate the periodical recurrence of agricultural suffering, followed by the no less periodical scarcity and high prices, the only season at which it is practicable to excite a general demand among the industrious classes for the repeal of a law which, disastrous to all, falls upon them with a doubly crushing weight.

It is extremely probable, however, that the financial embarrassments from which the country is now suffering may lead to a crisis that, in its turn, may lead to a complete modification of our corn laws, or, what is more to be wished for, to the entire repeal of all those laws. Since last autumn it is calculated that upwards of 5,000,000 of quarters of foreign wheat have been imported into this country. Such an importation, were it of constant recurrence, would have nothing very alarming in it, for a regular trade would be formed, and, either directly or indirectly, the whole amount would be paid for in the produce of our own industry. For instance, we import annually very little less than 300,000,000 of pounds of cotton, which, even at the low price of sixpence a pound, would amount in value to no less a sum than 7,500,000*l*. No one, however, would dream of looking on so large an annual importation in any other light than as a highly gratifying fact. The whole amount is paid for in British manufactures, and, could we even consume twice the quantity of cotton that we do consume, the only consequence would be a yet greater development of domestic industry. But the sudden, fitful, and capricious demand for corn to which our unfortunate system gives rise, instead of favouring trade, deranges all its relations. To form a regular market for any particular article of merchandise is usually the work of many years: when, therefore, a large accidental demand for corn arises, after an interval of six or eight years, during which there has been no demand at all, the necessary supply cannot be procured in exchange for goods for which no market has been formed, but must be obtained either on credit or for ready money. To pay for 5,000,000 of quarters of wheat in gold is, probably, a task beyond the power even of England to compass in the course of one year. A large portion, therefore, must be a debt incurred to the foreigner; a debt represented by bills of exchange, of which an unusually great number are now in circulation, as may be inferred from the extravagantly high rate of dis-

count at present charged in all the principal money markets of Europe. England has hitherto been the creditor of foreigners: the fatal effect of her corn laws has been to convert her into a debtor. In one instance, it is well known, the Bank of France has accommodated the Bank of England with a credit to the extent of no less than 2,000,000*l.* sterling. The humiliating necessity in which the Bank of England was placed, of soliciting such an accommodation from a foreign establishment, was the result of the extensive exportation of gold in payment of foreign corn. The transaction, however, though it may afford a momentary relief, cannot, in any way, lessen the debt we have incurred to the foreigner: the transaction is, in point of fact, neither more nor less than the incurring of a new debt to pay off an old one; an operation frequently resorted to by merchants when on the eve of bankruptcy, but which, when it becomes known, seldom fails to destroy the credit of all who have recourse to it.

How different would now have been the position of this country, if, in 1815, a moderate fixed duty had been laid on foreign wheat, or if even the comparatively liberal measure of Mr. Canning, in 1827, had been acceded to! In either case an average annual importation, to a moderate extent, would have taken place, sufficient to prevent the famine prices of last autumn, but by no means sufficient to discourage domestic agriculture. The spirit of hostility which our corn laws have engendered in Germany would never have been called forth; and the Prussian commercial league, had it even been formed, as it probably would have been, would only have offered a more enlarged field for the development of British industry. The stimulus given to German manufactures, by our refusal to receive in payment the only articles which Germany could give in return for the produce of our looms and forges, would never have been known. Had even a manufacturing interest clamoured in Germany for protection against British competition, an agricultural interest, fearful of losing the British market, would have been equally clamorous against any restriction on foreign trade. We have seen, in the case of the United States of America, how successfully the agricultural interest has been stimulated to defeat the endeavours of the manufacturers to exclude the produce of British industry from the union. A similar cause would have produced a similar effect on the continent of Europe; and, even now, the adoption of a wiser policy, though it could not repair the mischief that has already been done, would, at least, prevent the evil from extending farther.

It has been argued, sometimes, that, if we were to admit the corn of Prussia at a low duty, we should only create a constant drain of gold; for that the German Commercial League, having now a powerful manufacturing interest organised throughout the country, would not consent to such a modification of the tariff as would allow of a large consumption of British manufactures. We are convinced that this conjecture is entirely erroneous. The high duties imposed on cotton and woollen manufactures and on hardware by the Prussian tariff are confessedly a consequence of our proscription of the staple produce of Germany; and if Dr. Bowring, lately on a mission to Berlin, as the representative of the British Government to the Commercial Congress sitting there, had been authorised to announce any intention on the part of England to adopt a more liberal corn law, we have reason *to know* that he would have been met with the greatest readiness to reciprocate such a policy. As it is, we fear a most favourable opportunity to retain a valuable market has been allowed to escape us; and bitterly we may rue hereafter the infatuation by which our public councils are guided on this subject.

Another favourite argument with the advocates of our existing corn laws

is the desirablenesss of making ourselves independent of a foreign supply. But has our existing system had any such effect? Are we not at this moment most painfully dependent on foreign countries for our food? Our very corn laws are the cause of this dependency; and nothing but a free trade can ever secure that independence for which the advocates of dear bread profess to be so anxious. A free trade alone, by securing the farmer against those ruinous fluctuations to which he is now periodically exposed, would prevent that constant variation in the supply to which those fluctuations give rise. Even the owner of the land, for whose exclusive benefit the corn laws exist, would not be all loser by their repeal, for though he might be forced to consent to a slight reduction of his rental, (a contingency of which we are by no means certain,) he would, at least, be secured against the frequent necessity of consenting to an abatement of rents in periods of agricultural distress; while, on the other hand, the general prosperity of the industrious classes would react on the value of his land, and soon relieve him from the necessity of so unwelcome a reduction.

We are not, however, without some hope, that the financial pressure which is beginning to be felt, but which in 1840 will be much more severe than in 1839, will at length have the effect of awakening the nation to the necessity of a complete revision of our whole existing commercial policy. We have already a large deficit in our annual revenue. That deficit will be considerably larger next year, in consequence of the check which must be given to trade by the scarcity of money. The new postage act, beneficial as its operation will, no doubt, be to all classes, will necessarily increase the deficiency in the revenue, and means must be found to restore the balance between income and expenditure, or national bankruptcy, or, what is the same thing, a return to a paper currency will be the inevitable consequence. To impose new taxes is a course that the boldest Chancellor of the Exchequer will scarcely venture to suggest. The House of Commons has, indeed, pledged itself to make good any deficiency that may arise in consequence of the adoption of a penny postage, but that pledge is one that different members will construe according to their different opinions; and those who are opposed to the existing system of corn laws will naturally point to the imposition of a moderate fixed duty on foreign corn as the readiest means of adding to the national revenue.

NATIONAL EDUCATION.

This long neglected question which, a year ago, could not find its way into a corner of the metropolitan newspapers, suddenly grew up into so much importance in the last session of parliament that, for several weeks, it occupied more space in every journal in the kingdom than all other topics of public and political interest. The government had taken it up, and the discussion assumed a form that could no longer be evaded or trifled with:— a thousand pens flew out in all quarters — meetings were convened in every nook and corner of the country — speeches, resolutions, handbills, placards, pamphlets, caricatures, sermons, convulsed the whole population, from St. Paul's to the remotest points of the kingdom; there never was so fierce an agitation got up in so short a space of time — there never was so belligerent a spirit exhibited upon a topic so civilising and peaceful: — one might have thought that the friends of education, instead of desiring to promote the improvement of their species, were really engaged in some plot to depopu-

late the land, so fierce, rancorous, and desperate was the course adopted by their opponents. But the storm is over, a dead lull has succeeded to the whirlwind — time has been allowed for men to recover their self-possession and their judgment — and in this interval of calm, when the public has leisure to review the question, unruffled by prejudices and external influences, it appears desirable to resume the subject, and to inquire what has been the effect of all this clamour.

Are we, the impartial educationists, beaten by the ecclesiastical exclusives? To those who contend for victory more than truth, this may be an important question. To them it may appear that an array of 3000 petitions to parliament, called forth in a fortnight, followed by so great a limitation of the government scheme, as nearly to amount to a surrender of it, do indicate power on the one side and weakness on the other. But to those who regard the cause of impartial education in its own essential strength, and contrast that strength with the spectacle of ignorance, arrogance, and sophistry which was displayed by its opponents; and who know that the vaunted petitions were the result of a senseless alarm spread by the clergy among those whom they could frighten; it is matter of conviction that the cause, so far from having been defeated, is incalculably advanced by the late discussion. They are aware that it is an abuse of words to call those clerical petitions the voice of the British public; instead of, as they really were, a sudden movement of the *staff* of a well organised corps, yet unmet by the public. A cause cannot be said to be defeated, whose strength is yet to be tried; and such, we believe, is the popularity of the cause of impartial education, that we look forward with assured confidence to an array of *names*, for that is the test of petitions, from a few towns alone, which will outnumber these annexed to the clerical appeals, had they been twice as numerous. The liberal churchmen — and they are many — have not yet moved; the dissenters, half the religious population, have yet to take the field; and, above all, the masses of the people, seven eighths of the population. These have yet to demand the means of that physical, moral, and intellectual elevation, which sound education alone can bring. What are the 3000 petitions when compared with an appeal like this?

There is another encouraging proof that educational exclusiveism has obtained by its claim only an apparent, and even that a short-lived advantage. Although the government has so far yielded as to modify their scheme, they retain, and have declared to the country and the world, that they retain their impartiality. Although their opponents have retarded the government plan, they have not yet promulgated their own. At best they hold the unenviable position of the dog in the manger; — a position devoid of moral force, and which no party ever yet was able to sustain long. The sovereign has condemned their course, and given the weight of her approbation to those who respect the rights of conscience. Two of her ministers have published their speeches on the great question *, which, for the enlightened and extended views they have taken of the essentials of education, the high-toned morality which pervades them, and the sound protestant liberty which they claim for the humblest conscientious worshipper in the land, are alike an honour to these statesmen, and the age in which we live; leaving us no reason to doubt that the same principles, the same moral elevation, the same Christian liberty, will ultimately characterise the great measure of national education.

* The Marquess of Lansdowne and Lord John Russell. (Ridgway.) See also an admirable pamphlet, entitled, "Recent Measures for the Promotion of Education in England" (Ridgway); evidently patronised by the government.

We have tried to view Lord Brougham's recent eloquent letter to the Duke of Bedford as *not* a surrender to the church and peers. Nay, we thought we saw in it a stroke of acute policy in taking the churchmen at their word, when they disclaimed, as, in the House of Lords, they pointedly and, even indignantly, did, the imputed pretensions of controlling the religious education of the dissenters; and a suggestion to legislate on the principle of reorganising all the power the church demands, the care of the religious education, but the *religious* only, of their own members. But when we reflect that Lord Brougham expressly admits the defeat of the impartialists, and the invincibility of the peers and the church,—proposes to give the church that pre-eminence in the education of the people which he says is due to the establishment, and, with Dr. Lindsay, who would take education from the pope rather than go without it, would be content with the education which the church may modify if it does not dictate,—we are forced—and we say it unwillingly—to part company with that distinguished educationist, and to protest against the compromise he suggests. It is time enough to talk of taking education from the pope, or, which is little better, any Protestant sect whatever, when it is demonstrable that we can do no better. We have said that we do not despair; nay, that we have only derived fresh confidence in the cause of just and impartial education from the result of the recent struggle. Holding, as we do, the claims of the church to be devoid of the foundation of justice, we see in that element of weakness their final failure. We feel assured that the dissenters will never, for a temporary advantage, make the concessions proposed by Lord Brougham. Postponement, and that not for so long a period as many think, is the worst they can suffer; and we had better all suffer this, rather than mark the education of the entire people with a brand which for ages, if not for ever, will disfigure and degrade it.

All shades of party join now in the cry of "educate, educate!!" Yet the word has a hundred meanings, and hence the looseness of the discussions upon it. Modes and machineries are canvassed and debated, but the substance—the matter of sound education is rarely if ever contemplated. A few authors have approached the subject philosophically, and carried out right principles into right practice; but we are not aware that any part of the periodical press has done more than treat of educational statistics and machinery. Two questions remain. First, What is the *substance* or *matter* of that education which, going beyond mere humble literature, will render the masses of the people, honest, merciful, and intelligent? And secondly, How is such an education to be communicated to those masses, with perfect respect to the rights of conscience in religion? As we deem both questions concisely, yet satisfactorily, answered in four letters to the Marquess of Lansdowne, by Mr. Simpson of Edinburgh, the well-known author of "The Philosophy of Education," and as these have only yet had a very partial circulation, we have obtained the author's permission to give to them the greater permanency of our pages. It is necessary to premise, however, which we do at the author's request, that the defective appreciation of, and zeal for, the education of the people, which justly applied to the government at the date of the letters, immediately before Lord John Russell's proposed measure was brought forward, is an imputation which, by that very measure, coincident as it is in principle with the views developed in the letters themselves, is no longer applicable. The letters are four in number; and, as we are unwilling to separate the first two, we shall divide the four into two articles; offering, in this number, the first and second LETTER.

POPULAR EDUCATION AS IT OUGHT TO BE — ITS SOCIAL EFFECTS.

LETTER I.

TO THE MOST NOBLE THE MARQUESS OF LANSDOWNE.

MY LORD, — Having obtained your lordship's permission to address to you, and therefore to make public, a short series of letters on a national object, which has for many years occupied my thoughts, and practically exercised my observation, and which, I have reason to know, no statesman has more at heart than yourself — I mean the education of the entire people — I have now the honour of submitting to you the first letter of that series. It is well known to you that the subject of popular education demands, and is receiving, much attention. Petitions signed by nearly forty thousand names were last year presented to Parliament praying for a national measure — an increase from eighty signatures, the number of the year before. The cause has been agitated in between twenty and thirty of the principal towns in Britain; Education Societies, central and affiliated, have been established; meetings have been attended by thousands assembled; and, most symptomatic of all; festivals have, in many places, been held in its honour.

With the most perfect respect I state it as a fact, that *as yet* these signs of the times have not been attended to by our most influential statesmen. The war of party has precluded the possibility of political leaders giving to the subject of the education of the people the minute attention which it requires. This was manifest in the debate on Mr. Wyse's motion last June. On one side of that debate, the progress which education has made in popular favour, as well as in its own character as a science, reducible and reduced to practice, was not recognised; its vast effects on social order were scarcely estimated; its urgency was little adverted to; and the discussion, while, in the hands of the mover and his supporters, it had relation to the most modern views on the subject, unfortunately retrograded, when taken up by every one else, to those of times gone by.

Far and wide in society, inadequate, and often distorted notions on the subject of education prevail. As a science founded on recognised principles in nature, it is, to an immense extent, utterly unknown. The *being* to be educated — *man* — has by few been physically and morally analysed; and hence any thing like a wise educational treatment of his nature, and his *whole* nature, has not been conceived. Just views on the transcendently important matter are but of a few years' growth. When men now of middle age were boys, education, worthy of the name, was unknown. It was equally wretched in its matter and its method; and ninety-nine in every hundred of educated men can bear witness that their uneducated, and often miseducated, minds, only began to be improved by their own exertions after twenty years of age — and this so recently as forty, and even thirty, years ago. Early in the present century, education received a great impulse by the introduction of the MONITORIAL method of Lancaster and Bell. The improvement, however, was in method more than in *matter*. The old branches only of reading, writing, and cyphering, were taught, although much better and more easily taught than they had ever been before. Subsequently the EXPLANATORY method was superadded to the monitorial, and has much advanced education in matter as well as method, under the direction of that most meritorious amateur, Mr. Wood of Edinburgh. It consists, as your lordship knows, in explaining every thing that is read, and thence conveying much useful information to the young mind; but it stops short of complete intellectual instruction, inasmuch as it is *literary* more than *real*. It explains words by words, not words by things. Much of external nature becomes in various *other* ways known to the pupil; but it is not at first, or not at all, exhibited to him by his teacher. His senses and observing powers are not exercised. He becomes an early proficient in the English language; he pronounces, spells, parses, and derives most unexceptionably; he is a clever arithmetician, and has stored much Scriptural knowledge; but all this falls short of what is necessary to fit him for real life in the world; to this end he leaves the explanatory school yet partially educated. I wish to be understood as in nowise disparaging either the Monitorial or Explanatory methods, and, still less, the powerful conjunction of both in the latter. They were great improvements in the education of the country. They are both excellent separately, and still more excellent when combined; but even then they advance education to a point much short of its attainable excellence. A yet farther advance towards that excellence does not supersede either. It takes both along with it, and assigns to each a place in its yet more extended and improved system. I concur substantially in the following estimate of the explanatory system, by those acute observers the Messrs. Chambers, in the 277th number of their "Edinburgh Journal:" — "While we admire Mr. Wood's plan as *mode* of teaching, and still more applaud the philanthropy which has induced him for so many years to devote himself to the instruction of a few poor children, we should be misleading our readers if we allowed them to form the conclusion that juvenile education is perfect in the Edinburgh Sessional School. Learning to read and understand what is read, dexterity in grammatical and arithmetical exercises, with the commission to memory of certain catechisms and scriptural histories, are not education, any more than the possession of pen, ink, and paper, is literary renown. We cannot here enter into a formal or complete description of a right juvenile education; but we may say, that

the *whole* child must be treated and trained in such a way, that while evoking the higher powers of the intellect, and communicating necessary knowledge of every kind, we may establish *sound moral habits*. We mean not to detract in the least from the well-earned credit of this school; but there is obviously too great a disposition to look upon such merits as it possesses as perfect, when in reality we have not here, or any where else, as yet, more than a mere shadow of a complete system of education." Although, as I hope to show, the conclusion of the above passage is rather unqualified, I consider the caution it contains most salutary; for there is a current fashion of talking, both in and out of Parliament, which indicates an ominous contentment with matters as they are. The opinion is almost reduced to a formula as it passes from mouth to mouth; I have myself heard it repeated by statesmen in the highest places of power, "We need no *new principles* of elementary education, we only want extension of the *prevailing* methods and *existing* schools; these we would not disturb." In the debate on Mr. Wyse's motion, already alluded to, it was discouraging to hear this error adopted by men of the highest state influence. By them the schools of the British and Foreign Society — the representatives of the Lancasterian — and those even of the National or Church of England Society — the Bell Schools — were each in their turn suggested as models for extension over the land. No doubt the Borough Road Lancasterian School — the model school of the British and Foreign Society — having engrafted the explanatory method on the monitorial, and adopted even some portion of the more advanced system, to be presently described, is not only greatly a-head of any of the Church of England Schools — as was admitted even by zealous churchmen, at the late Norwich meeting for the extension and *improvement* of these schools — but much in advance of what the Lancasterian Schools themselves once were; yet it would be a lamentable mistake, were even the utmost at which the Borough-road and similar schools have arrived, to be adopted in the Normal seminaries which we hope soon to see established in this country, when it can be shown that a *superior and more recent system of education is actually known and realised*.

In the *transition state*, as it may be called, at which the public mind has arrived in this great question, it is urgent that it should be universally known that a more advanced and better system of elementary education than even the monitorial and explanatory combined, IS KNOWN, and in actual and most encouraging OPERATION. A system which, besides embracing, be it remembered, the best of both the monitorial and explanatory, advances upon both so much, that had it been in as extensive operation, and for the same period, as they have been, it would have wrought a beneficial change, physical, intellectual, moral, and, I will add, religious, which the others have failed to effect, and never can effect, upon a great portion of the population. Such was not, however, the happiness of our otherwise favoured land; and hence, after forty, thirty, and twenty years, the masses are yet uneducated, ignorant, and immoral; and yet do improvidence, intemperance, privation, disease, vice, and crime, degrade and disgrace society.

May I now solicit your lordship's attention to that newer and more advanced system which, *as a whole*, is not older than the last ten years. I say as a whole; for Infant Schools, forming one part of it, commenced at New Lanark above twenty-five years ago, and in London above twenty. The new system is secular and religious, as are likewise the monitorial and explanatory. In this letter I shall confine myself to its *secular* branch, reserving the religious for my next communication. I have called the system a whole, but that whole consists of distinct parts, each part systematically founding the part which it precedes, and each part imperfect but in connection with the other.

First — The Advanced System contemplates the commencement of training at the first dawn of intellect and feeling; in other words, NURSERY EDUCATION. Often is the future man marred in his dispositions, and foreclosed of his happiness, in the arms of an injudicious and uneducated mother or nurse. No result of a sound popular education will be more marked and more blessed, in another and more fortunate generation, than the improved intelligence and morality of these our earliest educators. This result will be consequential, and no doubt distant. The nation cannot prove judicious nurses, but these will come of a better system. The very first book of an enlightened educational course might do much to instruct even the present generation of adults.

Second — School Proper cannot begin sooner than at two years of age; and it is one of the peremptory rules of the new system that it ought not to begin later. INFANT SCHOOL EDUCATION, beginning at two years of age, was an entire novelty thirty, or rather twenty-five years ago. Previously, during the precious period from two to six, when the dispositions can be best trained, to the effect of preventing the growth of low and vicious, and fostering elevated and moral, habits, the infant soil was left a moral waste, or, worse, was too often planted with thorns. No elementary educational course previously known, included or even contemplated the Infant School. The new system presupposes it, and views the more Advanced School and the Infant School as inseparable parts of a series, or elementary *curriculum*. As a humble member of the Infant School Society of Edinburgh, I have, for nearly nine years, watched the working of an excellent model school, and can unhesitatingly testify that, on the points of health, cleanliness, refinement, honesty, truth, gentleness, and kindness, besides much intellectual improvement, obtained without a task or a tear, that school

has fully realised the most sanguine expectations of its founders, and warrants the brightest prospects for the country, when such seminaries shall become — as one day they *must* become — universal. *It cannot be too strongly pressed upon the Government and the Legislature, that without the foundation of the Infant School, the more advanced schools will fail, as they have hitherto done, in morally elevating and socially improving the masses of our population. A general Infant School system, at least, cannot be begun too soon. Every hour's delay is a loss to the next — and even to the present — generation.*

Third — At six years of age the pupil leaves the Infant, and joins the JUVENILE SCHOOL, where he remains for the rest of the elementary period — till fourteen. The transition ought to be almost insensible, as much so as the pupil's passing from his fifth to his sixth year. For his new school he has been so gradually, but systematically, prepared in his previous education, that to his perceptions the business merely advances. This progression — this link — would alone settle the question of the incalculable superiority of the new system of education over any other whatever which does not found on the basis of Infant School.* Some of the improved establishments, to be mentioned in the sequel, have already added the Infant School to their elementary course. I may mention the English department of the High School of Glasgow, under Mr. D'Orsey, and that excellent new seminary, the Hull College, under Mr. Burrows. In the Juvenile School, I have said, the moral as well as intellectual process, so well begun in the Infant School, proceeds. I am much tempted to expatiate here, but my limits forbid. I doubt not that your Lordship has often visited such schools, and enjoyed, as I have done, the moral luxury of witnessing the very *scene* which they present, in contrast with the best of the old seminaries. The intellectual education imparts, of course, the *instruments* of reading, writing, and accounting; and continues, what was also begun in the Infant School, the exercise of the senses and observing faculties upon their related objects in external creation. If every thing be explained under the explanatory system, every thing is not only explained, but *exhibited*, under what we may therefore call the EXHIBITIVE SYSTEM. External creation does not consist of words, but of *things, realities, objects*. Words, either spoken or written, are the mere signs of these, and are simultaneously cognised with them; so that a most impressive and beneficial education of words and their explanations is incidentally, but essentially, included in the exhibitive process. From the knowledge of the external features of objects in nature — and natural history is nothing more — the transition is easy to the analyses of chemistry, mechanics, and mathematics, which experience has shown may be usefully acquired in the elementary period of education. *Man*, too, in body and mind — physiologically and mentally — will next be made familiar to the pupil, to the effect of pointing out those vital conditions of happiness — health and virtue. History, literature, music, will complete the course, for both sexes and all ranks, of that education, which, as it embraces moral training and likewise instruction in the realities of nature, may, in so far as it is secular, be called the MORAL AND EXHIBITIVE SYSTEM. By it, all the human faculties, as well feelings as intellectual powers, are exercised and improved, *as powers*, besides such as acquire knowledge being actually instructed and informed.

Stated labour, although unfortunately it does, ought not to commence earlier than the age of fourteen. The Creator has willed this, and man ever suffers by infringing his laws. The bodily frame is not knit for labour sooner than puberty; while the observing, or *educable*, mental faculties are, during all the previous period of life, in their greatest vigour and keenest appetite. I cannot, however, enter here into the important question of the proper age for the commencement of labour; a better educated people will take a wiser practical view of it than can yet be looked for.

I need not to your Lordship, I feel assured, enter my humble protest against any *language* but the vernacular, forming a part of elementary, especially of popular elementary, education. Languages, dead and living, are but additional instruments, not additional knowledge. Let them, as new tools, be acquired and handled by those who need them. Society has suffered enough from the long-continued error of a *language*-elementary education. Milton and Locke saw this a century and a half ago.

As the title of this letter indicates, your Lordship will expect some observations on the SOCIAL EFFECTS which may in due time be expected from popular education as it ought to be. These observations need not be many, for they are obvious. The anticipated results, in the great body of the working classes, as they present themselves to the mind, are, to the friend of his species, of the most consolatory and delightful character. The prejudice — for opinion it has no title to be called — is yet too common, and is but another proof of the prevailing want of sound knowledge on the subject, that the education above sketched would *over*-educate the working-man, and unfit him for labour. Never, I humbly think, was there a greater, or in its effects a more unhappy error. What is desired and expected from an adequate education for the working man? It is, that he be rendered healthy, temperate,

* In the Third Triennial Report of the Edinburgh Infant School Society, just published, there is a letter from Mr. Dun, of the Davie Street Lancasterian School, of 700 pupils, certifying that the children he has received from the Infant School have proved the most satisfactory in intelligence, alacrity, attainment, obedience, attendance, quiet, gentle, and general good conduct.

intelligent, honest, merciful, and pious. Can this improved character come — has it ever come — of reading, spelling, writing, and cyphering? Has it ever yet come — for one moment to anticipate my next letter — of catechisms got by rote? Intelligent and acute men have often followed the pupils from the constraint and religious solemnity of many of the old schools to the freedom of their outdoor intercourse, and witnessed selfishness, coarseness, violence, indelicacy, and deceit, in proof of the *under* education with which they had been mocked. What these habits will ultimately produce, let Canterbury, Todmordon, and Ashton tell. Many of the dupes of Thom or Courtenay were *readers*, and enjoyed a high reputation among their neighbours for Scriptural knowledge especially. Look, too, at the ominous welcome with which the appeal to physical force is received.

Is it too much to expect that a higher practical morality and improved intelligence, combined with religious knowledge and practice, will arm the working man against the seductions of the fanatic, the anarchist, the incendiary, and the man of blood? Is it too much to expect that fourteen years of moral habits, religious *practice*, and always advancing intelligence, will lead the working man's mind naturally to the practical conclusion that that labour of which "all things are full," and which the nature of things renders necessary, is no *degradation*, is no *evil*, except in its excess? or that he will bring to that labour which nature has even connected with pleasure, and to which Scripture saith "man goeth forth" as to a blessing from God, the happy feelings of a fixed moral character; the reasoning and the skill of an exercised and stored intelligence; the steady hand of habitual temperance; while he will leave his labour with a mind that can enjoy leisure, physical comfort, domestic joy, and pure religious communing in the bosom of his family, more than are yet known to any miseducated rank of life whatever? What must not the feelings of the philanthropist be when he looks forward with well founded confidence — and even a short experience has shown that he may — to society as it will be, when such shall be the chatacter of its great *substratum* — its working population.

I need not enlarge on the effects of such popular education in preventing the growth, nay, striking at the very root, of crime. All sound principles of criminal treatment *presume* the diffusion of morality, and intelligence, and religion, by early education. Disappointment will visit all criminal legislation, as it has hitherto done, which merely operates on an uneducated people; and no symptom of restraint and reformation, for the actually criminal, will succeed, which is not founded on morality, and intelligence, and religion, both in the inside and on the outside of its walls.

A few words more and I have done. In anticipation of the objection that such an education is beautiful but visionary — the too common excuse for doing nothing for social improvement, and scarcely consistent with the dread of *over* education — I am happy to adduce examples of the actual realisation, *in so far as circumstances yet permit*, of the moral and exhibitive system in several seminaries of education in different parts of Britain which I have personally visited, and others abroad. There has not yet, of course, been time for any appreciable effect of these seminaries upon society at large; but I can speak to a most gratifying improvement, when compared with any other schools known to me, on the moral and intellectual character, the feelings, the conduct, and the happiness, of both teachers and pupils. If this be, as it is, the manifestation of moral habits produced by some years of moral and practically religious exercise, education were a meaningless word, unless the same feelings and habits were expected to form the character of the future life of the pupil in his intercourse with the world. If education, as it ought to be, is intended to fit for after-life — that after-life must take its colour, its whole character, from that education. The conclusion is necessarily prospective; but if there be in nature moral as well as physical effects, it is legitimate in the one as well as the other to judge of the harvest from the cheering aspect of the seed-time. I can now only find room to name a few of the seminaries alluded to, and respectfully, but earnestly, to call the attention of statesmen to them. Some of them are mentioned in the evidence I had the honour to give before the Irish Committee, three years ago, and I have no doubt they have had their due effect upon the enlightened report of that Committee. In the Treasury, as your Lordship knows, there is a grant for a Normal School or College for the training of teachers. It has lain there above three years. I rejoice that it is *yet* to be applied; for the advanced system will have what it would not have had till now — its fair chance with the older, in determining the vital point of the *character* of the Normal Seminary.

For Infant Education, I beg to refer to all the schools which Mr. Wilderspin has *himself* originally trained, and which have not departed from his excellent system. That best known to me is the Edinburgh Model School, under Mr. Milne, and already alluded to. For Juvenile Education, there are the schools of Dr. Mayo, at Cheam; Messrs. Hill, Bruce Castle, Tottenham; Mr. Heldenmair, Worksop; Mr. Voelker, Overton, Liverpool; the Corporation Schools, Liverpool; Messrs. Clark, Bath; Mr. Bruce, Newcastle-on-Tyne; Mr. Burrows, Hull College; Mr. Brumby, (late Dr. Jerrard,) Bristol College; the National Normal School, Dublin; M. Gaggia, Brussels; Academie d'Orleans, France; the Girard College, Philadelphia; and in Scotland, Mr. D'Orsey, Glasgow; Mr. Little, (late Mr. Cuningham,) Mr. Dun, Lancasterian; Mr. Anderson, Gayfield Square; Mr. Chalmers, Mer-

chiston Castle — the last four Edinburgh. * Many other schools which I have seen in different parts of the country have more or less adopted the same system, and do not fail to advertise their having done so as their best-founded claim to public favour. I beg to state that, with an exception or two, these schools are all working under the disadvantage of not *yet* having, what they all long to have, the great benefit of the previous Infant School foundation. Yet possessed, as their teachers are, of a practical knowledge of the means of moral improvement for any age, they all systematically apply these, and with gratifying success. Finally, the Moral and Exhibitive system is substantially adopted by the London Central Society of Education, and by all its provincial branches; and, yet more encouraging, has been recommended as the basis of the National System by the Report of the Committee on the education of Ireland, already alluded to. That Report is itself an invaluable volume — the result of three years of most extensive, enlightened, and judicious inquiry. I beg to refer to my own humble work on the *Philosophy of Education* — in its first edition called, *The Necessity of Popular Education* — for a more ample treatment of the matter of this letter, and have the honour to be, my Lord, your Lordship's most obedient servant,

JAMES SIMPSON.

Northumberland Street, Edinburgh, January 1. 1839.

STATISTICAL FALLACY — IMPARTIAL RELIGIOUS EDUCATION.

LETTER II.

TO THE MOST NOBLE THE MARQUESS OF LANSDOWNE.

MY LORD, — If I have in any measure succeeded, in my former letter, in showing that, during the present century, education has advanced from a mere name by means, successively, of the *monitorial*, the *explanatory*, and what I have ventured to call the *moral and exhibitive* systems, I am entitled, and called upon, in the commencement of my present communication, to point out a fatal error which is apt to mislead the public, and that even through the medium of Parliament, namely, the persuasion that where there are *schools* there is *education*. Upon this delusion, this statistical fallacy, the grants of public money have hitherto been allotted. No condition was required but the voluntary provision of a certain proportion to meet the given share of the grant; the kind of school seemed to be held of no moment. The National or Church of England Schools have confessedly received the largest share of the public grants, because they have erected the greatest number of schools, and "*educated*," as it is said, the greatest number of children. Nay, the most important of all schools, the Normal, for training teachers, is not viewed with more discrimination, seeing that the reason stated to Parliament, in the discussion on Mr. Wyse's motion why a grant of 10,000*l*., voted three years ago for establishing Normal Schools had not yet been applied, was, that nobody had come forward to demand it. I have learned that it has since been offered to the British and Foreign School Society, who have judiciously declined the undertaking of applying it, on the ground that Normal Schools established by Government grants ought to be under Government superintendence. I hope and trust that what this society have so sensibly refused will not be offered to any other, but entrusted to a Commission fully qualified to turn it to the best account of which the improvements in education will allow. One of the most zealous opponents of Mr. Wyse's motion for such a Commission, actually approved of an indiscriminate and uninquiring dispensation of the educational grants as a proof of the *impartiality* of Government.

Most statistical inquiries and reports proceed upon the fallacy of identifying schools and education. Some statisticians count the number of schools in a given locality; then the number of children educated, as is most indiscriminately stated, in each; and even report that in a given population so many can read words of one syliable, so many words of two, so many can sign their names, with other distinctions alike trifling. In criminal statistics reading and writing alone are noticed, with a sort of implication that the want of these mere instruments is a cause of crime. But one uniform item is found in all these reports, namely, *utter educational destitution far and wide in the land*. A majority, rarely under four-fifths, attend no school at all; and, if the quality of most schools be considered, those who do attend them are not in a much better condition than those who do not. Such reports may be necessary to stimulate the unreflecting portion of the public, by reiterated presentations of the same melancholy portrait; but the better informed on the subject are weary of them, and ardently wish for the day when an enlightened Government and Legislature will proceed on the notoriety of the destitution, whether that be no education, or bad education; and confer at once the blessing of sound elementary education on the entire people.

In my former letter secular education alone was considered; permit me now, with the earnestness and respect which the subject demands, to offer my humble views on religious. It is of course imperative to distinguish, with the utmost care, between, and clearly to define, secular and religious education. SECULAR education I understand to comprehend the

* The excellent school at Norwood, under the superintendence of Dr. Kay, secretary to the Government Education Commission, ought not to be omitted.

improvement of the human faculties, moral and intellectual, by exercising each on its own objects, and imparting instruction on the *works* of God, independently of his *word*. This instruction embraces all that man, by means of the faculties he has received from his Creator, may observe, discover, learn, and in any wise know, without Scriptural aid; and for which, therefore, seeing that God does nothing in vain, Scripture was neither intended nor given. RELIGIOUS education, I humbly take to consist in the inculcation of, and practical exercise in, the moral and doctrinal truths, which to the end of moral guidance in this life, and salvation in that which is to come, God has been pleased to reveal in his Holy Scriptures. More particularly, with regard to secular knowledge — independently of Scriptural revelation — man has faculties for acquiring the use of the instruments of reading, writing, drawing, and counting — for acquiring the knowledge of the surface, structure, productions, and atmosphere of the earth — the knowledge of the relations, to the earth and to each other, of the moon, the sun, the planets, and the fixed stars — the knowledge of the exact truths of number and extension — the knowledge of the substances composing the material world, their nature, qualities, combination, analyses, and agencies — the knowledge of the mechanical powers and relations of matter — the knowledge of the nature and powers of man, physical, moral, and intellectual, and his relations to the creation of which he forms so important a part; with the duties, thence pointed out, to himself, to his neighbour, and his God — the knowledge of the production and distribution of wealth, with the relations of labour — the knowledge, finally, of municipal rights and duties, of history, and of literature. The technical terms for these various branches of secular knowledge, such as geography, geology, chemistry, mechanics, physiology, ethics, &c., I need not enumerate. All and every part of the knowledge, now divided into its branches, might have been acquired by man, even although the revelations of Scripture had been withheld; and much of it was attained long before the Christian revelation was vouchsafed. It follows necessarily, therefore, that secular and religious knowledge are distinct objects of our contemplation; that each depends on its own peculiar evidences of facts and reasonings; and that the facts and reasonings of the one cannot, according to a sound logic, be intermixed or in any way controlled by those of the other. If no one would think of predicating that by means of all the secular knowledge which has been enumerated, the scheme of Christianity would have been even conceived, surely as little would any one maintain that that scheme would have directly or indirectly revealed any part of that secular knowledge. I am aware that it will be said, that a knowledge of ethics or morality is revealed by Scripture. Granted, I would answer, but neither exclusively, nor for the first time. Christianity is a paramount foundation of morality, but it is not the *sole* foundation of God's appointment. There prevails much confusion of thinking here, from not attending to the fact, that God has given a twofold foundation to morality — first, in man's constitution and its relations to the rest of creation; and, secondly, in his own revealed Word. The first is recognised in Scripture itself as the natural law, which was expressly "confirmed," not "abolished," and, according to Butler, was republished in the Scriptural. It is recognised by St. Paul in that *Nature* by which the things contained in the law may be done. It follows that the natural law existed before the Scriptural; that it still exists unabolished, and is a legitimate and independent object of knowledge. Nay, it is essential that it should be studied independently, else its distinctive nature and power as a Divine *addition* to Christianity itself could not be perceived; the first would, contrary to Divine authority itself, be merged in the second revelation. Bishop Butler founded his "Analogy" upon the essential difference of the two things which he analogically compared; while Melancthon, the highest reformation authority, says, "that it never was the intention of the Creator to supersede, by a law graven upon stone, that law which is written with his own finger on the human heart." So fortified, then, I have confidence in maintaining that there is a morality for secular study and exercise, as well as a morality in revealed religion, and that both are of God. As more feeling than reason has characterised recent discussions on the relative claims of secular and religious education, it is much to be desired that due discrimination should be exercised in it. I would respectfully ask any advocate for mixing or blending secular and religious knowledge, to put in words what he thereby means. The matter ought to be brought to this test. Let him lay his finger upon any one of the branches of knowledge above enumerated as secular, which he can say owed its discovery, or depends for its elucidation upon the specific doctrines of Christianity. It is an indiscreet and injurious zeal, although not uncommon, which claims for Scripture what Scripture itself disclaims — the character of a sufficient source of knowledge, secular as well as religious. What is, then, meant by blending, interweaving as it were, religious with secular knowledge; or, to use the current but unexamined form of speech, *basing* secular education on religious? Do what we will, we must, to attain a competent share of both, study them separately. However mechanically intermixed in school arrangements, the actual lessons on each must be given separately. The Creator has himself placed the knowledge of his works and of his word on different foundations; and, while He has commanded man to attain the knowledge of both, He has pointed out the grounds of each. Now, if the knowledge of both *be* attained, should the mere *order* in which this is done be matter of violent controversy? Is not that order the best which best achieves the end? Again, provided religious instruction be efficiently given, is it imperative, is it expe-

dient that it shall be given at the same moment, and by the same person as secular? Would not the division of labour advantageously relieve the already overburdened teacher of secular knowledge from the additional and separate duty of impa ting religious? Would religious be worse given if it were the special department of a still more competent instructor? I repeat my entreaty for a candid and temperate survey of this important question, for, with deference I say it, this has not yet been bestowed upon it; on the contrary, an unjust outcry, not to say a party watchwo d, has, in some quarters, attempted to put down all reasoning on the subject. In the evidence which, three years ago, I had the honour to give before the Committee of the House of Commons on the education of Ireland I made a humble attempt to draw the distinction which I have now endeavoured to make plain, and have thence been subjected to much unmerited and indiscriminate obloquy. The words I then made use of, being unpremeditated, were perhaps unguardedly emphatic, and have accordingly been laid hold of as a plausible handle for misrepresentation. The words were, "I consider that the idea of basing education upon *doctrinal* religion is an *utter absurdity;* doctrinal religion is a distinct branch of instruction, *afterwards to be attained*, and is addressed to a much riper state of the faculties, and a much more advanced state of knowledge, than can possibly be held to apply to what is called the original foundation." (Printed evidence, 3171.) It has been to me most painful to witness the treatment this passage has received from zealous religious professors. One and all have used it as proof of a wish and intention, on the part of the witness, to *exclude* religion from education altogether. *Not one* who has quoted the fifteen first words of the sentence, has had the candour to add the explanatory remainder. Few have quoted the first fifteen words themselves correctly; and some have left out the important word *doctrinal*. In one or other of these ways, I have had the misfortune to be misrepresented, in other words calumniated, in both Houses of Parliament, and in numerous party journals. I beg to take one example from the *Times* of 5th September last, which states that I am known to my countrymen as the author of "the saying"—"that the identification of religion with general education is utterly preposterous and absurd." The words were marked with quotation commas, to impress the belief that they were my own. I must do the editor of that journal the justice to say, that he gave prompt insertion to my disclaimer of these words, and of the character which they tended to fix upon me. I have not taken the trouble to notice the current misrepresentation, as propagated by many other journals; it yet continues to be reiterated, and I have no doubt will often and often appear again. I lament this undeniable immorality much less on personal grounds than for its effects in prejudicing the cause of national education. I have not, therefore, let pass this opportunity of solemnly declaring that I will yield to none of my opponents in solicitude that the same human being to whom I would impart secular knowledge shall also be thoroughly instructed in religious; nay, I will add, better, more practically so, than I have yet known him to be under the best of the old systems. If by *basing* education on religion, he meant the imparting of *early* religious impressions and instructions, I heartily concur in the vital importance of so doing: a mother's whisperings to the infant on her knee may be impressively religious. In religion there is something to learn, something to feel, from the first dawnings up to the maturity of the faculties. In right *order* I would inculcate religious knowledge, and so avoid that greatest of all educational errors, the unintellectual rote—often attended with no little conceit when made the object of competition and display—which is mistaken for religious knowledge by those who, on the notion of the *basis* or *foundation*, show an unreflecting hurry to inculcate the doctrines of Christianity on absolute infancy.

If I have shown that secular and religious instruction *may*, and, to the advantage of both, *should*, be given separately, and by separate teachers, I come now to consider circumstances in which they *must* be so given—and these are, when different religious sects meet, as they must do on any feasible scheme of national education, in the same *secular* school. Secular knowledge is alike to all human beings. But to deny this knowledge, which is a right, a worldly necessity, if I may so speak, to any human being who will not take mixed up with it my religious opinions, is quite as unjust as to deny him food, if not received on the same conditions. Very zealous sectarians, but only they, make no distinction between a proper respect for the conscientious religious opinions of others, for the *Protestant* right of others to the exercise of private judgment in interpreting the Scriptures, and indifference to all distinctions in religious opinions. Of course, such sectarians would force their own opinions upon all other sects, and are impregnable even to the argument *à converso*, when asked how they would feel the same conduct on the part of any other sect whatever.

With a view to a system of education entitled to the name of *national*, there is but a choice between two alternatives. EITHER to establish as many *secular* schools in each locality as there are religious sects, giving to each a secular master of its own religious sect, and imposing on him the care of both secular and religious education—OR, to establish one secular school for all religious sects under one teacher, and provide a different religious teacher, in the same school, for each religious sect. The first alternative need not be dwelt upon, for it is out of the question, both on the ground of expense and practicability. The second alternative may take one of two forms—either to place a teacher of religion, appointed expressly for the function, for each sect in each school, a plan little less costly than

the first alternative, *and, be it marked, one which all* VOLUNTARY *Dissenters must decline, as it implies taking religious instruction from the State;* or divested of these insuperable objections to commit that important department of education, the religious, to the proper teachers of religion already existing, the clergy of the different denominations. This is the course which humbly but confidently I predict will, because it must, be ultimately adopted. To the pastoral care of their own ministers the youngest of the young should be committed. The pupils should never view the department as a mere accessory to the secular school; but ever as a principal and paramount branch, to which as much time and care should be allotted as are requisite for its efficient fulfilment. The resort of the young to their pastor, or his visits to them, ought to be associated with privilege and pleasure. The Holy Scriptures should be his especial book, which the child has never seen desecrated and degraded to the profane uses of a common school reading-book, and has never learned by rote as a common task. By this arrangement three important points will be gained. *First*, the grand objection to National Education — the disagreement of religious sects — will vanish. *Secondly*, Religious instruction will be better, more impressively, more practically, given, than, as has been proved by experience, it ever has been given in the common and secular schools; and, *Thirdly*, The immoral and truly unchristian encouragement of religious animosities, of a religion of hatred but not yet of love, will in this country, as it has done in others, come to an end.

In my next letter I shall endeavour to obviate some current objections to the plan for religious education now proposed — such as, that it *excludes* religion from education — that it takes out of the hands of the secular teacher the power of enforcing moral conduct by Christian motives — that, seeing that secular education alone is to receive State support, the scheme provides for secular but leaves religious to chance — that the pastor has no time for the religious instruction of the young — that it interferes (an objection scarcely consistent with the immediately preceding) with the *natural* right of the clergy to guide and control education, both secular and religious — and that it is incompatible with the paramount right of the Established Church, as part and parcel of the law of the land, to superintend the religious education of the country.

In conclusion of the present letter I have much pleasure in being able — as in my first with regard to the advanced secular education — to adduce the fact of the realisation of the very scheme of religious, which I have humbly advocated, and that with all the advantages which have been predicted to attend it. Holland has for thirty years divided secular and religious instruction into the functions of two teachers; the one of the secular teacher of all sects, and as such provided by the State; the other of the pastor of the sect to which the pupil belongs. This latter duty the Dutch clergy of all denominations perform, with no lack of time, and the very reverse of a lack of good-will. In 1806, these reverend persons responded with alacrity to a circular from the Secretary of State for the Home Department, proposing that the State should furnish secular, and the clergy voluntarily provide religious instruction, in a great national plan. The circular and the answers, which last it is refreshing in this time of sectarian intolerance, to read, your Lordship will find in the appendix to Cousin's late educational tour in Holland, of which there is a translation by Mr. Leonard Horner. A very recent traveller in Holland, well known to the writer, who made it a special object of inquiry, reports, that the system has always worked in the most satisfactory manner; that there is no slacking of zeal, no failure in punctuality, no want of time in the voluntary and unpaid attendance of the pastors; that these, whatever be their denominations, are on the most friendly terms with each other; that religious hatreds are unknown; and that the pupils actually receive a much better based, more permanent, and more practical, religious education, than is to be met with in any part of our own country. The secular teacher, although he may enforce moral conduct by appealing to the Word of God as it is expounded to the pupil by his pastor, gives no direct religious instruction. Several teachers, who were asked if they did, were surprised with the question. They promptly alleged the diversity of sects under their charge, as rendering such a course incompatible with impartiality.

I need not inform your Lordship that the arrangement is in most successful operation in the excellent, but grievously misrepresented, corporation schools of Liverpool. I had the happiness to witness the gratifying spectacle of large classes of pupils in different parts of the establishment, surrounding the pastors of their own persuasion, who were at no loss for time for the interesting duty of religiously instructing the young. The largest group was of the Establishment, and the Rev. Mr. Aspinal was the instructor; who, nevertheless, does the full duty of one of the parishes of Liverpool. I rejoice to have this opportunity of humbly adding my tribute of honour to that rev. gentleman. After visiting all the groups, Church, Dissenting, and Catholic, I witnessed the conclusion: — all the pupils, without distinction of sect, assembled in one hall, and, before being dismissed, sang a hymn of praise to their common Creator. I should not envy the feelings of the man who could be present on such an occasion and stand unmoved.—I have the honour to be, my Lord, your Lordship's most obedient servant,

JAMES SIMPSON.

Northumberland Street, Edinburgh, January 5. 1839.

THE

MONTHLY CHRONICLE.

THE FOREIGN POLICY OF ENGLAND.

When great and stirring questions of domestic policy are at issue, — when we are discussing the modification of our political institutions,— or when civil liberty is, or is supposed to be, in peril, our relations with foreign powers naturally occupy but a secondary share of our attention. By assuming this as an axiom we readily account for the apathy with which so large a portion of the best informed of our country-people have contemplated the many changes that have occurred during the last twenty years in Europe, as well as in those states which the interests and jealousies of Europeans have drawn more or less within the circle of civilisation. Nevertheless, the merest tyro in politics is perfectly aware that complete independence of foreign control is necessary to the maintenance of domestic liberty; and the British public in general, little as they have qualified themselves to examine how foreign events bear upon the interests of their own country, are easily alarmed by exaggerated statements of distant dangers, — easily excited against a minister whom they are led to believe neglectful of relations, the importance of which they fully feel.

When we speak of this apparent apathy and real ignorance of the British public with respect to the foreign relations of their own country, it is far from our intention to exclude from this general censure those classes which at the first glance might be thought least amenable to it. It is in our legislature, in the two houses of parliament, and more particularly in the upper house, that this apathy or ignorance is most apparent. It may be questioned whether among those who are usually in the habit of joining in the debates, in either house, there could be found a dozen peers and commoners qualified to enter on a comprehensive discussion of the foreign interests of their country. On the ministerial benches in the House of Lords, for two sessions together, not a man could be found to reply to the rodomontade of the Marquis of Londonderry. Lord Melbourne, familiar as he is with every question of home government, and powerful as the influence is which his temper and urbanity enable him to exercise even over a hostile majority, was never able to return an effective reply to the lectures on Spanish affairs, which the noble marquis periodically inflicted on his peers, and which, lame as they were, and teeming with perverted and exaggerated statements, failed seldom to produce a powerful impression upon a willing audience, but which could not for a moment have stood the test of inquiry, if one qualified for the task had stepped forward to expose fallacies which to ignorance alone could look for acceptance.

The return of the Earl of Clarendon to England has extinguished the parliamentary importance of the Marquis of Londonderry, so far at least as Spanish affairs are concerned; but the protracted contest in Spain is

approaching its termination, and to other ground an active and powerful opposition will now transfer its attacks on the existing cabinet. Turkey, Egypt, and Persia will, in the next session, yield fertile topics for cavilling against ministers; and where, in the upper house at least, can Lord Melbourne look for assistance, should the local experience of Lord Aberdeen and Lord Strangford be put into requisition to provide the means of attack? It requires sometimes only a very slight perversion of a fact to make the worse appear the better cause, more particularly where the feelings of an audience go with the speaker. The Marquis of Londonderry, for instance, was wont to assert, that the atrocities which have all along marked the civil contest in Spain originated with the constitutional government, and were mere acts of retaliation on the part of the Carlists. This was the very reverse of the truth, and most men felt that it must be so; but when the noble marquis enumerated various obscure individuals, who, he said, had been wantonly put to death by the Spanish authorities before any similar deeds of blood had been committed by the adherents of Don Carlos, his opponents were confused: they felt, however unfounded or perverted the statement, that they were not themselves sufficiently in possession of the facts, to demolish what they were conscious was either a tissue of misrepresentation, or a mere web of sophistry. When Lord Clarendon, last session, delivered his memorable speech on the affairs of Spain, he inadvertently left this part of Lord Londonderry's declamation unanswered. The latter rose again, with some appearance of triumph, to taunt his adversary with the omission. The taunt, and the reply which it elicited, received no farther notice from the daily papers than a simple announcement that the two noble lords "mutually explained," an account little calculated to convey to the public an idea of the powerful impression made by Lord Clarendon's rejoinder. The individuals alluded to, he said, had not been political offenders at all, but mere robbers and murderers on the highway, — men who sought to practise their calling with greater security under the guise of political partizanship— men whom in every civilised community the law would have condemned to the same punishment to which they were sentenced in their own country. To this explanation the Marquis of Londonderry offered no remark.

There was no direct falsehood in the marquis's oft-reiterated statement, though a gross falsehood and foul calumny were implied; but to expose the falsehood and dispel the calumny a practical knowledge of all the details of the question was necessary, and this knowledge, apparently, was possessed by no peer on the ministerial side of the house till Lord Clarendon returned from Spain. But where shall we look for a Clarendon when the debate turns on Eastern topics, as it most assuredly will in the session of 1840? Lord Melbourne, no doubt, will be perfectly qualified to defend the principles on which he and his colleagues have acted; but will he be able to answer and refute the multitude of minute attacks, based on individual and obscure occurrences, which the ingenuity of opposition will incessantly direct against him? We fear not; nor can we at this moment point out the man, among his customary supporters, to whom in such a case he could look for effectual assistance.

In the House of Commons, the presence of the Foreign Secretary secures ministers, in some measure, against the annoyance we have just been speaking of, and vexatious attacks of the Londonderry kind are more cautiously made, or more easily baffled; but in the lower house, also, the number is lamentably small of those members whose general information qualifies them for a calm and searching inquiry into the foreign policy of their own country. Such ignorance does appear strange in an assembly

supposed to represent a people whose foreign relations are more widely diffused than those of any nation ever were before, — a people of whom a very large portion are scattered over the face of the world, — a people moreover of whom it may safely be said that a large majority are directly interested in the continuance of a friendly intercourse with other countries. Where then are we to seek the cause of this ignorance? We believe it will be found in the one fact, that the assembly in question does not represent either the opinions or the interests of the people, — that the representation is in truth little better than a fiction; one class, and one class only, having the supreme direction of that assembly, and that class exactly the one least interested in all that does not immediately relate to domestic matters. How vast a stake has England not embarked in her colonies, her Indian possessions, and her foreign trade! Are these interests represented in parliament? Where, for instance, are the men to whom the foreign merchants of this great metropolis of the commercial world can look up, as their representatives in the council of the nation? Where are they? we ask again; and echo repeats the question.

This apathy on the part of the public, and ignorance on that of their representatives, have not, however, on the whole, been attended by unmixed evil. A liberal ministry has been less thwarted by faction in the administration of its foreign policy, than in that of any other department of government; and to this circumstance we may safely attribute the triumphant success of that policy, when we compare it with the unsatisfactory results of all our arduous struggles to secure the permanence of good government at home. When we talk of the triumphant success of the present government in its foreign policy, we know we shall startle many even of those who deem themselves among the staunch supporters of that government; while from its opponents, we are perfectly aware, we have nothing but a loud and unanimous shout of affected derision to look for. Nevertheless, we shall fearlessly maintain our position; and, though we feel satisfied that a time will come when the Grey and Melbourne cabinets will have to bear the general censure of the country for the timid and wavering policy which made them hesitate, in their home government, to place their entire reliance on those popular principles which raised them to power and maintained them there, yet we feel equally satisfied that the skill with which they have conducted the foreign interests of their country will be fully appreciated by a future age, and that a national tribute of admiration will yet be the reward of those who, sometimes by dignified forbearance, and at others by a bold and firm assertion of their country's rights, have, during a period of unusual difficulty, preserved the general peace of Europe, and who successively have removed most of those embarrassments in which the blindness and incompetence of their predecessors had involved all the foreign relations of England.

Before we can pass an impartial judgment upon the conduct of a government, it is absolutely necessary that we should inquire into the difficulties by which, on its first formation, it was beset; and we have it on the word of one of their most zealous opponents, that the circumstances under which the Whigs took office in 1830 were of a nature to justify the gloomiest apprehensions. We need not here reprint the memorable speech of Mr. A. Baring, now Lord Ashburton; suffice it to say, he declared that nothing short of a miracle could prevent a general war from breaking out within a few months. And truly "the political horizon," as the newspapers say, looked threatening enough. A successful revolution in France had excited the hopes of the discontented from one end of Europe to the other;

Belgium, in imitation of the French, had renounced the allegiance imposed on her by the congress of Vienna; and Poland, by adopting the same course, had provoked the vengeance of a yet more formidable master. In Germany, Switzerland, and Italy, the most fearful fermentation was at work, and manifested its presence by partial insurrections, many of which were attended by important political changes. A successful revolution had emancipated Greece from Moslem domination; Persia and Turkey had been allowed to sink into a state of humiliating dependence on Russia; and Spain and Portugal were agitated by passions ill suppressed, that even to the most short-sighted presaged an early explosion, the consequences of which it was impossible for the most penetrating mind to calculate. The great military powers of Europe became alarmed, and hastily placed their armies on a war-footing. Every thing seemed to announce a general struggle, — a struggle which the diversion created by the Polish revolution perhaps alone prevented, but which there was reason to believe had, even by that event, been delayed only for awhile.

Nor was this all. A fertile subject of jealousy had been created by the French occupation of Algiers, in consequence of an insult offered by the Dey to a French consul; and while France had thus been allowed to annex a vast extent of coast to her territories, and to lay the foundation of an African empire to which it would be difficult to assign limits, Russia, by the treaty of Adrianople, had been permitted, in defiance of an express convention, to annex large portions of Turkey to her already unwieldy dominions. A general war, — the dreaded war of principles, the vision of which had haunted the imagination of Mr. Canning, — seemed about to commence; and England, it was felt, could not remain a mere spectator of the conflict. Such was the state of Europe in November, 1830. Nine years have since passed away; and, though a fierce and incessant party struggle has meanwhile distracted England, and materially interfered with her domestic government, not only has she herself remained at peace with foreign nations, but her influence has deterred foreign nations from going to war with one another; and her weight in the councils of Europe, which, from the death of Mr. Canning till the retirement of the Duke of Wellington, had been rapidly declining, till it had almost ceased to be felt, is at this moment more generally acknowledged than at any previous period since the overthrow of the Imperial authority in France.

The difficulties of Lord Grey, with respect to the foreign relations of the country, arose partly from the mere force of circumstances, partly from the errors and inadvertencies of his immediate predecessor. And here it may be, in passing, observed, that, as far as their foreign policy is concerned, we look upon the cabinet of Lord Melbourne as identified with that of Lord Grey. While every other office in the cabinet has been shifted from hand to hand, and has yielded more or less to circumstances arising out of the party warfare that has been incessantly going on, the foreign office has continued under the direction of the same minister, and has been guided by the same great principle originally laid down — the determination to maintain peace by every means consistent with national honour. Among the difficulties arising out of the mere force of circumstances, few perhaps were more serious than those to which the avowal of this principle gave birth. A government that displays extreme anxiety to avoid war may be thought almost to invite aggression, or at all events to abdicate its influence over its neighbours; and such unquestionably would be the case with any government not possessed of great moral force. This anxiety the Whig ministry have never ceased to avow; nevertheless, no act of aggression has hitherto

been attempted by any European power, though the spirit of faction at home has at times almost gone so far as to provoke insult from the stranger, as a means of annoyance directed against a government, which all the more legitimate devices of party warfare had failed to overthrow; meanwhile the honour of the country has been jealously maintained, and her influence abroad materially strengthened, notwithstanding the lamentable weakness to which party intrigues have been but too successful in reducing the administration at home.

Another important difficulty arising from the force of circumstances, was the fearful agitation occasioned by the progress of the Reform Bill through parliament. There cannot be a doubt that both William IV. and Lord Grey were deeply interested in the heroic struggles of the Poles for national independence; and it is equally certain that the triumph of that struggle would have placed the balance of power in Europe on a much more satisfactory footing than that on which it now stands. The treaty of Vienna would have afforded a sufficient pretext for interference, had any pretext been necessary; and had affairs at home been flowing in their ordinary channel, it cannot be questioned that the interests and sympathies of the British people would have imposed upon the government the honourable task of obliterating the traces of that great political crime — the Polish partition. But Lord Grey felt that remonstrance on such a subject, unless backed by a menace of war, would only have exposed his government to contempt; and a foreign war, it was evident to all, could not be entered on, at a time when the country had been brought to the verge of a revolution by the desperate devices by which the aristocracy sought to prevent the passing of the Reform Bill. There was no alternative but to abandon Poland or the Reform Bill, and Lord Grey chose the wiser course; — he resolved to secure the triumph of liberty at home, before he assumed the office of her apostle among foreign nations.

The chief difficulties with which Lord Grey had to contend, arose from the errors and inadvertencies of the Duke of Wellington's administration. Far be it from us to speak in terms of disrespect of one whose name will ever be a source of pride to his country, and whose frank and upright conduct in parliament, and his exemplary attendance to the business of the House of Lords, have obtained for him a degree of influence there such as neither peer nor commoner has within our recollection been able to exercise. But the noble duke is a Tory of the old school: he was strongly opposed even to the less bigoted Toryism of Canning; and the foreign policy of the cabinet over which he presided, whether intentionally or not, was directed by the principle of subduing that liberal impulse which the short but brilliant administration of Canning had imparted to all Europe. The policy of his predecessor, accordingly, was shunned rather than imitated by the Duke of Wellington; and Turkey and the Iberian peninsula were quickly made sensible of the change that had taken place in the councils of the British government. Mr. Canning had sent an English army into Portugal to prevent the liberties of that country from being destroyed by the Spanish Camarilla; the Duke of Wellington allowed a paltry tyrant to make that very army instrumental to his own usurpation of the throne, to the re-establishment of the principles of the Camarilla, and to the annihilation of Portuguese freedom. The sanguinary reign of Don Miguel was in fact the offspring of the Wellington policy. Had the British troops been withdrawn from Lisbon at the first manifestation of the Infante's treacherous designs, the usurpation would perhaps never have been attempted; or had the attempt been made, it would have been baffled by one loud and general burst of

national indignation. Even after the usurpation had been accomplished, it was evident that the sympathies of the English ministry were warmly enlisted on the side of the usurper. The Duke of Wellington and the Earl of Aberdeen could not indeed deny the treachery and thirst of blood which the petty tyrant of Lisbon was daily manifesting; but they betrayed, on more than one occasion, a decided partiality for the party by which he was supported; and while they spoke of that party as the one most desirous of a continuance of friendly relations between Portugal and Great Britain, they began to drop significant hints that the time was not far distant when they would deem it their duty to advise their sovereign to give his sanction to fraud, perjury, and usurpation, by the recognition of Don Miguel as king of Portugal. The accession of Lord Grey to power, and the selection of Lord Palmerston as foreign minister, were sufficient guarantees to the people of Great Britain that so humiliating a counsel would not be pressed upon their sovereign. The error or inadvertency of the Duke of Wellington was not, however, to be redressed with the same facility with which it had been committed; and it required a sanguinary struggle of some duration to overthrow a despicable tyranny, which would probably never have had existence if the noble duke had possessed the vigilance or penetration, or had been actuated by the principles of a Canning.

In Turkey, likewise, the policy of the Wellington cabinet obliterated in a brief space of time all that his distinguished predecessor had for years been labouring to accomplish. Russia had long been coveting an occasion for a foray across the Pruth, but the skill and prudence of Mr. Canning had always succeeded in preventing the meditated aggression. The death, in 1827, of that distinguished statesman removed one of the most powerful impediments to Russian ambition. The treaty of London, concluded in the early part of that year between England, France, and Russia, was expressly intended to prevent a war between the last-named power and Turkey, by making the pacification of Greece the common task of the three allies. We may fairly conclude, that had Mr. Canning survived a few years longer, the spirit of that treaty would have been maintained, and that the war of 1828 and 1829, so fatal to the independence of Turkey, would have been prevented. But the formation of the Wellington administration seems to have been to the Emperor Nicholas a signal for the resumption of his ambitious designs against the Ottoman Porte. It is difficult to imagine a pretext more empty than that by which an attempt was made to justify the Russian declaration of war. A circular addressed by the Turkish government to the Pashas (a document not intended for publicity) contained some expressions which the emperor was pleased to consider offensive, and by way of taking satisfaction for the affront, he invaded Turkey. Though unfortunate in the first campaign, his army succeeded in the second in forcing its way across the Balkan mountains to Adrianople, where a treaty of peace was signed, by which an extensive territory was transferred to Russia, and an obligation incurred by Turkey to pay an immense sum of money in the shape of an indemnity for the expenses of the war. We are not aware that any attempt was ever made by the Duke of Wellington, either to prevent the unjustifiable aggression, or to protest against the oppressive terms imposed by the victor.

The want of energy in the English ministry, in 1828, led to the war between Russia and Turkey; and to the same cause, in 1829, must be attributed the oppressive terms imposed on the latter power. It may perhaps be said, in vindication of the then existing cabinet, that powerful excitement at home made it as unadvisable, in 1829, for England to put herself

forward as the defender of Turkey, as, in 1831, it would have been the extreme of rashness to have hazarded a war to prevent the last vestige of Poland's political existence from being destroyed. Such an attempt, however, to vindicate the Duke of Wellington, would fail; for this distinction must be carefully borne in mind: the difficulties which beset him at home were of his own or his party's creating, while those which impeded the action of Lord Grey had been bequeathed to him by his predecessors. The violent agitation which arose out of the Catholic question was one the blame of which rested upon those who had so long resisted the adjustment of that question; in the same way that those who with melancholy consistency refused the slightest particle of reform, are alone responsible for the fearful convulsions which had well nigh arisen from the struggle in favour of the Reform Bill.

The fatal consequences likely to ensue to our Indian empire, from the abandonment of Persia to Russia, were pressingly urged on the Duke of Wellington's notice by all who made the interests of our Eastern possessions the immediate object of their study. By the treaty imposed on Persia in 1828, all the mountain passes which served to strengthen her frontier had been transferred to Russia, together with a large portion of the level country southward of the Caucasus. Russian garrisons were brought within a few days' march of Teheran; while few or no natural impediments were left, by which the advance of a hostile army from Tiflis to the Persian capital could be opposed by an inferior force. Under such circumstances, Persia ceased to be any thing but a dependency of Russia; and it became evident, if Russia really entertained designs on India, that Persia presented herself as the most convenient tool for the furtherance of such designs. It does not appear that any step was taken in 1828, 1829, or 1830, to counteract the effects of so untoward a change in the position of Eastern affairs. *L'occasion fait le larron;* and accordingly we find that the facilities so temptingly thrown in the way of Russia were not neglected. Persia became the *point d'appui* for Russian intrigues throughout the whole of India; and if those intrigues have been arrested or rendered harmless, it is to a class of statesmen every way the reverse of those who acted with the Duke of Wellington from 1827 to 1830, that England is indebted for the advantage of having been rescued from a growing and insidious danger.

Of all the countries of Europe, however, there is none from which a wisely conducted scheme of foreign policy might have obtained for England more important advantages than from Germany. In our November number we dwelt at some length upon the disastrous results to our trade with that country, to which our unfortunate corn laws have given rise. By means of those laws we have not only destroyed the best market in the world for the produce of our manufacturing industry, but we have converted into commercial rivals those who were formerly our constant customers. To the Tory party, or rather to that section of it who abjured Mr. Canning to place themselves under the guidance of the Duke of Wellington, are we indebted for the law that has exercised so calamitous an influence over the fortunes of this country. Had Mr. Canning's scale of duties been adopted, much of the evil that the corn laws have occasioned would have been spared, though even then our foreign corn trade would have been placed on much too narrow and monopolising a basis. Mr. Canning's scale of duties, though approved of by the House of Commons, was negatived in the House of Lords by the party that looked up to the distinguished soldier as its chief. That chief, in the next year, having himself been invested with power, substituted a scale of his own, which, though insufficient to satisfy the views of the ultra-fanatics among the landholders, was high enough to make the importation

of foreign corn an impossibility except in years of extreme scarcity. When we sum up the various mischiefs which the political incapacity of the Duke of Wellington has inflicted upon Great Britain, the existing corn law is certainly one that ought not to be forgotten; for had the noble duke not given the sanction of his illustrious name to aid the clamour of a little knot of selfish grasping landlords, the opposition to Mr. Canning's bill would have fallen to the ground, and the corn law would have been framed in a spirit much less hostile to the interests of the masses, less likely to excite popular clamour, and therefore much better calculated to secure a longer continuance of protection to our agriculturists, supposing such protection to be at all necessary to their continued welfare.

The commercial confederation of Germany is the legitimate offspring of the Duke of Wellington's corn law. Had it not been for that law, the confederation would perhaps never have been formed; or, if formed, its tariff would not have been avowedly drawn up in a spirit of hostility towards England. Nor can it be urged for a moment that the Prussian government proceeded with indecorous haste, or that the British minister did not receive timely and frequent warning of the consequences to which a perseverance in our anti-social policy must naturally lead. The archives of the Foreign Office are replete with remonstrances addressed by the Prussian to the British government on the subject of the corn laws, and with invitations to adopt a more liberal system of commercial legislation. Those remonstrances remained unheeded, those invitations were slighted; the consequence has been, as we have already observed, that we have not only driven our old customers from our doors, but have, to a certain extent, forced them to become our opponents in trade. Many articles with respect to which, ten years ago, England imagined herself in possession of a secure monopoly, are now manufactured in Germany of better quality and at a lower price than in England. English hosiery has almost ceased to compete with that of Germany in the transatlantic markets, and in most descriptions of cotton cloths the Germans have already equalled or surpassed us. So long as the cause of this evil continues to exist, so long the mischief itself will go on increasing; and though we do not carry our despondency so far as to believe our corn law in itself sufficient to destroy the last vestige of our manufacturing superiority, yet we do fear that, added to the many other burthens which the country has to bear, this, the most grievous of all, will, if not speedily redressed, impose so accumulated a load upon the energies of England, that her strength may prove unequal to the effort, should she again be called on, as towards the close of the last century, to enter on a struggle with an antagonist worthy to encounter her.

Such was the distracted condition to which the brief administration of the Duke of Wellington had reduced the foreign relations of the country, when, towards the close of 1830, he and his friends were fairly hooted from their places, and driven into unwilling retirement. The imbecility they had displayed in their dealings with other governments was, however, entirely forgotten at the time, owing to the deplorable, and apparently inextricable confusion, to which they had brought the domestic affairs of the state. At a time when fires were nightly blazing in every direction around the metropolis, while all attempts to detect the incendiaries proved abortive; at a time when Ireland seemed on the eve of a general insurrection; at a time when the King's ministers were afraid to allow one of the most popular of British monarchs to ride through the streets of his own metropolis, lest the execrations of the people against his counsellors should assume the semblance of insult to the person of the sovereign; at a time when our agricultural

labourers were moving about the country in formidable bodies, to lay the mansions of our gentry under contribution, while our Home Minister admitted his inability to afford protection against the outrage of a village mob; —at such a time it is not to be wondered at that the no less disastrous position of our foreign relations should escape the general notice of the public, and that our more distant dangers from abroad should appear comparatively of little moment, when all the elements of social order at home seemed hastening to dissolution. But when we take it upon ourselves to exercise our right to sit in judgment on the foreign policy of those who have administered the government during the last nine years, we must not allow the lamentable condition in which they found the home government to make us forget the scarcely less lamentable condition in which they found our foreign relations; and when we compare the state of those relations in 1830 with that in which they have since been placed, we feel ourselves fully justified in assuming, as we did in the early part of this article, that in no department of their government have the Whigs of 1830 been more triumphantly successful, than in their administration of the foreign interests of their country.

The downfall of the Wellington Cabinet in November, 1830, had an almost magical effect. The troubled billows of popular discontent were instantly allayed by the hope which took possession of all men's minds, that the early redress of grievances was at hand. It is not at present our purpose to dwell on the honourable and unremitting efforts of a liberal government to justify the hopes and expectations of the people, nor on the unrelenting zeal with which a disappointed faction has but too successfully sought to defeat those hopes. A bolder policy on the part of the authors of the Reform Bill would have secured to them much ampler powers for the carrying out of their own views; indeed, it may fairly be doubted whether the solicitude of Lord Grey to suppress that public enthusiasm to which he was indebted for the triumph of the great measure of his life, will not eventually have rendered necessary yet more sweeping changes than would otherwise have sufficed to readjust the equilibrium of our constitution. Lord Grey and his political friends chose to destroy a power which it should have been their aim to control and guide; and to their unfortunate timidity is it owing that the great effort of the people in 1831 has hitherto borne so few fruits.

On the Continent of Europe the announcement that a liberal administration had been formed in England, produced a no less striking and instantaneous effect. Despotism and monkish tyranny, it was felt, had lost their great hold by the fall of Toryism in England; and the Portuguese usurper was at once given up as lost, when it was known that Lord Palmerston had been appointed Foreign Secretary. The aversion was undisguised which the new administration felt for Don Miguel, whose contempt of every moral obligation has indeed extorted condemnation from those most anxious to uphold his power. Nevertheless, Don Miguel was the *de facto* sovereign of the country which had been the scene of his treachery and cruelty; and, faithful to that principle of non-intervention of which they demanded the observance by other powers, no attempt was made by the cabinet of Lord Grey to interfere between the usurper and the nation that appeared submissive to his rule. The acknowledgment of Don Miguel as King of Portugal, however, was indefinitely adjourned, and no opposition was thrown in the way of Don Pedro's endeavours to vindicate the rights of his child. Here was at once a marked distinction between the foreign policy of the Wellington and that of the Grey cabinet. The Tory duke had allowed the British troops to remain in Lisbon while the act of usurpation was proceeding, making their

presence appear to the Portuguese a tacit sanction of that act. The crime the accomplishment of which he had been instrumental in facilitating, the Duke of Wellington made no attempt to redress; he even studiously impeded those who were desirous of upholding the cause of loyalty and freedom. The usurpation of Don Miguel had been followed by the emigration of almost all that was distinguished or respectable in Portugal. The emigrants, however, in all such cases, form but a trifling fraction of the great body that participate in their sentiments; there was, accordingly, reason to anticipate that on the first favourable occasion a numerous party would raise the standard of revolt. A nucleus only was required round which the national party might rally; and there were not wanting bold and generous spirits in England ready to associate themselves in the sacred cause of rescuing Portugal from the foulest, and at the same time the most despicable tyranny, that has disgraced the modern annals of Europe. The patriotic endeavours of the Portuguese emigrants, and of their English friends, experienced a studied resistance from the Duke of Wellington. Not only were they vigilantly watched in England; but after they had sailed from our shores they were hunted down by British cruisers on the open seas, and the British navy was actively engaged in upholding a usurpation which the British army had been made instrumental to facilitate. The conduct of the Grey cabinet offered an honourable contrast to that we have been describing. Under a Whig government British men of war ceased to be employed in the humiliating task of guarding the blood-stained throne of Miguel; and although direct intervention between the tyrant and his victims was abstained from, no impediment beyond what the law enjoined was thrown in the way of the Portuguese emigrants. The result is known. Don Pedro was enabled to collect a small force in the Azores islands. With that force he invaded Portugal, seized on the city of Oporto, and there maintained himself till the naval victory of our gallant countryman Napier struck a blow which led to the almost immediate enfranchisement of the country. Portugal has become a constitutional state, and is now in a fair way, by qualifying herself for the enjoyment of liberty, to resume a high rank among civilised nations. That a people emerging from a most debasing system of political and spiritual slavery should not at once display a just appreciation of the freedom they have but newly achieved, is little to be wondered at. In Portugal, as in other countries where a tyranny of centuries has been trampled under foot by an indignant nation, a considerable period must elapse before the new institutions assume a permanent form. We do not, therefore, allow ourselves to be frightened by the modifications which the Portuguese constitution has undergone since the re-establishment of a limited monarchy, though we believe that to the country itself a more patient adherence to the constitution of Don Pedro would have been productive of greater benefits. Nevertheless, though we believe the democratic principle has been carried too far in Portugal, we do not despond; for we wish to see every country in the enjoyment of the freest system of government consistent with the maintenance of public order and the security of private property. Liberty and ignorance, it is true, cannot well go hand in hand; and where power is placed in the hands of an uninstructed multitude, popular passion exercises the influence that ought to belong to public opinion, and that passion is but too frequently directed to selfish ends by a small knot of artful and unprincipled demagogues. But, on the other hand, though an ignorant people are certain to abuse the rights of freemen, the possession of those rights will of itself promote their political education; and the longer they continue in the enjoyment of liberty, the better will they be qualified to appreciate the blessing, the less will they be likely to abuse it.

The Portuguese, we regret to say, cling with a melancholy pertinacity to the African slave trade, though bound by the most solemn treaties to renounce it; and this unfortunate predilection for a pursuit condemned by the whole civilised world, prevents the development of their colonial prosperity, and threatens to involve them in a quarrel with their oldest ally, and with a government to which, perhaps as much to their own efforts, they are indebted for enfranchisement from a most loathsome tyranny. We do not, however, believe that they will long persist in a course so little honourable to their national character; and the firmness and temper with which the British goverment have acted throughout a painful negotiation will, we are confident, lead to a resumption of that cordial intercourse which by both countries is so much to be desired. But even as she now is, can we look upon the Portugal of 1839 with other feelings than those of self-congratulation, when we compare her with the Portugal of 1830? Can we otherwise than rejoice when we reflect that the downfall of the Wellington ministry prevented the acknowledgment of Don Miguel as king?—when we reflect that, but for the policy of the Grey cabinet, monkish tyranny would now be paramount in Portugal, and that Spanish Carlism would have found its firmest ally in the kindred spirit of the Portuguese usurper? Portugal may not yet have become all that the friends of humanity would wish to see her, but what she has become is enough to justify the policy which England, under a Whig government, has pursued towards her.

The wearisome maze of protocols in which the Dutch and Belgian question was involved was another of the legacies bequeathed by the Tories to their successors. An enigma more difficult of solution it would not have been easy to conceive. Two nations, differing from each other in language, religion, and manners, had been violently joined together by the treaty of Vienna; and so extremely jealous was each of any supremacy that the other might attempt to arrogate, that the singular expedient was devised of obliging the royal family, and all the different departments of general government, to reside one year in the one country and the next in the other. To complicate the question yet farther, a portion of Belgium had, by a kind of political fiction, been declared a German state, and a foreign garrison had been permanently placed in one of the chief fortresses of the country. The incongruous materials of which the kingdom of the Netherlands was formed were severed by the first political concussion, and few were sanguine enough to believe that they could ever be reunited. The task that devolved on the British government was to complete the separation in such a manner as should inflict the minimum of injustice on Holland, and at the same time prevent Belgium from declining to the condition of a French province. Our limits will not allow us to pursue the sinuous course of diplomatic negotiation to which the Belgian question led; but we fearlessly maintain that Europe at large has reason to rejoice that during the negotiation a liberal, and not a Tory ministry, presided over the government of England. Had an attempt been made to coerce Belgium, a general war would have inevitably ensued; and, aided by the revolutionary spirit that then prevailed in Germany and Italy, the armies of France might again have overrun the Continent, and Central Europe would again have become a battle field, on which the revolution represented by France, and despotism personified in Russia, would have waged a sanguinary struggle, the issue of which could scarcely have been otherwise than disastrous to the cause of human improvement. From a calamity so fatal Europe has been saved, and in a great measure by the patience and firmness with which the British minister mediated between the conflicting principles engaged in the question. To Holland justice has

assuredly not been done; that would have required all the arrangements of the treaty of Vienna to have been reopened, an idea not to be entertained for a moment. But the injustice that Holland has suffered has been the minimum of what the nature of the case permitted; and Belgium, so far from declining to the condition of a French province, has been placed in a state of entire independence, and Holland and Belgium are more likely to form a permanent and cordial alliance as two separate states, than they would ever have done while tied together by the flimsy bond of a common crown.

The policy of our Whig ministers in Spain, we rejoice to say, has been signally triumphant; but the merit of a government is not always to be judged of by the vulgar criterion of success. Had Don Carlos even succeeded in establishing himself on the throne of Castille, the British government would have been equally entitled to our praise, for its honest endeavours to avert so grievous a calamity. Many, we believe, look on the civil war by which Spain was so long desolated, and which even now can scarcely be said to be completely at an end, as a mere war of succession, — a mere dispute as to which of two members of the same family was entitled to the crown. Had the question rested on so narrow a basis, it would have been entitled to a very small share of interest, except to the Spaniards themselves. But Carlism dates back to a far more remote period; and the civil war was already organised in Arragon and Catalonia, long before it was at all anticipated that Ferdinand VII. contemplated setting aside the Salic Law, which France had imposed on Spain, and restoring the ancient Spanish principle, which permitted the succession in the female line. Carlism in Spain, and Miguelism in Portugal, originated in a mere consideration of pounds, shillings, and pence; and both began to manifest themselves immediately after the abortive attempt of the Spanish liberals in 1821. When Ferdinand was re-established in the plenitude of absolute power by the intervention of a French army under the command of the Duke of Angouleme, great disappointment was felt by those who might not inaptly have been designated as the ultra Tories of Spain, at the hesitation of the king to restore to the church the splendid domains that had belonged to the Inquisition and to the other ecclesiastical corporations. The broad lands had been annexed to the crown, and Ferdinand showed no unwillingness to retain the splendid heritage which the revolution placed at his control. Those who encouraged the king in what was deemed a sacrilegious design, were branded as liberals and revolutionists; and the champions of the church, known by the collective name of the *Camarilla*, soon acquired an immense influence in Madrid, where they more than once exercised a supremacy over the ministry, and wielded a power which the king himself was not always able to resist.

The members of this "holy league" did not, however, confine themselves to court intrigues. Their emissaries were scattered over the whole of Spain; and in Catalonia and other mountainous regions formed themselves into armed bands that frequently set the government troops and the constituted authorities entirely at defiance. The king's brother, Don Carlos, was looked on as a convenient head for this dangerous faction, which, if we remember rightly, had already assumed the name of "Carlists" as early as the year 1825. From that time till the death of Ferdinand, the whole kingdom continued to be agitated by the machinations and atrocities of the Apostolic or Carlist faction, which, on the accession of the young queen, was found completely organised, and ready to enter on a struggle for the ascendency. To a moderately firm government the Carlists would have been little formidable; they had been so to Ferdinand only because he was never honestly seconded

by his own ministers, among whom the *Camarilla* seldom failed to count one or two of their most active members. But the Spanish Cortes, at the commencement of the new reign, committed a grievous error, the consequence of which was to throw some of the most important provinces of Spain into the hands of the faction. We allude to the arbitrary manner in which the constitutional privileges of the Basque provinces were abolished, without in the slightest degree consulting those most immediately interested in their maintenance. The Basques resisted so gross an act of tyranny; and had they not done so, they would have been unworthy of freedom.

The active discontent of the offended provinces was taken advantage of by the Carlists, who succeeded in associating their own detestable designs with the honourable cause of the outraged population of Biscay and Navarre. This unfortunate error of the Spanish government enabled Don Carlos, or rather the faction in whose hands the weak-minded prince was but a tool, to maintain for so many years a sanguinary civil war; in the course of which, more than once, there seemed to be a possibility that the crown of Spain might again become a dependency of the Inquisition. Had the Duke of Wellington during the momentous struggle presided over the British government, Spain would at this moment have owned the idiot Carlos for her king, and Europe would have beheld on the throne of Castille the abject tool of monks and inquisitors. By the pacification of the Basque provinces, Spanish Carlism has now been reduced to its own resources, which will be found utterly insufficient for a protracted struggle. A few bands may yet a while maintain themselves among the mountains, but their ultimate and speedy reduction may confidently be looked for.

The complicated question of the East remains; and there also England has good cause to rejoice at the progress already made in correcting the errors of a Tory administration. Had the Duke of Wellington, immediately after the battle of Navarino, displayed only a small portion of that firmness which has of late been shown, the Russian army would not, in 1828, have passed the Pruth; and the Sultan Mahmoud would not have been interrupted in that course of salutary reform by which he aimed at the regeneration of his people. The disastrous campaign of 1829 broke the spirit of the Turkish people. The humiliating treaty of Adrianople in the same year, and that of Unkiar Skelessi, which followed closely on its heels, effected the moral prostration of Turkey. We are now engaged in the almost hopeless task of preserving that distracted empire from total dissolution. The attempt may fail, but its failure will not make it less honourable to those engaged in it; and had England received that cordial co-operation which she was entitled to look for from France, the task would have been any thing but hopeless. As it is, the presence of a formidable British fleet in the Levant has proved sufficient to hold in check the several powers that long to share between them the spoils of a tottering empire; and should France persist in her capricious and vacillating policy, means may yet be found to dispense with her aid in the adjustment of Turkish affairs. The issue of our negotiations with respect to Turkey we shall not presume to anticipate; for, in addition to the natural difficulties of the question, we have to encounter those which may arise from the faithlessness of our allies, and from the impotence into which the Ottoman Porte appears to have sunk. But it can never be too frequently repeated, that the present embarrassments of Turkey owe their origin, in a great measure, to the pusillanimous councils of the Wellington cabinet; and should Lord Melbourne and his colleagues fail in their endeavours to repair the errors of their predecessors, it is with the latter that no small portion of the blame must rest.

But there is perhaps no part of their foreign policy upon which our Whig ministers are better entitled to point with a feeling of pride and satisfaction, than the results they have obtained in Persia and India. The complete ascendency which Russia obtained in 1828 over Persia, naturally encouraged the former of these powers to extend her designs. It has been said that the Emperor of Russia was a stranger to the machinations of the many Russian emissaries lately scattered over a large portion of the East; and we have been assured that the intrigues of Russian diplomatists to stimulate the Persian monarch to waste the resources of his empire in fruitless schemes of foreign conquest, were never authorised by the emperor, but, on the contrary, were strongly condemned by him. This, if true-while it rescues the character of Nicholas from the charge of duplicity, shows that there exists in Russia a power which acts independently of the sovereign's control; for it cannot be denied that the recognised agents of Russia were unwearied in their endeavours to urge the Shah to his ruinous expeditions into Afghanistan, — where, if successful, he would only have enlarged an empire which would not the less have remained a dependency of Russia; and, if defeated, he would only, by the entire exhaustion of his resources, have made himself more completely the vassal of his powerful neighbour. Persia, by cultivating the arts of peace, may yet recover from the blow inflicted by the last Russian war; and, as the prosperity and independence of Persia would offer the most effectual guarantees for the tranquillity of India, it is the policy of England to dissuade the Persian monarch from ambitious designs, which, whether attended by failure or success, are alike pregnant with danger to the welfare of his dominions. Nevertheless Persia rejected the counsels of a friend, and allowed herself to be guided by the instigations of a designing enemy. The expedition into Afghanistan was undertaken; and that expedition, if successful, might have been followed by the most serious results in India. That it was not successful is in part owing to the judgment, bravery, and military skill of a young officer belonging to our Indian army. Lieutenant Pottinger was travelling overland, either to or from India, at the time that the Persians were just about to attack the chief of Herat. His quick eye enabled him to detect the importance of the struggle then about to commence. He offered his services to the chief, by whom they were cheerfully accepted, and the young Englishman immediately prepared the city of Herat to sustain a siege. The siege commenced; but, owing to the indefatigable zeal and admirable judgment of Lieutenant Pottinger, the Persian army, though guided by the military skill of several Russian officers and engineers, failed in taking the city, and was eventually forced to retire in disgrace. Had Herat fallen, it is difficult to say to what extent Persia might not have been able to carry her conquests in Afghanistan, till the kingdom of Lahore would alone have remained between British India and the frontiers of the Russian tributary.

Persia had failed in her first attempt on Herat, but a second might lead to different results. The British government resolved to anticipate the designs of Persia, by placing Afghanistan in a condition to resist the meditated aggression. With this view it was resolved to recombine the scattered fragments of what had once been the kingdom of Cabool, and thus to place a powerful empire between Persia and India. Our latest advices from Bombay announce the gratifying fact of the entrance of our troops into Cabool, and the restoration of the former sovereign to the throne, from which some twenty years ago he was driven by the successful arts of an ambitious vizier. The throne, since the expulsion of Shah Shoojah, had

remained vacant; and the kingdom, parcelled out into a number of independent principalities, had been a constant scene of anarchy and civil war. It is not to be wondered at that a country so circumstanced should have excited the cupidity of an ambitious neighbour; but when reunited under the sway of a sovereign countenanced by Great Britain, it will be long before any foreign power will hazard an aggression on Afghanistan.

The restoration of the kingdom of Cabool has made our empire in India safe for many years to come; for, independently of its direct influence in establishing a barrier between India and the powers of the West, the moral effect has been immense which the decision of the British government has had upon all the princes of the East. The error of the Tories, who in 1828 abandoned Persia as a conquest to Russia, has been redressed by the Whigs in 1839, by the re-establishment of the kingdom of Cabool.

Here, for the present, we will pause, — warned rather by the extent to which our remarks have already gone, than by any exhaustion of our subject; for there are many points of our foreign policy, to which we have not yet alluded, which would place the conduct of the Grey and Melbourne cabinets, as compared with that of the Duke of Wellington, in an equally honourable light.

ON THE EXTINCTION OF HUMAN RACES.

BY DR. PRITCHARD.

While other branches of natural history are diligently cultivated, no degree of general attention proportionable to its importance is given to ethnograhy, or the natural history of human races. It has appeared to me for the following reason desirable to call attention to this remark. Opportunities for pursuing the investigation to which I have alluded are every day failing and disappearing for ever. This is not the case with respect to other subjects in natural history or general science. We might contrast the different departments of human knowledge in reference to the durability of the objects with which they are conversant.

Mathematical science, properly so termed, contemplates only eternal and immutable relations. The truths which it brings to light must have been recognised precisely as they are now known from all eternity, or where and whenever there were intelligences capable of apprehending them. The abstract relation of number and space must indeed have been the same, had no intellect existed in the universe. But, as far as mankind are concerned, it may perhaps be said, that the facts which relate to inorganic nature are eternal truths, for matter, as such, is to our view indestructible, as it is ingenerable, and immutable in its properties. Perpetuity of existence, so far as our ideas and knowledge of time extend, belongs alike to the smallest molecules of the unorganised world and to those great masses which, revolving in the heavens age after age, have offered themselves to the view of countless generations. It is quite otherwise with all the productions of organic nature, which exist only in series of similar individuals, destined one after another to originate and decay — a destiny common alike to the lords of the creation and to the potherbs and legumes which contribute to their daily food. But the organised world is subject to another vicissitude. The tribes of which it consists have but a definite existence, determined by the conditions of external nature. When these have changed, it would appear that new organised tribes, adapted by their physical constitution to the new state of external circumstances, replace the old ones. It would be

interesting to inquire whether such changes have had any influence on the destiny of ancient races of men. Certain it is that many vast regions of the earth, if not the whole or the greater part of its surface, were formerly the abode of tribes which have long ago perished; and many of these races were different in physical character from those which at present exist in the same countries. Were the old races swept away by changes in climate and local circumstances, which became incompatible with the conditions of their existence? This is a question for the solution of which no satisfactory data can be found.

An opinion was entertained some time since in France, which, if it had been well founded, would perhaps have furnished an example of this kind. A prize was offered by the Geographical Society of Paris for an essay which was to include the history of ancient negro races supposed to have been the aboriginal inhabitants of the region of Central Asia, of the great Himmalaya, and the mountains of Kuen-lun to the northward of that chain. It was fancied that the existence of such a people in that quarter was satisfactorily attested by ancient Chinese historians; and if the fact had been established that the highest and coldest region in the Old World was the aboriginal abode of black woolly-haired tribes, it might safely have been inferred that some great physical change must have taken place, since negroes now exist scarcely, in their wild and native state, except in the hottest part of the intertropical clime. But it turned out that this notion was entirely founded on mistake, and that the Kuen-lun recorded in ancient Chinese books to have been the abode of negroes, was not the mountainous country bearing that name, which is to the eastward of China and northward of Tibet, but certain islands bearing the same designation in the Indo-Chinese seas. It is uncertain to what causes the ancient depopulation of great regions of the earth may be attributed; such catastrophes appear, however, to have been of great extent. In the remotest parts of Northern and Eastern Asia remains have been discovered which prove that nearly the whole of that great continent was once occupied by human races, whose very names have perished. Some of these nations appear to have made some progress in arts and civilisation. Their tombs are found spread over the countries eastward of Jenisey. In those remote countries such remains are in great numbers and of magnificent construction; they contain ornaments and various implements of silver, gold, and copper; there are girdles of the precious metals, bracelets decked with pearls: in the same tombs are fragments of earthen manufactory or porcelain. I shall not at present detail the arguments which have satisfied the learned academicians of St. Petersburg that such relics belonged to races of people long ago extinct, who must have disappeared before the light of history dawned upon these countries, but shall hasten to remark, that discoveries leading to a similar result have been traced through the New World, from the countries bordering on the Mississippi and Ohio, where tombs are found containing skeletons of a different conformation from that of the present native tribes, to the high table-land of Tetecaca, in the Peruvian cordillera, where those strangely formed skulls are seen which deviate so widely from the usual form of human heads. Even in the islands of Polynesia, vestiges are discovered which have been referred to a former race of inhabitants; and to conclude this series of observations, there are facts which indicate that extensive countries in Europe were occupied by races of a different physical character from the present natives, in times which preceded the arrival of Celts and Goths, and other Indo-Germanic nations from the East.

I shall now pass to another view of this subject, for the sake of introducing which I have been led to offer these remarks. The extermination of

human races is still going on. Whatever were the causes which destroyed the ancient tribes, we know to what agency we are to attribute the similar fate of many nations who have perished since the historic age commenced. How many whole races have become extinct during the few centuries which have elapsed since the modern system of colonisation commenced? The Guanches, the numerous people of the Canary Islands, now exist only in their mummies, and in the traces of those arts by which they sought to procure for the dead an eternal repose, and which have proved the occasion of transporting their mummies into the museums of Europe. It would be endless to recount the names of tribes and whole nations in America who have been extirpated by the Spanish conqueror of that country. The last race that was utterly destroyed were the Charreas, of whom I saw three surviving individuals brought to Paris and exhibited as curiosities. They were a most singular race of people, whose moral and physical character is briefly sketched by Don Felix de Azava, but of whom we have no satisfactory account, nor can we now ever hope to obtain it. The whole country now occupied by civilised nations in the New World was three or four centuries ago thickly peopled by native tribes. A similar process of extermination has been pursued for ages in South Africa, formerly the abode of numerous pastoral nations of Hottentots, a peaceable and inoffensive race, who wandered about with numerous flocks in a state of primitive simplicity, and whose descendants are now found in the miserable and destitute bushmen, condemned to feed upon vermin and reptiles, and rendered savage and cruel by the wretchedness which their Christian conquerors have entailed upon them. Wherever Europeans have settled, their arrival has been the harbinger of extermination to the native tribes. Whenever the simple pastoral tribes come into relations with the more civilised agricultural nations, the allotted time of their destruction is at hand; and this seems to have been the case from the time when the first shepherd fell by the hand of the first tiller of the soil.

Now, as the progress of colonisation is so much extended of late years, and the obstacles of distance and physical difficulties are so much overcome, it may be calculated that these calamities, impending over the greater part of mankind, if we reckon by families and races, are to be accelerated in their progress; and it may happen that, in the course of another century, the aboriginal nations of most parts of the world will have ceased entirely to exist. In the mean time, if Christian nations think it not their duty to interpose and save the numerous tribes of their own species from utter extermination, it is of the greatest importance, in a philosophical point of view, to obtain much more extensive information than we now possess of their physical and moral characters. A great number of curious problems in physiology, illustrative of the history of species, and the laws of their propagation, remain as yet imperfectly solved. The psychology of these races has been but little studied in an enlightened manner; and yet this is wanting in order to complete the history of human nature, and the philosophy of the human mind. How can this be obtained when so many tribes shall have become extinct, and their thoughts shall have perished with them? I cannot conclude this paper without making an appeal to the members of the British Association in behalf of an attempt which has lately been set on foot by individuals, prompted by the most noble and generous sentiments, to do something more than merely to record the history of the perishing tribes of the human family, and to take up seriously the consideration whether any thing can be done effectually to prevent the extermination of the aboriginal tribes.

FRAGMENTS FROM GOETHE.

TRANSLATED BY JOHN EDMUND READE, AUTHOR OF "ITALY," "THE DELUGE," "CATILINE," ETC.

From the "Faust."

Scene — Heaven. Chorus of Angels.

RAPHAEL.

THE sun, in emulating song,
Joins chorus with his brother spheres,
And his predestined course along,
In thunder, as of old, careers:
Angels feel strengthened while they gaze
On mysteries that none fathom may;
Thy mighty works, Ineffable!
Are great as on Creation's day.

GABRIEL.

And swift — and swift as lightning flies,
Earth, in her state, revolves around;
The flashing lights of Paradise
Alternating with night profound!
In broad white billows foams the ocean
O'er the deep-based rocks wildly flung:
Seas — rocks — in everlasting motion,
With the swift spheres are forwards flung.

MICHAEL.

And tempests roar, for ever warring,
From land to sea alternate hurled;
And raging, as with fetters barring,
Their strength around the nether world:
There — cleaves its desolate career
The thunder-bolt's destroying ray!
But thy servants, Lord! revere
The gentle changes of thy day!

Chorus of Angels.

Angels feel strengthened while they gaze,
Yet thee, oh God! none fathom may:
Thy works, Ineffable, we praise,
Are great as on Creation's day!

Scene * *—A wild Solitude.*

FAUST (*alone*).

Sublimest Spirit! thou gav'st, thou gav'st me all
My soul hath asked; thou hast not turned in vain
Thy awful countenance, wrapt in flames, towards me!
All glorious Nature thou hast given me
As my own kingdom, with the power to feel,
And to enjoy. Not coldly, mighty Spirit!
Hast thou my search of wonders there allowed;
No! — thou hast given me in her heart of hearts
To look, as in the bosom of a friend.

Thou marshallest the ranks of infinite life,
To pass before my eyes; whilst thou dost teach
My kindred soul to recognise its brethren,
In the still woods, or waves, or liquid air!
And when the storm roars through the groaning woods,
Precipitating giant pines, and crashing
Their gnarled trunks and branches borne to earth,
While, with a far-off hollow sound, the hills
Hurl back the echoing thunder of their fall —
Then to the sheltered cave thou leadest me,
And openest my soul to my own eyes:
Its hidden depths and mysteries — its profound
And unimagined wonders — all revealed.

And when the bright moon rises to my sight,
Throwing her lustrous softness over all,
The silvered forms of an anterior world,
Rising from forth yon blackening wall of rock,
Or dew-besprinkled thicket, float before me,
Calming the pulse of feverish contemplation!

Oh! now I feel there is no perfect joy
Ever accorded man! for, with this gift
That brings me near and nearer to the gods,
Thou hast that cursed companion ever joined:
From whom I cannot flee, but must endure,
Whether in cold, or insolent irony,
He doth degrade me to myself! — one word —
One sarcasm — all thy gifts are worse than nought!
Still, with a fiendish and malicious joy,
He fans within me a consuming fire,
For ever restless for the Beautiful!
And thus I reel deliriously from
Desire to false enjoyment, while my heart,
Even in enjoyment, aches with fresh desire!

* This sublime passage from "Faust" possesses the more interest as it contains the germ which created and diffused itself through the "Manfred" of Lord Byron; such, also, was always the favourite remark, the boast, and the pride of Göethe.

In a niche in the wall an Image of the Mater Dolorosa. Flower-pots are placed before it.

MARGARET (*kneeling*).

I.

Mary, Mother! thou hast known
Sorrows many of thy own,
Graciously, then, bend to mine!
Lo, the sword is in thy heart,
Grief hath stricken, while thou art
Looking upon thy martyr'd Son divine.

II.

To the Father are *thine* eyes
Raised above: to Him thy sighs
For thee, for thine, ascends the skies.

III.

But who feels the pains now stirring
In my limbs? how heaves my breast;
How my poor heart beats, though erring;
How it trembles, unexpress'd:
All it longs for — all its woe —
Mary! *thou* alone dost know!

IV.

Wherever I go,
What hopeless woe
Weighs on my bosom — what distress;
Alas! when I am left alone,
I vainly weep — I vainly groan;
My heart is breaking in its loneliness!

V.

The tiles before my windows share
My grief, when no one hears:
The very flowers I placed thee there,
Were watered by my tears!

VI.

The morning's sun into my room
His rays of gladness shed:
But lonely there, as in a tomb,
I sat up in my bed.

VII.

Save me from death and shame! — Ah still incline,
Mary, Mother! Thou hast known
Sorrows many of thine own,
Oh, turn and listen graciously to mine!

MARGARET (*alone, spinning*).

I.

My heart is heavy,
My rest is o'er;
I find it never —
Ah! never more.

II.

When he is not near me,
The world seems to be
A grave; and then my life
Is bitterness to me.

III.

My poor brain
Is crazed with thought;
And with care and pain
Is my sense distraught.

IV.

My heart is heavy,
My rest is o'er;
I find it never —
Ah! never more!

V.

For him alone I watch,
Beside the casement seat;
For him I raise the latch,
And wander in the street.

VI.

His proud and lofty bearing!
His noble form so high!
His lips, those sweet smiles wearing!
And that commanding eye!

VII.

His flowing words so bland,
A stream of gentleness!
The pressure of his hand!
And ah! his kiss!

VIII.

How to him now my bosom presses!
Ah! could I hold
Him but once more in my embraces —
These arms enfold!
Once more those kisses give,
As I would wish — as I
Have kissed him — I would in them live,
And, with them — die!

MIGNON'S SONG.*

FREELY PARAPHRASED FROM "WILHELM MEISTER."

I.

Know'st thou the Land where the lemon trees blossom,
Where folded mid green leaves the gold orange glows;
Where a wind ever soft sighs from Heaven's own bosom,
Through groves of acacia, and myrtle, and rose:
Know'st thou it? — thither, my love, would I flee,
My dearest, my fondest, for ever with thee!

* These stanzas, independent of their exquisite beauty and feeling in the original, possess the additional interest of being, at least, suggestive to the opening of "The Bride of Abydos."

II.

Know'st thou those Halls, where the ancestral column
O'ershades the rich pictures that live round the wall;
Where the statues fix on thee, so pensive and solemn,
Their brows, while their whispering voice seems to call,
"What ails thee, poor Maid? wherefore wanderest thou here?"
Ah! there would I go: take me there with thee, dear!

III.

Know'st thou the Mountain, its rude path-cleft over,
Like the lightning's jagged path through the storm's riven shroud;
Where the mule's tinkling march, and the bells of the drover,
Beneath are unheard, as they walk in the cloud;
Where, in caverns beneath thee, the hoarse torrents raving
Are drowned by the storm in the pines round thee waving?
Know'st thou those wild paths? oh! there would I flee;
Ah! there would I climb, dearest, fondest, with thee!

IV.

Know'st thou the Land where the cypresses, stooping,
O'ershadow the rank grass with tenderest gloom;
Where the roses untended o'er wild weeds are drooping?
There sleeps my poor mother — alone in her tomb!
Even now, her voice chiding is borne to mine ear, —
"Why hast thou, sweet child, so forsaken me here?"
Know'st thou that spot? — Ah! my eyes overflow;
My dearest, my fondest, there — *there* would I go!

THE INFLUENCE OF PERIODICAL LITERATURE ON THE STATE OF THE FINE ARTS.

The influence acquired over the public mind by periodical literature at the present day is generally admitted to be one of the most striking characteristics of our times. The newspaper habitually read — the daily intellectual food — operates with gradual but irresistible force in producing and modifying our feelings and opinions. The "line upon line and precept upon precept," the constant dropping of the fountain wears itself a channel even in the firmest mind; and the sobriquet which the press has acquired of the "fourth estate of the realm" is so far from exaggerating its power, that there can be little doubt that, if its forces could be brought to bear unanimously on any one point, it would have a fair chance of victory against the other three. It has established this mighty empire, not only without the assistance, but even, in some cases, in defiance of the power of the laws; yet few will be disposed to deny that its influence has, on the whole, been productive of incalculably more good than evil; and that it has, in general, exercised its irreponsible authority with fairness and integrity, and stood "clear in its great office."

Where, and to what extent, it has been found wanting — what it might have done for the cause of truth and freedom, for all the great interests of

our race, had it been less warped by prejudice and less open to temptation, it is not our present business to inquire. We shall confine ourselves, in the remarks we are about to make, to one corner of the vast field over which its dominion has extended, — to one, it may be thought, of the least important subjects upon which it has claimed and exercised jurisdiction.

Since it is found by experience that in matters which concern men's every-day business, where facts lie open to the inspection of all, the mass of readers are willing to take their opinions upon trust; that in questions of an entirely practical nature the shallowest reasoning, the most erroneous views, supported with tolerable plausibility and perseverance by any considerable portion of the press, are pretty sure to gain ground, — a power so formidable in dealing with substantial realities is likely to meet with still less resistance in the airy regions of poetry and art.

In our busy, bustling community, amidst the din and stir of politics and trade, the Fine Arts are too often regarded merely as the luxuries of advanced civilisation,— higher, indeed, in the scale of refinement, but within the same category as mere sensual indulgences; and it would not be difficult to find persons of good education and excellent understanding, who, in the bottom of their hearts, are tempted to include all attempts to give them a higher place in the comprehensive and significant term "humbug;" in whose eyes pictures and sculptures are but furniture or toys, and works of imagination a scarcely allowable means of filling an idle hour. It is amusing, indeed, sometimes to see how a ray of genius will break the foggy atmosphere of these sons of care and toil; how the novels of Scott, for instance, having gained admittance into the house of many a sober elderly gentleman, under false historical pretences, he has suddenly found, "to his great marvel and astonishment," a bright world opened to his view, of whose existence he had not dreamed; or how he has lately, perhaps, been caught with a number of "Nickleby," or "Oliver Twist," persuading himself that he is moved to the perusal thereof by a laudable desire of increasing his knowledge of London life. But these cases are still exceptions; and notwithstanding the rage which sometimes prevails for a new novel which has happened to hit the taste of the day, "between wind and water," there is still a general tendency, in this country, to deny the imagination its legitimate influence; to exclude it as much as possible from all schemes of education, public or private; and, what is worse, to refuse too often a participation in its pleasures to those whose susceptibilities are, at best, but too much blunted by the effects of labour and privation.

It is but lately that the importance of the Fine Arts, in a national sense, has been generally admitted among us; and we believe few persons are yet sensible of the advantages that might accrue to our national character from a full development of that sense of beauty and harmony to which they all appeal.

It is as a sound and effectual aid to popular education, as the true means of counteracting the over restless activity of mercantile pursuits, and resisting the narrowing tendencies of sectarian zeal, that we would wish to cultivate the imagination. "Eye hath not seen, nor hath it entered into the heart of man to conceive" the glorious things that might be hoped for, from a people shone on by the lights of modern science, nourished in the purity of Christian truth, and imbued at the same time by that deep and all-pervading sense of order and beauty which makes the name of the ancient Greeks like a spell, and brings it "trailing clouds of glory" down through the long vista of three thousand years. It is not in vain that nature has bestowed this proud distinction on humanity. The infant of a few months old, the

rudest savage, exhibits a dim and struggling consciousness of the existence of the beautiful — the one leaping for joy at the sight of a brilliant colour, the other spending hours of patient toil on the decoration of some implement of hunting or simple article of dress; whilst the most sagacious animal in existence, to whom it is impossible to deny the possession of reason, and even of conscience, does not exhibit the faintest indication of it.

The first steps of a people advancing towards civilisation are not made in the direction of science, but in that of art. The dance, the ballad, the rude image, precede the knowledge of the simplest facts of chemistry or geography; and the history of the memorable people before referred to, may serve to show how far a genuine love of art may assist to develop an enlightened and noble humanity, in spite of the fatal canker of an absurd, corrupt, and vicious system of religion, and amidst the profoundest ignorance of the material universe. With a child the course is the same. His first acquaintance with the world of intellect is made through the medium of the imagination. The story is devoured with eagerness long before the slightest interest is manifested in the most striking fact of natural history, or in any of those things to which so much of the machinery of modern education is directed. Yet, notwithstanding the obvious hints which nature has thus given us of the course to be pursued in mental culture, it has been, and still is, to a great extent, the custom to regard the imagination as contraband, unless to a privileged age and class; and, instead of cherishing and cultivating to the utmost this divine faculty, through whose power we gain admission into the hidden spiritual world, to deprive it as far as possible of its natural aliment. Fortunately in this, as in other instances where we have contended with nature instead of humbly following her, she has been too strong for us. The circulating libraries have flourished in spite of all that has been said against them; and turbid and polluted as the stream has been which has flowed through them, it has served to fertilise many a barren tract, and break through many a barrier of superstition and brutal ignorance.

The neglect which the subject we are endeavouring to call attention to has hitherto met with, is manifest from the difficulty of expressing the most ordinary notions concerning it without borrowing phrases from foreign languages. That of fine arts, for instance, which we have used in its widest signification, as including all those of which pleasure is the immediate though not perhaps the ultimate object, is commonly limited to such as address themselves immediately to the eye, and do not include those of music, poetry, or the drama; to which last many of our remarks are intended to be especially applied, as the most important to a people at large, since there is none which takes so strong a hold on our sympathies, which strikes its roots so deep into the principles of our nature, and which consequently becomes so pestilent a source of evil in its corruption and decay.

Yet, notwithstanding the vast capabilities of the dramatic art to influence the popular mind — notwithstanding the fearful consequences of its perversion, it has never yet, that we are aware, received any further attention from our government than consisted in the establishment of a silly unmeaning censorship; and while the most careful watch is kept that no unwholesome provisions, no stale fish or unripe plums, shall be offered for sale in the markets, to the endangerment of the bodily health, those who live by poisoning the public mind are either left wholly to themselves, or are merely subject to the occasional caprices of magisterial interference, which usually regards the price, but very seldom the character of the entertainment. The cowardly brutality of the exhibition of beasts at Drury Lane meets with no check; and even the innocent nonsense of the puppet-show in the street is

exchanged for a pictorial and illuminated representation of the last new murder.

We are aware there exists in England a strong feeling against the interference of government in any case where it can possibly be dispensed with, and the experience of the past certainly affords little reason to hope that duties of this nature would be effectually performed under its superintendence. We apprehend, however, that this limited view of the obligations of those to whom such vast powers are entrusted may not always be the true one, and that the time may come when it will be regarded as much a positive duty of the state to cherish such dispositions as may prevent crime as to provide the means of punishment for offences already committed. It has, indeed, been lately pretty generally conceded in the discussion of the question of national education, that the politico-economical principle of the self-adjusting nature of demand and supply is inadmissible in cases of this nature — that the very absence of the demand most strongly indicated the existence of the want — and that the fact of a population being content to allow children to grow up in brutal ignorance, or to seek their own recreation in the coarse excitements of animal indulgence, afforded no argument against the expediency of establishing schools, or of providing better and healthier means of recreation. In the mean time we cannot but think that a power exists in the newspaper press of this country capable of meeting this evil; and it is probably to it we are chiefly indebted for what amounts to something like an acknowledgment of such a duty.

Of late years some steps have been taken towards the promotion of the object we have in view in these remarks by the opening of galleries of Art and Museums, from which the public were before virtually excluded. Still it happens from a concurrence of circumstances, to some of which we shall presently advert, that the dramatic art alone, which as means of intellectual culture to the great mass of the people, may almost be said to be worth all the rest, should have been left to drop slowly to decay, while the current of improvement has swept rapidly past it.

The causes which have been assigned for this singular anomaly have been so many and various, that it would be rather difficult to say what has not at one time or other been declared to be the cause of the decline of the drama. Patent theatres, private parties, late dinner hours, &c. having all been tried and found wanting, some one at last made the notable discovery that the English people had no taste for dramatic representations; an assertion that appears to us about equivalent to saying of an individual that he had no taste for eating and drinking, because at a particular time, and under certain circumstances, his appetite had declined, or his stomach rejected the food offered to it.

We have ourselves seldom visited the theatre without being struck with the idea of how powerful such a taste must be to enable the viands offered to find acceptance at all. The advance of civilisation, and the increased polish of manners among the middling and upper classes, are so far from superseding the taste for dramatic entertainment, that the very reverse of the position seems likely to come nearer the truth. The greater the number of the artificial restraints under which we lie, the more rigidly the laws of society require us to repress the external signs of natural emotion, the more do we pant for the freer atmosphere of poetry and art — the more ardently long to throw off, for a brief hour, those chains which time and the world are every day weaving closer around us — to soar above the little spot which we occupy in the world of reality, and view "the great globe and all that it inherit" from a higher point of view. With respect to those classes of society

who can but seldom turn their thoughts from the all-engrossing necessity of providing for physical sustenance, the stage with its manifold attractions must offer the first step towards more purely intellectual enjoyment. It is not to frames exhausted by toil, and hearts convulsed by strong and undisciplined passions, that the calm and recondite beauties of high art can possibly reveal themselves; but the sympathies appealed to by the drama can be awakened in every human bosom, and are often found to gush forth most abundantly from beneath the hard and rough exterior of uncultivated natures. The tones of grief and tenderness, of joy and triumph, are intelligible at once. The drama speaks no foreign language — requires no long and toilsome initiation; and in a country where artificial barriers, "light as air yet strong as adamant," arise between each grade of society, it is perhaps no small advantage that in the theatre at least all ranks may feel in common emotions the bond of a common nature. One burst of generous indignation of "heart-easing mirth," or of delicious tears, will draw closer the bonds of a kindly humanity, than twenty lectures upon charity and brotherly love, and teach a better lesson of true equality than the most eloquent expounder of the principles of "socialism."

It is painful to turn from even a momentary glimpse of what the stage might become, to consider what it has been, and, notwithstanding some recent symptoms of amendment, what it still is,—in few cases better than an idle and empty show — in too many a mere by-word for frivolity and licentiousness.

The increased importance of newspapers in a commercial point of view, the numerous triumphs achieved by them in the field of politics, have, we apprehend, had a considerable share in producing this deplorable state of things, by rendering them unfit to serve as tribunals of art. The interest with which discussions of the greatest questions of legislation and government, once confined to the professed politician, are now regarded by a large portion of the reading public — the multifarious channels continually opening for the transmission of news of every kind, have had the effect of reducing to an entirely subordinate rank a subject, different indeed in its nature, but of more deep and lasting importance than many which daily awaken a thousand clamorous echoes. The habit of watching party manœuvres, of grappling with local and personal questions, of fighting inch by inch against political opponents, indisposes the mind to the comprehension of what is refined, spiritual, universal; and the smoke and dust of party warfare render invisible the celestial forms floating in a higher region.

In criticising a book, the main object is how, without too much sacrifice of truth and honesty, to afford the requisite amount of satisfaction to an advertising bookseller; and in noticing theatres, to support this or that manager, or it may be to bring into notice a favourite dramatist or actor. The character of the paper is seldom considered at all as involved in the justice or soundness of the criticism, and the subject generally abandoned to the most subordinate and least responsible writers. Some papers have of late set a better example in this respect; but the reform appears rather to have been owing to the influences of private friendship, than to a thoroughly awakened sense of a public duty. Even where high praise is merited and awarded, the tone of personal partiality is too obvious in some — that of personal hostility still more disagreeably striking in others.

The merits and qualifications of actors and actresses are brought too prominently in advance of those of the poet, of whom they can be but the interpreters, the temporary gratification to their vanity being dearly purchased by the degradation of the art whereby they live. It can hardly be

expected that the genius and consummate artistical skill necessary to the production of a play of a high order, will always be associated with the humility that would induce a dramatist to content himself with the position assigned him; and it has thus happened that the stage, instead of being the favourite field of competition for literary talent, has, for a long period, been almost abandoned to translators, and to persons who transmute good novels into miserable plays.

When Mr. Macready entered on the management of Covent Garden theatre, the stage seemed to have sunk to the lowest possible point short of absolute extinction; and it is therefore fairly due to him to regard that period as the epoch from which to date what we hope may prove its permanent revival. Public attention has been awakened to what it no longer seems absurd to speak of as an intellectual art. Enough has been done to show the fallacy of the supposition of the absence of a taste for theatrical amusements, and to afford a glimpse of better days to come; but, with every wish to acknowledge our obligations to this gentleman for what he has done, we cannot deny that we think he might have done better — he might have trusted more to the high and genuine attractions of the drama, and turned his resources to a nobler purpose than that of pampering the prevailing taste for spectacle.

We are conscious, however, of the difficult situation in which he was placed, and of the necessity of meeting the overwhelming expenses of such an establishment. This, at all events, is a point we are not called on to decide. The question before us is, whether an intelligent, vigilant, and, above all things, honest watchfulness, on the part of the press over the interests of art in general, and of this one in particular, as most intimately connected with public morals and happiness, might not be the most effectual means for reviving and purifying national taste. The notion that the Fine Arts must ever be considered as exotics among us, — that there exists any defect in the mental organisation of the English to prevent their reaching the highest points in this as well as in any other department of intellectual exertion, we consider wholly unfounded; but at the same time we cannot be blind to the danger that there are some circumstances accompanying the present state of our society which tend to lower the character of art and literature, and while they render them more thriving as trades, induce those concerned in them to labour merely in a tradesman-like spirit, and endeavour to follow, rather than lead, the popular tendencies of the moment. As it can, however, scarcely be expected that professional authors and artists should always be ready to sacrifice immediate private interest to a prospect of remote though certain public good, it is only to the newspaper and periodical press, standing as it does midway between them and the public, that we have a right to look for a remedy for this evil. We would fain see a higher and more conscientious tone adopted in the critical department than we fear is consistent with the present anonymous system. A writer to whom a work of art is submitted for public judgment should regard himself as in honour pledged to speak "the truth, the whole truth, and nothing but the truth," according to his ability, and regard as an insult any attempt to bias his decision. Against the influences of real friendship it would of course be impossible to guard; but in by far the greater number of cases, these so-called friendly motives resolve themselves into nothing more than a desire to conciliate the givers of agreeable parties, encourage the willing contributions of engravers and publishers, or retain the small but convenient patronage of numerous free admissions.

It may be thought, perhaps, that these are, after all, very venial offences;

but we cannot admit that a habit of uttering petty falsehoods can be without any injurious effect, and certain we are that it tends to degrade journalists in their own and others' eyes from the high position they ought properly to occupy. Like other venal judges too, they are apt to disregard the interests of those who can offer them no acceptable bribe. The minor theatres, for example, stand more in need of a vigilant supervision than any other, as mostly frequented by a class of people likely to be more permanently affected by impressions made on them by the stage, than those who possess the advantage of a more extensive acquaintance with society and general literature. Yet how few and faint have been the notes of censure heard from the press when one has vied with another in producing the closest possible representation of some horrible and atrocious crime, or in bestowing a dramatic interest on the biography of the heroes of Newgate and Botany Bay! Is it not a sacred duty to endeavour to protect the young and the ignorant against a practice that threatens to turn a means of healthful and ennobling recreation into a frightful engine of corruption? If these offences were always met by the strong expressions of indignation which they merit — if the occasional exceptions found due notice and encouragement, the humbler caterers for public amusement would have some inducement to seek for other sources of attraction than the stimulus afforded to the basest feelings of our nature, and those of more pretension would find a surer method of excluding vulgarity than that of shutting up the shilling gallery. It is not the price, but the character of an entertainment, which determines that of an audience. Were the theatre what we may perhaps hope one day to see it, — a place where the idle and the dissipated might be weaned from frivolity, the ignorant purified and ennobled by the exercise of gentle and pleasing emotions, and all enabled, according to a beautiful and significant expression of a German writer, "to spring off their own shadows," — it might be opened at the lowest possible price, and be sure of the attendance of a refined and intelligent auditory, who would not merely enjoy a "barren laugh," but carry away thoughts that would render them better and happier in their daily lives.

SONNET.

A STAR-LIKE sweetness — an immortal grace —
Dwells in the liquid beauty of thine Eyes.
When painters dream of some supernal Face
Beaming through clouds, and gazing from the skies,
As in a trance, upon our darkened sphere,
From Thee the vision of inspiréd Sleep
Is drawn. And, lest th' enchantment, being too near,
Its spiritual radiance should not keep
For ever and for ever — like the pure
Calm lights in Heaven — they give to Thee a Shape
Of Glory, that thy lustre may endure
In one long memory, and so escape
From perishable matter, to survive
In that sweet Poetry that doth for ever live!

SKETCHES OF SPANISH GENERALS, CARLIST AND CRISTINO.

No. I. — The Curé Merino: Cordova.

"——— habiles à tromper comme à vaincre —."
Villemain, *Galerie des Portraits.*

Who has not heard of the brigand priest of Old Castile, the terror not only of Burgos, but of all the towns and cities between it and Madrid? Where is the captain-general, the governor, the soldier, or the civilian, whose cheek has not grown pale at the thought of being in the same neighbourhood with his ferocious cavalry? Who that has wandered along the wooded banks of the blue and beauteous Ebro, has not fancied that he beheld the flashing of their lances through the veil of morning mist which droops like silver gauze over the valley through which that immortal river rolls?

Amongst the chiefs who have rendered themselves notorious or celebrated during the civil war in Spain, the most remarkable is Merino; or, as he is more familiarly designated in Castile, the Cúra de Villaviado. Without making pretensions to much military talent, this personage has contrived to pass through a series of adventures of the strangest and most romantic nature. Amongst the peasants of Old Castile he is regarded, less as an object of terror or hatred, than as a being possessed of qualities of a most miraculous kind. The astonishing rapidity with which he passes from one spot to another has imparted to his movements an appearance of ubiquity; and the perfect impunity with which he is able to traverse the scenes of his depredations, has marked him out as an individual regarded by Heaven with peculiar care. Whatever may have been the remissness of the Spanish government in matters of greater importance than the capture of a bandit; or whatever may have been the negligence, or listlessness, of its officials, in affording protection to those who have either remained neutral during the present contest, or have preserved their fidelity to the queen, the attempts to capture this fierce depredator have been as unceasing as they have been fruitless. Cupidity, as well as patriotism, has been enlisted in the cause; and we should scarcely hope to stand unaccused of exaggeration, were we to enumerate the vast sums expended in the efforts to make him a prisoner, dead, or alive. On more than one occasion it has occurred, that the house in which Merino was reposing for a moment has been surrounded by a large body of men, in such a manner as to render it impossible for a human being to attempt escaping without falling into the hands of his pursuers. He has been seen, a few moments before, standing in the balcony, and basking leisurely in the warmth of a noon-day sun; yet, on bursting the door, he so suddenly and so effectually disappeared, as to baffle the most vigilant search. In vain have the owners of the house been threatened with punishment, for refusing to reveal his place of concealment; in vain has the wretched proprietor been dragged from his own door, and ruthlessly massacred by the disappointed soldiery, from whose very grasp the prize was thus snatched. It was promotion to a high rank to the officer commanding, and wealth, as well as promotion, to each of the soldiers of that detachment by which he should be captured. The ideas, regarding the

impossibility, as far as human efforts are concerned, to make the Curate of Villaviado a prisoner, which are entertained by the peasants on the southern bank of the Ebro, have been extended, more or less, not alone to the Carlist, but to the Cristino army; and it seems to be the opinion of those most concerned in the matter, that it is a hopeless task to waste any more time in trying to effect what Heaven itself seems to set itself against. The sacred character imprinted on him by his calling has been also remembered; and though the clerical profession is not treated with much respect in Spain, the soldiers seem tacitly to admit that Providence has hitherto interfered in his behalf. Who, and what is the man who is thus an object of so much interest to his partisans, and of hatred and terror to those who seek to destroy him?

Don Jeronimo Merino is sprung from the lowest class, and from a family the most obscure. Though we have given him that title which is so flattering to Spanish ears, yet, if a stranger were to inquire for him by this appellation from the muleteers of Cubasrubias, the goatherds of Villarleña, or the artisans of Cuscurrito, Santo Domingo de Calzada, or Pancorbo, he would be likely to remain in his ignorance. It is by the familiar appellation of "the Curate of Villaviado" that he is best known, not only throughout the wide district which forms the scene of his adventures and escapes, but in all the *pueblos* as far north as Miranda del Ebro. His father maintained a family, consisting of his wife and two sons, by cultivating a small patch of ground in Villaviado, in Old Castile, and by occasionally engaging his services as a muleteer and guide to a band of smugglers from the northern bank of the Ebro. The exceedingly small stature and delicate frame of Jeronimo, the second son, prevented him from affording much assistance in pursuits which required more robust followers. At the age of nine years, he was sent by his parents to the college of Lerma, for the purpose of learning the Latin language, with the view to his becoming a priest; being advised to adopt this plan by the vicar of Villaviado, who was distantly connected with Merino's mother, and who fancied that he had discovered in the delicate boy signs of intelligence superior to those of his class. The death of his elder brother did not allow him much time to profit by his studies; and he had scarcely begun to construe into middling Castilian the Æneid of Virgil, when he was recalled from his college to enter on the less intellectual occupation of a goatherd. In this inelegant employment he remained until the twenty-second year of his age, at which period the death of his former patron and relative once more recalled him to other pursuits. Considerable delay occurred in filling up the vacancy occasioned by the death of the old priest; and his friends, who were aware of his acquirements, advised the young goatherd to avail himself of the advantages afforded him by his education. He at once adopted the davice thus given, and located himself with the curate of Cubasrubias, for the purpose of completing, in as short a time as possible, the education necessary for the profession he was about to embrace. Owing to the diligence of his preceptor, and his own natural quickness of apprehension, he succeeded in acquiring, at the termination of eighteen months, a sufficiency of knowledge to enable him to become a candidate for the priesthood. The influence of his patron was sufficient to obtain for him a dispensation from the theological studies necessary for the profession, until after his being admitted to orders. He was therefore ordained priest, and entered on the duties of his native parish of Villaviado. In this occupation he remained until the French invasion, and the breaking out of the war of independence. Partaking in the intense hatred entertained by the Spanish people, generally,

for the persons, and by the clergy, in particular, for the politics and anti-religious opinions of the invaders, Merino was not slow in availing himself of his influence to excite resistance throughout those districts where he was known; and a formidable band was soon congregated, amounting to about 2000 men, chiefly composed of smugglers, goatherds, and muleteers, at the head of which Merino did not hesitate to place himself. With these irregular troops, the *guerrilleros* of the south, he contrived to inflict as much mischief in his own way on the French army, in that most harassing and destructive mode of warfare, as Mina, at the head of the better organised mountaineers of Navarre and Guipuzcoa. At the restoration of Ferdinand in 1814, though receiving no recognised rank in the Spanish army, less on account of the value of his services during the period of invasion, than by reason of the apparent indecorum of a priest bearing a military commission, a pension was bestowed on him, corresponding to the rank of brigadier. During the war of the constitution in 1823, he was again called into action, and rendered important services to the cause of the Royalists, until the final dispersion of the constitutional army, and the second restoration of Ferdinand. As soon as the announcement of the death of the king reached the junta of Burgos, in 1833, Merino once more summoned his ancient lieutenants and other followers to the field, and commenced his campaign in October of the same year, at the same moment when the standard of revolt was raised by Santos Ladrone in Navarre. His example was followed without delay by José Hilarion, the commandant of the royalist volunteers of Burgos, who did not participate in the good fortune which had always attended the expeditions of the old priest, as he was shortly afterwards taken prisoner by the Cristinos, and shot.

Merino is about sixty-eight years old. In size he is considerably beneath the middle stature, his height not being more than about five feet four inches. Apparently, his frame is of the most fragile and delicate texture; yet, under this appearance of physical weakness, his health is of the most robust and enduring kind. His features are sharp and strongly marked, and convey an expression of a strong and determined character. His eyes are large and deeply set, and are shaded by large and overhanging brows. His habits are of the simplest and most abstemious kind, even for a Spaniard. Contrary to the universal custom of his countrymen, including even ecclesiastics, he never makes use of tobacco in any shape. He drinks neither wine nor any strong spirit, and may be said to make but one repast in the day; a small cup of chocolate, a glass of pure cold water, and a morsel of dry toast, form his morning refreshment, and his evening meal is almost of an equally slight nature. It is said that his power of dispensing with the necessity of repose is wonderful; and it is asserted that about one hour, or one hour and a half in the twenty-four, is all the time that he spends in sleep. He seldom enters a house by night, and he never passes the period between twilight and dawn in the same place with his followers. The few moments of repose which he allows himself, whilst on the field, are snatched either on horseback, or on the ground, with his head reclining on the saddle, or buried in the mane of his charger. As soon as the hour of sunset approaches, he halts his troop, and orders them to encamp in the spot which he points out. Followed by a single attendant, who performs the duties of secretary, or servant, as the occasion may require, he retires within the recesses of the forest, at two or three leagues distant, and only reappears in the same place at sunrise the following morning.

Merino despises the elegance or splendour of military uniform, and his followers are as regardless as their chief in the article of dress. They are

never obliged to wear uniforms of any kind, and each individual appears dressed in those habiliments which best suit his taste or his means. His own costume is of the meanest kind, — the *zumara*, or sheep-skin jacket, and a coarse brown cloak of most ample dimensions, form the principal and most costly articles. Instead of the military cocked hat, his head is covered by a coarse felt, with broad brims. There is one thing, however, in which Merino exhibits a most delicate taste, and about which he evinces an unceasing and most tender anxiety, and that is in the selection of his horses. The surpassing beauty of these animals, two of which always accompany him, causes him to be instantly recognised on his entrance into a village, even where his person is not known. The weapons which he usually carries are, a sword, a pair of pistols at his belt, and a short blunderbuss with an unusually large bore. When about to enter into action, he puts from fourteen to eighteen bullets at once into this formidable weapon. He keeps the powder in the holsters of his saddle, and in loading inserts an entire handful in the barrel. In discharging this piece, he is obliged to place it under his right arm, and hold the extremity with the left hand, in order to break, as much as possible, the shock produced by so tremendous an explosion.

The old curate is very brave, but his personal courage by no means partakes of rashness; and all his attacks on the enemy are calculated with a mathematical exactness, and are conducted with a prudence, which provide against all contingencies. His greatest qualities are firmness and presence of mind, which have been found never yet to fail him at need. To this precaution must be attributed the fortune which has attended him in all his expeditions.

Two horses, the finest and the best groomed in all Castile, or perhaps in Spain, always attend him; on one of which he is mounted, whilst the other advances by his side. They have been so trained by him, that they move always together, whatever may be the rapidity at which he rides; and, from the regularity and uniformity of their paces, they gallop along with such equal speed, the one which bears him, as well as that which is at his side, that, to the eye of the beholder, they seem endowed but with one will and one power of motion. It is a curious sight to look on this little old man, shabbily dressed, without any exterior signs of authority, at the head of, or reviewing, the large force under his command, and mounted on so beautiful a creature, with another standing by his side still as a statue of black marble. Not a white speck is visible on the body of either; the glossy skin, shining like the finest satin, and the frame affecting as it were to work itself into wrathful impatience; the small head tossed on high; the thin, blood-red, and almost transparent nostril expanded; the flakes of foam flung to the right and to the left; and the animal itself seeming, like a human being, impressed with the warlike wildness of the scene, and excited by the crash of military music, which causes his small ears to tremble, and his Arab blood to thrill with delight. The gentle creature needs not the curb to restrain his impetuosity; he, as well as his brother that stands beside him, and imitates all his playful wrath, seems to be aware that the slow and dignified bearing is that which best becomes the occasion, when the troops are defiling in review before their general; and though the reins are left almost untouched, and flowing amidst his lion mane, which moves to and fro like the waves on the rocks of Guetaria, yet when changing their position, their movements are graceful and gentle as those of the doe by its mother's side. The feeling entertained by the ferocious old priest for these animals amounts to tender affection, and they seem to return it in the

most perfect obedience to his will, which is never conveyed but by word, or by a slight motion of the rein. When traversing the country at a rapid pace, the moment Merino perceives that the horse which he rides is at all fatigued, he leaps upon the other which is always saddled by his side, without being obliged to arrest their course even for an instant. In this manner it was that he escaped from the Lusitanos, by whom he was defeated at Palenzuela, in the commencement of 1823.

The large district lying between Burgos and Madrid, a space of forty-five leagues, forms the principal scene of the exploits, the dangers, and the triumphs of this remarkable man. Yet his deeds are not confined to this extent of territory alone; but within it he feels as if at home. It is to him a place of perfect safety. He passes, with impunity, the cities and towns which are scattered over that large tract, often accompanied by no more than four attendants, without dreading the slightest danger from the inhabitants, and encountering none as enemies but those who are in constant pursuit, but who, from long experience, well knew with what facility he baffles their search. The principal object to which his attention has been directed is, the arresting couriers, and capturing baggage, and every sort of stores, and other property, of the government against which he is in arms. The wealth thus acquired is distributed amongst his troops. But, though generous to an extreme, in this general division of the resources of the enemy, taken by the strong hand, woe to the man, whatever may be is rank, who dares to plunder on his own particular account. The peasant, the farmer, the proprietor, the tradesman, the merchant, may all sleep in security as far as Merino is concerned. Should one of his followers commit the most trivial depredation on the property of the peaceable inhabitant, either in town or country, no matter what his political opinions may be, he is punished with instant death, to which he is condemned by the sentence of his fellow soldiers of the same rank as the culprit himself. There is little chance of pardon, or escape, and no circumstances will justify the depredator, or save him from summary punishment, if proved to be guilty. To this certainty of justice being obtained, and to this security of protection for life and property, may be attributed the impunity with which he traverses the country, notwithstanding the immense rewards offered for his apprehension. There is scarcely a single instance on record of treachery practised against him by his own followers; and the certainty of large reward has never yet influenced the inhabitants of the districts where he is known, to do him injury. They well knew that such protection as, when they interfere not in the quarrel, is received from him, would not, and could not, be afforded by the legitimate local government. Amongst those who have been distinguished during this unhappy struggle, there is not one who can pretend to the disinterestedness, and total absence of selfishness, of Merino. He never appears to think of himself, and the fruits of his successes, however great in amount, are always distributed amongst his partisans. His conduct has been ever marked by this character, during the French invasion, the constitutional struggle, and the present civil war. In political feeling, he is blindly and devotedly attached to the royalist cause; but it would be doing less than justice, even to the Curate of Villaviado, sanguinary and ferocious as he is to his enemies, to assert that selfishness, covetousness, or personal ambition has been his leading star. No man was ever more free from such motives than Merino, and no man has ever been less ambitious. At the period of the war of independence, he became, after a severe contest, master of a town in Castile called Quintanapala, in which some battalions of the French army had established themselves. In their hasty evacuation of the

place, they were obliged to leave every thing behind. He captured a convoy, to the care of which was entrusted treasure to an enormous amount. Besides an immense quantity of stores, specie, to the amount of many millions of francs, was taken. A general distribution was, as usual, made amongst the soldiers: but of all the vast treasures thus possessed, Merino reserved nothing to himself but five or six dozen pairs of silk stockings, whilst his men were literally gorged with wealth.

Such is the individual who, at the head of about 4000 men, has spread terror from the Ebro to the Guadarama, and who was the first to rouse all Castile to arms against the government of Isabella II. To an exalted merit, as a general, he never pretended; but, in the peculiar service to which he has devoted himself, he has no superior, and, perhaps, no equal. In harassing the enemy, cutting off communications, capturing convoys, leading his adversaries into ambuscade, he has rendered more substantial service to the cause of Don Carlos than any general since the days of Zumalacarreguy. His enemies speak much of the cruelty with which the prisoners taken by him are treated; but, taking every thing into consideration, we doubt much whether his ferocity has been greater than that of the other chiefs on either side, who have rendered themselves remarkable for a thirst of blood, previous to the Elliot convention.

The writer of this article may be said to have, as it were, tracked the old priest from one place to another, during a portion of the autumn of 1835, having accompanied a division of the queen's troops, in their march from Castro to Miranda del Ebro; and he has often found himself, not only in the same village, but many times in the same apartment, where the indefatigable chieftain had taken his chocolate a few hours previously; and he can bear witness to the awe with which all, as well as himself, gazed on the spot where the terrible Merino had so lately snatched a moment of repose. He is idolized by his men, who well know how to appreciate the benefit resulting from having so disinterested a commander. Though entirely devoted to war, yet Merino does not altogether lay aside his sacerdotal character. He also possesses some knowledge of the practical part of surgery; and, at the close of an engagement with the enemy, may be often seen, not only performing the duties of a medical man, but assisting the chaplains of his little army, and administering spiritual consolation to the dying soldier, either in the field or in the hospital.

It is well known that the principal cause of the success of the Carlist army, in the commencement of the insurrection, was owing as well to the affectation of contempt with which the Cristino generals looked down on the rebels, as to the military talents of Zumalacarreguy. They disdained even to meet the insurgents on equal terms, and their pompous self-conceit was carried to so great a height, that their personal dignity was considered compromised in practising, against so barbarous an enemy, any of the more scientific operations of regular warfare. From this dream of self-complacency they were soon aroused by the intellect and energy of their less dignified but more skilful opponent. Before, however, a recovery was affected from this fatal error, the many defeats sustained by the Cristinos had not only broken, in the rudest manner, the charm which national vanity had woven around them, but also infused a recklessness, and spread a demoralisation amongst the queen's troops, which might well make them the scorn of Europe. How unexpected and overwhelming the humiliations were which led to such a result may be known from the fact that, previous to the breaking out of the civil war, there was not in Europe a body of men better disciplined than the Spanish army.

In 1823, after the second restoration of Ferdinand VII., the whole of the army was remodelled. Those officers who had served under the constitutional *régime*, were submitted to the examination of a *Junta de Purificacion*, and those who were unable to come forth from such an ordeal, with clear and unclouded reputations, unstained by a touch of constitutionalism, were compelled to retire on half pay, under the designation of *ilimitados*. Their places were filled up by officers taken from the ranks of the army of the faith, as well as by those who had served in the cause of legitimacy against the patriots of the New World. The elements which, after this universal purification, composed the new army, were at first of a more conflicting and discordant nature. They may be distributed into the following classes: — 1st. The *guerilla* officers who had served in the cause of independence, during the French invasion; 2dly. Those of the regular army; 3dly. The Americans, as they were designated familiarly; 4thly. Those who had served in the cause of royalism against the constitution, and who were known by the appellation of the soldiers of the faith; and, lastly, those who had fought for the constitution, but, having renounced their opinions, had been regularly purified.

From these mixtures were generated many causes of military as well as political discontent. The officers of the regular army, who were generally members of noble families, looked with contempt on the *guerrilleros*, and regarded them as upstart adventurers, who owed the good fortune they enjoyed, in being placed on a level with themselves, to the mere chance of events; whilst both together united in manifesting the same disdain towards the Americans, who had belonged to small forces of one or two thousand men, and where each individual was so independent as to be able to assume whatever rank might best suit, either his caprice, or his ambition. Their well-known ferocity made them, besides, an object of hatred, and they were commonly known by the designation of "the tigers." Time, however, had began to soften down the rugged edges of these dissimilar masses, when the increasing ill health of Ferdinand, and the intrigues of the Carlist party, rendered it necessary to remodel the army anew, and to combine, as far as possible, a body of men, who should regard, with favourable feelings, the approaching accession of the infant queen. General Cruz, then minister of war, made every effort to construct the army in harmony with the principles of the government; and, to effect that purpose, a test similar to that of 1823 was applied. Many officers who were well known for their apostolical principles, were dismissed, and replaced by the *ilimitados*, who had, themselves, on a former occasion, been treated in a similar manner. A short time previous to the decease of the king, leave of absence had been unfortunately granted to a large number; so that the army which, about a month before, had counted 70,000 men, could not muster then more than 45,000. The dispersion of so many men gave an opportunity to the insurrection to spread itself, without any material interruption. The succeeding ministry made every effort to repair the fault committed by Zea Bermudez; and, in the course of the following year, the total strength of the force again amounted to about 118,000 men. This body, however, was more formidable in appearance, than in reality; as, from the urgency of the impending danger, the troops were obliged to take the field against the enemy, before they well knew how to handle a musket.

The inefficiency of so badly organised a multitude was rendered still worse by the shameful manner in which they allowed themselves to be surprised at Viana, Cenicero, and Alegria, and by the unhappy issue of the campaign in the Amescoas. The troops were so completely dispirited by

these defeats, that they could with difficulty be induced to meet the enemy, unless with a superior force; and the least check was sufficient to disperse them. This irregularity did not exist alone amongst the common soldiers, or the inferior officers, but extended equally to those of superior rank. Public decency was outraged by the open disputes which took place between the general officers; and it not unfrequently happened that force was had recourse to, in order to prevent them laying violent hands on each other, in the presence of the very sentinels of the camp. Not only was common decorum outraged, but their conduct, as soldiers, was shameful in the extreme. The most scandalous cowardice was manifested by those who should have particularly set an example of bravery; and whenever an action, or even skirmish, took place with the enemy, the officers were not only amongst the first, but were actually *the first*, to fly from danger. To this original disorganisation, as well as to that affectation of superiority above alluded to, the earliest triumphs of the rebels were principally owing; and, whilst these scandalous scenes were going on in the camp of the Cristino army, the cautious, crafty, yet bold, and adventurous, chieftain on the other side, was imperceptibly, but surely, increasing his resources of every kind, and silently taking every advantage of the weakness of his adversaries.

In this deplorable situation affairs were placed when Mina was appointed to the command in chief of the army with which he was destined, if not to lose the laurels which he had won as a *guerilla* leader, during the war of independence, at least to convince the Carlists as well as Cristinos, that the glory of other days had departed. Exertions of the most extraordinary nature were made use of by him to remodel the force which had been entrusted to his guidance. He was obliged to employ the most severe measures, as well as the most degrading; but his ill health, caused by a malady which was incurable, prevented him from personally superintending the execution of his plans, and his incapability hindered him from restoring the *morale* of an army long since degraded by a hundred defeats. The result was that, instead of assuming the aggressive, the army of the queen was reduced, in a few months, to act on the defensive, against a force not more than a fourth of their number.

This most important duty of restoring discipline to an army so demoralised, was entrusted to a young man about thirty-four years old, who had, some short time previous, begun to attract public notice by the exertions which he made to cover the disgrace endured during the previous campaign. This individual was sprung from one of the most ancient families of the south, and he numbered amongst his ancestors some of the most illustrious captains of the middle age. He had already exhibited much acuteness of intellect in several diplomatic missions in which he was employed by the court of Spain. A lieutenant in the guards in 1823, ten years later beheld him a general of division, and second in command to the Viceroy of Navarre. Scandal whispered that he owed his rapid and extraordinary advancement less to his own merits, which, in a military point of view, had not then been much developed, than to the influence of certain court ladies in whose eyes he found favour. During the troubles of 1822, he found himself compromised, together with twelve officers of the guard, and was obliged to seek safety by flight, from the vengeance of an infuriated populace. He was driven to take refuge in the palace, where the Princess Maria, wife of Don Carlos, concealed him in her own apartment, for eight days, during which she brought him, with her own hands, his daily food, and at length provided for his safety, by procuring him the means of escape in a foreign country. The dissoluteness of morals which prevailed in the court and the in capital, during

the reign of Ferdinand, is known to those who possess even a slight acquaintance with Spain at that period; and, to a young adventurer of little or no patrimony, but in whose veins flowed the best blood in the kingdom, and inclined, by taste and habit, to the pursuits of gallantry, no theatre could be better adapted. Pleasing in person, and fascinating in manner — blending, with the consummate skill of an artist the captivating elegance and easy manners, of the French gentleman with the grave and dignified bearing of the Castilian *hidalgo*, he possessed the accomplishments which are common to every Spaniard who moves in an exalted station, as well as the discriminating spirit and good taste which made him understand how the more solid acquirements impart a consistency to those graceful, yet less serious, accomplishments. Every Spaniard is patriotic, and glories in his country, however peculiar may be his views of policy; but Luis Fernandez Cordova did not deem it necessary that any inflexible and determined principles should bar the path to advancement of a young man who possessed no external resources, and no other means to ensure success than what his own good genius bestowed. With the same versatility of mind, the intuitive foreknowledge of events, and the predisposition to attach himself to that party which was most likely to obtain the supremacy, he seemed to have deeply studied the character of Talleyrand, and to have regulated his actions by so great a model. During the revolution of 1820, legitimacy and its representative, the contemptible Ferdinand, had not a more earnest or a more devoted follower than Cordova; and he became, for a season, the victim of his zeal in a cause which the efforts of his maturer years and more influential position contributed, in a subsequent period, so materially to injure. One quality, however, was wanting, and that the most important: namely, discretion; and his excessive vanity often neutralised his better qualities. When the queen was obliged to accept his resignation, in 1836, as in these days dismissal is often termed, Cordova went to reside at Paris. During his stay in that capital, he, fancying himself, doubtless, a second Napoleon at St. Helena, employed himself in writing a history of his life, both political and military, and actually published a large volume, containing a defence of his public conduct, during the period he was commander-in-chief of the Spanish army. Amidst the party conflicts which took place in Madrid, and elsewhere, whilst he was at the head of the troops, he had been accused, by some of the journals opposed to the politics which he, at the moment, professed, of not only having held a suspicious correspondence with the Carlist general, and of having received bribes from the court of the pretender, but even of having entertained serious intentions of bringing about a second 18th *Brumaire*, and of placing himself at the head of the government. The accusation was heinous and treasonable; but the wound inflicted on his patriotic delicacy was salved by the indirect comparison to the hero of Castiglione, Lodi, and the Pyramids. He refutes the accusation of accepting bribes with all the indignation, real or affected, of the man who wishes to convince the world of his innocence; but when he approaches the more heinous part of the charge, that of a wish to trample on the liberties of his country, there is evidently a manifest hesitation, and a desire to linger, as much as possible, on the flattering insinuation. The ferocious character of his denial of corruption is softened down to a gentle assurance of his innocence, in the other respect; but there seems an inclination to prove, that, could his ambition (which God forbid) have got the better of love for his country, the talent, or the means, had not been wanting to accomplish such a project.

The writer of this article saw General Cordova, for the first time, in November, 1835, in the city of Vittoria, the capital of the province of Alava.

The impression made on his mind by the appearance of the commander-in-chief of the army of the north, was not unfavourable. The reputation of Cordova was, at that period, so established in Spain, and the attention of all was so occupied with him, that he had become an object of interest and curiosity. The successes of Mendigorria, and Mañeru, had rendered him illustrious for the moment. Contrary to anticipation, he did not present the appearance of a warrior. His age could not then have exceeded thirty-five, and his personal appearance announced six or seven years less. His figure is slight and delicately formed, and in stature he is about the middle size. His complexion, though not fair, is much lighter than the national *teinte*, and his features betoken much amiability, and are impressed with a character of gentleness. The eye, that beautiful feature, which betrays the inmost movements of the soul, is dark grey, and is certainly indicative of the higher and nobler qualities which distinguish him. The general calmness of his features is often broken up, as it were, into an expression of the most intense kind, when each trait seems to utter a language of its own. We have looked upon him for hours, when seated in his box in the theatre at Vittoria, and have contrasted his excited and troubled countenance, when lighted up by some sudden interest the subject of his conversation may have taken, and the not ungraceful rapidity of his gesticulation, with the silent and phlegmatic acquiescence of General Evans, who sat beside him, and who appeared to listen with attention, but without interrupting the torrent of declamation which rolled from the lips of his more excited companion: whilst the grim and bearded face of the man, who at the present moment rules the destinies of Spain appeared in massive and silent repose behind them. This third party was then the Brigadier Espartero, acting under the orders of Cordova, and attentive to his slightest movement;—he is now the Conde de Luchana and Duke of Victory, and is the same who has compelled his superior of other days to become a wanderer in a foreign land, oppressed by necessity, and, at this moment, wasting under, perhaps, a mortal disease.

With regard to the personal character of the young general, his habits were those of a confirmed *roué*. During even his career of ambition, he did not forget the fascinations of pleasure. A love of gambling and of gallantry, carried to excess, has been the principal defect of his temperament. He has, for a long time past, been the victim of ill health, and the fragility of his physical constitution proves the irregularities of his private life. In his demeanour towards strangers he is at once courteous and dignified,—reminding one of the Castilian gentleman of other and better days, though, from time to time, subject to violent but short-lived outbreaks of temper with those who were immediately connected with him. His bravery is undoubted; and the writer of this notice has seen him, more than once, charging amongst the ranks of the enemy, at the head of his personal staff only.

We should scarcely consider this man's private character a subject for much observation, were it not that his name is connected, in a particular manner, with the events which have taken place during the last six years in the Peninsula. Whatever may have been the drawbacks on his character as a man, and the defective nature of his patriotism as a Spaniard, his reputation, as a general, stands forth in happy contrast with that of the others who have commanded the armies of the Queen since 1833. We have remarked the lamentable state to which the army was reduced when Mina was summoned to take the command; and have observed that the lingering and incurable disease which was breaking down the frame, and wasting the energies, of the once celebrated *guerrilla* chieftain, had incapacitated him

from undertaking so arduous a task. The merit of having reorganised the army, and restored its *morale*, is solely and entirely owing to Cordova, whilst his reputation as a tactician, rests on still higher grounds.

We do not wish to bestow praise lightly, or without assigning a good and sufficient reason for our favourable opinion. The plan laid down by Zumalacarreguy for carrying on the war against the superior force that was opposed to him, was one suggested by a quick intellect, fully awakened to the difficulties he had to surmount, as well as aware of the advantages in his favour. He imitated, without perhaps being aware of the fact, the prudent and cautious conduct of the old Roman general against him of Carthage. His plan was based, like that of the hero of antiquity, on a system of delay at one moment, alertness at another, rapidity in surprising the enemy, marching and countermarching without end. None of the predecessors of Cordova had comprehended the peculiar tactics of the wily chieftain. Their sole object seemed to have been to inflict as much positive injury as possible on the insurgent forces, by occupying the principal points where the rebellion had established itself, and in bearing down its large masses wherever it appeared. The quick spirit of Zumalacarreguy at once understood and appreciated this slovenly and awkward attempt to crush him, and as rapidly disappointed it. His perfect knowledge of the country which he compelled his enemy to make the theatre of war, enabled him, without difficulty, to withdraw himself at pleasure from his adversary, and to fall suddenly, and when least expected, on detached portions of the force. A constant perseverance in this system of warfare produced, in a short time, the complete demoralisation of the Cristino army, and the impossibility of holding its positions in presence of the Carlist forces, when encountering it with only equal numbers. Zumalacarreguy profited by this circumstance; he attacked, in succession, all the fortified posts which annoyed him the most, and soon rendered himself master of the entire country between the Ebro, the Arga, the Pyrenees, the sea, and the mountains of Santander.

Cordova, in a short space of time, comprehended the nature of these tactics, and formed a plan of campaign suited to the occasion. He considered that after the abandonment, by those who had preceded him, of the fortified points which had served as a basis for the operations of the army in the mountains, the attempt to retake them would be attended with peril; and that even success would by no means counterbalance the enormous waste of time. Instead, then, of trying to drive them from these positions, he thought it better to shut them in by successive parallels drawn around them. The line of the Ebro formed the principal base of operations which secured all his communications and magazines. The most advanced points of this line were, Pampeluna on the right, Vittoria and San Sebastian on the centre, and Bilbao on the left. The communication with Pampeluna was the most important, as it is the point which was most advanced into the enemy's positions, the link of his communications with Aragon, and consequently with Valencia and Catalonia, where he had all his reserves. His head quarters were established at Logroño, and he kept a division at Lerin, together with the whole of the cavalry, in order to scour the plain. Their retreat, in case of necessity, was protected behind the Arga by the fortified bridge of Laroga, and, behind the Ebro, by that of Lodosa, through means of which the communication with the army at Logroño was at the same time secured. By taking up his quarters at Logroño, Cordova was always placed in the centre of the line, being able to pass, at pleasure, behind the Ebro, through Miranda and Puente Lara to Vittoria,

or Bilbao; and to Pampeluna, by Lodosa, Lerin, Larga, and Puente la Reina.

To the reader most uninformed in military manœuvres it will appear evident that, by the adoption of so skilful a plan, Cordova shut up his adversary between those important points, and forced him to keep within the limits of the mountains. The Carlists were thus deprived of all means of procuring supplies either of provisions or of recruits, and they were forced to confine themselves to the localities whose inhabitants were devoted to their cause, but whose devotion must soon be exhausted by the burden imposed on them of supporting so large a body of men. They ran the risk, besides, of being compelled to come down into the plains, and to give or receive battle under the most serious disadvantages. By this system the insurgents were reduced to total inaction; a condition which must have soon proved fatal to them, in wearing out the zeal of their friends, and destroying the *morale* of the soldiers; whilst, on the other hand, it gave the Cristino general ample opportunity to allow his army some repose, to complete its reorganisation, to repair its losses, to ameliorate its condition, to perfect its discipline, and to await the necessary reinforcements.

Cordova at length obtained the result of these operations, in the total rout of the enemy, after considerable loss, at the bridge of Mendigorria. The news of this victory at once hushed the public murmurs which had been excited against him; and the tide of popular feeling was turned in his favour. As soon as the tidings of this affair reached Madrid, no words could describe the universal joy. Cordova was hailed throughout the kingdom as a hero who was destined to effect the liberation of his country. The government at once confirmed him in the absolute command of the army, — thanks were voted him by the two chambers, and rank, and honours, and decorations, of the highest kind, were showered on him by the Queen.

As a literary man, Cordova possesses talents of no mean order. His proclamations, though occasionally inflated, were forcible and eloquent. One in particular may be instanced, which was addressed to the troops, after the action at Arlaban, in the neighbourhood of Vittoria; in which allusion was made to the sufferings of the soldiers when driving the enemy from positions which they had taken up on some of the highest mountains in Spain. The loss sustained by the troops in climbing up in the very face of the torrents and the most tremendous crags, exposed all the time to a murderous fire, was severe. In one part he reminds them that on that day they had ascended higher than the eagles. This allusion is really no metaphor, but is strictly true. The writer of this article actually beheld the eagles wheeling beneath the summit of the rocks on which the Cristinos had gained a footing, disappearing into the sea of smoke that swept along the deep valley which separated the combatants, and mingling their screams with the roar of the torrent, the rolling of 10,000 muskets, and the thunder of the mountain howitzer.

In concluding our observations on Cordova, we may say that he possesses qualities of mind which would have enabled him to render important service in any cause in which he may be engaged; but there is always some danger that the vanity of the man, as well as his occasional unsteadiness of mind, and irritable temperament, may neutralise the talent which he can command. Swayed by such a master-mind as that of Napoleon, he would have attained a high place, perhaps, amongst those by whose fame the world has been stunned, as if with the trumpet of the archangel.

NATIONAL EDUCATION.

We avail ourselves of the occasion of laying before our readers the remainder of Mr. Simpson's four letters to the Marquess of Lansdowne, on what has been well called "the Question of Questions," to offer a few more introductory observations, chiefly called for by what has taken place since our preceding number. In that number we termed the predicament of the politico-ecclesiastical opponents of impartial education, the position of the dog in the manger; and added, that that position, because devoid of a moral basis, is one which could not be long maintained. Since we penned these words, symptoms of a disposition to abandon the unblessed stronghold *have* been manifested. We did expect, we confess, a longer tenure, knowing that pride is a tumour of slow reduction; — but then shame is a powerful solvent of the swellings of self-esteem, and so preparations are making, as decently as possible, to quit a post which has, beyond all doubt, turned out to be a pillory. We cannot suppose that this uncomfortable discovery has been made by the Bishop of Exeter *alone;* — that the blush of a bad cause tinges no cheek but his; — that, in a word, he is not the chosen bearer of the white flag from the chiefs of a repentant enemy, whom their temporary trophies have covered with confusion of face, more than glory; for what must be the load on the *Church-conscience;* what the colour of the *Church-future*, here, and hereafter; the retribution on the *Church-head*, to stand as she does between seven eighths of the people, and intelligence, honesty and mercy; to be the means of perpetuating poverty, disease, and crime, with all their costly, but useless machinery of workhouses, hospitals, prisons, transportations and executions; — to suffer to lie at the *Church-door*, drunkenness, that accursed social plague, with its bitter fruits of domestic wretchedness, squalor, pestilence, insanity, sacrifice of property, and destruction of life; — to answer for the various forms of violence and cruelty which disquiet and endanger existence; — the tyranny and crimes of combinations, the widespread misery of strikes, the midnight conflagration, the bloodshed of fanaticism, the reckless onslaught of armed discontent, duped and betrayed by the base demagogue; — and this, — all this black account of social crime and suffering, for what?—for the ritual of the Church of England! — we will not say for its stalls and mitres, for *that* were to impute the *ne plus ultra* of human depravity. No, this false position, this attitude between light and darkness — between life and death, could not be long maintained; and what, accordingly, has happened? A leading prelate, — the last, the very last we should have expected to back one inch from the *Church-barrier*, — has, in a recent correspondence with Lord John Russell, volunteered a declaration to the Government and the country in these words, adopted from Lord John Russell, — "*That it would be wrong to withhold all public aid for the instruction of those children of the poor whose parents conscientiously object to allow their children to be taught the Church catechism, or to be compelled, at the price of their instruction, to attend divine service in other than their own places of worship.*" The right reverend prelate adds, — "I should rejoice to see instituted a conference between the Committee of the Privy Council on Education and the Bishops for the purpose of devising measures to carry into effect your Lordship's VERY JUST AND MODERATE PRINCIPLE; *and, at the same time, to give to the Church that public recognition of her being the fit guardian and administratrix of national education, with which your Lordship's*

principle can so well be reconciled." In proof that the Bishop of Exeter does not stand alone, he assures Lord John Russell, that the correspondence between them "will be read, especially that part of your Lordship's letter of the 15th, to which I have already referred, [the first of the above passages in italics, which, as well as the capitals, are ours] with the highest satisfaction by OTHERS, whose suffrages are more valuable than mine:"—a remarkable and most important conclusion of the correspondence.

Seeing that in this "very full and moderate principle" lies the essence of impartial national education; seeing, moreover, that the Government scheme which was withdrawn, and, *à fortiori*, that which was decided on; while it proposed to provide both secular and religious education for members of the Church, did not propose to *endow* in the normal College any other religious instruction but the established, or to pay for teaching all religions in the same school; but intended that these should be left, as the bishop approves, to their own pastors, we could scarcely believe our eyes,—after one more hurried glance, for contrast's sake, on the "hot-blast" columns of the late parliamentary debate,—on the glowing brands of latitudinarianism, erastianism, socinianism, popery, infidelity, deism and atheism, all of them, saving always their compatibility, showered down upon this very just and moderate principle,—when we turned and fixed them on the refreshing page, "the soft green" of the unexpected letter of the Bishop of Exeter!

We are aware that some impartialists lack faith in the soft green, fearing that it hides a snake. They think they see this in the prelate's reservation of the Church's "*fit*" guardianship and administration of national education, [our second passage in italics] so well reconcileable, according to him, with the very just and moderate principle; a reservation which apparently neutralises the concession. We do not share in their distrust of the right reverend prelates; we feel guaranteed by his presumed regard for a logical as well as a moral character,—"Anguis *non* latet in herba," else it would have been better concealed. The bishop, we think, has merely used wide words. He could not mean to take back so openly with one hand what he had just given with the other. He could not mean to reserve for the Church *such* a guardianship and administration of the education of the people, as would reduce to the absurd his own concession, and, in the face of the world, stultify himself. He does, he must, mean a real respect for the rights of conscience, and the privileges of dissent. By all the rules of interpretation of equivocal passages in written documents, we are entitled to take the admission of the just and liberal principle as the dominant clause, modifying that which is in apparent contradiction with it, by its own full and liberal import. Guided by this mode of construction, we feel warranted to conclude that the right reverend prelate meant to reserve the *religious* guardianship and administration only, and that of the members of the Church alone. On any other interpretation we must hold that he claims the *secular* education of dissenters, although he has just disclaimed the religious. But, as in secular education all sects must mingle, the bishop ought not to be subjected to the imputation of wishing to interfere with secular education at all. But we have his speech, as quoted by himself in his letter to Lord John Russell, and there, if there be meaning in language, he contemplates *religious* education alone. After correcting an erroneous statement of his words, as given in the celebrated demi-official pamphlet entitled "Recent Measures," &c., he denies, as contrary to the whole tenor of his speech, that "he assented to the principle, that the duty of the state, in respect to the education of the people, is *limited* to rendering secular

instruction accessible to all, and to the improvement of the quality of such secular instruction, by assistance from the public funds, and by constant superintendence;" and then goes on to argue that the duty of the state goes, according to his notion, *farther:* admitting, therefore, by implication, that it goes *so far*. "I was dealing," says his lordship, "with a question proposed to the bench of bishops by the Lord President, — 'Do they think that the Church has a right to the education of the people at large, including that portion of the people, millions in number, who do not belong to the Church?' My answer was as follows: — The Church has no right to claim the enforcement of any system of education on the people, or any part of the people, least of all on that part which does not belong to the Church. But, my lords, the Church has a right to demand from the state the means of *offering* education to all, whether they are members of the Church or not. God forbid that the Church should have either the power or the will to compel any persons, or class of persons, to accept its system of education! But we have a right, my lords, to demand that the state, acknowledging the Church to be the true church; acknowledging it to profess and to teach the true religion, and thereby implying the duty of the Church to inculcate — ay, and not only to inculcate, but to spread, that blessed truth which it professes; we have a right to demand that the state shall supply the necessary means to enable the Church to discharge its high functions; I ask, then, the noble marquess to call on the Government, in which he bears so high a place, to propose to parliament *such a grant* as will enable the Church to educate all within its pale who need public aid; and to offer to educate all without its pale who will accept the offer, IN THAT HOLY RELIGION which the noble marquess and his colleagues, and which the state itself, acknowledge to be true; and if true, of course to be alone true. Will the noble marquess do this his duty?" That this is a demand for the means of conferring *religious* instruction only is put beyond doubt by Lord John Russell's answer, with which the bishop declares himself satisfied. "I will therefore content myself with saying, that it has been the main object of the committee to extend and encourage the *religious* instruction of the people; but that while they have endeavoured to insist on the instruction of the children of churchmen in the *doctrines* of the Church of England, they have not conceived themselves justified in withholding all public aid, &c." (as already quoted). We therefore maintain that the bishop's suspected reservation is not inconsistent with his concession. We hope the conference hinted at between the committee and the bishops will not be refused; although Lord John Russell, in a reply, doubts any good result from it. It cannot commit the Government, and may regulate their future course. A refusal may give rise to much misconstruction and hostility. The only doubtful point is "the grant" to enable the Church to educate *religiously* all her own members, and others who are willing. Yet some mode of endowment was contemplated by the appointment of a chaplain in the government normal school. Will such concession obtain for us the blessed boon of national education? and will it be the *only* sacrifice which the dissenters will be called upon to make? Let us lay these questions to heart, and avoid a rash and hasty answer.

Let us now recur to Lord Brougham's letter to the Duke (now, alas! the late Duke) of Bedford, and compare it with the Exeter correspondence, which is a month later in date. What does Lord Brougham maintain, concede, and propose? First, he maintains that "the true principle of education is to give secular education in which all sects agree, and leave the important task of spiritual instruction to the several religious teachers. He maintains

that the cry is utterly "silly that we care *little* for religion, because, in truth, we consider religion of so inestimably important a nature, that it can never be made the subject of compromise and concession; and that, therefore, it cannot be taught to children of one sect by professors who belong to another." He maintains that education once taken up by the legislature can never be dropped again; and moreover, that it cannot be much longer delayed. He maintains that he, and all other private educationists, should give the matter at once into the more powerful hands of the Government, but, at the same time, rather increase than diminish their own personal exertions. The Government, he says, is friendly to our cause — nay, adopts our views. He maintains, finally, that private beneficence, as a means of educating the people, is not only unjustly oppressive to the benevolent, but altogether inadequate to the gigantic object.

In all these points we most cordially agree. Secondly, Lord Brougham concedes, that seeing the Lords have decided, by a majority of one hundred and twelve, "against any plan of education in which the Church shall not be *consulted*, that is to say, shall not have some deference paid to its claims, beyond those of the different sects — some superiority assigned to it above the level on which all sects are to be kept." — "No government in this country ever can carry a plan of national education in which a perfect absolute equality between all sects of religious professions shall be established, according to what I humbly presume to think the only sound and just principles. So far we must make up our minds, looking our position steadily in the face, to admit that we are completely defeated, and defeated without any hope of a favourable reverse another time."

He concedes, that as nothing will be gained by undefined plans of reforming the Lords, and "swamping" them by an adequate creation of peers would not only be a criminal but a futile measure, the determination of the Lords can only be altered by the progress of public opinion; "a work of time, ay, and of a very long time," too long to defer the rescue of the people from degradation, crime, and suffering, — too long, above all, to delay the universal establishment of infant schools.

Thirdly, Lord Brougham proposes to all liberal dissenters to take with a good grace, what he considers inevitable, if there shall be a measure at all, a CHURCH-SCHOOL BILL. The noble lord thus explains that startling term: — "I am not prepared to embrace the alternative of refusing all national education, rather than allow *some preference, some interference* to the Church, where I perceive such preference, such interference to be harmless." And again, "no one dreams of such a church-school plan as will exclude dissenting children, or force a discipline upon unwilling pupils, or give the Establishment any new powers of enlarging her bounds at the expense of the sects; and the admission into the scheme which may be propounded, of some clerical superintendence — under strict control — some provision for educating such as choose to be taught in the principles of the Church, without any kind of compulsion on others, — and with ample and equal provision for the secular instruction of all sects, — can never militate against liberty of conscience, and can never be consistently rejected by the real friends of education." After reiterating the alternative of a church-preferring system or none, he concludes with one of his finest bursts of eloquence, in which he gives thrilling effect to an otherwise trite topic, our costly provision for punishing, and our meagre means for preventing crimes; and with a fine allusion to the Greeks disputing about texts, when the Turk was thundering at the gates of Constantinople.

We feel assured that had Lord Brougham written *after* the Bishop of

Exeter, and not a month before him, his letter would have been considerably different from what it is; he would have conceded much less, and, above all, said nothing about a church-school bill. He would have said less about the total and irretrievable defeat of the impartialists, and the irreversability of the decision of the House of Lords. He would have arrogated much less to the temporary state of parties, and more — and here was a field for his powerful pen — to that most important element of all in a cause, its justice. He would not have so totally forgotten that this tower of strength is on our side, and that element of weakness on the other, a forced and vulgar alliance between the Church and a political party, for the latter's factious ends and objects. He would have eloquently predicted the short duration, even as an engine of party, of a religious zeal too sudden to be sincere, too notoriously *got up*, not to be flagitiously hypocritical beyond any thing in the history of party warfare. Above all, had his reasoning fortunately taken that direction, he would have recollected that the opposition that first met the Reform Bill, which passed in the Commons by a majority of one, and was rejected by an overwhelming majority in the Lords, was by no means infected with the moral weakness of the anti-educational resistance, and yet yielded to the voice of a determined people, led on by a patriot king. Even in their late decision, the Lords professed to be swayed by what was grievously misnamed the popular voice, — the memorable array of three thousand petitions, marshalled in a few days by three thousand well drilled clergymen, and signed even by their scanty average of names, on the grossest misrepresentations and falsehoods. No! the battle has not yet been fought. The politico-ecclesiastical coalition has yet to encounter the liberal churchmen, the entire dissenters, the masses of the people, whose cry for light and knowledge, unfettered by creeds and rituals, will shrivel the three thousand parish vestry petitions into insignificance. The moral power of determined purpose of sovereign, ministers, and people, to carry a great national measure has yet to be tried on the Church and the Lords, — a measure in presence of which the Reform itself takes the secondary rank of a means to an end — without which the Reform itself were a mockery. But if the Bishop of Exeter's concession has any meaning at all, it affords a sign of the times, that so vast an effort will not be called for. *He* makes no demand for a church-school bill; for he adopts Lord John Russell's explanation, which most assuredly involves no such thing. We said that this correspondence would have modified Lord Brougham's letter had it preceded it; we are not a little encouraged to find that even though it has followed that letter, it has not been encouraged by its much to be regretted confessions of defeat, to advance more confidently and farther. Nothing can more satisfactorily prove that the bishop's repentance is genuine. It may be — we hope it is so — that the bishop has applied to the Church and their political allies Lord Brougham's awful warning to the ministers and dissenters, — for it is the Church, not the dissenters, that stands out for a ritual, when an enemy worse than the Turcoman thunders at the gate; — it is the Church that makes that ritual the condition of the people's receiving intellectual light and moral training, and consequent elevation in the social scale. To the Church, then, every word of the appeal tells with tenfold force. Lord John Russell has seized on a most tempting occasion to apply the warning in the *right* direction. A political faction in the Church of Scotland, to which its moderator or president belongs, were absurd enough to go out of their way to address the Queen, grossly and wilfully misrepresenting the government scheme, with which, as abandoned, Scotland had nothing to do, and from

which, as adopted, Scotland has nothing to fear, beyond receiving money, and permitting an inspector to report to the committee of privy council, and through them to parliament, as to how it is applied, if taken. After convicting the reverend partisans of three grand *errors*, embracing the whole grounds of the address, Lord John Russell's calmly severe reproof thus concludes: — "It cannot be the opinion of the commission of the General Assembly of the Church of Scotland, that while commerce and manufactures are adding yearly to the numbers of the people, no additional efforts should be made to secure the rising generation from that ignorance of the word of God, and that indifference to his precepts, which are the unhappy consequences of our present inadequate provision for education; nor should the danger be disregarded, that while we are guarding against '*the deadly errors, whether of popery or socinianism,*' (quoted by Lord J. from the Address), a race of artisans and labourers may grow up, by whom every form of Christianity is alike unknown and unheeded."

We would cheer on our enlightened, liberal, and, above all, impartial government, in the noble stand which such answers as this demonstrate they are determined to make against bigotry and factious falsehood of every kind, and in every quarter. We trust they will be prepared to march onward with the great, the vital measure on the meeting of parliament. We feel safe in their hands, that in any "deference" which they may show to the established church, they will make that deference as moderate as Lord Brougham, in one part of his letter, expects the claim for it will be. Whether claimed or allowed, it must and will be far short of a "church-school bill." Administration of *secular* education by the clergy is a pretension that never ought to be listened to for one moment. Their wretched education, prejudices, habits, duties, objects, — all disqualify them more than any other class of men for this great public function. They would dwarf and disfigure the secular education of the people, as they have notoriously — and by the confession of their meetings for its improvement — done in their own schools misnamed *national.* They have besides, at least ought to have, no time for this vast work. They plead want of time for that first duty of a Christian minister, — teaching religion in the schools — feeding the lambs of the flock, — among the last injunctions of the master they profess to serve. Whatever be conceded, we repeat the warning, to keep secular education out of the hands of priests of every denomination. In Mr. Simpson's fourth letter the reader will find the true *rationale* of this warning; and we challenge any churchman to find a flaw in his reasoning, — abuse and bluster, be it marked, will not be held a legal tender. His third letter disposes of the common objections to impartial education which party spirit has enhanced into formulas for convenient use as watchwords, these concentrating a mass of misrepresentation, calumny, bigotry, and uncharitableness, as they are echoed from mouth to mouth, not exceeded in any known account of moral responsibility..

CURRENT OBJECTIONS TO IMPARTIAL RELIGIOUS EDUCATION EXAMINED.

Letter III.

TO THE MOST NOBLE THE MARQUESS OF LANSDOWNE.

My Lord, — In my last letter I took credit for a degree of concern for sound, practical, religious education, not inferior, at least, to that of any of those who have misrepresented my views. I farther regretted that of religious instruction, as in this country it has been imparted, the fruits should be so scanty; while I have advocated a scheme which would render religion, not the mere foundation of education, but its chief superstructure, impart it

much more beneficially, and at the same time be just and impartial to all religious denominations. I pledged myself in this letter to take notice of some of the current objections to the plan of placing pupils of all sects under one and the same secular teacher, and of each sect under the religious instruction of their own pastor. *First.* In spite of all possible disavowals, it has been charged upon this plan, that it *excludes* religion from education. Now it is impossible that it can be seriously said that religion is *expressly* excluded, in the face of the fact that it is expressly *included*. It may not be wisely or effectually included; but that it is excluded it is utterly preposterous to predicate. Yet so extensively has it been charged in hostile journals, speeches, and even sermons, that it has become a watchword, which is operating most injuriously upon the uninquiring public mind. The belief prevails, owing to industrious propagation, that the pupil never will, under the dreaded new system, receive a single religious lesson, but will be left in absolute heathenism or infidelity. So far is this from the truth, that under the proposed scheme the pupil will receive much more frequent, regular, and effective religious instruction, than he ever has yet received from the already overburdened secular teacher. The alarm has no foundation; it is a bugbear which is uncloaked the moment it is grappled with — a giant, as one speaker in the debate on Mr. Wyse's motion well said, created and slain by the same hand.

Second. When the users of this unlawful weapon are pressed, they escape from the charge of express exclusion, and take refuge in tendency, or virtual exclusion. We shall, they urge, separate secular and religious instruction, which ought to be intermixed and blended.

Will any user of this argument carry it so far as to say that doctrinal Christianity should or can be blended with lessons on material objects, on botany, chemistry, physiology? — that it is not imperative to close the Bible and the Catechisms, during the hour that we are busy with the retort and the crucible? Is there so little confidence in the durability of the impressions of religious lessons, that there must not be allowed an interval for a direct communication to the mind of natural truths and worldly knowledge? No one will go this length. What then is the meaning of the charge of separation? By the plan proposed, religion is not *blended* with secular instruction, but *combined* with it. Each depends upon its own evidence and reasoning; by each we gain the knowledge of one of two revelations from God, which He has separated in their essential nature. To each He has given a character of harmony with the other, which demonstrates that they are revelations from the same Divine Author. This is most strikingly apparent in the resemblance, or rather the identity, of the ethics of Nature with the ethics of Scripture. But in order to see this harmony, in order to profit by it, in an enlarged confidence in the great truth, that the God of Nature and Scripture is one God, we must not intermingle or blend the lessons of these two revelations, but study them separately, and, in their full growth and proportions, bring them to that heart-improving comparison in which they will be found to shed a flood of light upon each other. Let us then combine them in education, but let us not weaken and confuse both by blending them with each other.

In combination, secular and religious instruction may be given to each pupil by two teachers, the religious by a teacher of his own sect. When blended there can be but one teacher, and he must be of a sect whose lessons offend the consciences of all the sects in the school but his own. There is a fashion with the intolerant, especially of dominant sects, to hold *this* to be a very light matter, provided the teacher of both secular and religious knowledge be of their own denomination. They will not hear of compromising the *truth*, and making it bend to please any sect whatever. This is in the very face of the fundamental principle of the Reformation — the right of private judgment in the interpretation of the Scriptures. What is this right if it be not respected? It is responded, "Would you teach *error?*" Who, it is rejoined, on Protestant principles is to judge of the error? The standard of pretended infallibility was torn up and trampled down by the very first movement of Protestantism. It were to waste words to say more on this topic.

Third. The plan advocated, it is farther said, will *tend* to exclude religion from education, by depriving the secular teacher, in his moral training, of the use of Christian precepts and motives. To this I would answer, that the moral training of the pupil is not the duty of the secular teacher only. The pupil has two teachers, who, although in different departments, combine in his moral improvement. His conduct ought to be the effect of their joint instruction and watchfulness; his errors or misconduct the object of their united admonition and correction. Thus, while the secular teacher demonstrates to him that his misconduct is in the face of the natural institutions of his Creator, which are essentially commands with penal sanctions — a demonstration which many theologians forget is of God as much as his word — and while he may go the length of showing him that preceptive Christianity, and the natural moral law — that "*nature*" by which, according to St. Paul, the things contained in the law may be done — are identical, that a sound philosophy demands justice, benevolence, and piety, in the very terms in which Scripture enjoins to do justly, to love mercy, and to walk humbly with God; yet he cannot, having various sects under his care, urge as motives to *all* his pupils the same *doctrinal* Christianity. He must refer his pupil, at this point, to his own pastor. To those who may call this just course latitudinarian indifference,

a compromise of the *truth*, an encouragement of error, I would say, and say no more, that *their* assumption of infallibility is Popish and not Protestant. It would put an end to toleration itself. In Holland this joint superintendence of moral conduct is reduced to easy and satisfactory practice. Under a judicious system, which there is no wish to thwart, it might be quite as easily realised in this country, and made to increase instead of diminishing the power of moral and religious education.

Fourth. The arrangement, it is said, tends to exclude religion, inasmuch as the state is called upon to provide for secular education, leaving religious to chance. To this I humbly answer, that at *present* it is secular education, not religious, that is left to chance. While the latter is either endowed or voluntarily supported, the former is overburdening a benevolent few, or struggling on with the impulse of private speculation, and lamentably failing in its object. Now, logically reasoning, supplying the deficiency where it exists, will not occasion deficiency where it exists not, provided the deficient be not supplied at the expense of the full. The religious instruction of the country is not left to chance now, and will not be left to chance when the secular, now left to chance, is *otherwise* provided for. This includes the religious instruction of the young. I have heard of no denomination of pastors of whose duty the religious instruction of the young is not a vital, paramouut part *now*. I recall the word Duty, and name it Privilege. It is obedience, and it should be willing, to the gentle command of Him who said, "Feed my lambs." If it be said that it is unjust to increase the labours of the pastors without remuneration, while the State is endowing the secular teachers; I would reply that secular teachers for a national system are yet to be created, while there is no additional *duty*, beyond the *existing*, proposed to be thrown on the religious. It is nothing to the argument that many do not do this duty; very many do, and all ought to do it. Our opponents have a last ground here upon which I have seen them retreat. "What," they say, "if the clergy *refuse* to provide religious instruction to the young, who can force them?" Assuredly *that* would be leaving religious instruction to chance; but by *whom* would this melancholy state of things be occasioned! By forty thousand Christian ministers rejecting the care of the most important and interesting portion of their flocks — the young! renouncing an *old* duty, and that for the purpose of thwarting a great national measure — not rejecting a new! Could these Christian ministers be more foully aspersed, more deeply calumniated? The argument, miserable as it is, may be employed *for* them, it never can be resorted to *by* them. I cannot imagine one pious, conscientious pastor, when invited to the duty of instructing the children of his own sect, in his own locality — the children depending on him for the bread of life, which their secular teacher, not being of their sect, cannot give them — who could resist the appeal, and expect a blessing on the defective remainder of his pastoral labours. No — the difficulty is controversial, not real. Were the system established, and party divisions moderated, it would work harmoniously as well as effectually in this country, as I have repeatedly said it works in Holland.

Fifth. There is yet one objection more. The clergy, it is said, lack time and strength for this great increase of duty. Can this mean that the duty is not *now*, as it ought to be, done? — that, *de facto*, it would be labour superadded to what it already performed? If the duty is not done, there is a confessed failure of duty, as things are. If it is done, where is the increase of labour? This were answer enough, I humbly apprehend; but more may be said on this head. The religious instruction of the young, as the most important, should be the *first* duty of the pastor. His duties, in succession, according to their place in the scale of importance, should demand his care; and should his time and strength fail him, his least important offices should be the sacrifice. These last offices are most likely to be of a character which the early religious training of the young will itself render superfluous. We are entitled always to presume pluralities at an end, and the pastor localised in the scene of his ministrations. We are further entitled to relieve him from all secular avocations, such as farming, field sports, magisterial and political functions, and even literary and scientific labours. There is not a pretence for stating any one of these on the credit side of his account, in the question of his time and strength for the performance of the paramount labours of his holy calling. In the order of importance, I am not singular in placing the pastor's pulpit duties — I mean his sermons — lower in the scale of utility than many, who are habituated to things as they are, are accustomed to do; yet these are just the labours which occupy most of his time; and when we compare the time and labour of his preparation for that engrossing department of his office, with the good actually done — when we consider the inattention, the indifference, often the impatience, with which the very great majority of sermons are heard, chiefly because of the want of previous sound religious instruction, or from the rooted aversion to the subject created by the injudicious manner of its inculcation — we are tempted to ask whether pulpit homilies might not with advantage be abridged, both in length and frequency, and more impressive modes of teaching, both the young and the old, be substituted for them? It is vulgarly but truly said, when there is a will there is a way. I have urged that it is *already* the pastor's duty to instruct the young of his flock, and to do it effectually. If he omit it, or do it superficially, and he does this by

a mere Sunday catechising, he fails in his duty, and incurs a deep responsibility. He cannot *effectually* instruct the young unless he himself conducts the whole of their religious education, let him find strength as he may. But attention is prayed to another consideration, which is entirelely lost sight of; the amount of the labour of religiously instructing the young is greatly over-rated. It is looked upon as *one-half* of education, an equal partition, with the secular teacher, of the business of the school. Nothing can be more erroneous. Religious instruction, the highest authority characterises as a light burden — an easy, a pleasing duty. Of the multifarious branches of secular instruction, there is not *one* which is not more laborious, both in the teaching and the learning. If the pastor lack time for religiously instructing the young, what must the secular teacher do! There we do see want of time and strength for what would be an additional labour. But a few hours in the week might, by a judicious and affectionate pastor — hours to the pupil of privilege and pleasure, not of task, toil, and disgust — be so applied as fully and effectually to gain the blessed end of the religious education of the young. Religious instruction is essentially delightful, and there cannot be a surer sign that it is perverted than when it is felt by the young to be tedious and repulsive. In the Edinburgh Model Infant School, the children, when a choice is given them, invariably prefer a Scripture lesson to any other. This is a fact of immense value. Where is the Christian minister who would not rejoice in this feeling, and build upon it a yet higher and nobler superstructure? In the conclusion of my last letter I stated that the experiment had been made, and the end attained, not only in Holland, but, nearer home, in Liverpool.

With a word more I will conclude this letter. There is something, it is said, in the plan which I humbly advocate, which seems to legislate *expressly* the exclusion of the Bible from the secular school, a course which will not be tolerated in any system of national education. When this *feeling* is tested by reason, it will be found to be a mere habit of thinking, and will yield to a more rational view. But I am not inclined to concede that it is a generally prevailing feeling. A very great majority of intelligent persons, including many pious clergymen, with whom I have conversed, disclaim the feeling. They see that the Bible is *not* excluded from the school, when *in* the school it is committed to the pastor's hands instead of the secular teacher's, any more than chemistry could be said to be excluded in a seminary into which a special teacher was introduced to take that branch in hand. Nevertheless, there is no need for legislating the exclusion of the Bible even from the secular school. No reasonable friend of national education would reject an express legislation of the *inclusion* of the Bible, as proposed in Lord Brougham's bill; namely, that it shall be read without comment in the national secular schools, Jews and Catholics retiring; and, I would add, any pupils whose parents wish that their children should retire. I may, however, be allowed to express my fears that the practice would become, what it has become in many an existing school, an unimpressive and useless form; and, what is infinitely worse, would be *trusted to* as sufficient religious instruction. Unless I saw the pastor's labours superadded to this course of school Bible reading, I should be far indeed from being satisfied with the provision made for religious education. Much religious instruction and care would yet remain for the pastor, and that of a kind which, consistently with the justice and impartiality of genuine Protestantism, cannot be imparted by a secular teacher who has under his care more than one religious denomination.

One letter more will conclude the series. — I have the honour to be, my Lord, your Lordship's most obedient servant,

JAMES SIMPSON.

Northumberland Street, Edinburgh, January 10. 1839.

EDUCATIONAL CLAIMS OF THE CLERGY — OF THE CHURCH. — RELIGIOUS DIFFERENCES AS A CAUSE OF REFUSAL OR DELAY OF NATIONAL EDUCATION. — VOLUNTARY CONTRIBUTIONS. — COMPULSORY EDUCATION. — OBJECTIONS TO A CENTRAL BOARD. — CHEERING AUGURY.

LETTER IV.

TO THE MOST NOBLE THE MARQUESS OF LANSDOWNE.

MY LORD, — The third letter which I had the honour to address to you, was devoted to a humble endeavour to answer the current objections to an arrangement, for the religious education of the people, of a character just and impartial to all religious sects. I have, in this my concluding communication, to examine some objections to education being made a State, or rather a national object, as it is recommended to be in the excellent Report of the Irish Education Committee; of which Mr. Wyse was chairman; and the reasons for which I have detailed in the volume on the Philosophy of Education formerly alluded to. Preliminarily to this examination, the claims of the Established Clergy and the Church, to direct and control the education of the people, demand a few words.

1. THE CLAIMS OF THE CLERGY. — The clergy and education, both secular and religious, are ideas associated in the public mind, by the unexamined acquiescence of centuries. This hereditary impression is obviously of monastic origin. In rude times the monasteries were the asylums of learning, and of all that resembled science. A monoply of knowledge, or the reputation of it, was a powerful engine of priestly power. When universities came to be established, the education of the priesthood was their leading object; scholarship was the business of the divines, and they naturally became professors, tutors, and teachers, to the laymen, who subsequently began to resort to *their* seats of learning. In Scotland the parochial system of education has always been under the control of the clergy; a family preceptor is seldom looked for in any other profession; and many of the universities' chairs were, and still are, filled by clergymen. All this was natural and even necessary in less enlightened times; and although the clerical superiority on which it rested no longer holds good, the old habit of thinking still keeps its ground. It is time to examine this clerical claim — and I would wish to do so respectfully to that reverend body — seeing that the control of national education is peremptorily demanded for and by the Established Clergy even in the discussions of Parliament. The advocates of clerical control are bound to prove three points — that the clergy would be the best guides of national education — that they could do justice to such an undertaking compatibly with their proper clerical duties — and that their control would be sanctioned by justice. First, the qualifications of the clergy must not now be measured by the old standard of classical and theological lore, or by any standard older than twenty years. The qualifications to direct, must always bear reference to the thing to be directed. Viewing secular elementary educations in the light in which it is described in my first and second letters addressed to your Lordship, I am unable to perceive the *superiority* of the clergy, to all other classes, in the extensive and varied field of natural knowledge therein embraced. It is well known that university education, in England at least, is much more classical and theological than scientific and practical, which tends to place the clergy, as a class, in a position not equal to that of more liberally educated men, to direct an education of real practical value.

Secondly. The labour of a conscientious and efficient direction of the secular education of the people, *ought to be* very great. It ought to engross the whole time of any man, or set of men. If the clergy would undertake this vast accession of duty, how will they reconcile their doing so with the plea of want of time, examined in a previous letter, for a few religious lessons a-week to the young of their own flocks? If they would not bestow the indispensable labour, where is the worth of their direction and control of national education!

Thirdly. The claim is unjust. Its object openly avowed is the power of educating the whole people in the doctrines, rites, and discipline of the Established Church, while there is a great portion of the population by whom these are conscientiously repudiated. To enforce this pretension — and the purpose has been declared in both Houses of Parliament — is equivalent to resisting all plans of popular education which the clergy of the Established Church shall not control; in other words, any popular education at all.

2. THE CLAIMS OF THE CHURCH. — There are many who hold that, whether education be committed to the control of the Established Clergy or not, it ought to be directed by the Church, because, the Church being established by law, the whole people should be educated to belong to it. The State connection and endowment of the Church *are* established by law, but I am not aware that there is any law which compels all to belong to it, in doctrine and form of worship. The argument would prove too much; it would annihilate toleration. But freedom in religious matters now exists, so that to place education on any footing in which that freedom is not recognised, would be equivalent to banishing all Protestant liberty, and restoring the power of Popery. Few, if any, thinking men avow such an extreme opinion. There is too great a sum of light and justice among Churchmen themselves for this. There are very many who disclaim such a pretension, and who, reflecting on *what* it is which is refused, or even delayed — the rescue of the people from ignorance, vice, crime, and misery; reflecting, moreover, on the meagre results, for centuries, of a church-directed or rather church-neglected education — would join the just and liberal of all sects in entreating the Legislature not to give the direction or control of the people's education to any one religious denomination, dominant or dissenting.

It is not true that the advocates of impartial education are unjust, or in the slightest degree unfair, to the Established Church. They propose nothing that would interfere with the rights of the Church; nay, they would expressly reserve to the Church the freest and most unquestioned right to superintend and direct the *religious* education of all who adhere to its doctrines, forms, discipline, and economy, and moreover, of all who, though not within its pale, have no objection to take their religious education from it. This has never been disputed by any impartial educationist, and it is to propagate an unfounded prejudice to aver, that impartial education is intended to injure or endanger the Church Establishment. It is humbly asked, what more, in a nation of different sects, ought the Church to demand than what is above accorded to it? In the debate on Mr. Wyse's motion, so often alluded to, there were none of his supporters who did not reiterate his wish that full justice should be

done to the Established Church; but no more than justice; and certainly not such a measure of preference as would imply the grossest of all injustice, a general tax for the objects of a privileged denomination.

3. The existence of RELIGIOUS DIFFERENCES is no reason for REFUSING or even DELAYING the measure of national education. In the same debate it was instructive to observe the various, and singularly contradictory, views taken of a subject for which there was a marked want of preparation in the minds of the opposing members. Some speakers strenuously maintained that the disagreement among *religious* sects is a reason against the Government interfering even to give *secular* education to the people. Now, with the greatest submission, I would answer that that disagreement is in itself the strongest reason *for* the interference of Government, in order to legislate impartially. One opposing member said it was in vain to hope for a common *religious* ground upon which all sects could meet. I grant it, nay, I found upon it, but add that there is a common *secular* ground; and these predicates, being *both* true, combine to afford me an irrefragable basis for my whole argument. It is just because religious sects will not meet on one common ground that we should not force them into the same religious school, and that, at the same time, we should open to them wide the doors of the same secular school, where they *will* meet on common ground. For this last alone, it would be just for the Legislature to tax the entire people. Is *this* then to be refused because, in quite another thing, their religious persuasions, the people disagree? Is the most zealous churchman prepared to go this length? Are the people not to have the means of learning chemistry, mathematics, mechanics, because in their *religious* views they differ? This arrival at the absurd, I humbly submit, puts an end to the question. But, again, is the communication of useful worldly knowledge to be *delayed* even — for this, too, was urged in that memorable debate — till religious differences should, as it was termed, "soften down?" I was rejoiced to hear a Minister of the Crown characterise such objections as unreasonable; with submission, they are preposterous. If religious disagreements were a ground for delaying secular education, we should find all the differing sects alike urging delay; but this is not the case. It cannot be denied that the great body of the Dissenters are not hostile to a national plan of *secular* education. It is the Church alone that has taken up the obstructing position. It is not sect against sect, but the dominant against all other sects, that presents the true position of the question. It is not that we are to wait till differences soften down among all sects, but till all other sects yield to the Church. But that is a river which will never run out; if these be the only terms of peace, it may well be asked, when will the star of *that* peace arise above the troubled horizon? There is but one answer — Never! Ought then the Legislature to hesitate to take the common sense practical view of a question, the conditions of which are so plain, and do for Churchmen and Dissenters both, what they never will agree to do for themselves.

4. VOLUNTARY CONTRIBUTIONS, while they operate most unjustly on the benevolent, are utterly inadequate to the education of the people. It is another great practical error in this question to trust to VOLUNTARY EFFORTS and CONTRIBUTIONS for a purpose to which these are so immeasurably inadequate. It affords yet another instance of the unhappy denial of thinking, which the question has been doomed to experience. We have seen schools established by voluntary subscriptions, and are apt to conclude that that mode is in the course of nature, and in harmony with the fitness of things. We find speakers in both Houses of Parliament eloquent, on "the *accustomed* channels of private benevolence — the flow of private charity." It has become a sort of pet topic of declamation, which hurries us along; and truth and justice alone would excuse the apparent hard-heartedness of those, who, having stopped to examine its value, pronounce it worthless. What then is this flow of benevolence? It means that about *a hundredth part* of the British population — which is the *ascertained* proportion of the *money giving* benevolent — shall, as a bounty on their beneficence, be rewarded with the burden of educating the other *ninety-nine!* Would that some of the more amiably fluent on this topic were active members of charitable societies, educational and other, that they might learn the hollowness of our title to be called, what we call ourselves, a charitable *people*. In Edinburgh, the proportion who statedly inroll themselves in the lists of charitable institutions, in which there is no show, and no value — alas for our motives! — in pleasure, is 1500, in a population of 150,000; and it has been ascertained, that this is a large proportion as compared with many other places. These 1500 individuals support ALL the other charitable institutions of the place, besides the educational. Of course, ALL the charities, here and elsewhere, are struggling for existence; and as the voluntary educational institutions share the common difficulties, it results that the benevolent few are most unjustly overloaded to little or no purpose. The offer of Government to meet voluntary subscriptions *half-way* with grants, is an alleviation; but the *half* of the cost of educating the entire people still remains on the shoulders of the benevolent, a burden far beyond their power to support. Say that it would require 50,000*l.* to establish completely the means of popular education in Edinburgh; is it not to mock the benevolent remnant of 1500 individuals to ask *them* for 25,000*l.*, while ninety-nine for one look on, and refuse to touch the burden with one of their fingers? When we extend the

argument to the whole country, the notion of the benevolent few raising the half of the vast sums which will be required for this transcendently important national object, is perhaps the wildest that has ever found its way, unquestioned, into Parliament. ALL are to benefit, and to a degree beyond present calculation, by national education — by the intellectual, moral, and religious, elevation of the present unjustly degraded masses of the people. Is it just that a hundredth part shall pay for this general benefit? The current sophism that national aid will dry up the sources of voluntary beneficence, it is hoped, is now exposed. The answer to it is — the sooner the better; for while, on the one hand, the gross injustice, above pointed out, will have an end; on the other, national education will be realised, and will be generally and steadily, instead of partially and precariously supported.

There is a false analogy to which the opponents of National Education resort, with a view to detach the great body of the Dissenters from its cause. These, it is said, abjure *State* support to religion; how can they consistently accept of it to education? Bacon says that while ordinary minds see resemblances, superior reasoning powers see differences. Here the unreflecting "ride off" on the resemblance, notwithstanding, as is true here, that the difference is obvious. It has been already urged as a reason for separating religious and secular education, that the Dissenters cannot receive the former from the State; but what reason, or shadow of a reason, exists why they should not receive the latter? Secular education is for all sects — religious for each. All may be taxed for the education common to all denominations, but the Dissenters object only to all being taxed for the religion peculiar to one. I am taking no side in this *questio vexata* of State against Voluntary religion — I am only anticipating the Dissenter's answer to this attempt to shut *his* mouth when demanding National Education.

5. COMPULSORY EDUCATION. — Our opponents have conjured up yet another giant in this. They have gratuitously imputed to the national educationist the purpose of *compelling* the people to send their children to the national schools — *because* this is done in Prussia. To this it is answered that there is no intention to introduce the Prussian compulsion in England. Yet I could show, from the statute-books of both England and Scotland, and especially from that stringent code the Books of Discipline of the Church of Soctland, that compulsory education, were it, as it will not be, introduced, is not an absolute novelty in this island of liberty. I could show it existing in the free States of Switzerland, and America. Its principle is this, that parents, whom the law compels, *at their own cost*, to feed and clothe their offspring, that they may not become chargeable to the public, may reasonably be compelled, *without cost to themselves*, to put their children in the way of *not* becoming nuisances to society. If the parent incurs a *quasi contract* to feed and clothe, should he be from a similar obligation, on a much stronger moral ground, to educate his offspring. But into that principle it is unnecessary to enter. Nothing is contemplated by the advocates of national education beyond a well-founded reliance, borne out by the experience of Prussia itself*, on the *moral* compulsion which the very existence of universal education will create, and the reasonable connection which the Legislature can and ought to establish, between social privileges and educational qualification.

6. A CENTRAL BOARD OF COMMISSIONERS IT IS SAID WOULD BE INOPERATIVE. — As it is the unanimous opinion of the witnesses examined on the point by the Irish Committee, and of the friends of popular education as a Government object, that it should be *centralised*, or placed under the direction of a Board of Commissioners — on grounds into which I cannot enter here — that Board has been objected to. It is said that *because of religious differences* among its members, it would be inoperative. This certainly would be true on two suppositions; first, that the Crown were so ill advised as to compose the Board of religious zealots of contending denominations; and secondly, that religious and secular education were *blended* together in the national schools. But as zealots would not be appointed by a judicious Government, and as it is vital to the national plan that religion shall be imparted to the young by the pastors of their own denominations, where would be the difficulty of finding and bringing together the necessary number of the enlightened, moderate, and impartial men — by all means both Churchmen and Dissenters — who would direct the secular, and encourage the religious, education of the country by most harmonious co-operation. The experiment is not new; it has succeeded, on several years' trial, in Ireland.

7. A CENTRAL BOARD, it is lastly said, would be DESPOTIC. This objection is also of the bugbear character, and yet it was half the speech of the honourable member, in the discussion on Mr. Wyse's motion. A despotic educational board co-existing, in this country, with such things as parliamentary responsibility, a free press, a jealous people! The idea is prepos-

---

* The Prussian compulsion, itself, is extravagantly overrated. A recent traveller in that country informed the writer that his very natural allusions to the *physical force* school-going process occasioned much mirth. No one had ever seen an instance of a truant proceeding to school with a drum beating behind him. The *moral* compulsion of the shame of denying education to their children alone operates, and operates with the lowest of the Prussian people.

terous. A Commission, acting in sight of the public, executing the resolves of the public, administering the funds of the public, and annually rendering a minute account of their stewardship to the public, through the Parliament, are the servants, not the masters, of the public ; and, as such, only do for the public what it cannot do for itself. The checks upon their proceedings are numerous and powerful, and could not fail to be effectual. Your Lordship will find these enumerated in the report of the Irish Committee, already often alluded to in these letters. One of these alone affords an answer to the *despotism* objection — an objection, by the way, utterly inconsistent with the weakness of a Board distracted by religious divisions, for a disjointed oligarchy is powerless — and that is the proposed existence of Local Boards, whose consent, both to the establishment and conduct of schools, shall be required, in co-operation with the Central Board. This is fully and anxiously provided in Lord Brougham's bill, which was utterly distorted by one speaker in the debate. Besides the *books* taught, and taught from, will be in every one's hands, and these will contain the whole *matter* of the people's education.

There is one giant more, if it is worth, the ink with which I allude to it. The Commission, it is said, will be the tools of the Minister of the day, who will make use of them for overturning the liberties of the country. So that this unfortunate Board, now inoperative from its weakness, and anon despotic from its power, is after all to be the mere engine of a yet superior despotism, which, however, must itself work in full view of a vigilant Parliament, an unsparing press, and a most unceremonious public. But the Commissioners of Education ought to be, and must be, rendered by law quite independent of the Minister of the day, as the judges are ; and then it would be as much out of the question that he should pervert, or dream of perverting, the instruction as the justice of the country.

There is CHEERING AUGURY in several observations in the reported speech* of the Secretary of State for the Home Department, although he stood in opposition for the time to the object of Mr. Wyse's motion, as indicative of what that noble person's views may be expected yet to become. He *admitted* that, even with the most impartial dispensation of the Government grants, the results are unsatisfactory; that, nevertheless, a very large proportion of the population, especially the poorer classes, are utterly uneducated ; that the criminal experience of the country is a proof of that lamentable fact; that the STATE should afford education, as the means of knowing duty, before it punishes crime ; that the vast object is beyond the power of the two existing societies (the National and British and Foreign,) and of the *small* Government grants now given ; that many of the poorer districts are left entirely uneducated ; that voluntary exertions are not adequate to the education of the people ; and that, on the whole, the STATE HAS NOT DONE ITS DUTY to the people in this paramount concern. He *objected* that there are difficulties in the way of immediate legislation, although, at the same time, he characterised these difficulties as unreasonable. Those which he did enumerate have all been touched upon, and it is trusted removed, in this letter. He *preferred* the British and Foreign to the National Schools, because the religious branch of the former is impartial to differing sects. In this series of letters, which I now bring to a close — and I again offer to your Lordship my sincere thanks for the distinguished privilege of being permitted to address them to you — I trust I have pointed to a system which, while it includes the Noble Secretary's desiderate of impartiality, is, both secularly and religiously, greatly in advance of the system, at its best, of the British and Foreign Society's Schools. But I am grateful even for so much as he has declared. No well-informed liberal educationist can read the Noble Lord's speech without foreseeing that all his difficulties are destined to yield to farther information ; and that a sound education, physical, moral, religious, and intellectual, is in store for the entire British people ; who will yet sustain their high place among the nations, by the noblest and loftiest of all titles, a superior, intelligent, moral, and religious character, — I have the honour to be, my Lord, your Lordship's most obedient servant,

JAMES SIMPSON.

Northumberland Street, Edinburgh, January 5. 1839.†

---

* June, 1838.

† This fourth letter appeared in the London *Courier* of the 11th of February. On the next day, Lord John Russell gave notice in the House of Commons, of a plan of incipient National Education, in harmony with the leading principles in the series of letters now concluded. A Royal Board has already been constituted, and begun to act.

SECRET ANECDOTES OF THE FRENCH POLICE.

Mémoires tires des Archives de la Police de Paris depuis Louis XIV. jusqu'à nos Jours. Par J. PEUCHET, Archiviste de la Police. 4 vols. 8vo. Paris, 1838.*

THE compiler of this very curious, though, in many parts, unreadable book, had been for several years Keeper of the Archives of the Police of Paris. He was a man of good ordinary education, and not devoid of talent. Born in 1760, he entered, at the usual age, the college of *Louis le Grand*, and in due time was called to the bar. In 1788 he became acquainted with Abbé Morelet, by whom he was employed in collecting and arranging materials for his "Dictionary of Commerce." He also wrote for the New "*Encyclopedie Methodique*" the articles Police and Municipality; and shortly after became chief editor of the "*Gazette de France*," and, subsequently, of the "*Mercure.*" In 1800 he published "*La Geographie Commerçaute*," in 5 vols. folio, which important work drew upon him the notice of Count Chaptal, then Minister of the Interiour, who named him Member of the Council of Commerce and the Arts. At a later period, Count François de Nantes, Prefect of Police, placed him at the head of a bureau in his department. In 1814, after the restoration, he was appointed to the censorship of the journals; and after the hundred days, during which Peuchet had thrown up his office, he was made Keeper of the Archives of the Prefecture of Police, which place he occupied till 1827.

Our motive for entering into these details concerning the editor of this extraordinary book, is to show that the publication is not a surreptitious or catchpenny one, but that it has been seriously and diligently compiled by a person, who, from his acquirements and the facilities afforded him by the place he filled, was fully competent to execute such a task.

Peuchet begins his history of the police with the year 1667, at which period several reforms were introduced into that part of the public administration by order of Louis IV., who established it on a footing nearly similar to that on which it stands at present. Before that time, the police was under the direction of the *Prevôt de Paris* and two *Lieutenants au Châtelet*, one civil, the other criminal, who exercised their authority under the control of the parliament of Paris. Louis IV. substituted for this triple-headed authority the direction of a single functionary, or magistrate, with the title of Lieutenant of Police, which denomination underwent a change, like so many others during the revolution, and took the new name of Prefect of Police.

The contents of these volumes are necessarily, from the nature of the subject, of the most various and desultory description; the only order it was possible to observe in the treatment of such heterogeneous materials being a chronological one. They, therefore, it may be said, offer a vast moving panorama of the secret history of Parisian society, in all its phases, from the times of Louis XIV. to those of Charles X. The scenes of many-coloured life exhibited in these pages, embrace society in its utmost extent, in its heights, and in its depths, from the brilliant summits of the French court, with all its glitter, its heartless profligacy, its follies and its crimes, to the lowest and obscurest haunts and hiding places of murder, robbery, and every

* Memoirs selected from the Archives of the Police of Paris, from the Time of Louis XIV. to the present Day. By J. Peuchet, Keeper of the Archives of the Police. 4 Vols. 8vo. Paris, 1839.

other villany and sin, in all their darkest shades of cruelty, horror, and abomination. From this unexaggerated description of its contents, it is evident that, to the many, it must and ought to be a sealed book. But, as in things most evil, there may still be found some touch of good, there are, in this dark record of human debasement and crime, interspersed here and there anecdotes that throw a new and interesting light upon historical characters, and adventures, which, from their fearful nature and extraordinary *dénouement*, excite and reward curiosity more vividly than many of the wildest fictions of romance. A specimen of each of these we shall select for the gratification of our readers.

The first relates to the celebrated Duke of Buckingham, the favourite of James I., and of his ill-fated son, Charles I., and the victim of Felton the assassin. This very curious and piquant passage in the life of the gay, gallant, profligate, profuse, and enterprising Buckingham, Peuchet introduces in the following manner: —

"Now taking advantage of some isolated documents which I discovered in a pasteboard case which lay *perdu* behind one of the busts that adorn the *Salle des Passports* at the Prefecture of Police, I shall bring Cardinal de Richelieu upon the stage in a more interesting and prominent manner. The document I allude to is a report made to his eminence relative to the daring demonstrations of love which the Duke of Buckingham, favourite of King James I. of England, ventured to display towards Anne of Austria, Infanta of Spain, and Queen of France by her marriage with Louis XIII. It is well known that the Duke of Buckingham, who had been sent to Paris to make some representations to Louis XIII. in favour of his protestant subjects, took it into his head to play the *inamorato* with regard to the queen. This the king no sooner perceived than he complained of it to his minister (Richelieu), who was still more indignant even than his majesty at the presumption of the duke, as he himself had designs upon the heart of the queen, and was therefore still less inclined than the royal husband to support patiently the thought of Anne of Austria looking with a favourable eye upon the Duke of Buckingham.

"Wishing to see clearly through an affair so delicate in itself, and so important for him, he set to work two men, not a little celebrated at that time, and whose memory is not yet forgotten, both men of wit and intrigue, — the physician Bois Robert and the Marquis de Beautru. Both these persons have been always regarded as the permanent spies of Richelieu, whose duty it was to keep him *au fait* of whatever took place at the court and in the city. The Archives of the Prefecture of Police leave no doubt on this point, and the document I am about to produce furnishes the most undeniable proof. It is a report in the handwriting of Bois Robert, and signed by him and the Marquis de Beautru. This report speaks sometimes in both their names, and at others only in the name of one of them. Here it is, in all its *naïveté*.

"'I shall first inform your eminence, that I met by chance an Irishman, whom I had formerly known in Paris whilst he was pursuing his studies. I had then an opportunity of rendering him some services, for which he professed an unbounded gratitude. On leaving Paris he returned to England, and made no greater way in the world than to become the favourite *valet de chambre* of his Grace my Lord Duke of Buckingham. Although the emoluments of that place are very considerable, Patrick O'Reilly (for that is the Irishman's name) never has a sou in his pocket. So far he is like his master. I received him kindly on his coming to see me, and from my great zeal to serve your Lordship, I hesitated not to degrade myself (*m'encanailler*) by keeping company with this valet, hoping to draw something useful from him concerning his master. In this I succeeded by advancing him some money.

"'(Signed) Bois Robert."

"'Monseigneur,

"'Thinking only of the happiness of satisfying your eminence, I profited, in order to learn what was passing at the residence of the English embassador, of a friendship arising out of a duel, which took place some twenty years ago, and before the singular christian ordinance, issued by our lord the King against such practices. A young Englishman, Sir Hamilton, descended of a noble Scotch family, finding himself without a second in an affair of honour, his friend having broken his leg the very morning on which the meeting was to take place, very courteously entreated me to go out with him. As this was a request which no gentleman could refuse another, I accompanied to the field Sir Hamilton, who killed his adversary, a Spaniard of the house of Medina Sidonia. I was not equally fortunate, for the Spaniard's second, Count de Variclery, originally of Italian descent, though his family has been settled in France for the last two hundred years, gave me a severe sword wound, which confined me to my room for six months. From the day of that occurrence Sir Hamilton was as constantly with me almost as my shadow, and though frequently and vehemently entreated by his family to return to Scotland, he would not consent to leave me, till I had completely recovered. On taking leave he bound himself on his honour, without my requiring or wishing it, to render me any and every service I should ask at his hands.

"'Years rolled by, our intimacy gradually slackened, we ceased to correspond, and would have soon probably forgotten each other entirely, when I found him amongst the gentlemen of the embassy, who came to Paris in the suite of the Duke of Buckingham. I did not let slip the occasion of reminding him of the past, and calling upon him to redeem the pledge he had given me. Overcome by my repeated and pressing entreaties, he told, though reluctantly, all he knew. The following narrative is therefore, monseigneur, made up of what I learned from Sir Hamilton, and what Bois Robert contrived to draw from the *valet de chambre* of the Duke of Buckingham.

"'(Signed) Marquis de Beautru.'"

The report then proceeds as follows: —

"It is of general notoriety at the English embassy that the duke is in love with the queen. He has even been presumptuous enough to have the portrait of that princess placed in his closet, under a canopy of blue velvet, surmounted by white and red plumes; and wears, besides, a miniature of her majesty, encircled with large diamonds, suspended from his neck by a golden chain, as if it had been given him by the queen. He goes frequently to see the Duchess of Chevreuse, of whom he pretends to be enamoured, but she is in reality only his *confidente*. He has secured her good offices, by a present of 2000 pistoles, and a diamond necklace, valued, at the least, 100,000 livres. This present was offered to the duchess on her alluding accidentally before the Duke of Buckingham to her being straightened for the moment in money matters. The gold she accepted as a loan, and the jewels as a *galanterie*. From that time, all the rarest productions of the Indias and the two Americas were to be found in abundance at the duchess's, and in return, her house and her eloquence were at the service of the Duke of Buckingham. She omitted no opportunity of speaking of him to the queen, and pointing out to her majesty the excess of his passion *à travers son insolence*.

"Eight days ago the queen went to a collation at the hotel of the duchess. The king had promised to be present also, but the Duke of Buckingham was as unwilling to be obliged to follow in the suite of his most christian majesty, as he was to be absent on the occasion from his lady (*sa dame*), the audacious name by which he calls the greatest princess in the world. During this afternoon he appeared under five different disguises. The first time he wore the Albert * livery, and made one of the group of footmen in waiting for the arrival of the queen's carriage, and with an inconceivable temerity, it was he that let down the step of the carriage, thus usurping the functions of the officers of the crown; and it is said, that as her majesty stepped out of the carriage, he laid his hand tenderly on the royal foot. The queen at first walked about the gardens, and the duke's next appearance

* Albert, the family name of the Dukes of Luynes, of Chevreuse, and of Chaulnes.

was as one of a number of gardeners who came forward to offer fruits and flowers to our gracious sovereign. When it came to the duke's turn he dared to utter a compliment, but in so low a voice that no one but the queen heard him, and she was observed to blush. Later in the day he presented himself in the costume of a magician or fortune teller, and by means of this disguise spoke twice to the queen. On the first of these occasions it was remarked that the duchess nudged the arm of the queen, as if to caution her majesty against being surprised, and when the pretended astrologer approached, and appeared to be telling her her fortune, the princess became so confused, that the duchess made signs to the duke to warn him that he had gone too far. We know not, monseigneur, what sort of impertinence the duke allowed himself to utter at that moment.

"The Duke of Buckingham then disguised with an appropriate mask, made his appearance and danced twice in the ballet of demons which was performed on that occasion; and lastly, in order to enable him to remain a longer time near his lady (*sa dame*) that tasteful masquerade had been imagined, which drew forth the applause of your eminence and the king, that representing the visit made to the queen for the purpose of paying homage to her beauty and merit, by the emperors of China, Japan, Abyssinia, of the Moguls, Mexico, and by the Sultan of Constantinople, the Sophy of Persia, the Grand Khan of Tartary, and the Inca of Peru, each escorted by a suite of masks. It was known that the representatives of these sovereigns were all noblemen of the houses of Lorraine, of Rohan, of Bouillon, of Chabot, of Tremouille, &c. With the view of prolonging the duration of this gorgeous pageant, and the triumph of the queen, the above named potentates were invited to form part of their majesties' immediate circle. The Grand Mogul who was to have been personated by the young Duke de Guise, was in reality represented by the Duke of Buckingham, the former having consented for a loan of 3000 pistoles to let the latter take his place. The dress of the Duke of Buckingham was one blaze of jewels, and amongst them, to the astonishment of the whole court, sparkled the diamonds of the crown of England, which through an excess of foolish confidence, the King of Great Britain had allowed his favourite to bring away with him to France. The young Duke of Guise attended the simulated Grand Mogul, as one of the lords of his suite, under the title of his sword bearer, so that aided by the Duchess of Chevreuse, the Duke of Buckingham might change dresses with him a moment before the king invited their pretended majesties to unmask and sup with him and the queen.

"This shifting of dresses was effected by means of a closet, into which the Grand Mogul and his sword bearer retired, and as after supper they were to remask and recommence dancing, a new exchange of turbans and robes enabled the Duke of Buckingham to assume his former character. All this was managed by the charitable assistance of the Duchess de Chevreuse, so that during the entire of the entertainment the rash (*temeraire*) foreigner had frequent opportunities of conversing freely with his lady (*sa dame*). What did he not say to her?

"Since that evening no day has passed that the Duke of Buckingham has not *incognito*, and by the connivance of the duchess, seen the queen, and sometimes spoken to her. The last of these occasions was on the day before yesterday, when your eminence may recollect that a rumour had got abroad that the apparition of the *White Lady* * had been seen in the

* This spectral *White Lady* was a kind of French *banshee*, which was supposed to perambulate the corridors of the Louvre in the olden time, and afterwards those of the palace of Versailles, previous to, and predictive of, the death of any member of the royal family. The first French revolution seems to have so completely scared away the fair messenger of death, that she abstained

Louvre by several of the male and female servants of her Majesty's household. The king knows nothing of this rumour, as it was kept from him lest he might feel alarmed. The circumstance that gave rise to this story is as follows. My lord duke, but little satisfied, as it would appear, with the opportunities given him of being in the presence of his lady (*sa dame*), wished to be favoured with a more private audience, and under pretence of having to deliver into the queen's hands a private letter from her sister-in-law *, he solicited an interview. It was necessary, he gave to understand that there should be no witnesses present at the delivery of this letter, as its contents related to the means of bringing about the downfall of Cardinal Richelieu. Under colour of this pretext the meeting was granted to him. The undersigned hesitate to believe (*ne croient que médiocrement*) that this lord received any encouragement in his culpable passion. But this lady, accustomed no doubt to the chivalric and adventurous gallantry of Spain, saw in these demonstrations only a subject to divert her mind, but not interest her heart.

"The audience being granted, it became necessary to devise the means of meeting. The Duchess de Chevreuse, versed in intrigue, and hoping to interest the lady the more by the strangeness of the expedient, proposed to the embassador to take upon himself to play the mysterious part of the *White Lady*, a part which would have the further advantage of facilitating his escape in case of surprise from the terror inspired by such an apparition. The duke having put on a white and fantastically shaped robe, painted with black tears (*larmes noires*), and having on the breast and on the back the representation of a death's head, had his face covered with the pellicle invented by Noblen. † This pellicle had been of great use to him at the Duchess of Chevreuse's *fête*, in those disguises where it was not permitted to wear a mask. Besides having his features thus altered, the Duke put on a cap equally fantastical as the other parts of his dress, and to this cap he affixed a black velvet mask, called a *loup*. ‡ He then enveloped himself in an ample cloak, and covered his head with one of those broad brimmed Spanish hats called *sombreros*.

"A confidential servant of the duchess's, but who supposed he was conducting to the Louvre an Italian astrologer, introduced *our adventurer* by the private entrance and the secret staircases and passages, to which, for a long time back, none have had access but the creatures of the favourite the Duchess of Chevreuse. In fine, owing to all the precautions taken, the duke arrived without any obstacle in the queen's closet.

"The duchess, like a charitable and discreet person, was about to withdraw; already, on some pretence or other, Mademoiselle de Flotte, maid

---

from her accustomed warning visits before the departure of Louis XVIII. and Charles X. for the vaults of S. Denis. And the present reigning head of the family has shown himself a man so worldly and *positif* that so unearthly a visitant has most likely cut all connection with him. At least on a late melancholy occasion we heard nothing of a white robed spectre of the feminine gender, "making night hideous," by pacing up and down the long galleries of the Louvre, or glaring in the moonlight from the innumerable windows of the palace of Versailles.

* Henrietta of France, daughter of Henry IV., sister of Louis XIII., and wife, since 1637, of Charles I. of England.

† Noblen was an ingenious *méchanicien* of that time, the inventor of several curious contrivances similar to the automaton and duck of Vaucanson. He gave lessons in legerdemain to the great Condé, to Louis XIII., and the Duke of Orleans. He was born at Paris in 1600, and lived to the age of 95. He left a rich cabinet of objects of art. The pellicle above mentioned was a piece of gold beater's leaf, covered with a thin coating of white and soft wax, which being cut or slashed according to a model agreed upon, and laid on the face, it entirely changed its configuration and expression, the eyes and respiratory organs being alone left uncovered.

‡ The fashion then in use with the ladies of the court, and the rich *bourgeoises*, of wearing black velvet masks, called *loups*, spread all over Europe, and continued in vogue for 150 years.

of honour to Anne of Austria, had been sent out of the way; but the queen expressed a wish for the duchess to remain. As the duke was about throwing off his disguise, the queen jested graciously upon the laughable effect of his masquerading costume. The duke replied in his usual gallant style, but his *amour propre* was evidently wounded, till the queen, always so good, perceiving the pain she had caused him, gave him, by way of compensation, her hand to kiss. The duke raised it respectfully to his lips, and then kneeling at her majesty's feet, begged her to permit him to read the confidential letter which he had to communicate to her. This was the signal agreed upon between him and the duchess for the latter to withdraw; but it became unnecessary for her to do so, as the queen consented to accompany the duke into an adjacent oratory to hear the letter read. They went in, and as the door of the oratory remained half open the duchess closed it. On a sudden a loud knocking in the antechamber alarmed the *confidente*, it was a signal from the *valet de chambre*, Bertin, that the king was approaching. He was, however, mistaken, for his majesty, instead of coming to the queen, had quitted the palace and gone to shoot magpies in the gardens of the Tuilleries with Baradas, who keeps as close to him as his shadow. Nevertheless, the alarm once given, the duke resumed his disguise, and fled like a thief. In his hurry and confusion his hat fell off and his cloak flew open, and being seen for a moment in his apparition dress, by some of the lower servants, caused them not a little terror. The duke, profiting of their panic, slipped into the room of Bertin, the *valet de chambre*, whence he some time after made his way out of the palace, in a less remarkable costume.

"It was in consequence of these doings that your eminence, on going to visit the queen, found so much agitation and confusion prevailing in the apartments, and heard some of the servants asserting with so much earnestness, that they had seen the *White Lady*, or the *Great Hunter* of Fontainebleau, which in the minds of many are one and the same. This, monseigneur, is what has come to our knowledge, and which we hasten to make you acquainted with, in order that you may turn it to whatever use may be found most fitting."

To this account Peuchet adds — "This *proces verbal*, as it may be called, corroborated by what Cardinal Richelieu saw in the queen's apartment, and confirmed by what took place subsequently at a promenade, during which the Duke of Buckingham behaved so audaciously to the queen, that she found herself obliged to call to her side her ladies, who, through respect or complaisance, had kept at a distance, augmented to the highest pitch the jealousy of the king and the cardinal; and at length matters proceeded so far, that the duke received a private intimation to quit Paris without delay, or else some evil would befall him. It is well known, however, that the audacious embassador did not depart, until affairs were in such a state, that his longer stay must have led if not to his own ruin, at least to that of the queen's honour. After a short absence he, however, returned, but his stay was not of long duration. On this last occasion attempts were made to induce him to give up the miniature of the queen; but to all such demands he replied with great warmth, that they might tear it from him, but that he would never consent to part with it."

The other adventure compiled by Peuchet, from documents in the Archives of Police, relates to persons in a very different rank of life from those of the preceding one; but from its strange and fearful nature, it will, we suspect, be read by many with still more lively interest. It happened under the reign of Louis XIV., and is told by Peuchet in the following words: —

"Monsieur de la Regnie had filled for several years, to the general satisfaction, the functions of Lieutenant-General of Police, when, on a sudden, terror spread itself through Paris, in consequence of the extraordinary disappearance of several persons. In the course of four months twenty-six young men, the youngest seventeen, and the oldest twenty-five years of age, had been spirited away from their inconsolable families. The most extravagant and contradictory rumours were in circulation upon the subject, particularly in the Fauxbourg St. Antoine, which had to deplore the loss of four or five fine young men, the sons of rich and respectable upholsterers residing in that quarter of the city. Amongst other gossipping stories whispered about upon this subject it was pretended, that a princess, who was suffering from a dangerous liver complaint, had been advised by some foreign charlatan or quack doctor, to make use, from time to time, as a means of cure, of a bath of human blood, and that the unfortunate missing persons had been immolated for the purpose. Another equally horrible surmise was, that they had been made away with by the Jews, who out of hatred and derision for the crucified Messiah, were accustomed to put Christians to death upon a cross. Fortunately for the poor Jews, this latter opinion took no hold of the public mind.

"Whatever the secret cause of these disappearances might have been, terror and desolation reigned in Paris. The Duke de Gevres having mentioned the facts to the king, his majesty sent for the Lieutenant-General of Police, and reproached him with suffering the existence of such a system of kidnapping, which, in all likelihood, he added, must have been followed by violent deaths, as none of those missing had ever been heard of afterwards. Monsieur de la Regnie, in despair at the displeasure of his majesty, returned in very bad humour to Paris, and sent immediately for one of his most experienced agents, named Lecoq, a man whose services on many difficult occasions he had good reason to value. To him he made known the embarrassment in which he found himself, told him of the king's anger, and held out to him the prospect of so great a reward, that Lecoq, carried away by his cupidity, exclaimed, 'Ah, monseigneur! I see that, in order to take you out of trouble, I must renew the sacrifice of Abraham. I ask you to allow me eight days, in which time I hope to give you a good account of the affair.' Lecoq said no more; and Monsieur de la Regnie, who looked upon him as his best agent, dismissed him with a sign which gave him to understand that he had at his disposal all the resources of the police. At that time it was the custom in the police department to make use of mute signs on extraordinary occasions of this kind, the meaning of which was known only to the principal and most confidential agents.

"Lecoq, who was not married, had a natural son, to whom he was greatly attached, and over whose conduct and education he carefully watched. This lad, called by his companions L'Eveillé, from the precociousness and sprightliness of his disposition, was gifted with no common intelligence. Though little more than sixteen years of age, Nature had not only given him reason beyond his years, but had also been prodigal to him of external gifts. Young Lecoq, besides possessing a handsome face, was tall, and so well and strongly formed, that he looked more like a man of five and twenty than a youth of sixteen. L'Eveillé, whose real name was Exupere, obtained from his father all that could flatter the vanity of a young man; for his handsome person was always set off by costly and modish clothes. He, however, quitted the house but seldom, for the elder Lecoq knew but too well the danger to which handsome young men like his son were exposed in the streets of Paris; and on the rare occasions when Exupere was allowed

to go abroad, he was always accompanied by one or other of the police spies whom his father had at his beck.

"Lecoq, on returning from his interview with Monsieur de la Regnie, shut himself up with his son, and had a long conversation with him. In the afternoon of that day, Exupere was seen quitting the house alone, and splendidly dressed. Around his hat and suspended from his neck were gold chains: he wore two watches; and, from the chinking of his purse as he walked, it was evident that it was filled with good broad pieces of gold coin. But what still more surprised the neighbours (for the profession of the elder Lecoq was unknown to them) was to see the handsome and finely-dressed L'Eveillé go and return home several times during four consecutive days, without being accompanied, as had always been the case before, by his uncle (in reality his father) or some friend. It has been already stated that L'Eveillé, besides the remarkable comeliness of his face and person, was endowed with a lively intellect, courage, prudence, and *savoirfaire*. The confidential conversation he had had with his father had awakened his ambition; and he easily understood that he might acquire both honour and profit should he succeed in discovering, for the Lieutenant-General of Police, the cause of the extraordinary disappearance of so many persons. Accordingly, in the rich dress befitting a young man of family, he walked about the streets, on the quays, in the gardens of the Tuilleries and Luxembourg, and in the Salle des Pas Perdus at the Palais de Justice, and in the galleries of that vast edifice, then a favourite haunt of the gay and idle amongst the Parisians.

"Lecoq the elder had conjectured that the young men who had disappeared had been ensnared to their ruin by the seductive charms of some frail beauty; and he foresaw that, by putting his son in the way to meet such a creature, he exposed him likewise to a similar fate; but, reckoning upon his being forewarned, he hoped he might escape the snare that had proved fatal to so many others. The fifth day, towards three o'clock in the afternoon, young Lecoq, in all the *éclat* of his fine clothes, was sauntering on the terrace of the garden of the Tuilleries next the river, when a remarkably beautiful young woman passed close by him. She was walking alone, but was followed at some distance by a kind of humble friend, or *gouvernante*. She appeared to be about twenty-five years of age, was elegantly dressed, and had not only much of beauty in her face and shape, but a certain foreign grace or piquancy in her air and manner. L'Eveillé gazed, or pretended to gaze, with great interest upon the fine form and striking features of the unknown fair one. His glances were not thrown away, but were answered by timid and half downcast looks. He drew himself up, arranged the frill of his shirt, disposed in better order his lace ruffles, — in a word, gave himself the airs of a man who had the presentiment of an adventure, hoping all the time that it was that for which he had his instructions all ready. To make sure of this, he passed and repassed several times before the lady, and at length took a seat upon one of the benches of the labyrinth, which then existed in front of the *Champs Elysés*. He had not been there many minutes, when he saw the friend, or *suivante*, of his beauty approach the spot where he was, and, after a few turns, seat herself on the same bench. He took off his hat, as was the custom, and soon after entered into conversation; and, thinking the game already in his hands, he asked the *suivante* who was the young lady in whose service she appeared to be. 'Oh, sir,' replied she, 'the history of my mistress is almost a romance.' — 'A romance!' exclaimed L'Eveillé, 'you interest me deeply, — probably your mistress is . . . . .' — 'Yes,' replied the *suivante*, in a confidential

tone, 'you have guessed right; she is that interesting young person of whom all Paris is still talking; and, since you have so readily chanced upon her name, I will no longer conceal from you her history.' — 'Cursed witch!' said L'Eveillé to himself, and he drew nearer to the old woman. 'You must know, my dear sir,' said the latter, 'that the father of my mistress was a rich Polish prince, who came to Paris *incognito*, for the sole purpose of seducing the daughter of a *marchand* in the Rue St. Denis, who was at that time equally celebrated for her beauty and her *sagesse*; having turned a deaf ear to the most brilliant offers from some of the most amiable and high-born of the courtiers. The attempt undertaken by the Polish prince was in consequence of a wager which he made on the subject, and which wager he gained. But, on the birth of a child (my mistress), his better sentiments prevailed; and, falling at the feet of his victim, he said to her, 'I shall set out immediately for Poland, disclose what I have done to my sovereign, and leave no effort untried to obtain his permission to marry you.' The prince quitted Paris, but never returned. It was said that he had been set upon by brigands and murdered. The king of Poland, however, having been made acquainted with the unworthy conduct of the prince, wished to repair, as far as in him lay, the evil he had done; and, for that purpose, sent a confidential agent to Paris. But, alas! before his arrival, the mother of my mistress had died of a broken heart; and he found her infant orphan alone in the world. The king of Poland, on being informed of the circumstances, caused the child to be declared heiress of the vast wealth of the prince; so that she is now the richest *partie* in Paris, or all France. Happy the man who shall call her his own!' — 'Happy, indeed,' exclaimed L'Eveillé, 'the man who could entertain even a hope of pleasing her,' at the same time heaving a deep sigh. — 'Ah, young man, to please, you must sometimes dare ——' — 'To do what?' asked L'Eveillé. 'How should I know? — to be amiable.' — 'And how is that to be done?' — 'Oh, you question me too closely; and, for an intelligent youth, as you appear to be, you ask singular questions. — Adieu, monsieur.'

"'One word more,' cried L'Eveillé, 'one word more, I conjure you.' The *suivante*, who had risen, sat down again. It was now L'Eveillé's turn to speak; and he told the old woman, with as much apparent ingenuousness as he could muster up, that he was the son of a wealthy physician of Mans, and that he had been sent to Paris to attend the courses of lectures at the university; and added, 'Here I have been for the last ten days, and, as you see, not ill provided; for my father is generous, having no other child but me; and, besides watches, chains, and rings, I have two hundred pistoles in my purse, and leisure and disposition to devote myself to the task of pleasing so charming a person as your mistress.'

"The old sorceress chuckled and smiled, with a mingled expression of pleasure and contemptuous pity. She then took L'Eveillé by the hand, and said, 'You have entirely won my heart, and I feel a kind of motherly affection for you, of which I will give you a proof. Listen to me. You have not escaped my mistress's notice. She was struck with your person and manners, and desired me to find out who you were. I am charmed that her choice should have fallen on one so worthy of her. Station yourself this evening, a little before nightfall, in front of the principal door of the church of St. Germain L'Auxerrois. I will meet you there, and bring you, I have no doubt, good tidings. Take care to come well dressed, and with all your finery; for it might spoil all were you to appear before my mistress in the guise of a threadbare-coated, pennyless student.' This point being settled, they separated.

"L'Eveillé, in his joy, scarcely touched the ground along which he hurried home, as he felt convinced that he had discovered the decoy that had lured so many young men to their ruin. On acquainting his father with what had taken place, Lecoq shared in the suspicions and hopes of his son; but, as the hour of trial drew nigh, paternal tenderness filled his heart with fear, and he trembled at the danger the young man was about to encounter. However, in order to diminish that danger as much as possible, he summoned a number of his most trusty police agents, to whom he briefly explained the nature of the service, and recommended them to keep close to his son, without, however, compromising, by their too near approach, the success of the *coup de main* he was about to attempt. He himself was to walk at a short distance before them, resolved that, as far as in him lay, the expedition should not fail. A little before nightfall L'Eveillé, still more richly dressed than in the morning, proceeded to the place appointed. The church doors were about being closed, when an old woman, meanly clad, and with her face nearly concealed under a hood, emerged from the church; and, after throwing a furtive glance about her, recognised L'Eveillé, and made him a sign to approach her. 'The devil! I should never have known you,' cried L'Eveillé. 'What a strange figure you have made of yourself.' — 'Oh, it is a necessary precaution, my son, in order to escape the eyes of the numerous adorers of my mistress, who, hoping to gain me to their interests, beset me whenever they see me in the streets. Seigneur Dieu! these *godelureaux* are as numerous around our house as bees are about a hive. Let us hurry on; but first put this bandage on your eyes. This is a delicate attention shown by our Parisian gallants to their mistresses, and with which I know Mademoiselle Jaborouski (for so my mistress is called) will be not a little pleased, and will reward you for it.' — 'No, by my faith!' replied L'Eveillé, 'I shall not bandage my eyes. My father expressly forbid me ever to do so.' — 'Well, then, let us proceed,' said the old woman, 'without it, since your papa has forbidden you. I shall explain that to Mademoiselle.'

"They walked forward, the old woman a few paces in advance of L'Eveillé, and the police agents following at a cautious distance. They traversed the Rues de l'Arbre sec, de la Monnaie, and after various windings, those of Betezy, Lavandieres, Mauvaises Paroles, Deux Boules, Jean Lambert, and at length stopped in the Rue des Orfevres, not the least hideous street of that infected and black mud-covered quarter of Paris. There, near the chapel of St. Eloi, and opposite a tolerably good-looking house, the old woman halted, and said, 'Mon beau Garçon, my mistress does not reside in this poor place, but the house belongs to her, and it was her wish to receive you here first. I shall go up and let her know that you are here.'

"The old demoness entered the house, leaving L'Eveillé at the door. His father, to encourage him, though he trembled himself, crossed the street and squeezed his hand. He had scarcely moved away when the old woman reappeared, and after again endeavouring, but in vain, to persuade L'Eveillé to let his eyes be bandaged, conducted him into the fatal house. L'Eveillé, though armed, felt no little misgivings and fears of being attacked as he followed his faithless guide in utter darkness, through a long passage, and up some flights of stairs. However he met with no obstacle of the kind, and was, after some time, ushered into a room lighted with wax tapers and richly furnished. At one end of the room, upon a crimson-coloured sofa, fringed with gold lace, reclined in a most seductive *dishabille*, the daughter of the Polish prince, Mademoiselle Jabarouski. At the sight of the stranger, her hand, sparkling with brilliants (no doubt from the Polish mines), re-

adjusted over her half disclosed bosom, the too open folds of her robe, and after saluting her visitor with an encouraging smile, she made a signal to her Duenna to retire.

"The young man, forgetful for the moment of the object of his mission, felt as if under the spell of enchantment, and, fascinated by the beautiful person before him, he had scarcely power to speak or move. She, seeing his embarrassment, arose from the sofa and held out her hand, which he eagerly seized and kissed. This served but to put more completely to flight his presence of mind, and though conscious of the infamous and dangerous nature of the place where he was, he could not resist taking a seat on the sofa near so charming an object. So that it might have been said of him that he had completely fallen into the power of her whom he had come to surprise, and deliver into the hands of justice.

"The elder Lecoq,who with the police agents were impatiently waiting in the street, not hearing the signal agreed upon with his son, put a whistle to his mouth, and blew it loudly. The shrill sound reached the ears of young Lecoq, and put his illusions instantly to flight. He started from the sofa, and the syren, under whose fascination he had been, under pretence of giving directions to her old *suivante*, went into an adjoining chamber. L'Eveillé profiting of her absence, made an inspection of the room, in one corner of which stood what appeared to be a kind of Indian screen. Wishing to see what was behind this, he endeavoured to close up its folds, but finding them immoveable, he shook them with some violence, when he heard a click, like that of a spring giving way, and one of the folds descended into the floor, and left unmasked a deep and ample recess or cupboard, upon the shelves of which were ranged twenty six silver dishes, and in each a human head, the flesh of which had been preserved by some embalming process. A stifled cry of horror burst from the youth's lips, which but a moment before had been breathing the accents of admiration and passion. But his agony of terror was still further increased, when looking towards one of the windows of the room, he thought he saw several other cadaverous faces fixing upon him through the panes their glazed but fiery glances. He grasped at the back of a chair, to keep him from falling, his hair stood on end, drops of cold perspiration covered his forehead, his cheeks became paler and more livid than the faces of the dead that confronted him, and his nerves at length giving way, he sunk upon his knees, and clasped his hands in a delirium of terror and despair.

"At this moment the window was burst in, and his father, followed by the police agents, jumped into the apartment; for the elder Lecoq, alarmed by the silence of his son, and dreading that he might be assassinated, had bravely mounted to the assault of the house, which he was enabled to do by means of ladders, which the agents procured from a neighbouring house-builder's yard. This fortunate and daring act of Lecoq's did in fact save his son's life, for immediately after the noise made by Lecoq, and the police agents breaking into the apartment, Mademoiselle Jaborouski, followed by four armed ruffians, rushed from the adjoining chamber, but the police agents being superior in number, and equally well armed, resistance was in vain, and the fair murderess and her four accomplices were secured, and after being manacled, were carried off to prison. A close examination of the house led to no other discovery worth noticing."

The explanation of this most strange history given by Peuchet is as follows. A number of the most desperate malefactors, whose crimes had often merited the gibbet and the galleys, had formed an association under the command of an experienced and daring chief. This arch villain had

in the course of his wanderings fallen in with a rich but most profligate Englishwoman — a modern Messalina. Besides being his mistress, she lent herself to serve as a decoy, by means of which young men who had the appearance of wealth were lured to the den where young Lecoq had had so miraculous an escape. There, after sharing in her gallantries, they were murdered, and their heads separated from the bodies. The latter were disposed of to the surgical students for anatomical purposes; and the heads, after being dried and embalmed, were kept until a safe opportunity offered of sending them to Germany, where a high price was given for them by the secret amateurs of a science then in its infancy, but which has since made some noise in the world under the name of phrenology, or the system of Gall and Spurzheim.

The government, dreading the effect on the minds of the people likely to be produced by a public exposure of these numerous and atrocious murders, took measures for the prompt but secret punishment of the culprits. The four robbers were hanged, and their female accomplice was also sentenced to death; but destiny ordained otherwise, as the sequel will prove.

The conclusion of this strange eventful history is thus narrated by Peuchet. The Chevalier de Lorraine, the Marquis de Louvois, and the Chancellor of France happened to be present in the Marchioness de Montespan's apartment, whilst Louis XIV. was relating to her and the Duke of Orleans, his brother, the adventure of young Lecoq, who had been rewarded with a considerable sum of money and a lucrative place. The marchioness expressed great horror at the profligacy and cruelty of Lady Guilfort (which title, like that of Jabarouski, was one of the many names assumed by the Englishwoman, her real name having never been discovered), and asked the king if the execution of so base and fiendish a creature should soon take place? Louis XIV. replied, that the law would take its course, and then changed the conversation. Soon after the Duke of Orleans and the Chevalier de Lorraine took their leave. After quitting the apartment, the Chevalier said to his Royal Highness, "This Englishwoman must be a rare piece of womanhood (*une maitresse femme*), suppose we have her to sup with us." The prince cried out, "shame! shame!" But the very extravagance of the proposal pleased him; and on the favourite renewing his entreaties he consented. The Englishwoman being confined in the Bastile, a blank *lettre de cachet* was procured and filled up with an order to the governor to deliver to the care of the bearer Lady Guilfort, for the purpose of her *being transferred to the prison of Pignerol.* The governor of the Bastile, deceived by this false warrant, delivered up his prisoner; but shortly after having done so, he came to the knowledge of the trick that had been played on him, and in the first moment of alarm and anger he talked of complaining to the king; but on the name of the Duke of Orleans being mentioned, he resolved to hush up the matter, which was done by means of a *procès verbal* certifying the sudden death and burial within the precincts of the Bastile of the female prisoner in question.

Lady Guilfort, who supposed that her removal from the Bastile was only for the purpose of being taken to the Conciergerie, preparatory to her execution, soon perceived, however, that the carriage took the direction of one of the barriers of Paris; after quitting which, and at the end of a two hours' drive, it stopped. A kind of equerry came and opened the door, offered her his hand to descend, and, after passing through a long corridor, and up some flights of stairs, ushered her into a brilliant and well-lighted apartment. A well-heaped fire of logs was blazing in the chimney, and

nothing about the room wore the appearance of a prison. After the interval of a few minutes, three gentlemen entered the room. Though plainly dressed, it was evident, from their air and manner, that they were persons of high rank. One of them, immediately on entering, put an opera-glass to his eye, and examined with haughty curiosity Lady Guilfort; the two others threw themselves into arm-chairs. Lady Guilfort, after the first surprise was over, had no difficulty in recognising in the persons before her the king's brother, the Duke of Orleans, the Chevalier de Lorraine, and the Marquis d'Effiat. She quickly conceived the motives which led to her being brought into their presence; and though, under other circumstances, she would have willingly joined in the wildest orgies with the persons in whose company she then found herself, yet the recollection of her dungeon in the Bastile, and the terrible death impending over her, left her no thought but that of making her escape. She affected not to be aware of the rank of the personages before her; but, seeming to enter into the spirit of the adventure, she exerted all her powers of fascination, and soon made captive to her seductive influence the Chevalier de Lorraine and the Marquis d'Effiat. But the Duke of Orleans, never a great admirer of the fair sex, and who could not vanquish his horror of the Englishwoman, tired before long of the scene; and bethinking himself that the gratification of his curiosity might be too dearly purchased by the risk of the king's displeasure, should the circumstance meet his majesty's ears, he proposed to have her conveyed back to the Bastile. His companions, however, made him sensible of the want of generosity in such a proceeding, and it was agreed that Lady Guilfort should be sent off in the direction of Brussels or England, at her option. The Duke of Orleans, having refused to stay for supper, was conducted by the Chevalier de Lorraine and the Marquis d'Effiat to his apartments; for this scene took place in the palace of Versailles, and in the lodgings of the Marquis de Lafare, the use of which he had given to the Chevalier de Lorraine for twenty-four hours.

After returning to the room where Lady Guilfort was, all three sat down to a *petit souper*. The most exuberant gaiety, and not the most refined gallantry, was the order of the night. At the close of a supper which had been prolonged into the small hours of the morning, Lady Guilfort on a sudden rose up, and taking up a taper, made her lowest courtesey, and wished the gentlemen good night. The marquis and the chevalier likewise quitted the table; and their frail guest, before she left the room, contrived to tell each, without the other hearing, that she would leave the door of her chamber open. She then quitted the room. Soon after the two gentlemen moved off as if to their respective chambers; but, after leaving in their rooms their lighted tapers, they stole back in the dark and on tiptoe, and met face to face at the door of the lady's chamber. Seeing the trick put upon them, they burst out laughing, and both entered the chamber, to reproach her with her duplicity; but they had scarcely advanced three paces into the room, when Lady Guilfort, who had been concealed in the corridor, pulled the door to, locked it, put the key in her pocket, and hurried back to the supper-room, where, tying together the table-cloths and napkins, she fastened one end of this *impromptu* rope to the balcony, and, by means of it, let herself down into the park, where she lay concealed until the gates were opened in the morning. She then slipped out, and hurrying into the town of Versailles, took the first vehicle that offered, and arrived in Paris before her two imprisoned admirers were released from durance; as they dared not during the night make a noise in the palace by calling or ringing for the servants, to have the door of the room in which they were locked up forced open, lest it might lead to the discovery of their participation in the

criminal trick played off upon the governor of the Bastile, and the consequent escape of Lady Guilfort.

On arriving at Paris, Lady Guilfort hastened to the *Rue Plat d'Etain*, where, in an obscure and miserable-looking house, but admirably contrived inside for the purposes of concealment, lived one of the chief agents of the band of malefactors with whom she was connected. There, after explaining to her accomplice the means by which she had recovered her liberty, she found a secure asylum. In a little time, aided by this villain, Lady Guilfort organised a new troop of bandits upon whom she could reckon, as the old saying has it, *à pendre et à dependre.* She, as chief of the association, planned the expeditions, appointed to each the part he was to play, partitioned the booty, and, at times, took a personal part in the expedition. The individual in whose house she had taken refuge was named lieutenant of the troop.

As it was no longer possible to allure victims to the den by means of Lady Guilfort's personal attractions, the efforts of the band were principally confined to house robberies; but murders were avoided, unless where they became necessary to the safety of the robbers.

Besides the feelings of hatred arising from the loss of four of the troop, including the captain, and the diminution of their gains effected by young Lecoq's interference, Lady Guilfort nourished a deep desire of personal vengeance against him for having been duped by him, and resorted to the following stratagem to gratify that feeling. Young Lecoq, enriched by the bounty of the king, and possessed of a lucrative place, led a regular life, undisturbed by any fears of Lady Guilfort's vengeance, he supposing her to be dead: when one day a grave-looking and respectably-dressed man called upon him, and after requiring a promise of secrecy with regard to what he should tell him, asked if he should like to be put in the way of detecting a set of smugglers, who carried on an extensive and thriving trade between Belgium and Paris in Brussels lace and other prohibited goods. Lecoq, whose ruling passion was avarice, eagerly accepted the offer, and agreed to the terms proposed. His informant was to point out Lecoq as a sure agent, to whose house the smugglers might consign their bales and cases of contraband merchandize. Ten or twelve days after the conclusion of this bargain, a cart stopped at Lecoq's door, and from it were taken two large wooden cases, which, according to Lecoq's orders, were placed in a store-room on the ground-floor of his house. The carter, after in vain searching his pockets for the keys, said, that he must have left them at the stage where he had stopped the night before; but that he would return thither, and bring them to Lecoq the next morning. From some over acting on this man's part, and from observing that these cases were perforated in seven or eight places with small holes, Lecoq had his suspicions awakened. He communicated his doubts to a friend of his, a courageous and resolute young fellow; and in the evening, when every thing was quiet in the house, they both, armed with pistols, descended with noiseless steps the stairs, and took their posts near the door of the store-room, which had been left purposely unclosed.

They had been for a considerable time on the watch; and Lecoq's friend getting impatient, was about abandoning his post, when an indistinct noise from that part of the store-room where the cases were placed struck their ears. They redoubled their attention—the noise increased; and they were soon able to ascertain that it came from the cases. Lecoq squeezed his friend's hand — the signal was understood — they both cocked their pistols. — "John," said a voice in the lowest possible whisper, "are you there?"—

"Yes." — "We appear to be alone in the house. Let us breathe a little air; for I am stifled in this cursed box. We can lie down again when the people of the house come back."— "Do you think they have any suspicion?"— "Not the least; with all his cunning, Lecoq is blinded by his avarice — the Englishwoman judged him rightly, and to-night at twelve she may satisfy her vengeance in the heart's-blood of the infamous *mouchard*" (police spy). "Fire!" cried Lecoq, at the same time discharging his pistols in the direction of the cases — his friend did the same; and the explosion was followed by a double cry of agony — the balls had taken effect. Lecoq ran into an adjoining room, where he had placed a lighted lamp in a cupboard, and bringing it with him into the store-room, he and his friend saw the robbers stretched at the bottom of the cases, one dead, and the other having his thigh broken. The noise of the fire-arms brought several of the neighbours to the house, and soon after the patrol arrived. This circumstance greatly annoyed Lecoq; as the public rumour of the discovery of the two robbers would, if it reached the ears of any of the band, prevent them from keeping their engagement for midnight, and thus frustrate his intention of securing them all. He, however, endeavoured to repair as much as possible the evil, by enjoining silence on those who entered the house. He also informed the lieutenant-general of the police, who sent him a company of soldiers, disguised, and who came to the house only one by one, where they were conveniently posted for the reception of the robbers.

It had scarcely struck midnight when the noise of several feet was heard approaching, and soon after they stopped opposite the door of the house, whilst at the same time five knocks were given upon one of the panes of the window of the store-room; the door, after a moment's delay, was cautiously half opened, and four men successively entered, followed by another figure in female attire. The door was then slapped-to violently, a whistle was blown, and instantly numerous torches and tapers were brought from the adjoining rooms, which lighted up the hall, and exhibited to the stupified banditti the muskets of thirty soldiers levelled at them. In despair they dropped their arms, and were seized, bound, and carried off to prison. Before their departure Lecoq went up to the female figure, and putting a lamp to her face, beheld features totally unknown to him. The woman was not Lady Guilfort. Lecoq's disappointment and astonishment were extreme. The next day, however, he received a note, which in some measure cleared up the mystery. This note, which exists in the archives of the police, was brought to him by a porter, who said it had been given to him by a lady in a thick veil. The contents were as follow: —

"Tremble! One of us must perish. Yesterday I was near your house, when the impatience of my two agents rendered abortive my plan; but wishing to revenge myself on the new captain of our troop, and the unworthy rival he has preferred to me, I did not warn him of the fate of our advanced guard, but allowed him to proceed on the expedition, knowing that he would thereby become your and the police's prey. I have succeeded, and they will now expiate the scorn they treated me with. You may judge from this if my vengeance knows how to reach those that incur it. It is your turn next, young *faufaron*, who imagine that you are secure from my blows, by having made yourself a *mouchard*, when at best you are good for nothing else than to be *"

Peuchet adds, in a note —"After this letter, the conclusion of which is expressed in too energetic terms to be repeated to ears polite, the report breaks off abruptly, several pages having been torn out of the police register. We are, therefore, ignorant of the *dénouement* of Lady Guilfort's history; but from what we have seen of it, it is abundantly clear that this was not the last of her adventures."

SOME RECOLLECTIONS OF CHILDHOOD.

"THERE is blood upon thee, thou jade! there is blood upon thee! Fie upon thee, and upon thy demure looks! False-hearted woman! to stir up men to slay each other: but thou art now in the fire, suffering, and to suffer, for thy misdeeds. Fitly is thy church of Rome styled a harlot, and a fit daughter art thou of that church. Thou soft-eyed harlot! Thou murderess!"

How strong are the recollections of childhood! The earliest impressions are deep; they are also indelible, and they become more distinct and vivid through time: time can deaden the perception of the present, and it can weaken, or wipe out, the memory of the past, of the eventful history of manhood; but it is unable to eradicate whatever suddenly struck deep roots into the kindly soil of infancy. The delineations of recent transactions grow pale and vanish from the mind, and even the mind itself seems finally to wear away; nevertheless, each declining year, whilst it takes something from us, constantly strengthens, enforces and revives, in compensation, and that we may be young again in growing old, our first childish recollections. Many of these are strong in me; but the strongest of all, I think, is the remembrance of the new and painful feelings produced in me, a very little child, by overhearing such strange, passionate words, addressed with passionate vehemence, to a picture, which I had been taught to call "The Lady," and to look upon with reverence. And how clearly do I now see the person who uttered the words, and the place where she uttered them! The person was styled my Great Aunt. She was the long surviving widow of a most courtly and not unlearned prelate: his writings, I have been told, bear ample witness of his learning; and I can myself testify still more abundantly to the almost inconceivable antiquity of his widow. We have nothing remaining amongst us now, nor, indeed, is it easy for the present generation to imagine any thing so old. She was old in age; the very few years of my infant life, being added to her years, would have completed her century: but she was older, by far, than one or many centuries in dress, in manners, in habits, and in notions; so that she appeared, I know not how many years ago, even amidst the most old-fashioned family in an old-fashioned neighbourhood, not merely antiquated, but obsolete; like some word, of which the form and sound remain, but the meaning has long been forgotten. She spoke seldom, and when she spoke she was listened to with attention, but without observation, as men listen to a sermon or liturgy: her talk was of dignitaries of the church, of bishops and deans; she sometimes discoursed of kings, as receiving the homage of bishops, and as giving to deans and chapters, together with a recommendation directing the choice, license to choose bishops; and she has recognised in conversation ambassadors, as being the representatives of kings. Her visits were rare and brief; but her coming was known long before her arrival, and with much expectation and awe did children ponder over the announcement. For she was a living catechism of the forms and rules of good breeding and polite behaviour, of bows and courtesies, of standing and kneeling, of inclinations, reverences, and genuflections; and as to kissing the hand, or taking the hat quite off the head, her authority was absolute and infallible. Nor was she less knowing, or less nice, touching the punctual and precise decorum of public worship; using always a gentle, but most exact, dominion

over inferiors, and separating, with a curious discrimination, the degrees of submission due to each of our betters. But, above all things, above the obligations of religion, above those even of gentility itself, above all forms and formalities, above kings, and above the very bishops themselves, rose her great maxim and axiom, the first principle and sole basis of civil society, — reverence to the ladies. It is impossible to see a petticoat, although it may flutter in the wind upon a hedge, unoccupied and in tatters, without being forcibly reminded of her earnest, painful, persevering labours to impress a conviction of the grand truth upon the tender understanding of a child, and to form his young manners to the orthodox practice. Although a profound awe preceded and accompanied her, it was never attended with dislike; not only was each visit celebrated by the donation of a small gold coin, but she was uniformly an advocate for indulgences, provided they were fenced round with a triple barrier of ceremonies. If her assiduity in training the plant was wearisome, so that the tender shoots often ached with intolerable fatigue, the discipline was never harsh; she freely bestowed the respect which she inculcated; the little boy was addressed continually by the word "Sir," most distinctly pronounced; there was no impatience, no anger, no hard words, no threats, no punishments; and the teacher was so intimately connected with heavenly things, that her instructions appeared to have something of a divine sanction. I had known her only as calm, grave, decorous, sententious, ceremonious, without one word or gesture of passion, until the moment when, with the voice and deportment of a fury, she assailed the venerated picture of the mute, meek "Lady."

The place in which this ancient person committed the strange trespass and assault may be described in a few words, and its peculiar form will be readily apprehended by persons who are acquainted with the structure of our old English manor houses. The true hall, of which the situation and general appearance will be understood without description, bore the name of the entrance parlour; and the family for a long time, but very improperly, had styled "the hall," a long room, that was in truth the gallery. For it was placed not in the centre of the house, or next to the principal door, but at the end of a long passage, and quite at the extremity of the mansion, constituting the northern wing. Moreover, like a gallery, but unlike a hall, it was low, and, in proportion to its great length, narrow. The shape of the hall, for so we continued to call it, was precisely that of the capital I, as we sometimes find it upon tombs and in old books; namely, with three short transverse strokes, one at each end of the letter, and another in the middle, so that the three cross strokes formed three angles, or six square recesses. At the top of the letter, which is the western end of the hall, there was a chimney and a vast fire-place, a convenience that is rarely found in a gallery. At the end of each recess, except that in the middle of the south side, where the room joined the rest of the house, there was a square window. The five windows consisted principally of stone, iron, and lead, and the casement was obscured with numerous armorial bearings in stained glass: the antique structures, having been warped and worn by the weather for many generations, admitted a little light and much wind. Nor was the scanty illumination favourably received; for the roof, the floor, and wainscot were of dark wood, — whether of oak, of walnut, or of chestnut, was a thesis for interminable discussions: whatever the substance might really be, its dusky hue augmented the gloom of the long, low, narrow room; besides, every corner and each projecting piece of the black timber had been carved, with vast labour, into the grinning, gaping, staring head of a grim, horned, tusked devil. From the ceiling to the floor, from

the left hand of him who entered by the door quite round even to his right hand, the walls of the apartment and of the recesses were entirely covered with paintings; that is to say, with portraits, and for the most part with very ancient ones — the stern images of armed men, dark and frowning.

What a dreary place was the hall for a young child! What terror have I felt at being left alone with the nasty kings! The only resource was to shut the eyes, and to press the pinafore close upon them with both hands, for there was not a single object on which the timid eye could rest. The sky and the ground were alike black; nothing without could be seen through the windows, the bottom of which was far above my head; and the light streamed faintly down in strange ribands, orange, purple, green, or blood red. At every turn there was a wide-mouthed dæmon, straining and striving to grasp and to devour: each picture showed at first through the dusky air a surface as dull as the panel against which it hung; but a stiff figure slowly opened upon a steady gaze, like a spectre in the night; and some warrior grasped his sword, curled his beard, and knit his brows. It was necessary, however, to be often there; and, as fear makes us sociable, I was careful not to leave my companions, or to be left by them; and when my father paced about the hall, as he was wont, bearing me in his arms, I clung closely to him. Indeed it was his delight to show the portraits to me, to teach me the name and the history of each; and my first lesson was to repeat, as I might, what I had thus learned. Above the ample hearth a panel of the wainscot, not a framed picture, bore an ancient painting of a sad man with long bushy hair and a beard flowing in prodigious luxuriance; as the surface of the stormy sea is wholly covered with foaming, curling waves, so mountainous billows of mighty locks, ringlet on ringlet, and never-ending tresses, were tossed about over the wide board. In the midst of the maze were firmly fixed the iron features of the founder of our Angevine family, of old Grisegonnelle, or Graycoat, the first Earl of Anjou. Near him was his descendant Jeffery the Fifth, the husband of the empress Maud; a grave youth, whose picture hung in a small frame on the left of the fire-place. On the right a bigger frame, much gilded and much tarnished, held the austere visage, pencilled with painful minuteness, but of large proportions, of the renowned son of Jeffery and the Empress.

"Kiss the hand of our first kinsman king, my child; who, by the style of Henry the Second of England, was the first of the fourteen kings of our house. Do homage to our royal kinsman; kiss his hand with dutiful affection; be ever a good, loyal child!"

This portrait, together with the painful duty which it imposed, was one of my earliest and strongest recollections; a duty painful, not through any lack of the natural instinct of inborn loyalty, but through an instinctive dread not less natural; for not only was the countenance of the king terrible, but a two-edged sword, of length indeterminate, gleamed terribly across the picture. The right hand did not enter within the limits of the frame, but the left was placed in the centre, and at such a height, that a tall person by stooping a little and a short one by a slight effort might readily kiss it; and accordingly the oftentimes repeated kisses of many loyal and dutiful generations had nearly worn away the hand, and had brought to view once more the dark grain of the wood beneath. Nevertheless, the fingers were still seen to press the ridge that passed along the middle of the blade between the two edges, and the light fell aslant from the window in the recess upon the keen outer edge, which shone so sharp and so bright, that when I was held up to kiss King Henry's hand, I shrank back involuntarily, and

inwardly inquired, "will it not cut me?" and I would have asked the question aloud, but I feared the reproof, "Oh you little coward," still more than the threatening weapon.

My apprehensions, however, gradually wore away as my months and years increased, and by constant habit I became familiar with the aspect of my grim-visaged kindred. I went through my historical and genealogical task with satisfaction; and with a certain pride, when I was able to give the name of each portrait, and was commended for the simple fidelity with which I told its story. By degrees also I was reconciled to the gloomy hall, and was content to remain there alone, refreshing my memory by conning over my long lesson of household traditions, and in fixing each incident firmly to the precise portion of canvass, or of panel, to which it related. I attained finally to the power of deriving a certain mysterious pleasure from that which had been originally a source of extreme terror: I could bear to place my little wooden stool directly opposite to one of the blackest of the old paintings, even on a cloudy evening and in the most obscure corner of the ill-lighted chamber; and, seating myself there, to gaze patiently and steadily in solitude and silence, whilst the solemn figure slowly disclosed its dusky contour to my eyes, and I continued to pierce with my young sight the deepest shadows in the hope of discovering some traces of former days that I had as yet failed to observe; but, with my utmost curiosity, many a black depth was still unfathomed, and many a vague shadowy form undetermined. Those faces, which had been dreadful and disagreeable, ceased to alarm me, and even grew to be agreeable from being accustomed: it is affirmed, indeed, to be the peculiar character of the Angevine family, and an invariable one likewise, not a single exception having occurred from its first founder Grisegonnelle to his latest descendant, that a countenance of grave austerity and sad severity melts away softly, either under the steadfast eye or renewed glances, into a sweet, soothing, engaging smile, at once unexpected and hardly to be forgotten. Henry Plantagenet had drawn the two-edged sword of sharp justice, and had thrown away the scabbard; he grasped it eagerly with both hands, and stood frowning upon all with a stern and terrible countenance; for so hard a brow none of the hard deeds of a hard age would seem hard enough; he might muse upon the murder of his primate, before the fact or after it, calmly vindictive; and, with a serene asperity, could curse his sons and die. Yet there was much majesty in his sternness, an intelligence which repelled not, but rather arrested the attention; and it was frequently remarked by those who are the most just, acute, and sagacious of observers,—by the ladies,—that, on steadily watching his piercing eyes, they at last perceived how he could look upon Alice, or upon Rosamond; and some have faintly traced upon the lips, on a summer's evening, through the gray twilight, the sweet, asking smile of his son, the gentle Richard, never to be denied.

Richard stood there in his place, leaning on his lance; but he was sad—his long captivity had weighed upon him heavily. I know not how many gentlemen can reckon fourteen kings of their family in an unbroken succession, and perhaps as many more sovereign princes ruling under another designation; but he will derive some benefit from the twenty or thirty sovereigns of his house, nor ought he to believe that the monuments of lineage and consanguinity are altogether vanity, who shall be fully impressed, through the careful consideration of them, that sovereignty is clouded with care, and that to kings is assigned at least a full share of sorrows and sufferings. This truth is plainly shown by the portrait of the noble Richard alone, of whose fine features the expression is as sad as it is sweet: yet it

is not so sweet as the countenance of "The Lady," which indeed it closely resembles; nor more sad.

Tradition has assigned to each member of the family a soft but distinct and thrilling voice; and the painter has given to each regular teeth and a well-formed mouth, with moving lips that could quiver with animation. He has invariably given also the Plantagenet frown, and the Plantagenet smile; sometimes the one predominates, sometimes the other, but both are always found together; they are conspicuous in the three Richards, in the five Henrys, in the five Edwards, in the Earl of Morton; and they are perhaps still more apparent in the old Earls of Anjou, and in all their descendants in another line. Much of the characteristic frown has been softened, in some examples, into sadness, but enough of it always remains to mark with unerring precision the true Angevine race. In the first Richard, sorrow has obliterated from his forehead the hereditary sternness; so likewise in "The Lady," whose likeness to the king is not that of a remote kinswoman, but of a sister or a daughter: nevertheless in neither of these, the least austere of their house, have tears been able utterly to obliterate the indications of a lordly anger; a deep sense of injustice dwells in the heart, and whether it be resolved to revenge or to forgive unprovoked injuries, we perceive that they are still fully felt.

It is altogether vain to endeavour to describe a picture; whoever would understand and know it must see it. The portrait of "The Lady" has long hung, and it still hangs, in the recess on the right hand at the top of the hall; that is, in the north-western corner, and upon the same wall in which is the chimney; so that the light enters from the window on the right of the beholder, and falls upon the left side of the figure, in just accordance with its lights and shadows. The eyes are of a full rich blue — so dark, indeed, that, with the usual illumination only, they appear to be black; and, in like manner, the hair, in its shades and simplicity, looks black also; but it is merely brown, without any predominant tint whatever of red, of yellow, or of blue, being in the utmost brownness, intensely brown. The colour of the flesh denoted that a bountiful nature had freely bestowed the red and white that attend on health; but through grief these had yielded to a prevailing paleness, which was not sickly, but pure and transparent. The arms and hands were especially white, round, taper, and polished. The arms hung down before her, turning a little inwards, and crossing each other near the wrists: with a peculiar air of simplicity, timidity, and distrust, she seemed at once to shrink with apprehension and to be resigned to her destiny. The naked arms, shining in the middle of the picture, and standing out from the dark ground, attracted the most careless eye; the attitude of patient suspicion arrested the attention; and curiosity was stimulated by a certain archness, not without malice, which gradually broke upon the thoughtful observer. The drapery was black; a hood of black silk, and a black mantle of many folds, concealed the form, as completely as the fullest curtain, in impenetrable obscurity and entire plainness; it terminated a little below the ends of the fingers, and a little above the knees, if indeed it be permitted to speak of parts that were so studiously hidden. The only ornament, a Roman cross, was suspended by a black cord; four garnets set at intervals made the shaft, and another marked each end of the transverse bar; the second stone from the top, being the point of intersection, was the largest of the six large garnets, these being connected by many round white pearls. The other pictures had gilded frames; "The Lady" was inclosed in a wide frame, which had no gold, but some gilded scallop shells, being principally white, with carved

work of a murrey colour. Besides, she was often distinguished by favours, or cockades, of ribands of the traditional colours of the family, of white and crimson—a strong, rich, deep crimson, that has been sometimes termed murrey or mulberry, and is thought to be best represented by the garnet; which colour, moreover, has sometimes been allowed to degenerate into scarlet, to the unspeakable mortification of those who would preserve unchanged the antique usages and honours of a gentle race. Moreover, "The Lady" received a threefold share of the yearly tribute of the broomflower. The Angevine family bore for some time the name of its author, Graycoat, Gray Petticoat, Grisegonnelle; for freedoms were used by the playful Paladins, which their prudish descendants would not permit. Any allusion to woman's apparel was unworthy of the austere crusaders, and they were displeased with the loose lives of the chivalry of Charlemagne; precisely as we, the orthodox sons of the established church, are now dissatisfied with the laxity of our crusading forefathers, and as we are ourselves censured for the like looseness by our more strait-laced brethren the dissenters. Accordingly, as the wits of the twelfth century remarked, the Counts of Anjou put aside the petticoat and assumed the rod, and exchanged their former name for that of the plant which makes the hills of Palestine yellow with its blossoms, and the shoulders of the penitent red with his own blood. Not only did the broom give its name, but it became also the cognisance and badge of the house. On the 15th of July in every year, the hall was plentifully decked with the gay flowers of the yellow broom, in honour, it was said, and for the perpetual memory of Henry Plantagenet, whose birthday that day was affirmed to be; nevertheless, history teaches that Henry the Second was born in March. It should seem, therefore, either that oral tradition is more exact than written history, or that the persons who celebrated the festival of that king mistook either the day or the occasion of their festivity. It is certain, at least, that Jerusalem was taken by the crusaders on the 15th of July; and it is not impossible that a family which had been distinguished in the holy wars, and was otherwise connected with the kingdom of Jerusalem, long continued to commemorate that famous conquest with their own yellow flowers.

However this may be, the picture of "The Lady" was never defrauded of a goodly garland of broom, with ribands of white and murrey, and often with the additional decorations of roses, both white and damask, for such were the rival roses of our house. Her image and her memory were held in much reverence; and of the strong recollections of my childhood, the strongest is that of the new and painful feelings produced in me, by overhearing the strange passionate words which were addressed with the most passionate vehemence, by a person otherwise so apathetic and unimpassioned, to the Lady Plantagenet. At the time when they were spoken, I was concealed by the shadows in the recess on the other side of the fireplace, opposite that in which the subject of wrathful reproach hung, in a recess darkened by the neighbouring walls of the house, so that my ninepins and other cumbrous playthings were piled in the corners unseen. I was busy with my hoarded toys, when my attention was drawn towards the footsteps of my aunt, and my astonishment was excited by her furious gestures and reproachful words. She did not discover me then, nor did I relate what I had heard to any person, for I was sensible that it was not intended for my ears; and I was apprehensive lest I should be blamed for having learnt, although accidentally and innocently, some terrible secret. The last emphatic words, "Thou murderess!" and the air and tone with which they were uttered froze my young blood. My natural horror at the

crime of murder had been lately augmented in a painful degree, by a little incident which I will briefly relate.

I said, that the walls of the hall and of all the recesses were covered with portraits; but this statement is not quite correct. The recess in the middle of the side next to the house, that is, of the eastern side, had no window, nor any portraits; it was separated from the hall by a sort of partition, which we always called the chancel, a carved screen of the same dark wood, whatever it was, that lined the hall. The middle of the open Gothic screen formed folding doors, or gates; these were heavy, but had no fastening of any kind, and might be pushed back with a slight effort, and then they slowly closed again of themselves. It was said that it had been formerly a chapel; and opposite the entrance, that is, at the eastern end, there seemed to have been an altar with steps; and the walls showed vestiges of antique paintings, of men and women, of a blue ground and of much gilding; but these decorations, as well as the carved work within, had apparently been defaced by violence: however, the walls could be little seen, being covered with old arms and other matters placed against them. This recess was dark, and seldom did any one visit the murky retreat. I never set my foot within the chancel, until I was led thither one evening by my nurse, an aged woman with long white locks, to witness her quaint, cautious prudence. My father rarely quitted his ancient, secluded mansion; but he had gone to pass three or four days in the assize town with his family and servants, in order to perform the duties of high sheriff of the county; and on this occasion some of the plate was carried with him, and the rest was safely deposited in a huge iron chest, except two or three silver spoons that were left out for my use. These, well rubbed and wrapped in a clean napkin, my good nurse bore in her left hand, and a lighted taper in her right, as she slowly conducted me to bed, at eight o'clock on the evening after my father's departure. I followed her to the hall; she pushed open the chancel, and we entered the recess: she gazed around for a few moments, as if the spot was strange even to her; and presently the faithful, careful servant deposited the spoons in a niche of the wall, as being the place whence it was least likely they would be stolen; adding, that if she should die suddenly in the night, an event which she always predicted, I should remember where the plate had been put away. Then, giving the taper to me, she turned aside some faded tattered banners which hung on the left of the entrance, and with her eyes and fingers closely examined the wainscot beneath. She fixed at last upon a broad dingy panel, on which the remains of garlands of roses, white and damask, still lingered in the corners; and she pushed and pressed it repeatedly in different parts. She exclaimed, "I have forgotten it, I think," and was about to desist, when the board turned round so suddenly as to startle us, and remained in the position of a writing desk. The picture on the back, which now lay before us, was as fresh as the artist left it. King Henry stood naked to the waist, his wrists bound with cords to the iron grate of a shrine, or tomb, on which was extended a mitred figure in pontifical robes. The kingly crown, the sceptre, and the royal robes were scattered at his feet. The countenance was manifestly that of our first kinsman king, as pourtrayed in the hall, but less stern and more sad: he bore the torture with a fierce patience; but his face was of a ghastly paleness, and full of despair and ghostly horror. His back and shoulders were furrowed and torn up with stripes, and the blood trickled fast to the ground. On each side stood a brawny priest, with uplifted arm dealing alternately heavy blows. Their white stoles were spotted and splashed with blood; great gouts of blood were seen on the tomb and on the marble pavement;

and the dropping scourges were clotted thickly with gore clinging to the twigs, of which the ends were bruised and ragged, the bark being beaten away, yet a few of the yellow flowers of the broom still hung amidst the blood. The leaden visages of his tormentors were sullen and pitiless; and two other priests, not more merciful, in white vestures sprinkled with blood, showed, with high-raised torches, where to strike. The picture of Henry's penance was executed in the old hard style of minute imitation, and the fresh blood shone as bright as if lately shed; and when my nurse touched it with the tips of her fingers, it seemed wonderful that it did not stain them.

We stood mute before the eloquent panel; the faint light of the taper glimmered from my trembling hand, until the good Mary, pointing to the suffering king, said with a solemn voice, "That, my dear, is your papa's grandpapa: he did a bloody murder; see what God Almighty has just done to him: mind, when you are a man, that you do no murder, or it will be the same with you!"

These awful words sunk into my soul; they brought crime and punishment home to my house and heart: I turned aside and wept inwardly with shame and grief, for I was too much afflicted to speak, or even to cry. My nurse replaced the board with some difficulty; and when the sharp click of a concealed spring announced that all was right, she took the candlestick from me, and we retired. I crept sadly into my little bed to pass my first sleepless night, and to shed upon my pillow a tear for each drop of Henry's blood.

I had often heard, and I had myself faithfully repeated, the story of Beckett's murder; and I well knew that his body lay far off, and that the penance had been inflicted at his tomb in Canterbury; yet I felt as if that dark recess had really been the scene of the dreadful discipline and scourgings. The thought of murder presented to my active fancy the image of appalling punishment; and when the sweet, shrinking, graceful, gracious "Lady" was fiercely addressed, "Thou murderess!" my heart ached because of the tortures that must await her in the hateful recess. A rude stripping of her lovely person; a wanton exposure of her sacred and much hidden body to vulgar eyes—to sour-faced, remorseless priests; a horrible laceration and carnage of her sweet flesh, with a frightful effusion of her dear blood—of her bright, pure blood!

THE ITALIAN MINSTREL.

Poor Minstrel! England's feudal hour
Thy vagrant music hail'd,
When to each gallant Troubadour
Profusion never fail'd:
Not then in soft theatric light
Your glowing daughters shone;
The Roman sword was yet too bright—
The Eagle scarcely flown!

How soft, borne on the summer gale,
His foreign accents come!
They speak to wakeful hearts a tale
Of youth, and spring, and home!
The maiden's song — the warrior's call —
The lovers' tender strife; —
Those simple strains seem blest with all
The poetry of life!

I see the Adriatic wave —
A flood of golden light —
The walls of Venice proudly lave,
As in her days of might!
I hear ten thousand warriors greet
The red cross furl'd on high —
For Palestine a gallant fleet
Bears Europe's chivalry!

The minstrel's glance with milder beam
Meets yon fair maiden's eye,
And, wand'ring near Arezzo's stream,
Fond Petrarch still may sigh; —
Or Paulo, in forbidden songs,
Feed a more hopeful flame,
Till fair Francesco's treasured wrongs
Are seal'd in death and shame.

Full well his beaming eyes declare
Dark passion's trembling spring;
And thoughts of beauty linger where
All other thoughts take wing.
I envy much thy wand'ring lot,
Void of all patriot care;
Thy country's nobler lore forgot,
Joy tunes the light guitar!

The worshipped syrens of thy land
Strike but a gaudier lyre, —
The sunbeams of a darker strand,
Which soon in tears expire!
Oh, Italy! thou hast a name
To light up every eye!
The poet's heaven — the home of Fame!
The dream of History!

W. G. A.

REVIEW OF NEW BOOKS.

Dr. Davy has collected into two volumes a variety of papers bearing upon physiological and anatomical researches, the greater number of which have appeared at different times in the Transactions of the learned societies, and in various scientific journals.[1] This mode of republication is highly desirable in reference to such essays, as it enables the reader to get at the bulk of all contributions of that nature at once, without being compelled to seek for them through scattered periodicals and miscellaneous volumes, many of which are difficult of access, and some, perhaps, gone out of circulation altogether. In this form the labours of scientific investigation take a durable shape, find their way into the libraries, and are not only exhibited in a complete series, but are rendered easy of reference by a clear and distinct arrangement. The subjects treated by the author are extremely numerous and interesting; several new facts in the physiology of animals are brought forward, and some curious and instructive experiments are explained and illustrated with remarkable felicity. The whole is enriched with lithographic plates drawn by Mr. Ford, which considerably enhance the general value of the publication.

Within the whole range of English legislation it may be fairly doubted whether there is a section of law so innately absurd and despotic at the same time as that which regulates the killing and the sale of game. The modifications which, from time to time, have been introduced into these statutory prohibitions and penalties have taken off something of their original harshness and ridiculous perplexities; but notwithstanding all the efforts made in and out of Parliament to reduce them to a system reconcileable with common sense and public opinion, enough of their ancient feudal origin remains to stamp them with the barbarous character of the ages in which they were formed and accumulated for the gains and baronial pride of the lordly tyrants of the soil, at the cost of the misery and blood of their serfs. The total abolition of these laws would be a great boon to the community at large; but the substitution in their place of a reasonable and liberal code — protective alike of property and individual rights — would be a still greater. Whoever is curious to know exactly what those laws used to be, when they were exposed by Sidney Smith in the pages of the Edinburgh Review, and what they are now, may be confidently advised to consult a book recently published by Mr. Bell, of Lincoln's Inn[2], in which the entire mystery of this department of flagrant injustice in the disguise of law is fully and ably developed. The book has the merit of being perspicuous in its explanations, comprehensive in its matter, elaborate in its details, and of bringing into one view a multitude of cases and decisions of great importance to landlords, tenants, gamekeepers, sportsmen, and *poachers*.

A reprint of an American work on the "Medical Jurisprudence of Insanity" has been recently published in London, with an introductory essay by Dr. Spillan.[3] The author of this book, Dr. Ray, perceiving the

defective state of the law (he writes, of course, in reference to the United States, where, it may be inferred, legislation on this subject lingers far behind the progress of science), thought that a treatise of definitions upon which new laws might be constructed, would be a valuable contribution to this neglected branch of inquiry. In collecting the materials for this very useful undertaking he has freely availed himself of the labours of our distinguished medical philosopher Dr. Pritchard, of Haslam and Connolly, Hoffbauer, Georget, Esquirol, and others. The object proposed by Dr. Ray is obvious enough, and may be briefly described. Hitherto the law has dealt darkly with insanity; the obscurity in which the malady was involved became inevitably reflected in the legal provisions framed for its guardianship and treatment; and as little was known with certainty of its strange varieties, so the law was incompetent in some instances, and in others injurious as a practical agent of amelioration and improvement. The gradual collection of statistical returns in France and Italy, the enlightened philanthropy of Pinel, and the humane perseverance of many distinguished men, both on the Continent and in England, led at last to more enlarged and accurate views of the disease; and many of its diagnoses and phases, which were previously the source of contradictory speculations, became distinctly intelligible, leading at last to the adoption of curative processes, medical and moral, from which the happiest results are now in course of active development. The old system of barbarous coercion may be said to be generally abolished; the nature of the wants of the insane is better understood; the manifestations of their calamity are beginning to be regarded with close and watchful interest; and kindness, sympathy, and knowledge have superseded cruelty, aversion, and ignorance. But the law has not kept pace with this double advance of science and feeling; several absurdities still deform our statutes; the regulations for the government of the insane are here and there inadequate or excessive; and a revision of the code is demanded for the sake of enabling those who are engaged in the responsible and anxious duty of superintending the afflicted to accomplish the full measure of utility which lies within their power. Dr. Ray proposes to give such descriptions of the various forms of the disease as will enable the legislature to adapt the laws to its diversities and fluctuations. In so far as his *general* classification is concerned, we see no reason for questioning either the correctness of his outlines, or the appropriateness of the propositions he makes for the reform of this department of medical jurisprudence. But as he proceeds, he falls into the error which is common to every treatise we have seen on this subject. He overlays the inquiry with endless speculations upon those minute subdivisions in which so many well-meaning theorists have indulged, and loses the simplicity of his preliminary statements in a mist of details which legislation can neither compass nor illuminate. Dr. Ray must have had enough of experience (for he is evidently well acquainted with insanity) not to be aware that these refined theories which affect to exhibit so many species of the disease, with a view to an exact arrangement and distribution of cases, are perfectly useless in practice; and his good sense ought to have shown him that if they be useless in practice, they are worse than useless in law. Now, he does not suggest that the law ought to recognise all these subtle distinctions; but he submits them to consideration as if it were desirable that they should be all taken into consideration. For the purpose of law, however, all that is requisite is such a general classification as will enable it to comprehend within its enactments every known form of the malady, leaving the adjudication of individual cases (as, indeed, they must be left in the end, however the law may

be devised) to the authorities or tribunals that may be appointed to decide upon them. The law may declare such and such symptoms to constitute insanity; but the jury or the tribunal, whatever it shall be, that is convened to investigate the case, must finally declare whether these symptoms exist, or whether they exist in a sufficient degree to bring the individual within the meaning of the law. Every attempt to make the law meet all imaginable cases must be a failure. Legislation must proceed, to proceed safely, on general grounds; and the rest must be left to the discernment, the sagacity, and the experience of approved persons to whose judgment the application of the law is committed. Dr. Ray does not absolutely suggest that the law ought to be made special and dogmatic; but the tendency of his book is to leave a vague impression in that direction on the mind. It contains, however, much curious and valuable information, and has been collated from such an extensive variety of sources that it is calculated to produce an excellent effect upon the community. Public opinion, as much as jurisprudence, requires to be remodelled on this subject: many prejudices still lurk in the public mind, which this book exposes and disproves; and, although it is not sufficiently perspicuous, logical, or comprehensive for the immediate purpose to which it is addressed, we can recommend it to attention as a useful digest of facts and principles.

Black's "Translation of Schlegel's Lecture's on Dramatic Art and Literature," has just been issued in a second edition, preceded by a luminous introduction, conceived in a noble spirit of criticism, by Mr. Horne, the author of "Cosmo de Medicis."[4] The appearance of this work at a juncture so favourable for the serious consideration of the topics it discusses is, probably, ominous of those changes which, it may be hoped, the enlightened character of the age demands too energetically to be resisted. We need not remind the reader that Schlegel's eloquent lectures are directed to an exposition of the poetry and humanity of the stage, and that he treats the subject, in its whole scope, with a masterly, and, which is quite as much to the purpose, a sympathising genius. The perusal of these essays must have the effect of directing attention to that mighty obstruction which has hitherto in England prevented the development of the dramatic art — which has not only arrested the cultivation of that species of literature in its highest and worthiest forms by men whose tastes and powers qualified them to prosecute it with success, but which has forced into existence a spurious and motley race of productions disgraceful to the moral as well as the intellectual tendencies of the public mind — and which has forced the dramatic talent of the country into other channels; — we allude to the mischievous monopoly of the winter theatres. This monopoly not only limits the field of the legitimate drama, but, by the diversion of great means to the worst and most meretricious classes of stage exhibitions, has the effect of depriving the public of that very enjoyment for the maintenance of which the monopoly was ostensibly granted. We are convinced that a valid case might be made out against Drury Lane and Covent Garden, on the ground that they have failed to fulfil the terms of their original undertaking; and that the neglect into which they have suffered the national drama to fall would justify the legislature in revoking the patents, even if no stronger reasons could be urged for such a proceeding. We do not, of course, allude to the systems of management adopted by the present lessees, who have inherited the embarrassments of their predecessors; and we acknowledge, with a full sense of its merits, the

[4] *A Course of Lectures on Dramatic Art and Literature.* By Augustus William Schlegel. Translated from the original German, by John Black. Second edition. Two Vols. London: J. Templeman; J. R. Smith. 1839.

important effort made by Mr. Macready to restore the stage to its proper dignity. But we speak of the whole effect of the monopoly in past years — of its general and ultimate influence upon the progress of dramatic literature — its gewgaws, its rope dancing, its wild beasts, its bastard comedies, its melodramatic tragedies, its patchwork revivals, and, above all, its perpetual exclusion of living talent. If we ask, on the one hand, what has the monopoly done to *encourage* the cultivation of the drama? — we shall be directed, perhaps, to a few plays, scattered over a wide waste of years, and we shall find that the English stage has produced, probably, some two or three dramatists, whose works half a century hence may be held in estimation by the public. But is it credible that during that long period there were not many writers in the country who only wanted access to the theatre to vindicate the glorious uses of their art? Is it credible that there has not been one man in England who could write a genuine comedy since the days of Sheridan? — or, that with such few exceptions, we have not had a poet amongst us with the desiderated power to create a new tragedy? On the other hand, if we ask what has the monopoly done to *prevent* the cultivation of the drama? — we find the answer multiplying upon us in the endless impediments that choke up the avenues to the green-room — in the preoccupation of managerial favour by playwrights who arrange their scenes by the carpenter's rule, who prepare acting pieces as milliners prepare dresses, and cut, flounce, and line them according to the latest pattern — in the mechanical spirit that pervades the whole interior of the theatre, giving even to the wardrobe keeper and the machinist a staring and prominent place amongst the attractions of the play-bill — and in the perpetual preference that is uniformly exhibited for costly and ephemeral spectacles over inexpensive and permanent nature. These things are so notorious that it would be superfluous to dwell upon them, were it not also evident that their notoriety has not conducted us one step nearer to the abolition of the cause of the evil. That cause is to be attributed clearly and solely to the existence of a monopoly which renders competition illegal, and which forces the minor theatres into the most monstrous expedients to sustain the vicious taste upon which they are compelled to subsist by the immoral conditions of a demoralising law; thus effectually extinguishing the enthusiasm of dramatic genius, which looks around in vain for a vent through which it may find its way before an audience capable of appreciating its labours. In reference to this subject, Mr. Horne makes the following judicious and striking observations: —

"An easy access to all the stages — all being equally permitted (as every sane mind must naturally think they ought) to accept the finest dramas they can obtain — and speedy production of accepted pieces, will afford the only chance of restoring the "English Drama." In such a case we should find the pure dramatic ore of many writers, at present, in most instances, quite unknown to the stage, soon wrought into available and influential works. But, under the patent system of exclusion, the author of the "Bride's Tragedy," is heard of no more; the fine execution and high promise of the "Jew of Arragon," and "Woman's Love," are suffered to die out of mind; and the author of the "Provost of Brugés," though it was a successful tragedy, gives up the time-wasting task of again finding "the opening." Of recent, unacted, publications, it is not to be doubted that a most intense dramatic excellence (notwithstanding the perversity of construction in "Andrea of Hungary," and "Giovanna of Naples,") exists in Landor; that D'Israeli, and the author of the "Lords of Ellingham," possess dramatic capacities that entitle them to fair trial before the public: while the passionate imagination and pathos of George Stevens seem to spring out of the ground, like one of the old Elizabethan dramatists revivified. The old English dramatists are incessantly invoked by the critics, in most cases for the purpose of confounding with despair the children of to-day. Here now is just such a man: notwithstanding certain vital, no less than artistic errors, (in "Gertrude and Beatrice," besides the adoption of an antiquated phraseology, which surrounds his genius as with fogs and vapours, there is no more

mistaking him than the sun blazing beyond. The tragedy of "Garcia" (unpublished,) manifests an unaffected fine spirit, and a considerable knowledge of stage construction; while for a revival of the highest class of refined comedy we might confidently anticipate a genuine result from the accomplished genius of Leigh Hunt. But amidst the existing difficulties and depravities inseparable from the patent monopoly, little effect on dramatic literature can be expected from any occasional successes.

We may add to this enumeration the name of Mr. Horne himself, who has displayed capabilities of the highest order in the two dramas he has given to the world through the press, the only mode of publicity (we need not say how defective a mode) left to men, who, like him, with a genius able to revive the triumphs of a well-ordered stage, are compelled to waste their energies in perpetual protests against a system of corruption and exclusion. The monopoly cannot stand. It is an insult to the common sense of the nation. It puts a direct premium upon the lowest species of theatrical entertainments; it legalises the most contaminating description of vicious exhibitions; and, unlike all other monopolies, it involves this gross absurdity, that it keeps out of the market the very article which its prohibitory regulations were designed to protect. We shall return to this question again and again; for, in reference to the literature of the country, we regard it to be of paramount interest; and, in our future remarks upon it, we hope to demonstrate the necessity, as well as the justice, of abolishing a privilege, which is not only abused in its exercise, but which, were it even honestly acted upon, would be productive of results precisely the reverse of the objects which were contemplated at its origin.

In the mean time, and so long as the monopoly lasts, we shall continue to draw the attention of our readers to such dramatic pieces as, under the malign influence of the winter houses, are forced into print, instead of being fairly tested on the stage. We may not succeed by the specimens that come before us, in exemplifying the great talent that is shut out from its legitimate arena by those barbarous restrictions, because few dramatists are willing to risk the issue of printing their productions; and because it may happen that those who have the highest claims are not always prepared to venture upon an ordeal so uncongenial to the aims of their ambition; — but we may hope to prove, through these occasional notices, that the decline of the stage is not to be attributed to any lack of original and able writers.

A tragedy called "Gisela [5]," presents a favourable example of that mixed drama of real life in which Comedy comes in to the help of her graver sister, and conducts a story of considerable interest through fluctuating scenes of humour and pathos. The plot is founded on a German tradition, and is highly romantic in its subject and treatment. The scene is laid in the Rheingau, where the ruins of the two feudal castles of Brömsberg and Ehrenfels, nearly opposite the busy town of Bingen, still mark the place where the incidents are supposed to have occurred. The time of the action is in the beginning of the twelfth century, at the end of the second crusade, when Hans Brömser von Rudesheim (whose name is suggestive of the vineyards of his native home) is taken prisoner by the Saracens. During his captivity, he makes a vow that should he ever obtain his freedom, he would forswear arms, appropriate all his wealth to the erection of a monastery, and dedicate his daughter (whom he left behind him) to a vestal life. Shortly after he has made this rash vow he is released, and returns home. But in the meanwhile, his daughter, Gisela, has pledged her faith to the gallant Karl von Ehrenfels, and bound herself by as strict a promise as her father. At this point the interest of the story begins to be unfolded, but a want of

[5] *Gisela; a Tragedy.* In Five Acts. By I. J. H. London: John Lee. 1839.

skill in its conduct disappoints us in the progress of the events. Hans Brömser is accompanied by his squire, Degenband, who, aware of his lord's design, lays a plan to entrap Gisela, in the hope of possessing himself of her person and fortune. This piece of treachery is scarcely developed in the attempt to carry it into effect, than it is frustrated by a follower of Karl's, who surprises Degenband, and slays him in the third act. Having got rid of this difficulty, we return to the unhappy Gisela, who is urged and threatened by her father to such an extremity that she throws herself out of the window of her chamber, and is drowned in the Rhine. This terrible consummation of her unfortunate attachment closes the third act; and the remaining two are occupied with the remorse and gradual insanity of the bereaved Hans. The window of Gisela's chamber is bricked up, and Hans remains within, sleepless and wretched, haunting the spot where his cruelty destroyed his child. The last scene exhibits the outside of the castle overlooking the river. Karl and some of his followers are below. A thunder storm bursts over them; a flash of lightning strikes the earth, and the bricked-up window falls outwards. Hans appears within, approaches the open space, steps forward, and is lost. The termination of this play is a mere scenic expedient which might produce a *coup de theatre* in representation, but which is wholly independent of the deeper purposes of tragedy. In the construction of the drama, the author has committed a fundamental error in casting upon the concluding acts the burden of the father's anguish and despair. The real interest ceases with the death of Gisela, and every line that follows weakens its impression. An audience will not sit out an additional hour merely to be satisfied about the fate of an old man whose arbitrary authority has prematurely spoiled their sympathies for the evening. Apart from these considerations, "Gisela" is a work of merit. The lighter parts, — the minstrelsy of Henry, the lover of Gisela's confidante, — the humours of the servants in the old baronial halls, — and the more serious dialogue throughout, evince a command of diction, and a happy fluency of dramatic management that, bestowed upon more favourable materials, could hardly fail of success.

Mr. James, relinquishing for an interval the more congenial labours of novel-writing, for which he possesses such an extraordinary "gift" of facility, appears as the author of a drama entitled "Blanche of Navarre."[6] The plot of this piece is deficient in originality, and cannot be said to atone for the defect by any very remarkable talent in the management. Like almost every play where there is a greater bustle of incidents than the progress or nature of the story will justify, we are perpetually doomed to disappointment. We are constantly led to expect something which never comes; and when the catastrophe arrives, we find that there has been much noise and rant and very little earnestness, a want of justification for so much "sound and fury." The rapidity with which the incidents follow each other, and the absence of a sufficient motive for the principal points of the action, reduce the tone of the piece below the level to which the dialogue aspires. The whole work seems to have been conceived and accomplished in a hurry; and, with the exception of a few scenes which are written with vigour, and which indicate a poetical capacity, there is not much in it over which the reader will care to linger.

For the season of gifts and holidays, to which we are now approaching, we hardly know any work that comes more strongly recommended by the interest and morality of its contents, than the beautiful volume of Fables,

[6] *Blanche of Navarre; a Play.* By G. P. R. James, Esq. London: Longman & Co. 1839.

original and selected, which has just been published by Mr. Tilt."[7] The editor of this collection of precepts in action appears to have consulted a great variety of sources, and to have availed himself with excellent judgment of the best specimens extant in the languages of antiquity and of modern Europe. We find amongst the contributors to this richly-embellished work, the names of Æsop, La Fontaine, Nivernois, Lessing, Dodsley, Gay, Croxall, Yriarte (the Æsop of Spain), Goldsmith, Florian, Addison, Sir Roger L'Estrange, and others, whose productions in this way are familiar to all lovers of such wise and witty fictions. The charm of the fable, as a successful form of conveying practical instruction to the young — whose understanding is most easily reached through their imagination — need not be insisted upon; and in the volume before us, this charm is greatly heightened by the illustrations, which are numerous, quaint, and exquisitely finished from the designs of Grandville. It is the most complete and attractive publication of its class we have seen. Several original fables of considerable merit are introduced, in addition to the most celebrated of all ages and nations; and, as a whole, it forms an anthology which young readers will welcome with delight, and from which even the oldest may glean profit as well as entertainment.

The excellence of intention exhibited in a poem on "Blindness[8]," by Mr. Park, will not permit us to investigate its poetical claims too closely. The design is incomparably more meritorious than the execution, which, however, is by no means deficient in occasional evidences of ability. But Mr. Park wants the requisite power to sustain the interest of such a subject through so elaborate a performance. Had he limited himself to a less ambitious plan, instead of carrying us over three somewhat lengthy cantos, by which the inquiry is rendered at last not a little dull and wearisome, he might have succeeded better in attracting attention to the misfortunes of the blind. Yet, although the versification sinks under the matter, and is chargeable with some inequalities and irregularities, there is so much true benevolence in the sentiments, and so much pains have evidently been bestowed upon the collection of illustrative facts, that we recommend the volume to the perusal of all those who are interested in the subject. They will find some curious details in the notes, and through the body of the poem they will see that Mr. Park has very nearly exhausted all the considerations and feelings suggested by the great calamity to which he dedicates his muse. We must not dismiss the book without observing a very extraordinary omission in the references and allusions to celebrated persons who have suffered from blindness. Mr. Park, we suspect, cannot have heard of the very remarkable labours and productions of Lieutenant Holman, the Blind Traveller, or he must have made an important place for him in these metrical outlines. The travels of Lieutenant Holman are unquestionably amongst the most striking instances on record of the power of mind in vanquishing difficulties, and form a material feature in the history of that melancholy deprivation against which his courageous spirit and active intellect enabled him to struggle so long and so successfully in every part of the world, and in almost every conceivable circumstance to which travellers in pursuit of knowledge are exposed. We hope to find an opportunity of bringing the works of the Blind Traveller under the consideration of our

[7] *Fables, original and selected, by the most esteemed European and Oriental Authors. With an Introductory Dissertation on the History of Fable; comprising Biographical Notices of the most eminent Fabulists.* By G. Moir Bassey. Illustrated by numerous Engravings, designed by J. J. Grandville. London: C. Tilt. 1839.

[8] *Blindness; or the Second Sense restored and lost.* A Poem, in three parts. With Descriptions and Physiological Notes. By Andrew Park. London: Smith, Elder, & Co. 1839.

readers, and, in the mean time, counsel Mr. Park to amend his annotations by introducing some reference to them in his next edition.

Connected, in some degree, with this subject are two treatises by Mr. Stevenson, "On Cataract[9]," and "On Deafness."[10] These little works have severally reached a fifth edition, which may be accepted as a satisfactory evidence of their utility. They are written with a degree of perspicuity unusual in medical books, and are equally worthy of approbation for the popularity of their style and the fulness of their professional knowledge.

A very elegant, portable, and useful volume called "Black's Picturesque Tourist of Scotland[11]" is one of the best guide books to that country we have seen. The descriptions are accurate, and written with a gusto not often detected in such publications. The stranger is instructed upon all points necessary to enable him embrace all the beauties and antiquities within the shortest space of time, and at the least cost; and the whole is richly illustrated by maps and well-executed engravings. A useful Itinerary at the end considerably increases the practical utility of the publication.

Mr. Mann has published in a small condensed volume, to which an excellent map is attached, the results of a residence of six years in the Australian provinces[12], from whence he has just returned. There is not much novelty in the information which this book contains; but it is recent, unprejudiced, and minute. The accounts given of Van Diemen's Land, New South Wales, Port Philip, and Australasia are full and intelligible. Mr. Mann has no party to subserve but truth, and states his impressions with an impartiality that will strongly recommend the publication to the serious attention of emigrants. The most important suggestions he makes for the improvement of the condition of those provinces are the repeal of the old land-regulations, and the adoption of a simpler and cheaper plan by which the cost of land would be diminished, and favouritism abolished. He is also of opinion that the new mode of assigning convict labour is likely to be attended with the most pernicious results. There are some notes upon New Zealand towards the close of the volume, but the only novelty they contain are a few letters from natives during the progress of their conversion to Christianity.

A comprehensive "Encyclopedia of Rural Sports[13]," by Mr. Blaine, is now in course of publication. The plan of this work is comprehensive, and the collection of the materials has engrossed seven years of the author's life. It promises, if we may judge from the number before us, to be the most complete, the most accurate, and, beyond all comparison, the most interesting production of its class extant. It embraces the whole history of Rural Sports from the earliest ages, when they formed indispensable occupations for man in the pursuit of food, to the present day, when many of them are known merely as traditions, and the remainder practised only as amusements. In addition to this historical development, Mr. Blaine furnishes his readers with the natural history, the anatomical structure, physiological peculiarities, and geographical distribution of the chief animals, giving such instructions for the treatment of diseases as may be expected

reasonably to come within the scope of the undertaking. The whole is most profusely illustrated with wood engravings, and forms one of the most agreeable and instructive publications of the season.

"Solitary Hours[14]," by Caroline Southey, is the first volume published by Caroline Bowles since she changed her name, and went to cultivate poetry in the retirement of Keswick. The lover of pure English verse will discover even in these pleasant associations something to create an additional charm in the book; for, let us reason as we may, and try to abstract ourselves from individualities of all kinds in our admiration of the works of genius, we cannot help feeling a personal interest in the movements and domestic revelations of those to whom we owe some of our most enduring intellectual delights. The sympathy they awaken is beyond that of words, and images, and illusions of the imagination: they grow upon us like familiar friends, and, in spite of all our efforts, we are perpetually trying to *realise* to ourselves their lives and habits, identifying them with attributes and forms corresponding with our estimates of their characters, and surrounding them with fanciful circumstances appropriate to the general notion we have of their pursuits, tastes, and meditations. This little book by Caroline Southey is, in this point of view, a book developing the inner nature of the writer. It has no great vigour of expression, not much originality of thought, and will not startle anybody with novel terms or quaint exercises of skill; but it is full of sweet humilities — it exhibits a deep and reverential love of the good and beautiful — displays a chaste heart and a clear head; and, tending always towards the charities of hope and toleration, diffuses a calm over the spirit of the reader which is better than a thousand treatises on morals and religion. It consists of short pieces in verse and prose, tales, sonnets, and snatches of reflection, every one of which is recommended by some gentle suggestion addressed to the purer part of our turbulent humanity.

A pretty narrative poem[15], full of the warmth and perfume of the tropics, discovers in the author, Mr. Dunbar, a pleasant facility in the construction of a story, and some skill in the art of versification. The work is light and musical, and has as much purpose in it as such inventions usually aim at. Some of the shorter poems that follow are in a happier vein; for in such pieces there is less demand upon the philosophy and sympathy of the writer, and a better excuse for sunny hopes, fantastic conceits, and slender bubbles of sentiment.

"Ystradffin[16]," with less power, and perhaps hardly so much variety, is, on the whole, a more acceptable volume of verse. It consists of one long poem, full of historical or legendary characters, and exquisite scenes drawn from South Wales — a sort of metrical mirror of the costume, the traditions, the domestic habits, and the scenery of the upper part of Carmarthenshire. In the treatment of all these points, Mrs. Bowen exhibits the talents of a close observer of nature with a strong tinge of poetry in her character, rather than of a poet making close observations on nature. The octo-syllabic measure favours this spirit of detail, and the picturesque tone of the place and the people help to inspire the whole with a sufficient relish of romance. The poem bears a shadowy likeness to Scott; but the multitude of small facts and faces that are diffused through it preserve it from being a servile imitation.

[16] *Ystradffin: a Descriptive Poem.* With an Appendix, containing Historical and Explanatory Notes. By Mrs. Bowen. London: Longman & Co. 1839.

Among the useful little manuals which in this practical age, when all sciences and arts, occupations and speculations, are reduced into the shapes of catechisms or hand-books, is a curious, and certainly very original little treatise on the art of breeding and keeping rabbits.[17] Considered in reference to domestic economy, the rabbit is really a more important animal than people are generally aware of; and, as whatever is worth doing is worth doing well, Mr. Rogers may be commended for the pains he has taken to teach the world how to mange their live stock of these fancy creatures, and for the pretty little wood cuts with which he has illustrated his design.

Of a similar character is a little work entitled "The Poultry Yard[18]" the object of which is to exhibit a practical view of the best methods of selecting, rearing, and breeding domestic fowl. Mr. Boswell, in this useful treatise, points out the means by which cottage economy may be greatly improved in reference to the various kinds of foreign and domestic birds, and how small places may be made, by a constant attention to certain rules, productive to a degree of which their proprietors are seldom aware. The book is small, cheap, and valuable.

The second thousand of a volume, reprinted from the original American edition, entitled "The Student's Manual[19]," has been called for. The success of this work, and of similar works derived from the same source, is a remarkable illustration of the direction of the influence which the mind of America is gradually assuming over our literature. In her fictions and her poetry she is doing nothing; but in moral philosophy, in the moral and practical culture of youth, she is setting a bold and triumphant example to England. The advances she is making in education are even more marvellous than her progress in steam and wooden houses; and it is here that the contrast with England furnishes the most humiliating points for consideration. The book before us is a valuable work — with some crotchets — but containing a great mass of useful, every-day, living truths.

A curious historical novel, referring to the times of Herod, has recently been reprinted. This work, entitled "Mariamne[20]," was originally published in 1825, but the panic which at that period convulsed the country indisposed people for reading fictions of this class, which require more leisure and research than a flippant tale of fashionable life such as, even in 1825, used to obtain a rapid and extensive circulation. The great merit of the book consists in its faithful reflection of an antique age — its sketches of the men and events of an era, which, although chronologically remote, is so closely mixed up with scriptural history as to be familiar to us in its general aspect and outlines — and its clever portraiture of costumes and habits. The story itself is highly dramatic, and well sustained; and is not deficient in vitality of action and character.

Under the title of "A Comparative View of Ancient History[21]," Mr. Smith supplies an obvious desideratum in elementary books. The

plan of the undertaking is simply to exhibit the principal events of history contemporaneously in chronological order. The space it occupies is not much, but the labour of its production must have been considerable. Of the plan we fully approve; and of the execution we have only to regret that the author did not render it a little more explanatory — that he did not furnish a few more striking points to fascinate the attention of the student, which is likely to wander away from these dry notes and index fingers — and that he did not contrive to exhibit his facts in a more continuous shape. As it is, however, the reader will find much valuable information compressed into its pages, and will be greatly assisted in his historical studies by the luminous and useful observations on chronological eras with which the volume closes.

If it were possible to revive the interest of the Canada question, the publication of the debates which took place in the House of Commons on the settlement of Quebec in 1774[22] would be likely to have that effect: but it may be doubted whether the public care much to look back so far upon the history of a disaffected province. The book, however, is well calculated to set people thinking in the right channel to show the origin of our connection with that limb of America, the nature of our arrangements in the first formation of our government on the St. Lawrence, and the progress of our efforts to meet the wants of a population which experience has proved to be both ungrateful and unwise — as indeed the ungrateful always are. These debates are full of instruction, and have been edited with great care.

A capital book on Zoology for the use of the young has been compiled by Mr. Fennell.[23] Such a book was much wanted, notwithstanding the multitude of scientific compendiums that are hourly cast upon the human tide of readers, and the spirit in which it is executed will be appreciated by every person familiar with the difficulties of the subject. It is simple and comprehensive, written in a style to attract and instruct, and profusely embellished with expressive wood-cuts.

We have a translation from the German of the quaint autobiography of "Thomas Platter[24], a schoolmaster of the sixteenth century, who, born in humble life raised himself by his perseverance and his talents to a respectable professorship, and to a little property of four houses in the town of Basle. The tract is worth reading, and not wanting in a useful moral. Old Platter is a fellow of some humour as well as sense, and, notwithstanding that he deals overmuch in scriptural phrases, there is a fund of solid matter in him that will make the reader feel an interest in his odd adventures. The wood-cuts are all antique, and look like the carved blocks from whence the impressions in very ancient continental books were taken.
